APPENDIX D

California Department of Public Health

Safe Drinking Water State Revolving Fund

2013 July Updated Final DWSRF Project Priority List

PPL #	System Number	Project Number	Borrower/System Name	Project Name	Project Description	Project Category	Bonus Points	System Type	Problem	Project Costs ($)	Connections	Population	District	County	Region	List Year
1	3600391	3600391-001	Hill Crest Mobile Est Inc	Water Storage Tank Replacement and Distribution	Hill crest Mobile Home Estates is a Mobile Home Park in Yucaipa California. There are approximately 196 spaces in the park. The Park is a 55 and older park and the residents are almost all retirees living on fixed incomes. The owner provides water to the residents from an on-site well. The water is stored in a 20,000 gallon tank. On August 10, 2010 the Department of Public Health, County of San Bernardino issued a statement identifying violations of CDPH 64583 and 64585. The lab results had identified coliform bacteria in the water. Furthermore, the tank was said to be in a state of disrepair. The water had been provided to the residents for little or no charge for the past 30 years. The recommendation provides that Hillcrest should contract with the local water company. The park is heavily rent-controlled, and the cost to Hillcrest to replace the Storage and Distribution system represents a hardship.Hillcrest and its residents are in need of assistance to have proper drinking water provided to them. If the costs can be assisted/subsidized from the CDPH program, the residents and Hillcrest would be able to continue to afford the water provided.	B	15	C	The owner provides water to the mobile home community from a well located on the property that is held in a 20,000 gallon tank. The mobile home park is a 55 and older park and there are approximately 196 spaces. Recently, the Department of Public Health, County of San Bernardino, issued a statement identifying violations of CDPH 64583 and 64585 due to coliform bacteria. This statement was issued August 10, 2010 and 45 days were provided from its receipt to obtain a new storage tank and assure that the water is potable.	80,000	180	900	13	San Bernardino	V	2011
2	2210921	2210921-003	Whispering Pines Apartments	Water source expansion/ Deepen existing well or drill new well	Do a small study to determine the best location to drill a new well, complete the necessary environmental review. Do the preliminary work to prepare and access the site. Drill the well. Test the water and hook the well into the system.Also, determine if deepening existing wells 1 and 2 is feasible or perhaps the most feasible course of action to increase the supply of water. Well 2, has had the water quality issue. Perhaps it will be possible to redrill and reseal this water source.	B	0	C	The water system has an inadequate water supply. The most productive well has had a water quality problem. An attempt was made to reseal the well. It failed. Two new wells have been drilled in an attempt to replace the well with the quality issue. The new production has been inadequate to provide sufficient water to the complex. We need more water.	98,000	16	28	11	Mariposa	III	2009
3	2700509	2700509-001	OAK MANOR WS	Oak Manor Water Application	We need to hire professional consultants to find an appropriate location for a new well, and we will need to cap off the old one. We currently have two holding tanks, which will need to be inspected, and have the water lines re-routed to these tanks from the new well.	B	0	C	Current well is approximately 40 years old, and was originally an agricultural well with a single casing. Last year, we had high levels of coliform when our water was tested, during the rainy season. Our County Health Department seems to think that the casing is the problem, and that we will need a new well that complies with residential standards with a sanitary seal on the casing to prevent the contamination from the rain run-off. According to our water management company, this cannot be corrected in our old well, only if we drill a new well. We do not have the funds to drill a new well.	40,728	33	71	05	Monterey	II	2007

4	2900502	2900502-002P	FLORISTON WATER SYSTEM	Floriston Spring Filtration Project	To facilitate the completion of the plant, the Board has contracted with an appropriately CDPH licensed operator/consultant to assist the current operator and Board in bringing the plant to completion, and satisfying all requirements of its regulating agency. Additionally, a civil engineer experienced with surface water treatment, and an Electrical Engineer for SCADA have also been contracted.Here is a list of tasks identified to complete the plant and enable it to produce water that meets the CDPH surface water standards.* Document the existing installation* Review the water quality of the spring and prepare a pilot study of proposed remedies.* From the pilot results, receommend a pre-filter system to remove seasonal particulate produced by the spring.* Evaluate, design, and install process controls and alarm monitoring for tank level, plant flow, outgoing chlorine and turbidity levels.* Solve backwash water discharge disposal from filters.* Design and installation of a SCADA system to allow remote viewing, alarm monitoring, and control of filter systems.* Prepare as-built documentation of the plant design, including an operation & maintenance manual.	B	0	C	The community of Floriston is under a boil notice, and has been for close to 2 decades. Since the town's inception in the late 1800's they have relied on a spring water source above the community. The community sits on the side of a rocky canyon above the Truckee River. Past studies have concluded that drilling a well would not yield sufficient water to meet the Town's needs. Additionally, a drilling rig would have great difficulty getting to the community as the only access is through 2 small tunnels under the Union Pacific railroad tracks.The spring collection system was last updated in the 1960's. The spring output varies seasonally, and usually yields sufficient amounts to cover demands, however, it is under the influence of surface water and routine raw water sampling show total and fecal coliforms at various times of the year. The spring also discharges fine particulates that must be filtered.A filtration system was engineered and approved by CDPH for bag filtration about 10 years ago, and placed on-line in the last few year. This system is in place, however, the gravel pre-filter, capable of backwashing, was never purchased or installed, hence, the expensive bags are being clogged at an unacceptable rate. The plant location was changed after design, due to land easemant issues, and has some hydraulic issues to address, and other components designed for the operation have not proved workable. The plant does	0	40	100	21	Nevada	I	2012
5	1900903	1900903-001	SLEEPY VALLEY WATER CO., INC.	Sleepy Valley - Disinfection and Reliability	PROVIDE CHLORINATION, NEW PIPELINES, AND 500,000 GAL RESERVOIR	B	0	C	Shallow Groundwater Requires disinfection facilities; Bacteriological MCL failures, wells subject to flooding which results in water outages and distribution and storage coliform problem	500,000	62	100	16	Los Angeles	IV	1998
6	1910023	1910023-003	AVERYDALE MWC	Well #1 Replacement and Disinfection Treatment	replaceing well #1 and also installing disinfection system.	B	0	C	We had a persistant problem with bacteriological contamination of this well that has caused Multiple TCR violations.	350,000	291	1,500	16	Los Angeles	IV	2007
7	5510013	5510013-005	TUD - Columbia Water System	Shaws Flat Pipeline Extension	CONSTRUCT A WATER MAIN EXTENSION FROM THE COLUMBIA SYSTEM INTO THE SHAWS FLAT COMMUNITY.	B	0	C	THE SHAWS FLAT AREA HAS NUMEROUS FAILING SEPTIC TANK SYSTEMS THAT HAVE CAUSED MICROBIAL CONTAMINATION OF THE LOCAL WELLS.	574,000	1,548	3,646	11	Tuolumne	III	1998
8	1110001	1110001-003	City of Orland	City of Orland - New well construction	The Public Works Director, City Engineer and members of the Public Works Commission have researched locations to construct a new well site. A site located on City owned property, east of Interstate 5 and at the end of Eva Drive has been determined to meet the City's water needs. The well will have a natural gas back-up generator. So the source is protected, it will be in an enclosed structure.	B	0	C	By letter of November 3, 2011, the City was ordered by Department of Public Health to discontinue the supply of water from Railroad Avenue Well 02. A regular raw water sample collected October 18, 2011 was enumerated at 30 MPN/100 ml for both total and fecal coliform. In July 2009 fecal coliform bacteria was also detected. The well was constructed in 1958 with steel casing and was not constructed with a sanitary seal.	600,000	2,615	6,525	21	Glenn	I	2012
9	1600013	1600013-001	LAKESIDE UNION SCHOOL	Drill a new well	Drill a new well	B	0	P	On-going bacteriological problems from the well.	300,000	5	388	12	Kings	III	2007
10	1900679	1900679-001	RANCHO LOS AMIGOS MEDICAL CENTER	Consolidation with the City of Downey	The project is a non-transient community water system consisting of 1 connection and chlorinated ground water source. The system is in need of an additional water source, upgrades to their treatment equipment and their water storage tank, installation of backflow protection device for each medical building, certified operators for maintaining and operating the system and collection of mandatory samples (distribution and source).	B	0	P	The water system is in need of an additional storage and source of supply, backflow protection device for each medical building, certified operator to maintain and operate the system and overall system improvements.	1,960,200	1	2,000	16	Los Angeles	IV	2008

11	0500029	0500029-001	TAMARACK SPRINGS	Tamarack Springs Water Source Improvement Project	The Water Source Improvement Project planned involves drilling a well on private property near to the current water storage tanks and establishing the necessary pumping, monitoring and storage capabilities to run the system most efficiently. We anticipate maintaining the current system to provide storage for fire suppression with the new source providing potable water supply. Other communities in the surrounding area found a suitable aquifer at a depth of 700-800 feet. The estimated cost of this project is $90,000.(Water system details not populated in Section B)ID: 05-00-106Tamarack Springs Mutual Water Company, Inc.Calaveras CountyService Connections: 40 (15 currently active)Population served: 40Regulating Entity: Calaveras Environmental Management AgencyType of Public Water System: Transient, non-Community	B	0	N	The Tamarack Springs Mutual Water System supplies water to a small community of 40 properties in Calaveras County. The water system currently relies on two springs that have been demonstrated to have seasonal water quality issues and limited production in dry months. Over the past 5 years, the water system has failed total coliform testing 28% of the time. In the last 12 months, total coliform failures resulted in a tier 2 notice to all property owners and an e. coli failure in April required a subsequent tier 1 notice.Historic records also show that the spring source for the water system diminishes to a negligible flow during dry years as measured by storage tank overflow. Residents have implemented standard conservation measures but in the absence of a reliable water source, priority usage is given to permanent residents. The 30,000 gallon storage meets the needs of permanent residents for an estimated 2 months. Depleting that reserve also depletes the fire suppression capability of the community. We anticipate that these shortages will increase in severity with climate change.	90,000	15	35 10	Calaveras	III	2012
12	0900591	0900591-002	NORTH ECHO SUMMIT WATER ASSOCIATION	North Echo Summit Water Association Distribution and Storage Improvements	To ensure a sufficient and dependable supply of potable water, the North Echo Summit Water Association (NESWA) intends to upgrade its 80-year-old deteriorating water system. In March 2008, NESWA hired an engineering consultant to evaluate and provide a conceptual design of an integrated water supply, distribution, and storage system. The consultant recently completed plans and specifications (90% completion level) for a new water distribution and storage system. The project will be “shovel ready” in the summer of 2009.This application is seeking funding for Phase 1 of upgrades to the NESWA system. Phase 1 includes four main components. These include: (1) system planning and design, (2) replacement of the majority of the distribution line, (3) installation of a 20,000 gallon storage tank, and (4) installation of two booster pumps. Phase 2, which is not part of the current project, will provide NESWA with an additional source of water which may include a surface water treatment system and/or a groundwater well. Implementation of Phases 1 and 2 would solve the problem of an insufficient and undependable water supply and the coliform contamination issue. Phase 1, alone, will significantly reduce water loss due to leaks and will prevent pathogen contamination of the water system through open pipes and tanks. Phase 1 will result in more dependable delivery of water that is of	B	0	N	The North Echo Summit Water Association’s (NESWA) system, serving 42 U.S. Forest Service (USFS) cabins, was installed in the 1920’s. NESWA recently incorporated as a Mutual Benefit Nonprofit Corporation with the State of California and became an IRS tax-exempt corporation. Cabins are occupied early June through October, approximately five months each year. Traditionally, the water system’s primary source was supplied in the late spring to mid-summer by Hawley Spring, a source of seasonal groundwater. When Hawley Spring dried up, usually in mid-summer, the system typically switched to a secondary, but dependable, surface water source. However, a crisis situation now faces NESWA: the system has insufficient water supply and pressure to meet the users’ needs. This is the result of both: (a) a deteriorating water distribution and storage system and (b) NESWA discontinuing use of its dependable untreated surface water supply, as ordered by the El Dorado County Environmental Health Department (County Health Department). The County Health Department has cited NESWA with two on-going violations:(1) total coliforms exceed maximum contaminant level (Safe Drinking Water Act, Title 22, Section 64426.1(b) Total Coliform MCL Violation), and(2) insufficient system water supply (Waterworks Standards, Chapter 16, Section 64554 (a): At all times, a public water system's water source shall	617,000	42	84 09	El Dorado	I	2009

13	3600760	3600760-001P	Loch Leven Chstn Conf Ctr	Loch Leven Camp & Conference Center System Rehabilitation Phase One	Loch Leven Camp and Conference Center is requesting funds from CDPH for Phase One of our water system rehabilitation. This Phase One project includes the replacement of the gravity storage tank, replacement of the Spring Box, and installation of an ultra violet disinfection system to replace the current chlorination system. The project may include the replacement of some directly associated water lines, when necessary. The applicant understands that the CDPH typically prefers consolidation of the old and new system where possible. This first phase will be consolidated with the current lines. However, the issues of the failing system have been approached with patches and temporary fixes over the years and as a non-profit entity, the options for the most appropriate fixes have been cost prohibitive. We believe full replacement of the equipment is in fact the most efficient way to address the problems with the system and assure compliance with Health Department standards. In addition to saving time, money and water, full replacement will benefit the surrounding environment. Mountain Home Creek, a Class I waterway, flows through the camp and is impacted by the treated water leakages from the system. The current process for water treatment is to chlorinate at both the spring house and the pump house to avoid further positive tests for bacteria. With a properly working system, less filtration will be	B	0	N	The target water system is a transient non-community water system that serves the Loch Leven Christian Camp & Conference Center, a non-profit camp facility open to all groups including faith-based groups, community groups, clubs and special interest groups, and corporate groups. During the summer months, the camp is used primarily by youth camps serving children ranging from 2nd grade to high school graduates. Loch Leven serves up to 135 people per week, including resident employees and their families. In addition to our users, drinking fountains are accessible to the general public using our site to access San Bernardino National Forest hiking and biking trails.The system consists of a spring source, concrete pump house reservoir, and a gravity storage tank. The system has a total of five service connections, the organized camp with several buildings, and four residences. The spring gravity feeds the pump house reservoir; a submersible pump is then used to pump the water to the storage tank uphill. The water is chlorinated at the discharge line of the submersible pump. The storage tank gravity feeds the distribution system. Any run-off water or leakage impacts Mountain Home Creek, a Class I stream (fish bearing).The primary issue is the age of the system. The entire system is old, and over the years pieces have been replaced and repaired to meet the San Bernardino County of Public Health standards and	0	1	100	13	San Bernardino	V	2012
14	0011123	0011123-001	T.U.D. Mountian Boy Ditch Conveyance	Mountain Boy Road Conveyance Project	CONSTRUCT A WATER SYSTEM WITH A WATER TREATMENT PLANT, STORAGE, AND PIPELINES; OR EXTEND WATER LINES FROM THE BIG HILL WATER SYSTEM TO SERVE THE DITCH CUSTOMERS.	B	0	U	INDIVIDUAL DITCH CUSTOMERS USING UNTREATED DITCH WATER SUPPLIED BY TUD.	364,880	15	30	11	Tuolumne	III	1998
15	0011120	0011120-001	T.U.D. Ditch Conveyance Conversion	TUD-DITCH CONVEYANCE CONVERSION	INSTALL THREE WATERING STATIONS, TWO WATER MAIN EXTENSIONS, SIX WATER SERVICE EXTENSIONS, AND UP TO 20 WELLS. 16	0310003	0310003-010	AWA Sutter Creek	Canal Raw Water to Treated Water Pipeline	This project would interie the existing Amador Water System treated water facilities located near the intersection of Ridge Road and New Yark Ranch Road and place a treated water pipe in the canal begininng at New York Ranch Road to Lake Tabeaud (approximately 16.24 miles). Additional pump stations are necessary to deliver water to cosumers along the canal and meet State Health requirements.	C	25	C	For many years, untreated surface water was conveyed to the Tanner Water Treatment Plant for treatment via an open canal. Although a pipeline has replaced the canal as the primary conveyance source to the Tanner Water Treatment Plant, over 100 customers remain on the canal. The Agency has a program in place to require documentation in the form of receipts from bottled water suppliers to ensure these customers have treated water for domestic purposes. However, the full-proof method to ensure these customers utilize only treated water for domestic purposes is to replace the canal with a treated water pipeline, providing certainty that the violations of Title 22 of State Code are impossible.The constructive conveyance system is divided into two sections. The residents in the Bosse-Previtali area are within the upper 16.5 mile section. This section of the conveyance system is composed of the greater number of customers utilizing unfiltered-raw water and remains the greatest concern. Customers, Residents, and visitors in the Bosse-Previtali area are exposed to health risks associated with the historic use of this unfiltered-raw water for domestic use in homes. These homes only water source is from the unfiltered-raw constructive conveyance system owned by the Amador Water Agency. Specifically, 75 of 107 unfiltered-raw water customers within this 16± mile area are out of compliance with the 1996 Amendments to the Safe	5,450,000	1,654	5,458	10	Amador	III	2009

17	5304501	5304501-005	Riverview Acres Water System (Salyer Mutu	Salyer/Riverview Acres - Consolidation	Salyer Mutual Water Company proposes to conduct a feasibility study to resolve the problem of unfiltered surface water and lack of documented water rights. The project would involve 1) a feasibility study to identify options and select an alternative should groundwater supply not be viable; 2) design and specifications for the selected alternative; and 3) completion of environmental documentation. Short of groundwater supply, the only two other options are obtaining water from Willow Creek Community Services District (CSD) through wholesale purchase or consolidation; or documenting their prescriptive water rights with the State Water Resources Control Board, Division of Water Rights.	C	20	C	Salyer Mutual Water Company is a community water system that uses surface water from the Trinity River for its domestic water supply. Water pumped from the intake is disinfected with chlorine and delivered to the distribution system. To date, we have not provided filtration treatment of the system's surface water source and as a result are in violation of the State's Surface Water Treatment Rule (SWTR). The SWTR required continuous reliable filtration and disinfection of all surface water sources used by domestic water supply systems. Currently, Salyer Mutual is under a standing boil water advisory from CDPH and provides quarterly notification to its customers. We are already evaluating the potential for a groundwater supply through a Proposition 84 grant. If we are unable to find groundwater of adequate quality and quantity, we will need to find an alternative to supply safe, reliable water to our customers. Note, the water system has not be able to provide documentation regarding their surface water rights.**Note: Salyer Mutual Water Company took over ownership and operation of the Riverview Acres Water Company as of Feb. 8, 2012. We currently have 56 active connections.	500,000	50	85 01	Trinity	I	2012
18	5510013	5510013-009C	TUD - Columbia Water System	San Diego Ditch Constructed Conveyance	The proposed project consists of the design, environmental review and construction of approximately 1400 lineal feet of six inch potable water main connected to the District's Columbia Water Treatment Plant and installation of service connections for each of the nine customers currently connected to the untreated ditch system.	C	20	C	The Tuolumne Utilities District provides untreated water service through an open, mostly unlined ditch system, to a number of its customers not currently located near a potable water main. This ditch water is the only source of water supply to approximately 9 customers on the San Diego Ditch located in the Columbia area of the District's system. Many of these ditch water customers use this untreated supply in their homes for drinking, cooking and bathing. This untreated ditch water delivered to customers contains high levels of total coliform, fecal coliform, organic material, and widely fluctuating turbidity.	0	1,548	3,646 11	Tuolumne	III	2007

19	0310003	0310003-008	AWA Sutter Creek	Ione Raw Water Conveyance Conversion Project	The Agency has completed a feasibility study and has determined that the best solution is to consolidate the Ione and Tanner Water Treatment Plants (WTP) at the Tanner Site. This consolidation would be through the construction of a new Regional WTP facility. Amador Water Agency (AWA) already owns the site at Tanner with sufficient expansion area. Once the Regional Tanner WTP is constructed, these facilities could be consolidated and then supply treated water to these 11 customers through the "old" raw water transmission pipeline. The existing raw water transmission pipeline would require cleaning, testing and moderate improvements prior to the conversion to a treated water conveyance system. AWA further believes that a weighted review of the 2000 census area, qualifies the service area as a low income or "disadvantage area" for these 11 customers.	C	20	C	In the 1850's a ditch system was constructed to convey raw water to various areas of Amador County. These ditch systems for years conveyed the only source of water for residents, ranches and businesses in the Sutter Creek - Ione and other community areas. In the mid 1980s, the Amador Water Agency (AWA) piped a 7.5 mile stretch of this raw water conveyance system from the Sutter Creek - Tanner Facility to the City of Ione (Ione transmission pipeline). This transmission pipeline is the source water conveyance for the Ione Water Treatment Plant which serves the City of Ione. Currently, there still remain 50 raw water services on this raw water line. There are 11 customers' whose only source of water is this raw water conveyance pipeline system. This unfiltered raw water has the potential for surface water contamination from either fecal or E.coli. Therefore these 11 customers are out of compliance with the 1996 Amendments to the Safe Drinking Water Act and the Health and Safety Code. Although, they are in compliance with the Agreement entered into between the AWA and the California Department of Health Services (DHS). AWA has a contract with these customers for a bottle water program / purveyor as part of this Agreement. Reminders to these customers	1,500,000	1,654	5,458	10	Amador	III	2007
20	1310005	1310005-002	Holtville, City of	Holtville Annexation - north of 9th St - distribution system	Annexation of service area north of 9th Street.	C	20	C	198 homes north of 9th St. are on raw unfiltered canal water which does not meet coliform standards. description (attachment 1)	3,225,356	1,508	6,299	14	Imperial	V	1998
21	1000063	1000063-005P	NEW AUBERRY WATER ASSOCIATION	Groundwater under direct influence of surface water feasibility study	A feasibility study is necessary to determine the most feasible and appropriate alternative to resolving the system's ongoing issues and to bring the water system into compliance with waterworks standards. The project is anticipated to evaluate consolidation, (new) source improvements, water treatment, or any combination of the three. It is anticipated that the project will leave the water system in a position to seek funding for implementing the identified project.	C	10	C	New Auberry Water system is dependent upon two working wells and one inactive well, which all require a GWUDI evaluation. All wells are old and aging and we suspect that no well is equipped with an annular seal. No construction documentation is available for the wells. Without an appropriate annular seal, the wells are vulnerable to contamination in a number of ways: 1) Water from the flood plains pass by the wells; 2) water flows into the nearby creek can influence the wells; 3) one active well is located 50 to 100 ft next to waste water ponds; and 4) one well immediately adjacent to wastewater disposal ponds has been inactivated due to persistent bacteriological contamination believed to be from the wastewater ponds.A number of other issues inhibit optimal operation of the water system. A number of leaks in the aging water distribution lines could potentially be source of water loss. The lack of meters prevents the system from quantifying exact water losses. New mains, valves, and meters need to be installed. Ongoing electrical supply issues prevent the water system from efficiently operating their well pumps, theoretically shortening their useful life.	500,000	36	80	23	Fresno	III	2012
22	1900904	1900904-003	ACTON CONSERVATION CAMP # 11	Add an additional water well away from the river to support the current population and possible expa	Add a new well 200-300 feet away from the river and the septic system.	C	10	P	Camp 11 is a first responder fire suppression camp located in an isolated location. A second well is needed as a back up water source. The current well is located in close proximity to a creek and to the septic system. The new well would be installed away from the creek and out of the way of the septic system. The new well would be treated as the primary well, with the current well being a secondary water source.	200,000	1	90	16	Los Angeles	IV	2009

