Salinas River 2016-2025 Stream Maintenance Program
CONCEPTUAL EXAMPLE OF TREATMENT APPROACH IN SELECTIVE TREATMENT AREAS

While maintenance activities in the selective treatment areas follow the low-flow channel much more closely than in secondary channel areas, maintenance will occur in a patchwork fashion as shown below in order to minimize impacts to the low-flow channel and the historically-preserved 10-foot buffer adjacent to the low-flow channel. The figure below provides a conceptual example of how this patchwork approach will be implemented in the selective treatment areas.

Notes

1. Imagery and selective treatment area conceptual mapping provided by MCWRA.