23	1900007	1900007-002	CALIFORNIA CONSERVATION CAMP # 14	Drill a new well away from the creek	Drill a new well 200 to 300 horizontal distance away from the creek. Secure the pump with a secured, concrete block structure.	C	10	P	The current well is located at the southeast side of the property within 100 feet of the stream. The well is housed in a concrete block shed. There is a flow meter and pressure gauge in close proximity to the well head. Due to the proximity of the ground water well to the San Francisquito Creek the source is designated by Department of Public Health as Ground Water Under Direct Influence of Surface Water.	200,000	1	95 16	Los Angeles	IV	2009
24	1900901	1900901-004	FIRE SUPPRESSION CAMP 19	Add new well 200 - 300 feet away from river. Current well is in river.	The project is a small community system serving 130 year long residents with a groundwater well. The current well is in very close proximity to the river. Department of Public Health recommends protecting this well from the river and drilling a second well 200-300 feet away from the river.	C	10	P	The water system is in need of an additional water source to meet the demands of the community; ie; new ground well. All details can be provided by the Department of Public Health.	300,000	1	125 16	Los Angeles	IV	2009
25	1000405	1000405-002	DOYALS MOBILE HOME PARK	GWDUI Investigation and Resolution	The water system needs funding to study the three options presented by CDPH. Funding will also be needed to implement the appropriate solution presented by the study.	C	0	C	CDPH is concerned that the sole water source, Well 01, is under the direct influence of surface water (GWDUI). The Water System has three options: use an alternate GW Source, install full surface water treatment for Well 01, consolidate with another water system.	250,000	15	16 23	Fresno	III	2011

29	4400528	4400528-002	LAUREL COMMUNITY LEAGUE	Laurel Community League Drinking Water Catch Basin	Our concept is to erect a sealed pumping chamber consisting of two 4-ft reinforced concrete walls, and a removable top, tied to and sealed to the sides of an existing abandoned railroad tunnel portal. This will provide us with 64 cubic feet of raw water capacity, and will effectively elevate the chamber significantly above the stream bed, increasing the systems' capacity, and absolutely preventing the entrance of contaminants.	C	0	C	The Laurel Community Water League currently has a catch basin into which well water is gathered, and then pumped to service the users. Currently, an inspection report indicates that the catch basin is in violation of CA Title 22, Article 6 Distribution Reservoirs, 64585 Design and Construction, also CA Title 22, Chapter 16 CA Water Works Stds, Article 2 General Requirements, Sec. 64560 Basic Design, because of its proximity to a seasonal flowing stream, and the potential for contaminants enter the drinking water source. We propose to construct a new catch basin in a sheltered location, sealed, that will comply with the above-mentioned regulations, provinding a contaminant-free pumping chamber.	50,000	24	55 05	Santa Cruz	II	2009
30	2701263	2701263-003	PARTINGTON RIDGE MWC	Water Treatment Facility	Finalize design and permit for filtration and treatment of water for distribution and use.Installation of slow sand filters to process up to 40gpm of water.Installation of upgraded UV system for primary water treatment.Installation of chlorine injector system to function as topping off treatment of UV treated water. Installation of all required monitoring and measuring devices and systems. 31	5400506	5400506-004	NO KAWEAH MUTUAL WATER CO	Slow Sand Fitration, Reservoir, and Pump Plant	Within an existing easement construct three new river wells, a new approx 90 gpm Slow Sand Filtration Unit with a 125,000 gal Steel Reservoir, a 3 Stage Vertical Turbine Pump Plant with Hydropnuematic Tank, a system intertie where existing mainlines cross, miscellaneous piping and conduit, electrical and controls, a stand by generator, control building, security fencing, engineering design, environmental, and survey	C	0	C	Both North Kaweah Mutual Water Company and Tract 403 Water Company currently operate separate community water systems and both are out of compliance for the treatment of water under the influence of surface water. They both lack the filtration required to remove giardia and cryptospiridium and have marginal chlorine contact time. This project contemplates the construction of a new Slow Sand Filtration Unit, Reservoir, and Pump Plant to serve both companies and correct the deficiencies.	590,000	35	75 12	Tulare	III	2007
32	5304501	5304501-003C	Riverview Acres Water System (Salyer Mutu	Riverview Acres WS (Salyer MWC) New Filter Plant	The proposed project includes acquisition of land and installation of a filtration treatment system (likely membranes) to treat water from the Trinity River, sludge basins, and a new storage tank to increase chlorination contact time and improve disinfection.	C	0	C	Riverview Acres WS (Salyer MWC) supplies its customers unfiltered surface water year-round from its sole source, the Trinity River. Additionally, although the water is continuously chlorinated, contact-time prior to the first customer is insufficient. For these reasons, Riverview Acres Water System does not comply with the California Surface Water Treatment Regulations and has been under a continuous Boil Water Order.	1,489,440	50	85 01	Trinity	I	2008
33	2300663	2300663-003	Harwood Water System	Harwood Water System - New Surface Water Treatment Plant	The surface water system would encompase a roughing filter, tri-media filtration, chlorination, one 5,000 gallon clearwell, two 5,000 gallon storage tanks, coagulants, flow meters, pressure sensors, chemical feed pumps, raw and treated water continuous turbidity monitoring, chlorine monitoring, pH monitoring, SCADA system, satellight disc, alarms, level monitoring in chemical crocks and storage tanks, valves, piping, booster pumps and pressure tank. The plant would have two trains each with a capacity of 15 gpm.The plant is to provide 99.9% (3-log) Giardia cyst, 99% (2-log) Cryptosporidium and 99.99% (4-log) viruses removal and inactivation.	C	0	C	Harwood Water System (Harwood) is located within the community of Branscomb, Mendocino County. Branscomb is located off Branscomb Road approximately 13 miles west of Laytonville and Highway 101 and 12 miles east of Highway 1. Water is supplied to residents of a trailer park (18 connections); one house; k-2 School; and one small grocery store. The water system is classified as a community water system.The domestic water source used by Hardwood is one creek. The source has been designated by the Department of Health Services (hereinafter Department) as a surface water source and is subject to the filtration and disinfection requirements of Sections 64650 through 64662 of the California Code of Regulations (CCR), Chapter 17, Surface Water Treatment Regulations (SWTR).Creek Source & Treatment: The creek is located about ½ mile south of Branscomb Road into a wooded area. Raw water is collected in a 15 by 18-foot wooden box located in the center of the creek. The box is divided into three chambers. Water flows into the center chamber and through perforated walls into the outer chambers. Water from the outer chambers flow by gravity into a 4-inch line and to a 300-gallon tank and chlorination building located off Branscomb Road. A chlorine crock and chemical feed pump that pulses a 5.25% sodium hypochlorite solution into the raw water line at a preset	250,000	22	100 03	Mendocino	II	2008

36	4300520	4300520-002P	Idylwild Water System	Connection to a Reliable Source of Supply Project	The Receiver is taking a two-pronged attack at the project: 1) Gathering information and data for installing a surface water treatment plant (SWTP) and associated supply line upgrades; and 2) entering into negotiations with SJWC, CDPH, and CPUC regarding connection costs to receive Montevina Treatment plant water as the source of supply. It is expected that the cost of a SWTP project will be slightly under the upper limit of what will be accepted as a connection cost from SJWC.Assuming a connection can be agreed to easily: An alternatives analysis of the possible projects will be completed, leading to a recommended project to connect to SJWC. It is expected some work will be required to improve Montevina Pipeline capacity and that a new delivery line and delivered water storage tank will be required in the Idylwild system. Design and construction of these is a fairly straight forward engineering project, with easements and tank site land already in place.Assuming that SJWC requires exorbitant connection requirements: Follow through with initial SWTP project steps: Validate water rights from Sept 26, 1973 deed, complete detailed water quality testing, select appropriate pre-built SWTP to install, cost out a new buried 3" supply line with bore & jack crossing under Highway 17 from the diversion to a new large tank. Prepare an alternatives analysis of the options and if the SWTP is a clear choice, proceed with approvals. (So	C	0	C	The existing source of supply is a creek diversion in Moody Gulch, an open space preserve not controlled by the water company that is uphill and north of Highway 17. Raw water is transported by gravity through approximately 2000' of 2" plastic pipe strung along the ground and through a major culvert under the highway. There is no treatment other than chlorination. Winter conditions occasionally break the delivery line or worse yet crack it, making location and repair complicated and creating system outages (one recent one was approximately 5 days). On two occasions in the last 20 years a major storm has scoured the inside of the culvert such that about 500' of line was washed away. A new treatment facility is also required: The system is under CDPH Compliance Order 02-17-09CO-00, to comply with "Section 64652(a), Chapter 17, Title 22, of the California Code of Regulations (CCR), which requires water systems to provide multibarrier treatment to its surface water source to reliably ensure at least a total of 99.9 percent (3-log) reduction of giardia lambllia cysts and a total of 99.99 percent (4-log) reduction in viruses through filtration and disinfection." There are also two subsequent citations: Citation 02-17-10C-001, and Citation 02-17-10C-004 for failure to "Develop a corrective action plan that will specify the method(s) and timeline to bring Idylwild Water System into compliance with all elements of the Surface Water	10,000	43	135 17	Santa Clara	II	2012
37	4810025	4810025-005	SID-Pleasant Hills Ranch	SID-Pleasant Hills Ranch Estates Drinking Water Treatment Plant	The project consists of construction and operation of a 175 gallon per minute membrane filtration water treatment plant with post chlorination and 40,000 gallons of storage. A transmission pipeline will run along Pleasants Hills Ranch Way from the treatment plant to the existing Pleasant Hills #2 Pumping Plant, a distance of approximately 2000 feet. From that point, existing distribution pipelines to homes will be sanitized and converted from non-potable to potable service. The facility will be owned and operated by the Solano Irrigation District. The project will satisfy a Compliance Order enacted by the California Department of Public Health and U.S. Environmental Protection Agency as part of the Long Term 1 Enhanced Surface Water Treatment Rule amendments to the Safe Drinking Water Act. The subject property is located in the Solano Project Place of Use. Envirionmental site assessments for the project have been completed and the property site has been procurred.	C	0	C	Community Water System No. 4810025 is under Compliance Order No. 02-04-03CO-001. In order to bring this existing public water system located in rural Vacaville into compliance with mandates of the Safe Drinking Water Act of 1974 as amended by the Long Term 1 Enhanced Surface Water Treatment Rule, it has been determined that a centralized drinking water treatment plant be built. Raw, untreated surface water is supplied from Lake Berryessa (Solano Project) and was originally intended by developers (late 1970s) to be treated via Point of Entry water treatment technology which were deemed to be inadequate and cost ineffective in meeting California Department of Public Health (CDPH) requirements. Solano Irrigation District (SID) obtained a CDPH Letter of Commitment for Prop. 50 (Chapter 4a.1 Small Community Water Systems) funding in August of 2008. SID continues to pursue available assistance for construction of a centralized membrane water treatment plant for this community in order to meet established drinking water quality requirements.	2,000,000	39	135 04	Solano	II	2009

44	3110042	3110042-003	Tahoe Swiss Village Utility	Tahoe Swiss Village Utility TSVU Water Treatment Facilities	The entire community would benefit from this water treatment facility to serve potable water. Additionally, fire protection would be enhanced by 320 GPM. The existing leaking 4" steel lake intake line as well an the very small water pumping plant would be replaced and land restored for the enyoyment of the community beach. The "state of the art" multibarrier water treatment facility with membrane filtration, disinfection with chlorine and contact time would complete the process. The plant would have an new 8" flanged epoxy lined ductile iron lake intake pipe. New submersible pumps attached to the pipe in the lake would supply the membrane filter. The effluent would then fill up a 15,000 gallon CT concrete basin. This filter plant would be intigrated into the entire water system with a new radio telemetry system. New booster pumps would supply the community with fully treated water. A new 480 volt electrical panel would more efficiently provide power to this station. There would be a natural gas generator to supply the station in an emergency event. The building would "blend" into the environment with detail given to the scenic impact of the water pumping plant.	C	0	C	This project has a Proposition 50 funding favorable standing. A complete Application was submitted to CDPH in November of 2007. In December 2008 we were informed that "letter of committments" were put on hold. TS submitted a complete application to the Tahoe Regional Planning Agency, for permitting. CDPH has a copy of that application and is under review. Tahoe Swiss (TS) serves water to a small community. TS, in its over twenty years of ownership combined three different water systems into one "larger" integrated company. Presently, TS has three sources of supply. Two are approved groundwater sources with one unapproved surface water source. The surface water source is in violation of the federal and state surface water filtration rule. During peak day demands if one approved source is out of service, the surface water source must be used to supply uninterrupted service to its customers. When the surface water is used, TS must chlorinate at 3 ppm, issue boil water orders and take BAC samples. TS has had to utilize the surface source each of the past two (2007 & 2008) summers for at least one day.	1,567,780	378	300 02	Placer	I	2009
45	4400631	4400631-001	LAS CUMBRES MUTUAL WATER CO	SWTR Compliance	Design/construct appropriate SW treatment system	C	0	C	System uses springs for over 50% of water supply. New EPA standards will require treatment of springwater. (Reranked from D to C 4/3/02)	750,000	122	337 05	Santa Cruz	II	2002
46	3110018	3110018-003	Tahoe Park Water Company	Tahoe Park Main Well No. 2	The project would provide for a second well of 850 gpm as a secondary, redundant water source for the system. The new well would be constructed on the same parcel as the primary well, and fitted with a 75HP submersible pump and surface facilities. The existing lake source would be abandoned.	C	0	C	The secondary water source of the Tahoe Park Water Co. (TPWC) is unfiltered surface water from Lake Tahoe. The primary water source is a well. Water storage in the system is less than 30,000 gallons, situated at an elevation lower than the upper portions of the system. When the well pump fails there is no choice but to provide unfiltered lake water to maintain continuous supply. The nearby Tahoe City Public Utility District is unable and unwilling to provide a secondary connection.	200,000	436	750 02	Placer	I	2009

47	3110041	3110041-004	Midway Heights C. W. D.	Midway Heights-Applegate Annexation Improvement District	The project proposes the installation of approximately 20,000 LF of 10-inch pipeline, 11,800 LF of 8-inch pipeline, 141 service connections, two (2) 250,000 gallon storage tanks and associated appurtenances. The newly constructed water distribution system will be tied into the existing Midway Heights County Water District's treated water distribution system and therefore will not require the installation of new treatment facilities.	C	0	C	The MHAAA (Midway Heights Applegate Annexation Association) Improvement District is located within the Community of Applegate in the rural area northeast of the City of Auburn. Many homeowners are living on low yielding and/or failing wells. As many as 30 homeowners currently rely on bottled water for their drinking, cooking, and oral hygienic needs. A total of 141 out of approximately 210 potential property owners have expressed interest in the proposed improvement district. The U.S. Environmental Protection Agency (EPA) rules strictly prohibit the use of raw water for the purposes of drinking, cooking, or oral hygiene. PCWA monitors customers who receive year round canal water through the Constructed Conveyance Program. The Agency's year round canal customers who do not have an approved source of drinking water on-site are required to purchase bottled water through an approved distributor. The Agency has identified four such customers within the MHAAA service area. Additionally, the report for the Placer LAFCO: Mid-County Water Service Review (April 2006) prepared by Dudek, indicates that this area is experiencing a significant reduction in groundwater availability and adequate water supply for drinking, irrigation and fire suppression. Approximately 30 people have been identified to be on bottled water due to the inability to drill wells due to septic loads and or proximity to the	7,374,600	406	1,080 02	Placer	I	2009
48	0300037	0300037-003	LAKE AMADOR RECREATION AREA	Jackson Valley Irrigation Dist. Pipeline, Water treatment and Storage Project.	The Jackson Valley Irrigation Dist. Pipeline, Water Treatment and Storage Project will be the construction of a newly installed dedicated potable water pipeline from Lake Pardee down into the Jackson Valley. The project includes the installation of a new updated water treatment and storage facility located at Lake Amador. This primary treatment plant will have the capability to service all JVID customers with clean treated water thus eliminating the need of small home treatment plants. The pipeline itself will be a 16" Raw water pipeline that will travel from the north spillway of Lake Pardee to the new water treatment plant located at the JVID Lake Amador property. From the treatment facility a dedicated 8" potable water line will travel down into the valley to the Oaks Mobile Home Community and beyond with the ability to service customers along the way. This project will solve the water quality source problems that the Jackson Valley Irrigation Dist. Customers are facing and meet the CDPH requirements of finding an alternative source of water for potable use. The Econmic Recovery funds will be used for: completion of alternatives, development and evaluation; facilities planning and environmental documentation; design; and construction and startup.	C	0	C	The Jackson Valley Irrigation District (JVID) a public entity, serves potable and irrigation water to customers in Amador County, specifically the Ione / Jackson Valley area. Potable water customers / connections include the Lake Amador Recreation Area (LARA) with 30 connections, the Oaks Mobile Home Community in the midst of 220 connections and roughly 150 rural connections, with total services to be approximately 400 connections or around 1,000 customers. JVID's source of supply is the 22,000 acre-foot capacities Lake Amador, which is fed by Jackson Creek and diversions from Pardee Reservoir, an excellent source for water quality with low organic levels and no wastewater discharges. The Jackson Creek a main tributary of Lake Amador receives storm water runoff and treated wastewater from the City of Jackson. During most of the year, the dilution ratio for the City of Jackson's treated wastewater into Lake Amador was determined to be less than 20:1. It is estimated that Lake Amador consists of more than 5 percent treated effluent during 30 percent of the year. The California Department of Public Health (CDPH) has indicated that this is not sufficient dilution ratio for a potable water supply for in home use. In the 2003 Annual Inspection Report, the CDPH stated that the customers receiving JVID water source for potable use are required to seek an alternative source of water because of the poor water	2,000,000	73	2,000 10	Amador	III	2009

49	0310002	0310002-001	AWA, City of Ione	Amador Raw Untreated Surface Water Constructive Conveyance-Treated Water Converison	Placement of a treated water main from Tanner Treated Water System to the Ione area will provide treated potable water for raw water customers using raw water in their homes. The distance of this pipeline is approximately 51,100 feet and will follow existing raw water line easements.	C	0	C	For many years, untreated surface water has been conveyed from the Tanner raw water reservoir to the Ione WTP. Although a pipeline has replaced the canal as the primary conveyance in the mid 1980s, approximately 50 customers take raw untreated water from the pipeline and for many it is there only source for use in their homes outside of bottled water. The Agency has a program in place to require documentation in the form of receipts from bottled water suppliers to ensure these customers have treated water for domestic purposes. As required in the July 12, 2001 compliance agreement with the Depatment of Health Services (curently Department of Public Health), the Water Agency must investigate afforable potable options for these customers. The water Agency believes that the installation of public treated water main from the Tanner WTP to the Ione area provides the best solution for these customers. The potential of grant funding for this small system may make this an affordable means for treated water.Continued use of raw water presents muliple potenial violations to Title 22 of State Code:• Section 64421 (Article 3 of Chapter 15) stipulates primary standards for bacteriological quality.• Section 64652 (Article 2 of Chapter 17) stipulates treatment requirements for surface water. • Section 64654 (Article 2 of Chapter 17) outlines disinfection requirements for surface water	4,000,000	1,497	4,940	10	Amador	III	2009

52	0310012	0310012-005C	AWA Buckhorn Plant	Bosse-Previtali Untreated Raw Ditch Conveyance Treated Water Conversion Project	The project would provide treated water from the Agency's Central Amador Water Project (CAWP) to a 10 mile cluster residential area along the existing Amador Canal. The CAWP treated water system is located a distance of 1 to 6 miles from this canal area. This treated water service would convert 108 current unfiltered-raw water customers to treated water service of which 59 utilizes the Amador Canal as its only source of water. The project would complete environmental requirements, right-of-way acquisition, construction plans and specifications together with construction. The Agency further believes that a weighted review of the 2000 census area, qualifies the service area as a low income or "disadvantage area".	C	0	C	The Amador Canal conveyance system is a 23 mile open ditch system from Lake Tabeaud to the Tanner Water Treatment Plant (WTP) in Sutter Creek. The source is the Mokelumne River via Lake Tabeaud. The system was originally built in the 1850's to convey raw water to goldrush era miners in Amador County. Currently the Amador Canal serves a cluster of 108 customers within a 10 mile area of which 59 customers' only water source is the canal. This ditch system is monitored, controlled and maintained by Agency staff walking the ditch in all weather conditions with no connection to the Agency's telemetry systems. Maintaining the quality, reliability including sufficient pressure to provide service to these customers is a continual effort. The existing low flows and warm weather induce additional issues with debris, algae, color and odor. Additionally, there is continual opportunity for accidental or deliberate contamination as well as fecal or E.coli from individual septic systems, livestock or wildlife. Added to these issues are blow-outs, un-planned and planned outages. All of which create high maintenance and operation costs which burden is passed on to existing low income users. The canal system is exposed to health risks associated with the use of un-filtered-raw water in homes. These	2,200,000	2,558	8,508	10	Amador	III	2007

53	5410006	5410006-006P	Lindsay, City of	Well 15 Pipeline Segment and Sampling Stations Project	The proposed project is to install three (3) climate controlled, continuous recording chlorine analyzers at: 1) Well No. 15, 2) about 100 feet before the first service located on Avenue 242 and 3) about 100 feet before the first service to the five (5) homes located in the vicinity of Avenue 240 and Road 188 which are currently under a Boil Water Advisory (BWA) (Project). In order to assure 4-log virus inactivation, an eight (8) inch diameter, 1,000 foot pipeline will be installed before the five (5) homes subject to the BWA. In addition, alarms and shut down control will be provided at each sampling station should the chlorine residual fall below acceptable levels. The Project also incorporates the following:A. Preparation of CEQA documentation (the installation of a new pipeline and sampling stations may be exempt under CEQA Guidelines Section 15301, Class 1(d) and Section 15303 Class 3(d));B. Preparation of Project construction drawings; andC. Development and granting of pipeline and sampling station easements.Initiation of the plans, specifications, easement and environmental clearance can begin by December, 2011, provided the City of Lindsay can execute a funding agreement with the CDPH by November, 2011.	C	0	C	The City of Lindsay (City) owns and operates Well No. 15. The City regularly relies on this well to meet water demands. According to the City's Boil Water Advisory (BWA), "Since May 2009, the City of Lindsay Well No. 15 has shown positive bacteriological samples". A May 26, 2009, letter from the California Department of Public Health (CDPH) to the City directed the City to maintain a BWA for 34 homes near well 15. The CDPH letter also required the City to submit a plan for CDPH review and approval detailing how 4-log virus inactivation will be provided. The City submitted a memorandum from Keller/Wegley Engineering, dated June 25, 2009, which identified a possible solution to achieve 4-log virus removal and monitoring. A July 3, 2009, letter from CDPH to the City lifted the BWA for homes along Avenue 242, but continued the BWA for five (5) homes in the vicinity of Road 188 and Avenue 240. In addition, CDPH listed a number of operation and monitoring practices for Well No 15. A July 17, 2010, letter from CDPH to the City communicated specific CDPH requirements with regard to the use of Well No. 15 until a long term solution is furnished addressing positive bacteriological samples from water produced by said well. One CDPH specific requirement is as follows: "the City should install equipment at Well No. 15 to facilitate continuous recording of chlorine residual, alarms and shut down control."	315,000	2,335	11,450	12	Tulare	III	2011

57	3500507	3500507-001P	Bitterwater-Tully School WS	Bitterwater-Tully School Water System Upgrade	The project is to upgrade the Bitterwater-Tully School's water system to provide reliable multi-barrier treatment of raw water supplied by the Hepsedam Water Company (HWC) pipeline. This project includes: 1. Collecting Raw Water Data2. Conducting a Watershed Sanitary Survey3. A thorough investigation and evaluation of current water system components4. Design Development of Water System Upgrade through evaluation of items 1-35. Engineering of the Water System Upgrade6. Producing Plans and Specifications for the Water System Upgrade7. Review and documentation of Water Rights with HWC8. Constructing the upgrade to the Bitterwater-Tully School's Water SystemPlanning and feasibility studies for upgrading the Bitterwater-Tully School's Water System to provide reliable multi-barrier treatment have begun. Raw water data is being collected by a properly licensed water system operator. An engineering firm has been retained and they have completed a preliminary review of the existing water system. A Watershed Sanitary Survey (WSS) of the Hepsedam Water Company (HWC) source springs on Hepsedam Peak, the spring boxes, and the entire pipeline will be conducted, dependent on access as some of the pipeline is on private property. The WSS will include a survey of all the connections to the pipeline, if possible. Other planning and feasibility studies necessary for	C	0	P	The Bitterwater-Tully School is located on Airline Highway (California State Route 25) about 40 miles south of Hollister and 15 miles northeast of King City in unincorporated San Benito County. The School has a non-transient, non-community water system supplying domestic water to a daily population of approximately 55 students, staff and visitors. The School's water system's only source of supply is untreated water through a connection to a pipeline of the Hepsedam Water Company (HWC). Bitterwater-Tully School provides disinfection of the water through chlorination, and has four storage tanks: a 3,000 gallon concrete tank for untreated water; and three polyethylene tanks with total capacity of 9,500 gallons for chlorinated water.The HWC was regulated by the California Department of Public Health (DPH) as a public water system at one time, but was inactivated in 1995. The source of water for the HWC pipeline is two springs located on the flank of Hepsedam Peak. The springs can only be accessed by 4-wheel drive vehicle over 15 miles of difficult terrain, and the last several miles must be traversed on foot or horseback. The spring and pipeline have not been inspected by the DPH in at least 15 years.Bitterwater-Tully School conducted bacteriological monitoring of the raw water at the connection to the Hepsedam pipeline quarterly since the second quarter of 2009 through the third quarter of 2011 with results for total coliform	100,000	2	55	05	San Benito	II	2012

58	4300779	4300779-001	Lakeside SD-Lakeside School	Well, storage and distribution replacement	The well to be replaced in accordance with current water standards to a depth of 150 feet hard rock depth. Extend or replace control and power circuits. Abandon old well in accordance with current regulations.The storage system to be relocated away from adjacent slope in accordance with geotechnical recommendations. The tanks to be replaced with a single 20,000 gallon tank on a approved foundation. The booster pump and control system replaced to maintain current standards of pressure and flow. Extend or replace control, power circuits and water distribution pipes. Destruction and removal of old storage system. Replace main 3 inch transite with 2 inch PVC. 200 feet through asphalt and concrete. 100 feet through undeveloped ground. Provide connections to existing service entrance. Abandon existing 3 inch transite in place underground. Relocate 1 inch 500 feet PVC away from adjacent slope, trench, make connections as necessary.All work is per public construction code and standards, state and local codes and prevailing wages.	C	0	P	Well. According to the engineering report from The department of Health Services in the Matter of the Permit Application from Lakeside school, system No. 4300779 Section III. Appraisal of Sanitary Hazards and Safeguard, the well at lakeside draws water from 16 feet and the well was constructed with a sanitary seal to 14 feet.Therefore the well does not meet the sanitary seal requirements and is extremely susceptible to contaminant infiltration due to the perforations occurring at such a shallow depth. The California Well Standards specify the space between the casing and the wall of the of the drilled hole (the annular space) shall be sealed to a depth of 50 feet. In addition,the American Waterworks Association (AWWA) Well Standards specify that the diameter of the bore hole be at least 6 inches larger than the casing; the surface to a depth of 14 feet and 2 inches thick from 14 to 31 feet deep. The Lakeside well does not meet the requirement and further adds to the susceptibility of the well. Storage system. According to the Geologic and Seismic Hazards Assessment of Lakeside School Campus by Kleinfelder Inc. in 1998, the Lakeside campus is located within a State of California designated Earthquake Zone for the San Andreas fault. This study was was performed in accordance with CDMG Special Report 42-Fault Rupture Hazard Zones in California (Hart 1997) as mandated by the Alquist-Priolo Act of 1972.The storage	75,000	3	110 17	Santa Clara	II	2009
59	1900011	1900011-001	CAMPS SCOTT & SCUDDER	SWTR Compliance	CONNECT OLD SYSTEM TO ADJACENT MUNICIPAL WATER SYSTEM	C	0	P	UNTREATED WELLS UNDER SURFACE WATER INFLUENCE, INTERMITTENT POSITIVE TOTAL COLIFORM RESULTS.	210,000	2	275 16	Los Angeles	IV	1998
60	3100034	3100034-003P	BIG BEND WATER USERS ASSOCIATION	Big Bend Water	The project encompasses all phases of a water system; source, treatment, distribution, and storage.Source: currently the system is delivering surface influenced, untreated water. The Mutual is on a boil order. A new well would help with water capacity issues. A vertical well(s) could provide much needed relief.Treatment: treatment is required through Placer County Health. Current engineers estimate is $250,000. $150,000 for treatment equipment in a prefab metal building. Approximately $100,000 for site development, electrical service, access and contingencies.Distribution: the distribution system consists of 3,000 lf of 4 inch steel pipe which was installed in the 1940s. Replacement of all distribution lines with 4 inch C-900 PVC is needed. It estimated that the system loses more than 20% of water through leaks.Storage: current system storage capacity is 16,600 gallon concrete tank. Relief from the horizontal wells output of between 10gpm to 4gpm could be mitigated to some extent with additional storage. A 20,000 storage tank is advised.	C	0	N	System problems:1.) Surface influenced horizontal wells/springs- so treatment is mandated by Placer County Health.2.) Distribution lines need replacement-approximately 3,000 lf of 4" pipe.3.) Storage capacity-additional storage capacity is needed. 20,000 gallons would suffice. Current storage capacity is 16,600 gallons.4.) Additional water source- the current horizontal wells produce between 10gpm and 5gpm depending on the season. More flow in the spring and less in the fall.Placer County Health has required a Boil Water Order for the past 3+ years. Placer County Health has issued a mandate order under California Safe Drinking Water Act beginning with Section 116270 and the California Cose of Regulations, Title 22.	10,000	20	25 02	Placer	I	2008

61	1900764	1900764-001	HENNINGER FLATS	Treatment Plant Expansion, Storage tank replacement and additions	Close down first water tank (East tank) and construct a new tank for storage. Install new water lines and backflow valves where needed. Add additional water storage to serve the population. Repair valves. Ensure distinction between drinking water and irrigation water by designing maps defining water systems and providing proper signage to guide the public.	C	0	N	Henniger Flats is a public campground/historical site in Altadena. The campground is visited by an average of 300 campers per week. The water system is obtaining its water from a nearby spring. It then feeds into a tank that is in bad disrepair (cracking, leaking and exposed to the public). Water flows further into a chlorination system and three separate storage tanks. The campground is in need of new locked and secured storage. In addition, new water lines and backflow valves are needed to ensure there is no comingling of irrigation and drinking water. Because this system is used by the public, the system must be designed to ensure that there is no public access to the water source and that the tanks are locked and secured.	300,000	1	25 16	Los Angeles	IV	2009
62	1909644	1909644-001P	AZUSA SPRINGS WATER SYSTEM	Azusa Springs Water System	Full replacement of our current antiquated system under our May 2008 Simplified Capital Improvement Plan is estimated at approximately $496,925. Our monthly cost for a certified/qualified water system operator for the well operation and filter maintenance was $28,705 for the fiscal year 07/08. Our goal is to tie into the Azusa Light and Water main line for quality drinking water for our 5 tenants, and our 20 office personnel, as well as our 65 acre future Azusa River Wilderness Park which is the planning stage. We will then utilize our well water system for landscaping purposes only for our properties and Azusa River Wilderness Park.	C	0	N	The current water system, the Azusa Springs Water System (1909644), at 100 N Old San Gabriel Canyon Road, Azusa, CA is in need of major capital improvements. The Azusa Springs Water System is on an improved property that is being transformed into an open space park. The system is identified in your system as a Tranisent, Noncommunity Water System, however the Los Angeles County Public Health Department has identified our system as Small Community Water System.Our filtration system, storage tanks, all water lines, and our transmission pipes which currently runs under the San Gabriel River are all due for replacement. The system has one well site and a basic distribution system. The well and chlorinator are in a pump house that is located directly adjacent to the San Gabriel River. This system is considered under the influence of surface water due to the river's close proximity and the depth of the well at 55-70 feet. The groundwater is chlorinated at the wellhead by a Stenner sodium hypochlorite injection system. The groundwater then flows under pressure to the dual stage filtration system. The filtration system consists of two pressurized permanent media sand filters. The first filter removes suspended particles for the water and the second filter polishes the water, the water then flows uphill to two 10,000 gallon storage tanks. The distribution system consists of 6" PVC, 2" steel, and 2" galvanized pipelines.	0	13	25 16	Los Angeles	IV	2008
63	2701310	2701310-001	GORDA WS	Gorda Water Filtration System	the project consists of bringing the water system up to compliance with health codes and the Monterey County Department of Health and lift the Boil Water Order as soon as possible. This will involve the following:Selection of Surface Water Treatment System.Prepare engineering Letter Report and Specifications.Prepare Operations Plan.Coordinate and Conduct Final Inspection with MCDH (Monterrey County.Department of Health).Rebuild point of origin water collection box.install an engineered sand filtration system and pump, per specs.Install Monitoring and treatment equipment.	C	0	N	The water system is currently on a Boil Water Order and was put in effect as of May 20, 2010. Gorda Springs is a resort community with a restaurant and a grocery store. the community consists of approximately 16 employees who live and work here.	35,000	1	50 05	Monterey	II	2011

64	0900591	0900591-001	NORTH ECHO SUMMIT WATER ASSOCIATION	North Echo Summit Water Association Surface Water Treatment Facility	To ensure a sufficient and dependable supply of potable water, the North Echo Summit Water Association (NESWA) intends to install a treatment system to treat its traditional source of surface water. The proposed treatment system would solve the problems of an insufficient and undependable water supply, and coliform contamination.NESWA will use its groundwater source from the late spring until the source runs dry in late summer or early fall, after which the treatment facility will be used to treat NESWA's dependable surface water source in the late summer through the fall.NESWA has hired an engineering firm to evaluate and provide a conceptual design of an integrated water supply distribution, storage and treatment system. The firm is currently developing detailed plans for Phase 1, which includes replacement of the majority of the system's main pipelines (approximately 7,000 feet) and installation of a 20,000 gallon water storage tank. NESWA members are fully funding this Phase 1 work, for which construction is expected to begin in the summer of 2009. This grant application is seeking funding for Phase 2, which is the development of the surface water treatment system. NESWA's engineering consultant has not yet developed detailed plans for this system. However, it will most likely involve both filtration and chlorination processes and will have sufficient capacity to meet peak hour water demand	C	0	N	The North Echo Summit Water Association's (NESWA) system, serving 42 U.S. Forest Service (USFS) cabins, was installed in the 1920's. After operating for many years as an informal association, NESWA recently incorporated as a Mutual Benefit Nonprofit Corporation with the State of California and became an IRS tax-exempt corporation. Cabins are occupied early June through October, approximately five months each year. Traditionally, the water system was supplied by groundwater in the late spring to early summer and by surface water in the late summer to fall. However, a crisis situation now faces NESWA: the system has insufficient water supply to meet the users' needs. This is the result of NESWA discontinuing use of its dependable surface water supply, as ordered by the El Dorado County Environmental Health Department (County Health Department). The County Health Department has cited NESWA with two on-going violations:(1) total coliforms exceed maximum contaminant level (Safe Drinking Water Act, Title 22, Section 64426.1(b) Total Coliform MCL Violation), and(2) insufficient system water supply (Waterworks Standards, Chapter 16, Section 64554 (a): At all times, a public water system's water source shall have the capacity to meet the system's maximum daily demand (MDD))The first violation is recurring positive tests for total coliforms, as shown by routine bacteriological	375,000	42	84 09	El Dorado	I	2008
65	3500537	3500537-001P	St. Francis Retreat Center	St. Francis Retreat Water Treatment Upgrade	Fall Creek Engineering of Santa Cruz, CA has designed a treatment system that would deal with our demand and the existing conditions. Elements of the plan include -- Ozone generator, injector and contact tank -- Strainrite filtration system (3 unit system with pressure differential controls) -- Chroline injection to maintain system residual -- automated pH and turbidity monitoring -- Treatment building to house the equipment	C	0	N	The primary well, and only well to remain in production through the year, was drilled in the 1960's and installed without an annular seal. Tests have revealed that the static water level in the well equates to the groundwater level of the adjacent pond. Elevated coliform bacteria counts in the raw water from this well confirmed that the well is indeed under the influence of surface water. We are under orders to post notification of "Failure to meet Surface Water Filtration and Disinfection Treatment Requiremjents," as required by Section 116450 of the California Health and Safety Code. Proof of Notification has been forwarded to the District Drinking Water Office in Monterey, CA. Notification is required until such time as we can either install an approved filtration and water treatment plant, or make arrangements to be serviced by the closest municipal water district, San Juan Bautista. Water District constraints at present indicate that connection to this local water system will be delayed into the unpredictable future. Meanwhile, we are mandated to maintain a minimum 1.0ppm chlorine residual in the distribution system. This elevated residual is creating customer complaints	90,000	10	145 05	San Benito	II	2007
66	1206008	1206008-001	Mattole Triple Junction High School	SWTR Compliance	Surface water treatment rule compliance.	D	25	P	Turbidity failures 8 months out of the year. This system uses a surface water source. The Mattole river reaches turbidities of 800+ NTU. Lack of analyzers on site makes it difficult to design or plan a solution	225,000	1	60 01	Humboldt	I	2002

67	1700519	1700519-003	Crescent Bay Improvement Company	Crescent Bay Improvement Company-SWTR Compliance	For the well drilling portion of the project, a geological study is necessary to determine the optimum well location and to advise on site acquisition for the well and treatment facilities. Further environmental studies (archeological, etc.) may be required under CEQA. Once the site is obtained and the well is drilled, additional treatment of the water may be necessary, based on the test results of other wells in the neighborhood. Determining the necessity of additional treatment and then installing the treatment facilities would then complete that project. We believe that an additional well will be required to meet capacity even if we were to acquire the adjacent water system.	D	20	C	Crescent Bay improvement Company has been on a Boil Water Order since 1999. It draws surface water from Clear Lake for a community of 23 hookups. It has been unable to meet compliance standards for turbidity and disinfectant byproducts under Surface Water Treatment Rule Sections 64664, 64652(a), 64655(b), 64657.40(c), 64646(a), 64659 and 64661. The company was established in 1935, and the distribution system dates back to the late 1930s. The California Department of Public Health regulator has advised us to seek ground water as a source for our system rather than surface water. drill a well and replace surface water source with ground water,	900,000	24	18 03	Lake	II	2012
68	4900543	4900543-003	Sonoma County CSA 41-Salmon Creek	Consolidation of Treatment Works Salmon Creek/Carmet and Sereno del Mar Water Systems	The project consists of the installation of 3 miles of dual pipeline. A 2" raw water line to deliver Salmon Creek's water sources to the treatment plant at Sereno del Mar and an 8" line to deliver finish water from the 300,000 gallon gravity tanks at Sereno del Mar. This plan is similar to the project completed at Carmet-by-the-Sea in 2003 using USDA funds. This proposed project will complete the consolidation of the distribution systems and all water sources at Sereno del Mar, Carmet-by-the-Sea, and Salmon Creek. This proposed project is similar to SDWSRF Project 0003046-01 submitted in June 1999, which involved the consolidation of all surface water treatment in the existing microfiltration plant at Sereno del Mar. The Sereno del Mar plant was constructed in 2001 using a State Revolving Fund loan. Sereno del Mar (124 users) and Carmet-by-the-Sea (64 users) are charged $6.75/month to repay the DWRSRF-11197C307 $250,000 loan. When Salmon Creek (100 users) is added to the system, the monthly cost for repayment of the loan will be reduced to $4.50/month. Carmet-by-the-Sea is also repaying a USDA loan in the amount of $140,000 for construction of the water intertie to Sereno del Mar. This repayment amounts to a $10.50 charge/customer/month. Salmon Creek is currently repaying a SRF loan which financed the distribution system. This cost is $28.00/month/user.	D	20	C	The Salmon Creek Water System currently utilizes two separate sources. A shallow well adjacent to 3 residences provides brackish water with a specific conductivity exceeding 2,000 omhs/cm. This well may not have an adequate well seal. The second source consists of an underground spring which is collected in a 5' deep French drain, located adjacent to a public road. This source has a high turbidity during the winter rains so additional disinfection is applied to increase the CT. On numerous occasions, the brackish well water is used when the turbidity exceeds 1.0 to 3.0 NTU. Both sources may be under the influence of surface water and must be treated in compliance with the Surface Water Treatment Act. The Department of Health Services requires treatment. A small on-site treatment works will be costly and operation costs with continuous monitoring would be beyond the financial capacity of the 100-customer community. The community has sufficient surface water sources but this supply must be treated. This surface water may be treated at an adjacent water system's micro- filtration facility. Adequate storage for both domestic and fire use is also available at the adjacent water system. Salmon Creek customers pay the highest monthly charge for public water systems in Sonoma County,	500,000	99	220 18	Sonoma	II	2007

Upgrade water treatment plant to meet the LT1 requirement (through addition of approved filter technology). May and probably will require addition to existing treatment plant building to house upgrades. 2. Update and upgrade turbidity meters and turbidity recording equipment to meet 15 min reporting standard. 3. Repair or replace 14,000 gallon horizontal storage tank per state inspection dated Feb. 27, 2007. 4. Replace worn 3 H.P. pump at creek pumping station. 5. Convert 4 existing filters to dual media to eliminate the flow restriction imposed by the state inspection report of Feb 27, 2007. 6. Automate flow, turbidity, and storage tank systems to provide indicators and alarms for critical levels (such as high turbidity or low storage tank alarms).	D	0	C	1. Water treatment plant does not meet the LT1 requirement . 2. turbidity meters and turbidity recording equipment do not meet 15 min. reporting requirement. 3. 14,000 gallon horizontal storage tank needs to be repaired or replaced per Feb 27, 2007 state inspection report. 4. Worn 3 H.P. pump at pumping station. 5. current 4 filters need to be dual media to eliminate filter flow restriction (per Feb. 27 inspection). 6. Flow, turbidity, and storage tank systems have no indicators or alarms for critical levels (such as high turbidity or low storage tank condition).	10,000	37	80 01	Trinity	I	2007

86	1000213	1000213-001	HARRIS FARMS/HORSE BARN	Harris Farms Horse Division Treatment Plant Modifications	New equipment items including the following are proposed for the treatment plant: A new pressure contact clarifier pretreatment unit, an additional 42 inch diameter pressure filter, a new 100,000 gallon capacity treated water storage tank, a granular activated carbon (GAC) filter system, an ultraviolet light reactor to disinfect filtered water, two (one duty, one standby) new distribution system booster pumps controlled by variable frequency drives to maintain system pressure, and new filtered water and backwash water totalizing rate of flow meters. The existing hydropneumatic tank and the two storage tanks would be demolished.The contact clarifier will improve the filtered water quality, and the GAC filter system will reduce organics and TTHM precursors. GAC treatment, along with UV disinfection to allow a reduction in the chlorine dose will resolve the TTHM problem, and the TOC removal ratio problem.	D	0	C	The DPH inspection report dated December 2007 listed deficiencies for the treatment plant. The 100 gallon per minute treatment plant is approximately 30 years old and includes a pretreatment unit, 2 each 42 inch diameter pressure filters, two each 20,000 gallon storage tanks, a distribution system booster pump, a hydropneumatic tank, plus chemical feed equipment and instrumentation. These items require correction: Treated water contains TTHMs above the MCL; CT requirements are not being satisfied; and the TOC removal ratio is below the required ratio. In addition, the pretreatment equipment at the plant is not functional and needs to be replaced, the service flow rate through the pressure filters exceeds 3 gpm/square foot, and the storage tanks' capacity is less than required by Title 17 Code of Regulations Section 64554. Further, the existing tanks lack access openings to allow cleaning. The storage tanks and the hydropneumatic tank are also leaking water, and cannot be properly repaired.	388,000	20	100	23	Fresno	III	2009
87	2100519	2100519-004	ESTERO MUTUAL	Data logging and Recording Equipment	The project would include the installation and calibration of in line data logging and recording equipment. Installation would be in Estero Mutuals treatment plant, and consist of wiring, plumbing, and mounting of equipment into exsisting system. Monitoring equipment would allow for continual measurements of raw and finished water. Also any technical support for initial system start up, and for any problems that may arise after installation would be included in the project.	D	0	C	The surface water treatment plant does not have any data logging or recording equipment for raw or finished water. In order to be in compliance with surface water treatment rules, Estero Mutual needs to install in line monitoring equipment that can generate data for monthly reports. Scott Callow R.S. Marin County Health Department personal communication.	11,900	110	125	18	Marin	II	2007
88	2100519	2100519-006	ESTERO MUTUAL	Storage tank replacement	Obtain all permits,remove old tank and erect new water storage tank. The new tank would provide reliable water storage for drinking and fire protection for the community.	D	0	C	Estero Mutual's 200000 gallon drinking water storage tank is badly corroded and leaking. The tank needs to be replaced to ensure drinking water and fire protection to the community. Estero Mutual Water Company does not have the funds to replace the tank.	395,000	110	125	18	Marin	II	2009
89	4810025	4810025-001C	SID-Pleasant Hills Ranch	Solano Irrigation District	Install POEs treatment..	D	0	C	Unfiltered Surface water source.	463,000	39	135	04	Solano	II	1999
90	1009028	1009028-001	HARRIS FARMS SOUTH #101-144	Harris Farms South Camp Water System Improvements	New equipment items including the following are proposed for the treatment plant: A new pressure contact clarifier pretreatment unit, an additional 42 inch diameter pressure filter, a new 100,000 gallon capacity treated water storage tank, a granular activated carbon (GAC) filter system, an ultraviolet light (UV) reactor to disinfect filtered water, two (one duty, one standby) new distribution system booster pumps controlled by variable frequency drives to maintain system pressure, and new filtered water and backwash water totalizing rate of flow meters. The existing hydropneumatic tank and the two storage tanks would be demolished.The contact clarifier will improve the filtered water quality, and the GAC filter system will reduce organics and TTHM precursors. GAC treatment, along with UV disinfection to allow a reduction in the chlorine dose will resolve the TTHM problem, and the TOC removal ratio problem.	D	0	C	The DPH issued compliance order #03-12-080-009 dated April 29, 2008 for the South Camp system. The 90 gallon per minute treatment plant is approximately 30 years old and includes a pretreatment unit, 2 each 42 inch diameter pressure filters, two each 20,000 gallon storage tanks, a distribution system booster pump, a hydropneumatic tank, plus chemical feed equipment and instrumentation. The compliance order requires improvements to correct these items: Treated water contains TTHMs above the MCL; CT requirements are not being satisfied; and the TOC removal ratio is below the required ratio. In addition, the pretreatment equipment at the plant is not functional and needs to be replaced, the service flow rate through the pressure filters exceeds 3 gpm/square foot, and the storage tanks' capacity is less than required by Title 17 Code of Regulations Section 64554. Further, the existing tanks lack access openings to allow cleaning. The storage tanks and the hydropneumatic tank are also leaking water, and cannot be properly repaired.	388,000	40	160	23	Fresno	III	2009

94	4900647	4900647-002	Sereno Del Mar Water Company (PUC)	Consolidation of treatment works Salmon Creek/Carmet and Sereno Del Mar Water Systems	The project consists of the installation of 1-1/2 miles of dual pipeline, a 2" raw water line to deliver Salmon Creek's water sources to the treatment plant at Sereno del Mar and an 8" line to deliver finish water from the 300,000 gallon gravity tanks to Salmon Creek. This plan is similar to the project completed by Carmet-by-the-Sea in 2003 using USDA funds. This proposed project will complete the consolidation of the treatment plant, distribution systems and all water sources at Sereno del Mar, Carmet-by-the-Sea , and Salmon Creek. This proposed project is similar to SDWSRF Project 0003046-01 submitted in June 1999, which involved the consolidation of all surface water treatment in the existing microfiltration plant at Sereno del Mar. The Sereno del Mar plan was constructed in 2001 using a State Revolving Fund loan.Sereno del Mar (124 users) and Carmet-by-the-Sea (64 users) are charged $6.75/month to repay the [DWRSRF-11197C307] $250,000 loan. When Salmon Creek (100 users) is added to the system, the monthly cost for repayment of the loan will be reduced to $4.50/month/service. Carmet-by-the-Sea is also repaying a USDA loan in the amount of $140,000 for construction of the water intertie to Sereno del Mar. This repayment amounts to a $10.50 charge/customer/month.Salmon Creek is currently repaying a SRF loan which financed the distribution system. This cost is $28.00/month/user.	D	0	C	The Salmon Creek CSA #41 water system currently uses two separate sources. A shallow well, located adjacent to 3 residences, provides brackish water with a specific conductivity exceeding 2000 UMHOS/CM. This well may not have an adequate well seal. The second source consists of an underground spring which is collected in a 5' deep french drain, located adjacent to a public road. This source has a high turbidity during the winter storms so additional disinfection is applied to increase the "CT". On numerous occasions the brackish well is used when the spring turbidity exceeds 1.0 TO 3.0 NTU. Three boil water notices were issued in the past five years. Both water sources are subject to surface water intrusion and need to be treated in a surface water treatment plant. Fortunately, the micro-filtration treatment plant located at Sereno Del Mar has excess capacity and may be expanded to accommodate the water sources located in Salmon Creek. The cost to expand this plant is approximately $5,000. The community of Carmet and Sereno del Mar completed the initial consolidation in 1999. A small on-site surface water treatment plant at Salmon Creek may be expensive to operate and the continued monitoring may be beyond the financial capacity of the 100-customer community. Salmon Creek customers pay the highest monthly charge for public water system in Sonoma County, exceeding $100/month for a single	700,000	124	200 18	Sonoma	II	2009

95	4900543	4900543-004	Sonoma County CSA 41-Salmon Creek	Construction of a ground water treatment plant and water storage tank	In order to comply with the Surface Water Treatment Act, the Salmon Creek community of 100 customers must provide treatment to both the well and spring water sources. These two sources are under the influence of surface water. This project includes the construction of a building for the treatment works, a micro filtration Treatment plant, pump station, relocation of the existing generator, fabrication of a finish water storage tank, construction of a raw water pipe line between the existing concrete water tank and the new filter building. The replacement of the existing fire pump may involve an agreement with the Bodega Bay Public Utility District, and the construction of a short inter-tie for fire suppression purposes only. If an agreement can not be completed with the Bodega Bay Public Utility District, then a local fire water supply will require the construction of a larger finish water storage tank. This proposal includes funds to replace the existing fire pump and sufficient storage. The cost to comply with the Surface Water Treatment Rule will financially impact the water system users. Salmon Creek is currently repaying a SRF loan which financed the distribution system. This cost is $28.00/month/user. This proposed improvement may increase this capital repayment by another $20/month/user. Salmon Creek CSA #41 will need a forgiveness of principal to reduce the customers' monthly capital repayment charges.	D	0	C	The Salmon Creek CSA #41 water system currently uses two separate sources. A shallow well, located adjacent to 3 residences, provides brackish water with a specific conductivity exceeding 2000 UMHOS/CM. This well may not have an adequate well seal. The second source consists of an underground spring which is collected in a 5' deep French drain, located adjacent to a public road. This source has a high turbidity during the winter storms so additional disinfection is applied to increase the "CT". On numerous occasions the brackish well is used when the spring turbidity exceeds 1.0 TO 3.0 NTU. Three boil water notices were issued in the past five years. Both water sources are subject to surface water intrusion and need to be treated in a surface water treatment plant. The operation costs for a small on-site surface water treatment plant will be a burden for the 100-customer community. Salmon Creek customers pay the highest monthly charge for public water system in Sonoma County, exceeding $100/month for a single family residence. This charge includes capital repayment costs for the installation of the water distribution system.	550,000	99	220 18	Sonoma	II	2009

97	3100058	3100058-005	DUTCH FLAT MUTUAL	Consolidation of Dutch Flat Water Co. with PCWA	Do to the increasing federal and state treatment mandates and personal responsibility for the existing volunteer operations staff, Dutch Flat Mutual is looking for alternatives to their continued operation of the treatment plant.Dutch Flat Mutual would like to purchase wholesale treated water from PCWA. The project would consist of hooking up to PCWA's treated water main, which would allow Dutch Flat to decommission its existing WTP.Service to Dutch Flat Mutual could be made with an extension of about 150 feet of pipeline, installation of a 2 inch meter, an altitude valve with a flow rate controller and telemetry equipment. This would be connected to the Dutch Flat Mutual storage system.	D	0	C	The Dutch Flat Water treatment plant does not totally comply with the Cryptosporidium Action Plan, and will have difficulty complying with any new regulations.1. The pre-treatment facilities (i.e. the rapid mix chamber, flocculation basin and sedimentation basin) are uncovered. This allows contamination from animals entering into these unit processes, becoming trapped and decaying immediately prior to the dual media filters;2. The pre-treatment facilities are located in a heavily wooded area allowing large accumulations of vegetation to reside and decay in these basins. Monitoring TOC's in the raw water as required by law may ultimately not be representative of the actual TOC level that enters the filters. 3. Although enclosed within a 6' cyclone fence, the exposed pre-treatment facilities are close to a public road and subject to intentional contamination from vandals throwing contaminants into the facilities;4. Settled water turbidities can exceed 1 NTU which can be the same or higher than the raw water turbidity;5. The unit processes are all controlled by manual valves and thus highly subject to improper operation due to operator error. Improper sequencing of the valves could cause any number of problems leading to contamination of the treated water.6. As the valves are manual, the operator must slowly open the valves following the backwash process in order to gradually increase the filtration rates which cannot be	220,000	94	290 02	Placer	I	2009

99	4900570	4900570-004	Palomino Lakes Mutual Water Co.	Well replacement to overcome the direct influence of surface water	Please note that "consolidation" is not an option. The closest public water system is five miles away. There are no private systems with the ability to help within that same five miles.The problem of the well being substandard has been known for some time. The Palomino Lakes Mutual Water Company (PLMWC) Board began negotiations with vineyard owner (where the present well is located) some time ago. To date it has been an unsuccessful process however very recently the talks have become considerably more productive. Based on the progress there appears a successful resolution may be at hand. Additionally the Board is exploring a possible site on the adjacent parcel that was actually suggested by the reluctant vineyard owner while he negotiated.The solution is a new, deeper well, closer to the Russian River, where sufficient depth is available to allow the well to meet sanitation standards while being far enough away to minimize turbidity problems. All of the expected well drilling, casing, proving, drilling waste control and removal, etc expenses will be required.Also required are the usual support items including a pump, controls, electrical service, water treatment equipment and structure, monitoring equipment, underground piping to connect into the existing water main, etc. as well as additional access road and fencing.Since certain aspects of this project are givens, regardless of well location,	D	0	C	On May 10, 2011 the Department of Public Health (Department) Drinking Water Field Operations staff inspected the Palomino Lakes Mutual Water Company (PLMWC) facilities. This inspection, and test results from early 2011, caused the Department to notify the PLMWC the well was not at Department standards.The PLMWC immediately modified the water treatment procedure to meet a 3-log inactivation of Giardia and a 4-log inactivation of virus through higher disinfection. This action was reported to the Department during a June 17, 2011 meeting in Santa Rosa between the Department, the PLMWC system operator and the PLMWC Board of Directors.On June 23, 2011 Janice M. Oakley, P.E., Sonoma County Engineer for the Drinking Water Field Operations Branch based in Santa Rosa, formally notified the PLMWC the system's well was being reclassified as "...a groundwater under the direct influence (GWUDI) of surface water". The Surface Water Treatment Rule, sections 64650-64666 of the CCR, was specifically cited.By instituting the higher disinfection rate and logging data on regular basis a "boil water" has not been necessary and all water users are being updated as needed. The problem stems from the well depth of only twenty-four feet and the surface seal only being four feet. Additionally this well is in a vineyard where the surface waters may contain farming chemicals as well as wild animal contaminants.	500,000	110	340 18	Sonoma	II	2012
100	4400608	4400608-002P	FOREST SPRINGS	Forest Springs Water Upgrade	To address non-compliance regarding the surface water treatment rule, Forest Springs intends to acquire a pre-engineered and prefabricated State-certified alternative treatment unit. The unit would be delivered to the site and construction would take place to install the unit at the treatment plant site, plumb the unit, and complete hook up of electrical power and control circuitry. During construction associated with the surface water treatment filtration unit, any cross-connections or other plumbing modifications would be completed and the sand filter backwash process stream would be modified. Additionally, process modification would be completed to increase chlorine contact time. All work would be completed according to County-approved design drawings and specification which will be included in the application. Work will also be completed to provide all necessary engineering report(s). The final stage of work would include system start up and final documentation.	D	0	C	The County of Santa Cruz, Ca has directed the Forest Springs Water System to address the following problems: 1) unapproved surface water treatment technology needs to be brought into compliance; 2) the existing sand filter is backwashed with raw water, which is not compliant; 3) cross-connection between raw water intake and clear well could allow filter bypass, which is not compliant; and 4) the system has insufficient chlorine contact time, which is not compliant. Since 2006, quarterly notices have been distributed to users that explains water treatment is not compliant with surface water treatment rule.	100,000	128	385 05	Santa Cruz	II	2009
101	4610002	4610002-001P	Downieville Public U.D.	Downieville PUD / Treatment Upgrades	The proposed project will provide a modern, approved technology, water treatment system capable of coping with the full range of raw water turbidity typical of the source creek. The upgraded system will also be designed to provide adequate disinfectant contact time prior to the water reaching the first customer. We anticipate the new system to be either a micro-filtration system or a packaged system which provides coagulation, flocculation, sedimentation, and filtration. Additional contact time will be provided by increasing the detention capacity through additional storage at the plant prior to entering the distribution system.	D	0	C	The current mixed media direct filtration system is not an approved surface water treatment system. During periods of high runoff in the source creek, the increased level of turbidity overwhelms the filters and causes the treated water turbidity to exceed standards of the Surface Water Treatment Rule. The District was cited for a turbidity violation in 2003. The treatment plant is over 30 years old and lacks many of today's starndard automated control, alarm, and monitoring systems. Additionally, the treatment plant and associated storage is only able to meet about 30% of the required CT factor for pathogen reduction.	818,000	224	391 02	Sierra	I	2007

102	3301115	3301115-001P	CHIRIACO SUMMIT WATER DIST.		The new project will include a 300,000 gallon storage reservoir, plus a new pipe system from the canal to the reservoir which will split water into potable and non potable for use at the Chiriaco site. All new plastic piping will be included as well	D	0	C	The present system is antiquated and needs to be updated to meet the state SWTR and federal regulations. We will send additional information and the drawings and information on the new system as soon as we have the finished plan.	0	24	400 20	Riverside	V	1998

107	1700568	1700568-002	Riviera West Mutual Water Co.	Improve System Reliability during Power Loss	Install emergency generators at the surface water treatment plant to operate the plant and the booster pumps. Install emergency generators at the booster pump station in the distribution system.	D	0	C	The Company experiences both fluctuating power surges and power outages during both winter and summer periods. The water treatment plant does not have any backup power.	130,000	240	500 03	Lake	II	2009
108	1700568	1700568-003	Riviera West Mutual Water Co.	Clarifier pretreatment with plant upgrade	By upgrading the existing water treatment facility to a direct filtration water treatment plant, including the installation of a contact clarifier and mechanical coagulant mixer, the water treatment facility will be deemed an approved water treatment facility.The major components proposed in this project include: Contact Clarifier including a Mechanical Coagulant Mixer UV Disinfection System Enhanced Surface Wash System Emergency Generator Switch, Connectors Piping Electrical/SCADA	D	0	C	The Department characterized the existing treatment facility on June 17, 1994 as an inline filtration treatment system. Inline filtration is not an approved water treatment technology because there is insufficient reaction time for the coagulant to form colloidal particles before waters reach the filtration site. The lack of coagulant reaction time contributes to sludge forming in undesirable locations downstream and potentially contributed to elevated total trihalomethane (TTHM) formation in the distribution system. The Company's water treatment facility is still deemed to be an inline filtration treatment system. As it currently exists, the water treatment facility is incapable of meeting the surface water treatment rule in accordance with Section 64653 of the California Code of Regulations (CCR).The Company does not treat surface water through approved filtration technology. The effectiveness of the alternative filtration treatment process is deemed inadequate by the Department.	585,000	240	500 03	Lake	II	2009

109	1700568	1700568-005	Riviera West Mutual Water Co.	Emergency Intertie	Construct an emergency intertie between the effluent of Riviera West Mutual Water Company's surface water treatment plant and Buckingham Park Water District's distribution system.	D	0	C	To improve drinking water reliability to the customers of the Riviera West community, the Company plans to construct an emergency intertie. Buckingham Park Service District is the public water system located immediately north of the Company and less than 100 feet away from the water treatment plant transmission main. To facilitate improved reliability and health in the region, the Department investigated the site and finds this component to be eligible for project funding. The most recent water hauled to system was reported on October 17, 2003. Water outages were reported on June 22, 2004.	100,000	240	500 03	Lake	II	2009

112	5400903	5400903-002P	TRACT 92 C S D	Tract 92 CSD Feasibility Study	Feasibility Study The proposed feasibility study would include an analysis of options to provide a reliable source of potable water for the Tract 92 CSD. The study would include the preliminary engineering necessary to evaluate the costs of drilling a new water well (including test well) and the options of connecting to other neighboring water systems. Included in this evaluation will be the economics and practicaly issues related to connecting to California Water Service in Visalia. Issues to be considered will include the viability of approval from the Tulare County Local Agency Formation Commission. There will be environmental analysis of the recommended alternative and documents will be prepared for filing under CEQA by the Tract 92 CSD. Following the CEQA process if a new local well with storage is considered the recommended alternative a new well site will be located and a test well drilled. Assuming the results of the test well are favorable, the preliminary design of the production well and storage would be prepared by a licensed engineer.	D	0	C	Feasibility Study Tract 92 Community Service District provides water to the unincorporated area known as Union Addition. This unincorporated community consists of approximately 135 households and one church and is located Southeast of the City of Visalia. This economically disadvantaged community is a mix of retired people, farm workers, and low-income families. The community's water system was established in the early 1960's. The water system has two wells drilled on one site. At least one of the wells is producing water that fails the Total Coliform Rule. Analysis is pending on the other well. Over the past 4 months has consistently failed the Total Coliform Rule. The two wells were tested and once they failed an additional 5 sites were tested and they failed as well for Coliform Bacteria. We have received Notices of Violation from the Tulare County Environmental Health Department for the preceding 4 months for the bacterial contamination. The District has distributed notices of the violation as required by Tulare County Health to the water system users. The water distribution system was installed over 40 years ago. It consists primarily of asbestos/cement	300,000	91	500 12	Tulare	III	2007

113	2810013	2810013-005	Napa County Public Works-NBRID	NBRID Water Treatment Facility and Intake Replacement Project	The project consists of the design and construction of a new water treatment facility. The scope of work for the project will include replacement of the existing water treatment plant with a new facility that would meet or exceed all current water quality objectives for potable water, and include updated SCADA components for continuous monitoring by District operators and upgrades to mechanical and electrical equipment associated with the plant. Additionally, the confined space hazards that operators must deal with daily during routine operation and maintenance of the existing facility would be eliminated through the installation of a proper accessway and ventilation system. The existing facility would be decommissioned as a part of this project.All piping and equipment necessary to transfer the wastewater generated from routine cleaning of the filters to the sewer collection system will be installed as well, if the new facility is unable to recycle decanted backwash waste water from the filters through the water treatment system.The project also replaces the existing electric panel and wires supplying electricity to the intake pumps. Replacement of the panel and wires will ensure continuous power to the intake pumps and prevent future shutdown of the WTP due to power outage, under normal operating conditions.Finally, the project will include provisions to repair and upgrade the access	D	0	C	A Master Facility Plan (MFP) was completed for NBRID in June 2006. There were two primary areas of concern listed in the MFP in regards to the District Water Treatment Plant (WTP): Age of the facilities and the requirement to meet SWTR provisions. In addition to the concerns listed in the MFP, the District recently discovered both electrical and mechanical issues with the District's water intake facility in Lake Berryessa.The age of the WTP is approximately 40 years and the mechanical equipment is largely past its useful service life. In 2004 an electrical problem at the WTP left the residents of the community without water for four days. An emergency repair of the electrical panels was completed, and new equipment was purchased to replace what was damaged by the electrical problem, but additional upgrades/replacement is required for optimum efficiency of the WTP. Additionally, several components of the WTP are contained within confined spaces, making even general maintenance problematic for the operators.The plant does not contain redundant process trains, and the single filter is of antiquated technology and is not compliant with SWTR gravity sand filter specifications. Should the filter be rendered inoperable, the WTP would need to be shut down until such time as the filter can be repaired. The filter is located in a confined space area of the WTP which would delay repair of the filter and would likely result in	3,500,000	237	500 03	Napa	II	2011
114	4510004	4510004-005	Shasta Co. Service Area #6	Jones Valley CSA#6 ESWTR Compliance Project	Project would install a large diameter flocculation pipeline prior to filtration of the raw water. Coagulent would be injected into the raw water. The flocculation pipeline would provide the required contact time to react with the water. The flocculant would then be filtered through the existing filters. This system is an approved technology meeting the Enhanced Surface Water Treatment Rule.	D	0	C	The treatment plant uses in-line filter technology. Until 2009 it was certified by CDPH as complying with the federal Long Term 1 Enhanced Surface Water Treatment Rule. The Certification was based on a demonstration study previously approved by CDPH. In 2009, upon further investigation, CDPH determined that the system does not meet the Enhanced Surface Water Treatment Rule. The filtration system does not comply with CCR 64653.	350,000	377	1,119 02	Shasta	I	2011
115	1710013	1710013-003P	Callayomi County Water District	Callayomi Well Replacement Project	The proposed project is to replace the District's current wells with two new wells along with the associated pumps, pump housing, piping and a new water storage tank.The new wells would meet current well construction standards for a domestic water supply source. This action would address the issue of the District's primary well being out of compliance with well construction standards. The proposed well sites' locations have been selected to minimize the possibility of surface water influencing the groundwater source. This action would address the current issue of the likely surface water influence on the District's primary well. Each well site would be owned and controlled by the District. Both sites would be fenced to exclude any livestock from getting to within 100 feet of the well sites. This action would resolve the current conflict with the rancher, costly lease fees, and give the District complete autonomy over management of the well sites. The addition of the new water storage tank is associated with one of the proposed well sites. This well site (specifically picked for its high water volume, good water quality and to avoid any influence from Putah Creek) is further away from our current water storage tanks, and by adding this new tank it would insure that customers on this end of the District would not suffer any loss in water quality and pressure. This proposed water tank would also insure adequate	D	0	C	On a regular basis, the primary well providing the water for the Callayomi County Water District (District) is being contaminated by Total Coliform and E. Coli pathogens. The source of the contamination is from nearby grazing cattle and/or another source of surface water seeping into the well. This well does not meet current well construction standards for a domestic water supply source due to its 20-foot annular seal.As per a California Department of Public Health (CDPH) directive, fencing was installed to keep cattle 200 feet away from the well site. This created a contentious issue with the rancher. The well is located on the rancher's private land and leased from the rancher. In addition to the well lease fees the District is now paying a lease fee for the land excluded from cattle grazing.As per the same CDPH directive, the District is chlorinating the well water at the pump, filtering the water and doing twice-monthly tests. The chlorination and filtration is adequately treating the water. However, the fencing has been in place for 5 months and the water is still testing positive for Total Coliform and E. Coli. The CDPH suspects that the well with its shallow surface seal could be pulling surface water from another source. The State Water Resources Control Board determined the source of water for this well to be percolating groundwater and not surface water. But the CDPH uses different criteria to determine the	0	357	1,200 03	Lake	II	2012

116	1710022	1710022-007P	Lake County CSA 20 - Soda Bay	County Service Area 20-Soda Bay Water System improvements	The final design and construction funding is requested for the following components: pre-treatment equipment, ozone unit replacement, coagulant mixer unit, mixed media filter replacement, monitoring and controls, 100,000 of additional storage, repairs to the Riviera Heights storage tanks, and a supplemental water supply well.	D	0	C	The Soda bay Water System has insufficient treatment and storage capacity as identified in permit Number 02-03-11P1710022. A connection moratorium has been enacted as a result of these conditions. The permit requires a number of specific capital improvements to be made to the system by stipulated deadlines.	0	596	1,342	03	Lake	II	2012
117	2110004	2110004-019	Stinson Beach County Wtr Dist	Surface Water Treatment Plant Replacement Project (Phase 2)	With regulatory requirements becoming more stringent and currently accepted treatment process trending towards obsolescence, the District has decided to replace its aged conventional WTP with a pressure membrane treatment facility. The primary components of the new plant include a package 200 gallon per minute pressure membrane system, a new treatment building to house the pressure membrane system, a new laboratory, control room and equipment room, recyclable wastewater and waste storage tanks, pumps, all electrical and instrumentation, and a perimeter retaining wall at the existing WTP site to protect the new WTP facilities from slides which have historically caused damage to the existing facility.The project plans incorporate "green building" features. For example, construction materials will include steel framing, concrete pony walls, and exposed concrete as finished flooring, thereby reducing demand for wood and increasing the strength and durability of the new structure. The plans also include photovoltaic panels on south-facing portions of the roof. Environmental review and permitting for the project was completed in June 2008. The project involves two (2) phases of construction. Phase 1 involves construction of the perimeter retaining wall at the existing plant site. The District is filing a separate pre-application for the Phase 1 portion of the WTP Replacement Project. This pre-	D	0	C	The Stinson Beach County Water District's (District) existing surface water treatment plant (WTP), constructed in 1978, utilizes a package conventional treatment plant with coagulation, flocculation, sedimentation, and filtration which was manufactured by Microfloc Products (now U.S. Filter). The existing WTP has a capacity of 200 gpm. The process facilities are installed in a steel tank which is uncovered and exposed to the harsh elements of the coastal marine environment. Replacement parts are difficult to acquire for the WTP, and the steel tank and other components of the processing unit are severely corroded. Additionally, the existing structures that house the electrical and controls systems, the laboratory, and chemical storage have rusted due to the ocean atmosphere. The existing WTP has reached its useful life and is in need of replacement.	1,650,000	721	1,500	18	Marin	II	2009
118	4510002	4510002-009	Mountain Gate C.S.D.	Backwash Recycle ProjectWater Treatment Plant Upgrade	The Project would be to expand the plant to include a third filter to increase the "effective capacity" to 2.96 MGD, and converting from in-line to direct filtration which will address the federal Surface Water Treatment Rule and Section 64652, Title 22, California Surface Water Treatment.	D	0	C	From the CDPH Annual Inspection Report [dated February 19, 2009] and a PACE Engineering "Preliminary Engineering Report" [dated May 2010], it was determined that a "Backwash Recycle Project" – or a Water Treatment Plant Upgrade – was required for the Mt. Gate CSD. Because, at this date, the District does not comply with current CDPH water quality standards.Currently, the Treatment facility consists of two Horizontal Pressure Filters, which during "downtime for backwash" the "effective output of the existing treatment plant is about 1.97 MGD." By adding one more filter, the output would be raised to 2.96 MGD, with only 5% backwash downtime. Also, the Treatment Plant is classified by CDPH as in-line filtration, "which is an unapproved technology." The Plant needs to be brought into compliance.	894,600	664	2,500	02	Shasta	I	2011
119	4510002	4510002-005	Mountain Gate C.S.D.	filter plant replacement [project funded by Prop 50 executed FA]	replacement of warnout 2mgd direct filtration system with new conventional filtration package plant.	D	0	C	the district has 2ea. 1mgd pressure filters installed in the 1970's and early 80's. These filters are an unaproved technology and need to be replaced with conventiona filtration. in 2006 both filters had reached the end of their usefull life and were in failure mode. Dhs issued citation for failure to meet turbidity requirements. the district made repairs to the warnout filters ,as funds were unavailable for replacement.	1,611,000	664	2,500	02	Shasta	I	2009

120	2310004	2310004-003	Willits, City of	City of Willits Water Treatment Plant Improvements	The WTP deficiencies were evaluated by CDPH, and the City's consulting engineer developed a Technical Engineering Report, reviewed by CDPH, which included the following: Installation of a plant-wide SCADA system to enable WTP staff to continuously monitor water quality and treatment performance, and record data. Critical unit processes will be upgraded as necessary or designed (if new) to allow remote control and feedback. Installation of a Solids Contact Upflow Clarifier (SCUC) to remove the bulk of the turbidity in the raw water, taking the solids load off the existing adsorption clarifier – media filters, and provide additional time for manganese flocculation. The SCUC will reduce turbidity to within the treatment capacity of the existing treatment units, and will the primary point of solids removal from the WTP, reducing the forward flush and backwash demands on the existing treatment units during the high turbidity events. Installation of pH adjustment system using carbonic acid and lime. This will enable staff to optimize pH for general turbidity, manganese, or algae removal in the SCUC or in the existing adsorption clarifiers; increase alkalinity and free calcium to imcprove coagulation; and obtain a non-corrosive finished water. Installation of chemical feed piping, valving and mixing facilities to allow pH adjustment and coagulant injection upstream and/or downstream of the SCUC. Installation of third 1-mgd	D	0	C	The City utilizes the Morris Reservoir as its raw water source. The reservoir is significantly impacted by erosion of colloidal clay bearing soils in the winter months and algal blooms in the summer months, and the water is naturally very soft, which hinders good coagulation. Morris Reservoir turbidities can exceed 250 NTU at times, and are often well above 50 NTU for extended periods in the winter. During these raw water quality events the existing WTP struggles to consistently and reliably achieve clarified water turbidities less than 10 NTU and filtered water turbidities less than 1.0 NTU. From January 4th to January 8th, 2008, with raw water peaks over 200 NTU, the City notified the Department of Public Health that filtered water turbidities of up to 20 NTU from the WTP occurred for several hours. A Boil Water notice was also issued. In response, CDPH issued a citation of non-compliance for violation of the treated water performance standard of 1 NTU, and subsequently amended the City's Domestic Water Supply Permit with additional performance standards and monitoring requirements (CDPH, Domestic Water Supply Permit No. 02-03-06P2310004). The Permit amendment contained several requirements that will be addressed by this Project.CDPH has also conducted several evaluations of the WTP, including a Surface Water Treatment Plant Evaluation in May of 2006, which indicated that the WTP only met Cryptosporidium	4,700,000	2,168	8,062 03	Mendocino	II	2011
121	0910013	0910013-005	Georgetown Divide PUD	Auburn Lake Trails Water Treatment Plant Upgrade	The existing plant will be converted from in-line to direct filtration as required by the Surface Water Treatment regulations.This will be achieved by adding/modifying the following: new raw water pump station with VFD's, install new clarifier prior to filtration, relocate polymer feed injection location, install static mixer, modify existing filter header piping, construct new clearwell, upgrade chemical feed equipment to be flow paced, install streaming current meter for control of polymer dosing, modify plant process to meet requirements of Backwash Recycling Rule, modify existing solids handling capabilities, other maintenance/site improvements as necessary.	D	0	C	Upgrade the existing water treatment plant to an approved surface water treatment method as required by the current Compliance Order issued by the CDPH.	4,000,000	3,587	9,021 09	El Dorado	I	2009

122	4910005	4910005-003	Healdsburg, City of	City of Healdsburg Gauntlett/Panorama Water Filtration Plant Expansion	The project entails the installation of two additional micro-filtration skids within the existing filtration building. It is anticipated the micro-filtration skids would be manufactured "off site", bench tested, trucked to the Gauntlett/Panorama Filtration Plant, craned into position through the existing roof hatch, plumbed, piped, tested again, disinfected and put into service. Estimated time to complete 180 days.	D	0	C	The Gauntlett/Panorama Filtration Plant was commissioned in 2005 and consists of three micro-filtration skids with a filtering capacity of approximately 2.5 mgd. Current peak daily demand during the summer requires supply augmentation from the City's Fitch Well Field which is adjacent to the Russian River. The Fitch Well Field is not currently connected to the water treatment plant and is subject to seasonal pumping prohibitions from November to May due to surface water influence from the Russian River. Due to this restriction and long range demand forecasts based on the City's General Plan, the Gauntlett/Panorama Filtration Plant was designed to allow for expansion of filtration capacity by installing two additional micro-filtrations skids, bringing the total filtration capacity to approximately 4 mgd. This would allow for most of the summer time demands to be filtered, provided adequate supply is available from the Gauntlett Well Field. Additional filtration capacity would also allow the City to consider extending a raw water pipe line from the Fitch Well Field to the treatment plant, which in turn would facilitate lifting the seasonal prohibition on the Fitch Well Field. The additional micro- filtration skids would also provide redundancy within the filtration plant in the event one or more of the three existing micro-filtration skids had to be taken out of service.	2,800,000	4,272	11,706	18	Sonoma	II	2009
123	1910067	1910067-049	LOS ANGELES-CITY, DEPT. The project also consists of a relief station, flow meter and a 4-legged regulator station (three 36-inch legs and one 30-inch leg). this pipeline will allow water to flow directly from the proposed River Supply Conduit, Lower Reach, directly into the Silver Lake Reservoir Outlet Line, bypassing Ivanhoe Reservoir.	D	0	C	Once the project is placed into service, Ivanhoe Reservoir will be taken out-of-service to comply with the US EPA's Long Term 2 Surface Water Treatment Rule.	46,701,335	686,422	4,071,873	15	Los Angeles	IV	2009
128	2702595	2702595-001	CACHAGUA COMM CTR WS	Cachagua Community Center Water System Upgrade	Replacement of filtration system with slow sand filter or design that has proven ability to meet Health Department standards. Distribution infrastructure can remain unchanged.	D	0	P	Surface water treatment plant unable to maintain water quality standards. The filter system has been unable to meet Health Department requirements for turbidity despite 6 years of work and adjustments to the system.Most recent Boil Water Order issued October 3rd, 2008 and currently in effect.	150,000	6	32	05	Monterey	II	2009
129	4901095	4901095-001	Westminster Woods Camp	Westminster Woods Camp Second Slow-Sand Filter	We are using the slow-sand filter system and would like install a second one because they are the superior technology in water filtration, recognized by United States Environmental Protection Agency and the World Health Organization. These sand-filters are used all over the United States and Developing Countries alike. In order to install a second sand filter, we would require the resources to prepare a site for the tank, purchase a pre-engineered sand filter that could be linked in with our current operating system as well as sand to put in the system. Both the construction and set-up would be done in-house by our staff members that are certified by the Health Department as both a Treatment Operator and a Water Distributor.We anticipate that this project will take a few weeks worth of focus on the part of our employees to correctly install, test and get the new sand filter up and running properly. By using a pre-engineered system we are not only saving money in the construction of a new system but also in the salary of hiring out professionals to assemble a system from scratch. The project would involve a few levels of work. The first would be to determine the best location for the second filter and prepare the area either by compacting the ground level or installing a concrete slab to connect in with the piping system. Secondly, would be connecting the raw water source to flow meters and then connecting the new pipes and valves	D	0	P	Westminster Woods Camp and Conference Center 501(C)(3) non-profit organization that strives to use our own resources when we have them available. We currently facilitate and run our own water system based on what we are able to gather from the local watershed. We run a distribution center containing two 10,000 gallon storage tanks being pumped from one sand filter. That one slow-sand filter is extremely important because it is contains the key to our being able to provide safe drinking water and function in a highly sustainable system of using water that is available on our site for all our guests. Recently, the Department of Health Services is requiring we have two sand filters installed so that we can always have one online while the other is being cleaned. We are asking the CDPH to help us address this problem by granting us the monetary help to purchase and install a pre-engineered second sand filter. The cleaning process requires that we drain the tank in order to scrape the top layer of sand, cleaning the system. We then fill the tank from the under-drainage until it is two feet above the sand before turning on the over drainage which fills the tank the rest of the way. While the tank refills, we monitor the turbidity of the water. Since the sand has been disturbed we must wait until the turbidity reaches a level below 1.0 before the water is usable again. If it takes too long for our turbidity to reach a level below	15,000	16	120	18	Sonoma	II	2008

131	4901106	4901106-001	Catholic Charities - CYO Camp	CYO Camp Water System	Proposed Intertie to the Occidental Community Services District (OCSD) Water Distribution SystemThe OCSD receives its water under a Joint Powers agreement with the Camp Meeker Recreation and Park District, and distributes water to services within Zone 1, which encompasses most of the town of Occidental. Zone 2 encompasses the remainder of the OCSD and does not include water distribution, but is primarily a fire protection district. Four of the CYO camp's parcels are located in Zone 2; the fifth is within Zone 1, but not currently served by the water system.The project is the expansion of OCSD's Water Zone 1 to include the four remaining camp properties, allowing the OCSD to supply the entire CYO Camp with a new potable ground water source that would alleviate its need for continued treatment of its existing surface water source. The project would benefit the CYO Camp by providing a safe and secure source of water for potable use and a reliable supply for fire protection. The project would include an intertie pipeline from the OCSD water distribution system and the replacement of the CYO Camp's aging distribution system. The project would include new water meters and fire hydrants. The intertie would be approximately 600 feet of six-inch main from the existing OCSD main in Bitner Road to the existing CYO Camp distribution system. Trenching for the main intertie would be within an existing roadway	D	0	N	CYO Camp's Surface Water System serves approximately 20-25 permanent residents and some 6,000-7,000 children and adults each year at our 216 acre year round site through our Outdoor Education, Summer Camp, and Retreat programs.The following Water Treatment issues have been identified:· A history of high E.Coli values in our drinking water source, an on-stream impoundment called Lake George, is present and will require CYO to implement additional treatment procedures for Cryptosporidium as mandated by the federal Long-Term 2 Enhanced Surface Water Treatment Rule (LT2).· High turbidity values present problems during the winter storms. Hillside erosion and landslides in our 120 acre watershed have made it impossible at times to process our raw water source into potable water.· The raw water has high secondary contaminant levels for Iron (680ug/l vs. 300) and Manganese (60ug/l vs. 50). We do not currently treat specifically for these conditions. The following infrastructure and distribution improvements need to be addressed:· The galvanized pipe distribution system covering entire 216 acre camp property is 40 years old, making it difficult to maintain CDPH-required chlorine residuals throughout the distribution system.· There is an increased risk of potential contamination and water loss due to line breaks. The aging condition of pipe, improper bedding, cumulative ground movement, and	1,034,000	21	25 18	Sonoma	II	2008

136	4901111	4901111-001	Bellevue Union Sch Dist-Kawana School	Kawana Elementary School Diminishing Water Source	Kawana School's water source concerns have an obvious and efficient solution. Just as the community of Santa Rosa has expanded outward, so has its infrastructure. Developments have provided mitigating funds to general and specific elements of the water, sewer, and electrical systems. Roads have been built and drainage systems established.There is a city water line that runs down Moraga Avenue directly in front of the school site. Why planners didn't include mitigation for the connection is not clear, but it didn't happen. The distance from the water line to the school is less than 300 feet but the school does not have the capital funds to complete this connection on its own.To make this connection the controlling agencies we must work with are the City of Santa Rosa and its Public Works Department. Connection will include disinfection of the school's water system.This application is simply to connect the Kawana School site to the existing water line and consolidate this small system with the City of Santa Rosa's utilities. This application, made at the encouragment of the District Engineer, will insure clean and predictable water for the school community.	E	45	P	The water system at Kawana School is failing because the aquifer is diminishing. The loss of dependable water is an acute health hazard. Kawana School was built as a rural school in 1954. At that time the City of Santa Rosa water system did not extend out to the school site so the school district drilled the well to supply all domestic water to Kawana School. The well is 295 feet deep and produced a constant 105gpm. The plan included a 10,000 gallon storage tank which was fed through a 4'galvanized pipe. This well and storage system served the school with no performance change until 2005. The district supports its water systems with a licensed class "D" operator.The water quality at Kawana School is within acceptable levels, but when the well cannot keep pace with the flow out of the storage tank, the result is clouded water with visible iron oxide in suspension. The district has rescheduled the water well draw times and aligned the use times to reduce strain on the well. The problem continues as the current well strains to replenish the storage tank.The school district believes that the reduction in the well's capacity to recharge itself is due to the changes in land use around the school site.What used to be agricultural and open space, has had intensive residential development. Roads and contained drainage control move water away from the area. The rural site is now surrounded by hundreds of new homes. Water that	103,324	1	481	18	Sonoma	II	2008
137	2000511	2000511-003	MD#85 VALETA MUTUAL WATER COMPANY	Intertie with City of Chowchilla	Extend the water main approximately 1.5 miles to the west to connect to the existing water system in the City of Chowchilla. Additional improvements would include installing additional distribution mains and water meters to encourage customers to reduce water consumption.	E	35	C	The current water system is currently supplied water from one well that has very low production due to decreased water levels at this time. The existing source has high nitrates that exceed the current MCL. The system is currently experiencing water outages, which pose serious public health and safety issues due to the lack of sanitation facilities for the systems customers. The system has already attempted to install a new booster pump at a lower depth, but this only offered a small amount of help. The County has issued a notice to the customers prohibiting all outside irrigation and non-essential water usage and advising the use of bottled water for drinking and cooking.	725,000	19	45	11	Madera	III	2009

E	25	P	System is old and failing resulting in repeated breaks causing water outages and bacterioligical complications and violations. Several compliance orders have been issued.	505,696	13	200	14	San Diego	V	2009

140	1000054	1000054-002P	LAS DELTAS MUTUAL WATER SYSTEM	Las Deltas Distribution System Project	The project would replace distribution lines serving over 200 homes in the community of Las Deltas on Shaw Avenue in West Fresno County. The current lines in use at the community are old and undersized and need to be replaced so that the community can consolidate witht he City of Firebaugh.	E	20	C	The distribution lines serving the community need to be replaced. They are old and dilapidated lines that are constantly breaking and leaking and in need of repair. Recent tests of the system show the water pressure going below 15 psi on multiple occassions during the week. It is likely that the decrease in water pressure is associated with leaking and broken lines. According to the California Water Works Standards, Article 8, Section 64602, "Each distribution system shall be operated in a manner to assure that the operating pressure in the water main at the user service line connection throughout the distribution system is not less than 20 pounds per square inch at all times." It is the hope of the mutual and the community to find assistance with funding to help the system becaome compliant with all regulations and to eventually be able to consolidate with the City of Firebaugh.	1,200,000	107	375	23	Fresno	III	2011
141	1910012	1910012-003	BELLFLOWER HOME GARDENS WC	Manganese Treatment	This system proposes several options. The selection will be determined by the most cost effective method, and best engineering practices and standards. (1) Reactivate the existing well and treat the supply with Manganese oxidation and filtration onsite. Including an upgrade of the security fencing surrounding the site. (2) Permanently consolidate with a nearby water system. Or (3) drill another well to blend source and provide adequate supply.	E	20	C	The water system has one well. The water supply exceeds the Manganese SMCL and is currently in violation of SMCL with the CDPH. The well has been placed in inactive status and the system is buying water through an intertie with Bellflower Somerset Mutual Water Company. This intertie is not a permanent solution to securing an adequate source and quality of water. The system will need to add Manganese treatment to it's well and reactivate it, or will need a permanent consolidation with a nearby water system.	850,000	323	1,200	16	Los Angeles	IV	2008

147	1910249	1910249-005	WHITE FENCE FARMS MUTUAL WATER CO.	Well 3b Nitrate Treatment	THe project will be based on best engineering practices and the most cost effective solution. We propose to construct and install a nitrate removal treatment system at well 3b. The existing security fencing will be expanded to enclose the new equipment and will include water quality monitoring equipment within the security perimeter.The result would be well 3b supplying treated water to it's own zone; below the Nitrate MCL; and exclusive of dependence on AVEK. Well 2b is below the Nitrate MCL and supplies it's own zone adequately.	E	5	C	Well 3b has Nitrate level of 58, which is exceeding the MCL. 3b is a new well and is not permitted by CDPH to operate as sole supply. Well 3b may be used for blending with AVEK Water to lower the nitrate level in the distribution system, but AVEK is not a reliable source. Until we reduce the Nitrate level at 3b, we must depend on AVEK water.If AVEK water is unavailable to us, Well 3b can not be used due to it's Nitrate level. Well 2b is in a separate zone, and has a lower Nitrate level, but can not solely supply the demand of the entire distribution system.	890,000	445	1,760	22	Los Angeles	IV	2008
148	2310007	2310007-006	North Gualala Water Company	Water Source & Storage Construction	Following a planning study, NGWC plans to develop recommendations that address source capacity deficiencies. Our current source deficiency amounts to 250 gpm (or ac-feet). Our construction project would allow NGWC to comply with State Water Resources WR 2001-14 requirements. Build a reservior and water treatment plant to process the reservior held water. Water storage issues could be solved with enlarged tank farms to increase distribution.	E	5	C	By Order 2001-14, the State Water Resources Control Board (Board) requires our community to only operate two wells if minimum bypass requirements are met. These two wells account for 85% of our source production during maximum day demand. By Order WR 2001-14, our well field production capacity has been reduced from 250 gpm to 0 gpm, while maintaining our minimum bypass requirements. The elimination of the well field reduces our overall system capacity during maximum day demand conditions. The Calif. Code of Regulations requires our source capacity to, at minimum, meet our maximum day demand. As a result of Order 2001-14, our reduced source capacity can no longer meet maximum day demand. In fact, our total system source capacity (<100 gpm from waterboy plus 0 gpm from well field) is only <43% of the required source capacity (based on maximum day demand our system must supply 250 gpm plus 20% safety factor). North Gualala Water Company community is in the state of a major water shortage and needs to supplement current sources immediately.	10,200,000	1,033	2,595	03	Mendocino	II	2006

153	5301102	5301102-004P	Trinity Knolls Mutual Water Company	Trinity Knolls WC Capacity Protection and Improvement Project	The following Project Actions are proposed to prevent future water outages, to increase capacity and to maintain water quality for the Trinity Knolls Mutual Water System (TKMWC)A. TanksReplace the small tank with a new tank equivalent size to the large tank and reline or refinish the interior of the large tank to prevent future deterioration and to preserve water quality. This will, in addition to protecting our existing capacity, add approximately 20% to our current storage capability.B. Well Rehabilitation and ReplacementVideo inspect wells 1 & 2 to determine well condition and suitability for rehabilitation. Rehabilitate these two wells if possible. This will maintain, or possibly improve the production capacity and assure continued high water quality from these two wells.Identify a location for a new well. Acquire rights, drill a new well, build pump house, install water pump, chlorination system and associated hardware. Provide power and phone line to site. This will add to our production capacity and help prevent water outages.C. Main Line ReplacementReplace main lines running parallel to Highway 3 from Well #1 to the KOA manifold. Replace aging main lines in Trinity Knolls, Northwoods Estates, and KOA areas (including along N. Cutoff Road). Replace feed lines from all wells to the new mains. Install new infrastructure in the Labrador Meadows development. This will significantly reduce the risk of water outages to	E	0	C	Problem DescriptionTrinity Knolls Mutual Water Company (TKMWC) is an aging system with 109 active memberships (including 47 belonging to a commercial campground) that has been capacity limited for some time. Previous actions such as instituting conservation measures, installing meters, charging for over consumption, rehabilitating our primary well, limited main line replacements, and monitoring production numbers very closely for early leak detection have kept the system from suffering serious extended outages, but aging infrastructure will lead to capacity problems in the near future if other actions are not taken.In addition to the existing capacity problems TKMWC has 35 undeveloped memberships owned by existing TKMWC shareholders. These represent long standing commitments to provide one residential connection per membership. Without improvement and expansion, the existing water system will not be able to handle the additional load as these parcels are developed.Areas needing improvement include:A. TanksThe two storage tanks were professionally inspected in 2011 and it was determined that the interior protective coating in the large tank has deteriorated and the tank is beginning to experience corrosion that will lead to structural deterioration and water quality problems. The small tank is older and serious structural corrosion has occurred which has weakened the upper portion of the	1,904,144	60	36 01	Trinity	I	2012

162	4900620	4900620-002	Austin Acres Mutual Water Company	Austin Acres Mutual Water Company Pre App	Project will be to upgrade water system such that it has a safe continual well source that meets standards, provides adequate reliable pressure, provides better fire protection, and works such that the distribution system does not suddenly shut itself off or fail at length during power outage.Engineering research on possible system upgrades has been initiated by Kathy Walden, a volunteer resident on the water system (engineering degree BSEE). The below system improvements are described in the event that it is not possible for Austin Acres Mutual Water Company to connect to an existing nearby public water system.It is believed at this stage that the following will be necessary to get our system working properly:1. Well 01 improvement to meet State of CA code.2. Replacement of current 940 gallon storage tank which is unpressurized except by air cushion (requires frequent manual recharge which takes approximately 1 hour). Redesign of storage system which may include elevating a replacement tank, adding storage tank(s), adding pressurizing pumps, or other changes required by currently accepted methods.The following items may be necessary to get our system working properly:1. Possible upgrade of current well pump to handle current full-time residential water requirement load.2. Possible replacement of some system pipelines if inadequate, particularly to better our water system's fire protection	E	0	C	Austin Acres Mutual Water Company's system was designed 60 years ago to support up to 25 vacation homes within the connected residential addition. It was not designed originally to provide water in a dependable manner to the load of full-time residents now inhabiting the distribution area.Its well is very shallow (40 ft.) and depends upon the health of Austin Creek and will likely be insufficient at some point.The current storage tank is old/outdated and uses air (no tank bladder) for pressurization which means that sometimes distribution becomes impossible (water system must be shut off and tank re-charged with air). This creates supply uncertainty and water pressure problems with those residences that are uphill of the tank even when distribution is working properly.The storage tank is filled by the associated 1 HP well pump; during power outages the community is without water unless the system operator is available to briefly activate the generator used for that purpose. Extended power outages such as the three-day outage we suffered during January 2008 leave our community waterless except for a brief 1 - 2 hour early morning periods when the backup generator is run.To sum up, in the event Austin Acres cannot be connected to an existing nearby municipal water system, it will need:-- Well improvement to bring Well 01 up to State code.-- A new and larger storage tank design whereby existing	53,000	26	78	18	Sonoma	II	2008

166	4200703	4200703-002	EL CAPITAN MUTUAL WATER CO	El Capitan Mutual & State Park Water System Consolidation	Both systems have water supply shortage issues due to failing wells, and both have water distribution (storage) problems, which require the construction/replacement of storage tanks. These projects are CEQA exempt as they are in-kind replacements of existing facilities.The project will consist of:1 - Construct one replacement well, with a pump sized to meet the supply requirements of both systems.2 - Abandon the Park System GWUI wells and treatment equipment.3 - Construct a replacement storage tank (250,000 gallons) to serve the combined Mutual and Park System in a consolidated system.4 - ECMWC will construct a metered service connection which ties direcly into the Parks distrubution system to serve them potable water.By constructing one replacement well and one replacement storage tank together, and consolidating the two systems, significant reliability, safety, and economic savings will result:1 - The low producing GWUI demerited wells can be removed from the (Park) system.2 - The need for surface water treatment equipment will be mitigated, simplifying the system and lowering acute health risks.3 - The replacement storage tank will serve both systems; correcting the diurnal demand shortage for the Mutual System, and providing a new reliable tank that benefits both systems.4 - The replacement well will be a deep well, sited and constructed to avoid a GWUI classification.5 - Water	E	0	C	The problem involves similar water supply and storage issues for two adjacent water systems. Because the systems problems are similar (complimentary), the consolidation of the two systems (combined with a single capital program) will make both systems safer and more reliable.The ECMWC system (Mutual System) currently handles about 400 AFY of potable water. The Mutual System currently suffers from documented water supply shortages and distribution (diurnal storage) shortages, which have resulted in loss of water to customers in summer peak demand periods. The Mutual System's West-Side wells have declined in production due to age, and a supplemental well source failure (due to untreatable water quality), has resulted in a critical water supply issue; currently, the system has zero redundancy in well supplies.Concurrently, increases in the amount and periodicity of the systems diurnal demands on the West-Side have exacerbated outages or 'near-miss' outages. Diurnal storage capacity needs to be increased by 50,000 gallons to meet West-Side customer demands.The adjacent water system serving the El Capitan Beach State Park (Park System) has similar problems. The Park System has two wells, both of which have suffered production losses due to aging. One of the wells has dropped to approximately fifty percent of production output. In addition, these wells were determined to be GWUI, and	500,000	20	135 06	Santa Barbara	IV	2009
167	4200703	4200703-001	EL CAPITAN MUTUAL WATER CO	El Capitan Mutual Water Co. Water Supply Reliability Project	The project involves drilling a replacement well fo the failed Well 20, and constructing a 50,000 gallon storage tank near the existing Tank 2 location. The supply source increase from the well will reduce water shortages in the summer and will help to avoid a catastrophic water outage should one of the other west-side wells fail. The storage tank will increase system delivery capacity for daily peak outages if a well fails or if the adjacent storage tank requires maintenance.Both the well construction and tank installation are CEQA exempt; the project will only require a (ministerial) well drilling permit and a building (grading) permit for the storage tank. A CEQA CE is slated to be approved and filed in March 2009. Plans for the well project are 75 percent complete, and the tank project plans will be completed by June/July 2009.	E	0	C	The ECMWC is supplied solely by groundwater wells, and has two supply areas (East and West Sides) separated by approximately 2 miles. Well yields have declined (due to age) and recent well rehabilitation improved output only minimally. Well 20 had to be abandoned due to (untreatable) poor water qualilty. ECMWC needs to drill a replacement well immediately to make up for a water supply shortage. This project is CEQA exempt.In addition, the system's West-Side storage is 25 years old and water demands on the West-Side have substantially increased over time. ECMWC needs to construct additional storage (50,000 gallons) to prevent water outages which occurred several times during the summer of 2007 and 2008. The storage tank is also CEQA exempt due to its size and location.	325,000	20	135 06	Santa Barbara	IV	2009
168	1500289	1500289-001	ATHAL MUTUAL WATER SYSTEM	Athal Water Supply Project	At well site #1: Drill a new well, install a new pump, well meter, pressure tank and electrical controls, install secure fencing, destroy old well #1 and fund bid advertisement, legal, environmental and engineering services. At well site #2: Replace Well #2 pump, install 6 foot secure fencing and a well meter. 2000 Census DataKern County Census Tract 62.01, Block Group 1, Median Household Income = $27,465	E	0	C	This small community water system serves 65 homes east of Weedpatch Highway about 1.5 miles north of Lamont. The communitys' main well has collapsed and their single and smaller remaining well has a pump operating at only 52% efficiency. Public notification to conserve water due to failure of the water well and restricted water supply was issued in the October/November 2009 and is currently in effect. Failure to meet minimum pressure standards as per Section 64602 (a) of Chapter 16 of California Drinking Water Standards: Low pressures below 20 PSI were recorded this spring. These pressure problems increase during summer and high demand periods.	350,000	62	150 19	Kern	III	2011

172	2300644	2300644-001C	Woodside RV Park	Woodside RV Parks Water System Upgrades	In order to correct the problem our research indicates that 1 or more deep wells need to be added to our current system. Depending on the location of these new well(s), this would entail new pumps, pipe line to the distribution system and upgrading our current storage system. There are other deep wells nearby that produce good quantities of water year round. We currently have one existing deep well that needs to be cleaned and deepened to obtain more flow. By obtaining a good quantity of water from new wells we could eliminate our shallow well and attendant problems. or as an alternative use them for emergencies. Quality water is hard to maintain coming from surface wells and the state requirmnets for these will be tightened shortly.	E	0	C	This Park Serves Approximatley 100 Low Income Family units, year round. During the Summer this increases to abut 125 or more. Most all of our water sources are shallow wells. These wells fail to produce water at the capacity needed to support our community. Our current system is monitored by the state monthly and generally incures no problems. However, especially during dry years we have to import water at additional cost. We need financial help to cover the cost for engineering, plans and permits to correct this problem.	0	41	280	03	Mendocino	II	2009
173	5400641	5400641-003P	TEVISTON C S D	Teviston South Well Replacement Project	The Teviston Community Services District proposes to replace the South well with a new well since it is now evident that two wells are needed to maintain a consistent pressure above 20 psi. It is proposed that this new well be equipped with a new pump, storage tank, hypochlorinator and standby power source.	E	0	C	The source of water for the Teviston Community Services District is groundwater supplied by 2 wells (North well and South well). The lower portion of the older 50 year old South well is not currently usable and the pump is inoperable. A Video recording taken on 6/29/10 indicates that the bottom of the South well casing is in poor condition with numerous cracks and the bottom 60 feet of this well has been filled in and may have collapsed. Subsequent pressure readings on the system's distribution system indicate that with only 1 remaining well operating that pressure dips in the system well below 20 psi on a regular basis. Half the community's water supply is now gone.	0	70	300	12	Tulare	III	2011
174	5500077	5500077-002	SLIDE INN SNOWBOWL WATER CO	Slide Inn Snowbowl Water Company	inadequate source capacity	E	0	C	inadequate source capacity	100,000	100	315	11	Tuolumne	III	2008

175	5500077	5500077-005	SLIDE INN SNOWBOWL WATER CO	SLIDE INN SNOWBOWL WATER CO PHASE 1 WELL DRILLING	Slide Inn Snowbowl Water Company Phase I Well Drilling Project Scope. To get two wells drilled this project would need an engineer consulted, the forest cleared (since trees have matured in 45 years) , two wells drilled (completion of 2 new water sources) (& pipes, pumps, meters etc.), electrical work completed (wiring, installing a pole) , structures built, equipment rented, booster pump purchased, aqua testing and lots of man power to get it all done. One new well is needed for each section (Slide Inn and Snowbowl sections). The project will require the participation of an engineer, well drilling company, electrical company, trees removal company, equipment rental company, aqua testing company and laborers. Antiquated pipes and equipment would need to be removed as well. The water district is located at 5,200 feet in the Sierra Nevada Mountains; we have a window of 9 months out of the year to work on this project. If funding can be made available, we would start this project at the end of March 2011 and work until the beginning of December 2011 and so on until it is completed. We have sent to the California Department of Health a map for your perusal to get an idea of the two sections that need wells drilled. Having two new water sources drilled will stop the water outages our customers have been experiencing for years and give our customers a reliable water source.	E	0	C	Slide Inn Snowbowl Water Company is requesting your assistance to complete our Phase I Well Drilling Project. We were invited and accepted for a grant submission last year, but the paperwork arrived two days after the grant was due. Slide Inn / Snowbowl Water Company is located in Long Barn, CA on Highway 108 in Tuolumne County. We provide water for 134 water connections (500 population) to individual property owners in the municipality of Long Barn. We need two wells drilled. One well is needed on the Snowbowl section and one on the Slide Inn section of Long Barn. A map has been sent to the California Public Health for your perusal. Currently the Snowbowl well is at 180 feet and unsustainable at this shallow depth. With the current depth and antiquated equipment, the well draws a measly 20 gallons of water a minute. Two years ago the well drew over 60 gallons of water a minute. Each year, when ground water is the driest (December), customers will experience a water outage for three or four days effecting 40 connections. The well is a hard rock well (80 foot well casing). This March, 40 of our connections experienced a water outage for one week. On the Slide Inn Side, two wells working together have an output of only 20 gallons a minute. Both wells on this side are 45 years old, hard rock wells (580 feet) with an 80 foot well casing. On this side, both wells have had this output problem for the last 10 years. Almost twice a year 94	125,000	100	315	11	Tuolumne	III	2011
176	5400550	5400550-002	SEVILLE WATER CO	Seville Safe Drinking Water Project	The proposed project will be to drill a water test well which will determine if a sufficient quantity of potable water can be found in the community. If the test well is successful, a production well would be drilled and equipped with a pump and storage. The new well facilities would be tied into the community's water distribution system.	E	0	C	The Seville water system is supplied by one water well. This old and undersized well has recently seen an elevation of nitrate levels. The most recent level recorded was 43 ppm-very close to the MCL. It is anticipated that further sampling will determine that the nitrate level will exceed the MCL. The water system has other problems related to the distribution system for which a Statement of Intent has been issued by DPH and returned with the intention to submit that application prior to January 2008.	1,200,000	77	400	12	Tulare	III	2007

181	4400502	4400502-005C	TROUT GULCH MWC	Install Water Meters for all Flat Rate Customers	Install 170 radio-read meters in three phases:I. Procure remote meter reading equipment and 5 meters and replace failed units.II. Procure and install 100 meters for all unmetered customers.III. Procure 65 meters and replace remaining old manual read meters.Radio-read meters are preferable over direct-read meters because radio-read meters support early detection of service line leaks or excessive consumption and provide far better support for water conservation programs. Much of TGW's service area is comprised of very steep single lane roads. Meter reading in such terrain is both dangerous and very time consuming. Some mains and service lines are not accessable by public or private roads.Total Project Cost estimate is based on recent actual meter installations by neighboring water purveyors and quoted Remote Reading Module for Customer Data Management, Meter Reading and Billings software application (RVS) in use by TGW.	E	0	C	Mar Vista Water Company (MVWC) facilities had supplied water to residents of Forest Glen subdivision and a number of adjacent parcels for at least 60 years. Only a few of these residents have meters. Meadow Ranch subdivision, built in the late 1980s, had its own well and residential meters. Meadow Ranch was added to MVWC in 1987. Most existing meters have reached the end of their expected service life and several have failed. MVWC was under orders to install meters for the remaining 120± customers. See PUC Resolutions W-4579 - January 12, 2006 and Resolution W-4607 - July 20, 2006.TGW, a customer-owned mutual benefit water company, purchased theassets of MVWC on July 1st, 2008. These assets did not include uninstalled meters. Installation of these meters was one of the Santa Cruz County DEH's requirements for approval of the transfer of Domestic Water Supply Permit from MVWC to TGW on April 1, 2008. TGW has committed to an installation schedule for these meters.Note: DPW database updates: Ownership of this system changed on July 1, 2009. This system has provided water for 183 residences for a number of years. We have made efforts to update this data.	55,000	171	584 05	Santa Cruz	II	2009
182	3600196	3600196-006	CSA 70 W-4	Supply Reliability - High Desert intertie transmission	Construct 5.3 miles of transmission line to High Desert Water District	E	0	C	The District is currently operating under a building moratorium due to water quality and quantity problems	1,420,000	125	625 13	San Bernardino	V	2001
183	3710009	3710009-003C	Descanso Community WD	Emergency Pressure Improvement Project	The scope of the project is as follows. We intend to install approximately 1000 feet of 8” C-900 PVC pipe with one 8” gate valve on Veijas Grade Rd. In addition, 1 new Fire Hydrant will be installed on the new main. This project will create a loop between an existing 6” water main and an existing 4” water main. Currently the 4” water main is being supplied water through a 2” steel water main. This is its only source. The project is intended to alleviate low pressure problems to customers at the West end of Viejas Grade Rd., as well as 5 customers that are supplied off of the 2” water main. At times, when demand is high the pressure drops between 0 and 19 psi to these customers and fire flow is virtually non-existent. To our knowledge this problem has existed for 3 to 4 years. The project was designed 2½ years ago, but due to lack of funding the project has not moved forward.	E	0	C	Part of the service area located on the West end of Viejas Grade Rd. experiences low pressure when demand is high. During these periods the pressure has dropped between 0 and 19 psi and fire flow is virtually non-existent. This has resulted in customer complaints of no water. In addition, it has resulted in a violation of the Drinking Water Standards. To our knowledge this problem has existed for close to 3 to 4 years. The problem exists because the 4" water main at the West end of Veijas Grade Rd. is supplied by a 2" steel water main. This is its only sources of supply and it is insufficient in size and condition to keep pressure above 20 psi. Customers that are fed off of the 2" steel water main also experience these low pressure problems. This loss of pressure violates Drinking Water Standard Section 64602 (a) (Minimum Pressure).	35,700	313	870 14	San Diego	V	2009
184	3710009	3710009-004P	Descanso Community WD	Install Iron and Manganese removal plants at Well #5 and Well #6	Evaluation of Iron and Managnese removal at both well sites that are the Districts only source of supply. The planning and construction of iron and manganese removal plants at both well sites.	E	0	C	Inadequate source capacity and unacceptable water quality to meet system demands. In addition, a standby well, not approved as an active well due to unacceptable water quality, has been required to be brought on line and used without complying with the regulations for use of standby wells.	700,000	313	870 14	San Diego	V	2012

185	3610026	3610026-006C	SBDNO COUNTY SERVICE AREA 70 CEDAR GL	Pipeline Replacement, Well and Reservoir Project	The overall project costs to bring the District water system into compliance with the California Safe Drinking Water Act and the requirements of the State Department of Health Services is estimated to cost $16,000,000 and will require 3 to 5 years to complete. A computerized hydraulic model was generated, using Version 3.0 of the MW Soft Inc. H2ONet program, to verify the project needs and to generate the phasing and priority of the improvements to be constructed. Phase 1 improvements are estimated to cost $3,000,000 and will concentrate construction in that portion of the District designated as a low to moderate income area. Phase I improvements include the drilling and equipping of a new domestic water supply well (estimated yield is 100 gallons per minute (gpm)); replacement and upgrade of the existing 250,000 gallon tank to a 500,000 gallon tank; and the installation of 14,000 linear feet of new 8-inch diameter PVC pipe with hydrants placed in accordance with the local fire agency's requirements. Phase 2 improvements are estimated to cost $4,600,000 and include the drilling and equipping of another new domestic water supply well (estimated yield is 200 gpm); upgrade of the interconnect to the adjacent agency from 2-inch to 6-inch piping and valving; construction of 1.0 million gallons of new reservoir capacity; and the installation of 35,000 linear feet of new 8-inch diameter PVC pipe with hydrants placed in	E	0	C	In 2003, the Arrowhead Manor Water Company (AMWC), a private water company under the jurisdiction of the Public Utility Commission, provided water service to approximately 590 connections in the Cedar Glen area of the San Bernardino Mountains. The population served at the time was estimated to be approximately 1,900. In October and November of 2003, the Cedar Glen area was ravaged by the "Old Fire" and the AMWC customers suffered major damage. After the fire, the customer base was reduced to approximately 290 connections. As a result, Special Districts Department of the County of San Bernardino has purchased AMWC and operates the water system.The water district currently has the capability of producing 103 gallons per minute (gpm) of potable water from District sources and maintains a connection with an adjacent water district which can provide up to an additional 110gpm. Combined, the total supply of water does not meet the State Department of Health Services and the California Safe Drinking Water Act requirements for the 327 connections, and is severely deficient to serve the original 590 connections as rebuilding in the area occurs. The water system supply requirement for 327 connections is 383 gpm and for 590 connections is 840 gpm.The system is also deficient in water storage capacity, which proved to be disastrous during the "Old Fire". Total storage capacity is 0.66	3,000,000	264	950	13	San Bernardino	V	2009
186	1010061	1010061-001C	FRESNO CSA NO. 51 (DRY CREEK)	CSA 51 Water Distribution System	The proposed project involves the installation of a water distribution system that will provide metered service to 432 properties in CSA 51. The proposed system will connect to the City of Clovis at E. Shepherd Avenue and N. Fowler Avenue and the City of Fresno at E. Behymer and N. Willow Avenue. The proposed water system will purchase raw water from Fresno Irrigation District (FID) that will be treated and delivered by the City of Fresno to the CSA. Water from the City of Fresno will be delivered to the CSA for approximately 11 months out of the year when water is available to the Fresno surface water treatment plant from the Enterprise Canal. During the times that the Fresno plant is not operational, water will be delivered from City of Clovis facilities. Clovis also will be given raw water in exchange for providing potable water.The proposed water system will also contain water storage facilities to meet peak demand and fireflow requirements. Booster pumps will be installed as necessary to maintain the required system pressure over the varying terrain.	E	0	C	CSA 51 is comprised of 432 parcels which are currently on individual wells with no water system of any kind. A number of the parcels have experienced water outages and have drilled additional wells that have been dry or very low yield. Some property owners pay to have water trucked to a holding tank on their property. A group of property owners asked the Fresno County Board of Supervisors to help solve their water shortage problem. CSA 51 was formed to provide a solution which involves obtaining raw water from Fresno Irrigation District and having it treated by the City of Fresno and City of Clovis and then delivered to the CSA.	18,573,390	400	1,000	11	Fresno	III	2009

190	4910007	4910007-001P	Sea Ranch Water Company,The (PUC)	Funding for Distribution/Storage (fire flow) Improvements	Construct Four Pressure Reducing Valves (PRV Stations): In 2012 and 2013 these pressure reduction facilities will be coincidental to the tank 8 construction.• Construct Tank 8 at 0.99 MG: The initial phase of the tank 8 construction began with a geotechnical feasibility study in 2008. Permits and plans will be secured in 2011 and 2012, and construction of the tank will occur in 2013.• Construct Zone 2 Water Mains: Water main installations which will address the deficiencies listed in the Hydraulic Master Plan are scheduled for design in 2011, with construction to occur from 2012-2014.• Construct Pump Station 2 Pressure Reducing Valves (PRV) and 6-inch water main (2000 ft): Civil drawings will be completed in 2012 with construction of the PRV and water mains to occur in 2013• Upgrade Pump Station 1: This upgrade will be conducted with the Tank 8 construction. Civil drawings will be provided in 2011, with partial construction in 2012 with completion in 2013 as indicated in the Tank 1 Area Upgrades.	E	0	C	The installation of a 990,000 gallon water storage tank and associated facilities to increase deficient fire flows and provide adequate storage for a safe and necessary water supply.1 - 2005 DHS Inspection Findings: "The system must investigate increasing either the storage or source capacity in Zones 2 and 5 in order to meet fire flow requirements. The system should also investigate the development of additional source capacity for use during the summer months when the treatment plant is the sole source of supply."2 - 2007 CDPH Inspection Findings: "The system must investigate increasing either the storage or source capacity in Zones 4 and 5 in order to meet fire flow requirements."The Sea Ranch Water Company has studied these deficiencies and as a result has developed a capital improvement plan to correct fire flow issues within the deficient zones which have displayed negative pipeline pressures under use of the fire hydrants, and boil water orders when supply pumps in Zone 2 have failed. There were three boil water orders in 2005, 2006 and 2007 in Zone 2 as a result of deficiencies involving Zone 2 pumps or piping.	399,999	1,786	1,299	18	Sonoma	II	2009
191	4910021	4910021-001	Bodega Bay Public Utility District	Bodega Bay Public Utility District Bay Flat Road Well	The project involves construction of a new municipal water supply well, transmission main from the well to the existing distribution system and a chlorine disinfection system. The location of the proposed well would be at 1681 Bay Flat Road, Bodega Bay. The approximate anticipated yield of the well would be 200 gallons per minute and would account for about 20% of the Bodega Bay Utility District's peak production capability. The well will be drilled to a depth of 80 to 150 feet utilizing a cable tool drilling rig method alleviating the need for the use of drilling mud. A four-foot by six-foot concrete vault would be pre-constructed offsite and placed in the excavation over the well head. An eight-foot by ten-foot cedar sided shed would be constructed to house a chlorine disinfection system to disinfect water from the new well. Disinfection would include the use of up to a 12 percent chlorine solution contained in a 30-60 gallon day tank or the use of a chlorine tablet system. Secondary containment of the chlorine solution would be provided. The hypochlorite solution would be delivered at the well by pumping through a ¾-inch solution line installed in a joint trench with the new water main. Controls will meter the flow of the solution to the water main to ensure adequate disinfection. A 6-inch water transmission pipe would convey water from the new well to the existing water distribution system.	E	0	C	The town of Bodega Bay is the largest unincorporated commercial and residential center in western Sonoma County located along Highway 1, on the County's southern coast. Historically, the town was primarily a fishing village with relatively few permanent residents. The surrounding hillsides consisted largely of rangeland for sheep and cattle grazing. In recent times, Bodega Bay has evolved into a popular tourist destination with associated commercial development. In the mid-1970s, Bodega Harbour Subdivision, a major housing and golf course project was developed. Today, due to the desire to live at the coast, the town includes a broader cross-section of full and part-time residents. The Bodega Bay water system is classified as a small water system and serves residential and commercial customers. The approximate number of existing residential equivalent units (RUE) is 1900.The District is a publicly-owned utility with the Board of Directors elected by registered voters living within the District boundary. The District operates the water and wastewater facilities within Bodega Bay. Development within the District is guided by the Sonoma County Local Coastal Plan/Sonoma County General Plan and the Sonoma County Zoning Ordinance. The District obtains its water from three general sources as follows:1. Roppolo Well Field - Consists of three active wells with a total capacity of approximately 500 gallons per minute.2. Dunes Well	420,000	1,032	1,423	18	Sonoma	II	2009

192	2110004	2110004-018	Stinson Beach County Wtr Dist	New Groundwater Well at Steep Ravine Tank Site	The project involves drilling a new well at the District's Steep Ravine Tank Site to determine the potential for groundwater development on that parcel owned by the District. The well will be drilled and tests performed to assess the quantity and quality of groundwater produced at the site. Based on the water quantity and quality results, the well will be completed and equipped with a pump and all appurtenant facilities necessary to deliver water from the new source into the District's water distribution system. The cost estimate and funding requested for this project assumes a finished groundwater well (25-50 gallons per minute) with all appurtenances. This Project is currently on the CDPH's Proposition 50 Project Priority List as part of a larger project, previously conceived to investigate groundwater potential on additional parcels owned by the District and to rehabilitate existing wells currently operated by the District.	E	0	C	The reliability of the District's water supply sources is highly vulnerable to climatic conditions, seasonal shortages resulting from the large, uncontrolled number of vacationers and visitors to the community of Stinson Beach and the Golden Gate National Recreation Area beach and park during the summer months when creek flows are low, and environmental constraints relating to maintaining creek flow for anadromous fish. To meet the challenge of a highly vulnerable water supply, the District has undertaken a number of steps, including the preparation of an Urban Water Management Plan, aimed at gathering water supply information, enhancing public awareness, and reducing water use.As part of its water supply and demand management studies, the District has undertaken an evaluation of its existing and needed source water capacity and storage volume, following the procedures outlined in the California Department of Public Health's (CDPH) Waterworks Standards (Title 22, California Code of Regulations), and has determined that the District's existing source water capacity is less than the source water capacity needed to meet the maximum day demand. This project is intended to help address the CDPH prescribed minimum standards for source water capacity and the deficiency identified by the District.	150,000	721	1,500	18	Marin	II	2009
193	5410017	5410017-003P	London Community Serv Dist	London Community Services District Water System Rehabilitation	The proposed project includes installing new 8-inch diameter water mains at various locations, installing of new water services from the water mains to the county road right-of-way limits at those locations where a new water main is being installed. The new services will be reconnected to the existing house services with a service box and shutoff valve. A new water well can provided the needed water capacity during typical high water demnads. The 1 million gallon welded steel storage tank and two (2) 300 gpm booster pump system will give the District added flexibility to meet maximum day demand, peak hour demand and fire flow.The District completed a Proposition 218 Process in 2008. A public Hearing on the Proposition 218 process was conducted on July 16, 2008. The CEQA Notice of Exemption was filed with Tulare County on December 20, 2007 and Federal cross cutting information was submitted to the CDPHS in January and February, 2009.	E	0	C	The District's existing water distribution system is old and predominantly consists of undersized pipelines. The majority of the distribution system was installed in the early 1950's. During the pipeline installation, there were very few sectionalizing valves installed in the distribution system. Due to the lack of sectionalizing valves, the District is unable to isolate portions of the water system to repair pipeline and service lateral leaks. This requires the draining of the entire or at least the majority of the water system to repair a leak. This can result in all of the residents being without water until the leak is repaired and the distribution system recharged. With the large water demands and small diameter pipelines and low well water capacity, the residents experience low pressures. The individual water services were installed directly on the water mains without service saddles. The service pipe material is a polybutylene which is known to be prone to cracking and eventual failure. Due to the materials and installation procedures utilized, the District has experienced numerous leaks on the water services. Repairs to the water services also require the draining of the entire water system.	0	432	1,638	12	Tulare	III	2009
194	5410014	5410014-003P	Tipton Community Services Dist	Burnett Road Consolidation Project	Permanent interconnection to Tipton CSD	E	0	C	Single well system had well failure during July 2001. Emergency temproary interconnection to Tipton CSD.	0	587	1,992	12	Tulare	III	2001

195	2310007	2310007-016P	North Gualala Water Company	Water Source & Storage Construction	Following a planning study, NGWC plans to develop recommendations that address source capactiy deficiences. Our current source deficiency amounts to 250 gpm. Our construction project would allow NGWC to comply with State Water Resources Order WR 2001-14 requirements. Build a reservior and water treatement plant to process the reservoir held water. Water storage issues coudl be solved with enlarged tank farms to increase distribution.	E	0	C	By Order WR 2001-14, the State Water Resources Control Board (Board) requies our community to only operate two wells if minimum bypass requirements are met. These two wells account for 85% of our source production during maximum day demand. By Order WR 2001-14, our well field prodcution capacity has been reduced from 250 gpm to 0 gpm, while maintaining our minium bypass requirements.The elimination of the well field reduces our overall system capacity during maximum day demand conditions. The Calif. Code of Regulations requires our source capacity to, at minimum, meet our maximum day demand. As a result of Order WR 2001-14, our reduced source capacity can no longer meet maximum day demand. In fact, our total system source capacity (<100 gpm from the Waterboy treatment plant plus 0 gpm from well field) is only <43% of the required source capacity (based on maximum day demand our system must supply 250 gpm plus 20% safety factor). North Gualala Water Company community is in the state of a major water shortage and needs to supplement current sources immediately.	0	1,033	2,595	03	Mendocino	II	2009
196	1710021	1710021-005	Lake County CSA 21 - North Lakeport	Trident Water Treatment Module	The North Lakeport Water Treatment Facility's Trident Treatment Module project will include the addition of one Trident filter module. The current configuration includes three operating modules. The facility was designed and constructed to accomodate five filter modules, but due to the number of customers and demand at the time of original construction, only three were needed to satisfy demand.The Siemens Company manufactures the Trident filter modules here in United States. The steel module will provide an added treatment capacity to meet current demand. The new module will be delivered to the North Lakeport facility and positioned in the 4th treatment bay originally constructed at the plant. Associated inlet, outlet and drain piping, monitors and controls will be added to the existing facility. Mixed filter media (gravels, and sands) will then be loaded in stages within the module and run through several backwash and disinfection cycles and testing before bringing the additional unit online. Ancillary facilities including GAC filtration, chlorine contact tank and additional ozone contactor will be included in the upgradeOnce the Trident filter module is online, the North Lakeport Water Treatment Facility will be fully compliant, providing sufficient quantities of water for current customers and entitlements in CSA #21 customers, and a small amount of growth.	E	0	C	The North Lakeport Water Treatment facility serves customers in County Service Area #21. The facility treats surface water from Clear Lake to drinking water standards utilizing a treatment process including Trident filter modules. The facility was designed and constructed to accomodate up to five (5) modules, of which three (3) are currently in place and utilized. The Special Districts Administration was issued a Compliance Order (#02-03-08-002) for the North Lakeport Water System on May 13, 2008 for failure to provide source capacity. Population served by the water system has grown to a point where demand is outpacing adequate treatment capacity. The additional Trident treatment module will provide the additional treatment capacity needed to comply with the issued Compliance Order, essentially providing an estimated additional 500 single family dwelling equivalents.HEALTH BENEFITS include ample supply of clean drinking water, and fire flow.ECONOMIC BENEFITS include construction (engineering, equipment, labor to install, and filter media. Additional economic benefit through servicing and media replacement.COMPLIANCE BENEFIT includes the additional capacity gained by the addition of the Trident module fully complies with the Compliance Order.	2,000,000	1,204	2,868	03	Lake	II	2009
197	3610109	3610109-001	SHEEP CREEK WATER COMPANY	Source capacity project	Construct new source	E	0	C	Alternate source of water needed	10,521,466	1,108	3,019	13	San Bernardino	V	1998
198	2310008	2310008-005	Redwood Valley County Water District	Redwood Valley Off Stream Storage	Evaluate proposed off stream storage sites, including project design and environmental review. Also includes preliminary land survey.	E	0	C	Redwood Valley is currently under a court ordered moratorium that does not allow new services. The District is also subject to a Cease and Desist Order from DWR regarding annexed areas that are currently being served. This feasibility study would allow the District to explore the possibility of constructing off stream storage for high winter flows. Off stream storage would create a viable water supply that is currently lacking since the two primary water sales contracts that supply the District are both for surplus water subject to cut off during water short years.	4,000,000	1,339	3,969	03	Mendocino	II	2007

199	2310008	2310008-008	Redwood Valley County Water District	Redwood Valley Well Construction	The State Water Resources Control Board is urging this District to locate and develop a ground water source supplemental to its seasonal and surplus surface water supplies in order to avoid enforcement action. The District has identified three available agricultural properties that show promise for water supply wells. This project would fund up to three test wells, purchase of a property, two supply wells, and development of appropriate treatment to remove iron and manganese commonly found in the area. Additional costs would be power, security, and a pipeline to tie in to the existing distribution system. The estimated yield of 100-200 gpm would be sufficient to remove the threat of enforcement action and to provide emergency water supplies when the main source at Lake Mendocino is unavailable.	E	0	C	Redwood Valley CWD is under threat of enforcement action by the State Water Resources Control Board for providing water outside its place of use. The areas that are being served consist of four "annexations" on the edges of its recognized boundaries, including a small Rancheria with 30 homes. RVCWD has petitioned for a change of place of use, which is still pending. Such a change, if granted, would not remove the threat of enforcement action due to the seasonal and surplus nature of the other water supplies available to the district. RVCWD has been directed by the SWRCB to locate another source of water, preferably ground water, with which to serve these areas.	3,500,000	1,339	3,969 03	Mendocino	II	2009
200	5410001	5410001-003C	Cutler PUD	Replace undersized distribution system	REPLACE THE OLD AND UNDERSIZED PIPELINES AND INSTALL HYDROPNEUMATIC TANKS ON EXISTING WELLS TO REGULATE THE PRESSURE. 201	4910002	4910002-002	Cloverdale, City of	City of Cloverdale - New Well Construction	This project involves the design, construction, and inspection of a new municipal water well. Construction will include drilling and construction of new well head facilities and connection to the existing water treatment facility	E	0	C	Existing facilities are at 93% of the current capacity during summer usage and have no provision for backup. The existing wells and well field are supplied by surface flows and have diminishing production capacity and have the potential for significant water capacity shortages.	514,800	3,114	8,200 18	Sonoma	II	2009
202	4910002	4910002-001	Cloverdale, City of	City of Cloverdale - 16-inch Transmission/Distribution Water Main	This project consists of installing a 16-inch main in Asti Road and connection to an existing 12-inch water main. This phase of the project will extend the 16-inch diameter main from Citrus Fair Drive north to E. First Street and is approximately 0.5 miles long. Upon completition the project will provide a direct connection from the Water Treatment Plant to the storage facilities located on the south end of the City with minimal demands on the main. Computer modeling has determined that this project will allieviate the problem with maintaining tank levels with current demands. This project will also maintain safe fire flow pressure in the hydrants in the south end of the City.	E	0	C	The southernmost tanks in the domestic water system are gravity fed by the main reservoirs. During high demand periods, draws on the pipeline system limit the ability of the southernmost storage tanks to maintain adequate water and fire suppression reserves. The tanks partially recover during non-peak hours however they do not fully recharge, presenting a potential for interruption of service to the southern part of the City. Fire prevention in the southern part of the City will also be impacted by the difficulty in recharge.	900,700	3,114	8,200 18	Sonoma	II	2009

204	1910034	1910034-006	DOWNEY - CITY, WATER DEPT.	Water Systems Consolidation - City of Downey and Rancho LA Rahab Center	The City of Downey will consolidate with the Rancho Water System to provide water services to cover entire Rancho System service area.- Rehab the two existing wells and upgrade their motors and pumps- Install VFD motor drives to more effectively to control the supply system- Install SCADA system to have a 24-hour monitoring and control of the system- Upgrade the hospital fire services to install two 8" service connections with DCDA- Installed three 6" metered domestic service connections with RP backflow devices to protect drinking water source and system- Install all associated piping and devices- Introduce recycled water services to reduce potable water demand- Demolish inactive facilities (wells and reservoirs) to avoid cross contamination- Provide engineering service to updated all required documentation and system planning- Use certified water distribution and treatment operators for the O&M activities.	E	0	C	The Rancho Los Amigos System is a NC-NT small system providing domestic service to hospital and more than seven (7) other nearby LA County facilities. Their facilities and service areas are within the limits of the City of Downey. The system is currently operated under its Facilities Maintenance Department.In June 2008, the system had a MCL violation of TCR and Boil Water Order was issued. State DPH and LAC DHS have conducted investigation and inspection and found many significant deficiencies of the system and its operations. Based on the LA County DHS inspection report dated January 11, 2008, there are sixteen deficiencies need to be corrected. These issues include: - The aging distribution system has been lack of maintenance and replacement which cause the significant bacteriological account - There is no in-house certified water system operators - There are no backflow devices installed to protect their water source and system from medical, irrigation, and institutional facilities - No updated bacteriological sampling plan - Lack of planning to meet max demand to comply new Water Works Standards - Need addtional water sources to meet future demand - No O&M Plan - No updated service area map - No Emergency/Disaster Notification Plan - Do retail meters to track water usage and loss - There are not enough water pressure and volume for the required fire service to meet the fire code Rancho System has approached	980,000	22,332	113,379	16	Los Angeles	IV	2008
205	2110002	2110002-007	Marin Municipal Water District	MMWD Reservoir Operation Improvement Project	This project consists of three elements, and will result in increasing the District's reliable water supply by 1000 AFA. Project elements include: Replacing the Alpine-Bon Tempe Pump Increasing capacity of the Federal Works pump station Constructing a new pipeline from Nicasio Reservoir to Kent Lake Replacing Alpine-Bon Tempe PumpThe current pump, a submersible located at the upper end of Alpine Lake, has become inefficient and unreliable, and is at the end of its service life. While this pump provides most of the water used at the Bon Tempe Water Treatment Plant, its location is such that it has access to only about ½ of the water in Alpine Lake. This project element includes replacing the submersible pump with barge mounted pumps serving pipelines floating in Alpine Lake. This is the solution that the District pursued in the drought of the early 1990s and it has continued to function very well in the years since. Locating the replacement floating pumps farther downstream of the existing pump site will allow more of the lake storage to be utilized. Recent studies indicate that the best location for this type of facility would be a little over 2000 feet below the existing pump site. A pair of barges at this location and their attendant pipelines would provide access to about 2000 AF of additional storage, about 1000 AFA for each year of the two year design drought.In order for this project to be operated to increase reliable water supply there must	E	0	C	Marin Municipal Water District currently has a 3300 AFA water supply deficit. This project will partially close the gap between supply and demand by making an additional 1000 AFA available to the District. Seventy-five percent of MMWD's supply comes from surface water collected and stored on the District's watershed lands. The District's reservoir system has existed in its current configuration (five reservoirs located in the Mt. Tamalpais watershed and two additional reservoirs in West Marin) since 1983. The reservoir system capabilities and limitations have become well defined through experience during these 25 years. In light of the current water supply deficit, it is important to increase the amount of water available from this reservoir system where possible.This project meets Safe Drinking Water SRF Project Ranking Criteria for Category E: Water systems with water outages or significant water quantity problems caused by source water capacity or water delivery capability.Since regulatory constraints preclude increasing the storage capacity of MMWD's local reservoirs, the focus has been on more effectively utilizing existing storage capacity and finding justification for reducing the required minimum reservoir storage level included in the District's "reliable water supply" calculations. Current allowable minimum storage is about 10,000 acre-feet; about 13% of total storage capacity, meaning	6,000,000	60,599	190,800	18	Marin	II	2009

206	3710020	3710020-068	San Diego - City of	Alvarado 2nd Extension Pipeline & Morena Blvd Cast Iron Replacement	Build 22,504 lf of new 48" Alvarado 2nd Extension Pipeline from the western terminus of the existing 48" Alvarado 2nd Pipeline (at I-805 and Friars Road to Morena Boulevard and Napa Street); Use existing surface streets in Mission Valley to avoid tunneling under the SR-163 freeway and other bridge crossings; The Alvarado 2nd Pipeline is only used as a second supply to the high side of the Texas Street Regulators and has a low flow rate relative to its capacity; Replace the aging Kearny Mesa Pipeline transmission route with a new transmission route that uses the Alvarado 2nd Pipeline; Replace 17,032 lf of existing 20"/16" Cast Iron Morena Boulevard Pipeline with new 36" Morena Boulevard Pipeline; this 36" line will run from the end of the 48" Alvarado 2nd Extension Pipeline and connect to the Kearny Mesa Pipeline at the north end, operating at a 536 HGL; Replace 15,598 lf of parallel 16" distribution line from Friars Road and Morena to Morena and Balboa Avenue; new 16" line will operate at 390 HGL connected to the existing 16" line on Friars Road and terminating at Morena and Bunker Hill Street.	E	0	C	Replace Cast Iron pipe; provide redundant transmission to the coastal zones of La Jolla and Pacific Beach for supply reliability; improve water quality; reduce energy waste at the Miramar CWA Pumpback facility; reduce peaking problems in the Miramar Water Treatment Plant service area; and provide supply flexibility (Alvarado vs. Miramar); Part of a larger plan to improve transmission reliability to the coastal Pacific Beach/La Jolla Zones by replacing the aging Kearny Mesa Pipeline as the lead supply, and adding a second transmission route to the coastal zones.	64,000,000	273,015	1,266,731	14	San Diego	V	2012
207	3710020	3710020-066P	San Diego - City of	University Avenue Pipeline Replacement	Installation of water mains in the City of San Diego occurred in the 1900s to the late 1940s and were typically made of cast iron. The intended service life of these lines was 50 years, and while most have lasted much longer, the lines are gradually deteriorating due to corrosive soils. In the mid-1960s, the Water Department began a systematic effort to identify and replace nearly 600 miles of these pipes throughout the City's jurisdiction. Under the current City policy, cast iron water main replacements are coordinated with the replacement of aging and deteriorating concrete sewers located within the same public right-of-way. The City increased the cast iron water main replacement program to award 15 miles of replacement pipeline in FY08 and 20 miles in FY09 through FY11. Approximately 117 miles of cast iron pipeline were replaced from 1999 to 2008. A brief description of the project is below: 1. University Avenue Pipeline - Replace existing 20", 24", 30" and 36" cast iron mains with 16" PVC. The project limits are from the intersection of Polk Avenue and Oregon Street to the intersection of West Lewis Street and Stephens Street. The length of University Avenue Pipeline is 16,220'; 2. Park Pipeline – Replace 16" cast iron and asbestos cement main in Park Boulevard from University Avenue to Robinson Avenue with 16" PVC. Total length of 750'; 3. 5th Pipeline – Replace 24" cast iron in 5th Avenue from University Avenue to Robinson	E	0	C	The replacement of aging and deteriorating water mains provides an important infrastructure need to the citizens of San Diego and ensures progress to meet the Federal Safe Drinking Water Act's goal of ensuring that public water systems "provide an adequate, reliable supply of sage, clean drinking water." The main replacement project will provide direct funding assistance in meeting the Department of Public Health Compliance Agreement, No. 04-14-96-22 (Amendment No. 11), Compliance No. 73. The DPH Mandate requires that starting July 1, 1998, the City of San Diego is to award contracts for construction of at least 10 miles of water main replacement per fiscal year.	0	273,015	1,266,731	14	San Diego	V	2012
208	0900410	0900410-001	LATROBE ELEMENTARY SCHOOL	Millers Hill School	Construct additional well and connect to storage tank.	E	0	P	Miller's Hill School system needs additional source capacity to prevent water outages.	558,000	2	100	09	El Dorado	I	1998

209	1200684	1200684-003C	Mattole Elementary School	Mattole (#1200684)-Replace Transmission Piping.	This project will consist of replacing approximately one quarter mile of transmission line between the well site and school site.Construction of a new treatment building at the well site to house filters and monitoring equipment.Installation of a new DE water filter.Installation of a 10,000 gallon clear well to increase storage capacity, and installation of a new lift pump at the well site.Replacement of the old cement tanks with 2 5,000 gallon tanks at the school site.Moving the iron filters closer to the source to prevent Iron and manganese from entering the system. New monitoring equipment will be installed to better monitor and automate the treatment process this will include flow meters on both wells and for the distribution system, Raw water and finished water turbidity, an additional CL-17 for disinfection monitoring at the clear well.	E	0	P	Transmission Piping is 20+ year old PVC in a shallow trench with no bedding the pipe needs constant repair to maintain water supply to the school site. The clear wells are old concrete tanks that are cracked and deteriorating and sluffing off material into the water supply. This material is getting into the disribution system and creating other problems with the quality of the water.This project will also include the moving of the Iron filters to a location closer to the wells to improve the systems ability to remove the iron and manganese in the water source.This water system consistantly fails routine Bac-T sampling, requiring the School district to shut the system down for disinfection procedures and retesting.This School site is also the OES Emergency shelter for the Petrolia Area. With the current condition of the water system it is doubtful that this facility could perform this function.	675,700	1	100 01	Humboldt	I	2009
210	0202509	0202509-001C	LAKE ALPINE IMP. ASSOC.	Lake Alpine Improvement Association Water System Replacement and Upgrade Project	In order to meet California drinking water standards, the redwood water tanks that store spring-captured fresh water will be replaced with a 30,000-gallon steel storage tank for the Lake Alpine Tract system and a 15,000-gallon steel storage tank for the Bee Gulch Tract system that meet current state and federal standards. The increase of tank sizes is to 1) be equipped for future fire fighting capabilities, and 2) meet the demand of the growth in population served. Since the 1950s the total hook-ups for LAIA community have increased from 26 to 45, and the population served has increased to 150 people per day during the months of May through September.The new tank for the Lake Alpine Tract system will be equipped with a chlorinator and automatic tester. The integrity of the current cement pads are not expected to be adequate, and will most likely need further reinforcement. The aging galvanized and PVC pipes (1" to 1 1/2") that transport water from the original sources, Poison Spring and Bee Gulch Spring to the new storage tanks, will be replaced with approximately 7,520 feet of polyethylene pipe and appropriate fittings. There is also a need to replace the west-side cabin line, with polyethylene pipe, from the Bee Gulch tank, as its 1200 feet line (1") is inadequate for proper pressure to the cabins. Four water-testing stations will be placed appropriately. To monitor water usage and leaks, four meters will be installed.The	E	0	N	Lake Alpine is a tiny rural community nestled in Stanislaus National Forest, located on Highway 4 at the 7,300-foot level in Alpine County. The area is home to part-time residents occupying 37 cabins on Forest Service land for 4-5 months of the year and visitors who stay at the Lake Alpine Resort, a lodge consisting of a restaurant, general store and 10 rustic cabins. Two water systems serve the Lake Alpine Improvement Association: the west-end system referred to as the Lake Alpine Tract system (LAT) serves 25 resident cabins and the lodge, and the east-end system, referred to as the Bee Gulch Tract system (BGT) serving 12 resident cabins. Tanks: The LAT system includes two storage tanks: a 12,000-gallon redwood tank that stores nonchlorinated water for 25 cabins and the lodge and a 20,000-gallon steel tank that stores chlorinated water for the lodge. In 2008, the Lake Alpine Tract resident community was mandated to chlorinate the drinking water that is delivered to their cabins. For health reasons the chlorination process could not be achieved in the wood tank. As a result, during the summer months the cabin water supply line is diverted to an outflow pipe from the lodge steel tank. (A balanced chlorinated system is difficult to maintain as fresh water is fed from the wood tank to the steel tank.) Over the years the wood tank has developed several leaks caused by cracked staves and holes. The leaks are	119,712	26	25 09	Alpine	I	2009
211	4200872	4200872-001	VENTUCOPA WATER SUPPLY	Well and tank project	Construct new well and storage tank; may include meters	E	0	N	Low water production and inadequate storage to meet demand.	735,000	9	25 06	Santa Barbara	IV	2001

213	2700771	2700771-003	SPRINGFIELD MWC	Pajaro/Sunny Mesa Community Services District (PSMCSD)-Springfield Water System Distribution & Well	The project, as proposed, will include the development of a deep, new, large groundwater well with a deep sanitary seal to provide service to the various small systems and customers in the Springfield/Struve Road area. The well will be developed by the PSMCSD on the Moss Landing Middle School site within a permanent easement for the development of a new well. The easement has been granted and a test well has been drilled within the easement. Current water quality testing of the water produced by the test well demonstrates that the water produced at this location is free of both bacteriological and nitrate contamination that has compromised the potable of other wells and water systems in the area.Additionally the project will include the construction of a large new storage tank, including a backup power generator, within the easement to serve the school and the adjacent existing customers. The project will also include complete replacement of distribution lines on both Springfield and Struve Roads and for the Moss Landing Mobile Home Park and Moss Landing Middle School.	F	35	C	Moss Landing Middle School, a public school, has high nitrates and other water quality contaminants that prohibit their well from being used for potable purposes at the school. The Moss Landing Mobile Home Park, a low income community, is proposed to be incorporated into this project due to insufficient supplies from their well to serve their customers. The Springfield area, occupied by low income farmworker families, currently is experiencing severe groundwater contamination due to leaking septic tanks (biological contamination) and the leaching of commerical fertilizers from agricultural enterprises, into groundwater supplies. This constitutes an existing threat to the public health and safety of the area's residents. The resultant bacterialogical and nitrate contamination in groundwater supplies upon which the small, bankrupt systems depend can only be remedied with development of a deep, new well with a deep sanitary seal that can eliminate contamination from upper aquifers into lower aquifers. Currently, not only do the systems suffer from chronic and acute contamination but they also have no emergency power sources and distribution pipelines that are so old and deterioating as to cause infiltration of polluted groundwater into the potable systems. The bacteriological contamination (e-coli) as previously required public notification (quarterly). Additionally, PSMCSD is required to provide quarterly notices to	4,000,000	42	200	05	Monterey	II	2009
214	1510006	1510006-009	East Niles CSD	Water System Improvements for Consolidation of Four Water Companies	The proposed project will consist of replacing all four existing water systems in the respective water company's service areas with new piping, fire hydrants, valves, and service lines as well as constructing a new groundwater well with arsenic removal equipment. Connections will be made to the District's water facilities; however, a new groundwater source will be required to be constructed along with arsenic removal equipment and a standby generator. All existing water wells in the water companies's service areas will be abandoned.Water pipelines of 12-inches in diameter to 8-inches in diameter are to be constructed with resilient seat gate valves, fire hydrants, 1-inch copper water services, meters, and meter boxes. Pipe material will be AWWA C900 PVC pipe. Asphalt concrete pavement repair is anticipated and several road borings are also anticipated to be constructed. It is anticipated that once the existing water systems are abandoned, water connections from District meter boxes to customers' house plumbing will be necessary and is therefore to be included as part of the project.	F	30	C	Four water companies near the District's service area have had or are currently having water quality issues and water reliability issues with their respective water systems. The problems, according to preliminary engineering reports, are as follows:East Wilson Road Water Company has experienced high nitrate levels as high as 120 mg/l, exceeding the 45 mg/l MCL, from its groundwater and were issued violation notices from CDPH. Del Oro Water Company has experienced nitrate levels close to 45 mg/l and arsenic levels exceeding 10ug/l from its groundwater wells. Additionally, Total Dissolved Solid concentrations have been as high 1,300 mg/l exceeding the Recommended and Upper Secondary Maximum Contaminant Levels.Victory Mutual Water Company has experienced noncompliance issues as noted by CDPH in addition to the water system not being able to meet a 500 gpm fire flow with maximum day demand for its 185 service connections.San Joaquin Estates Mutual Water Company has experienced high nitrate levels as high as 109 mg/l from its groundwater well. Additionally, the Water Company has no backup well and has experienced water supply reliability problems in the past.All these water systems were constructed with materials that are not of the same standards. Therefore the proposed project would include constructing new water system infrastructure.	7,800,000	7,338	25,500	12	Kern	III	2009

218	5400994	5400994-001	HOPE ELEM SCHOOL	Well 2 Nitrate Remediation	Hope School is a rural school locate 4 miles south Porterville. Ground water is our only source of drinking water. There are no public systems near the facilities. The project will consist of exploratory drilling and sampling of various sites within the campus. Analysis the of sampling will be evaluated to determine the best location for the new well. Drill well to depth of 500 feet. Well will be sealed with cement for at least 130 feet. Install distribution infrastructure for potable and irrigation systems. Install intertie between well 2 and the new well so well 2 can be used for back up source. Final part of project is proper abandonment of well 1. Well 1 is contaminated due to deteriation of the steel casing. Presently well 1 is used for irrigation only and is not tied to drinking water	F	25	P	System tested above allowable Nitrate levels. Test results were .67 mcl.	85,000	1	100	12	Tulare	III	2007
219	5400919	5400919-001	BUENA VISTA SCHOOL	Buena Vista Drinking Water	This project will include the following: hire a consultant to oversee project drill test well -- water quality and access will be assessed prior to continuing with project. drill new well with pump and water storage system cap and dismantle existing water system.	F	25	P	Buena Vista Elementary School District is a one-school school district in rural Tulare County. Buena Vista maintains one domestic well that serves the students, staff and community members on campus. The District has had consistent nitrate MCL violations since 2004. The District has been providing bottled water for drinking and cooking purposes. The MCL for nitrates is 45 ppm. The violation range for Buena Vista for 2006 was 47-67, with an average of 55.	900,000	4	130	12	Tulare	III	2007
220	5400795	5400795-001	WAUKENA ELEMENTARY SCHOOL	Waukena Elementary School Safe Drinking Water Project Request	The project needed would first include the drilling of a test well in order to determine if a sufficient quantity of potable water could be found. Included in this stage would be the costs of any necessary permits, engineering reports, or other requirements for drilling a public test well. If a sufficient quantity of potable water was determined to be available, then a production well to provide the necessary amount of water for operation of the school would be drilled. Included in this stage would be the costs of any necessary permits, engineering tests or reports, or other requirements to construct the new well. In addition to a new well, a storage facility will be built in order to provide water when needed for various uses of the school. Connection to the existing school water system would finish the project. The old well and storage tank would be left, as it supplies water to the Waukena Volunteer Fire Department when needed.	F	25	P	The groundwater used as a source of drinking water for Waukena Elementary School exceeds the Maximum Contaminate Levels for Nitrate. The average Nitrate level from the last four quarterly tests is 65 ppm. A summary of test results is as follows: September 2006 64 ppm, December 2006 58 ppm, March 9, 2007 70 ppm, and June 2007 68 ppm. Other contaminants identifed are Arsenic and Lead. Lead tap sampling on September 2006 indicated a 90th percentile of 66 ppb (.066 ppm), and Arsenic levels indicated were 3.0.ppb. We routinely notify our school staff and families of these contaminates, informing of the dangers of nitrates for infants and expectant mothers, the dangers of lead poisoning in children, as well as health problems that can be caused from arsenic, such as cancer risk, and circulatroy system problems when consumed over many years. As a temporary solution we have a bottled water exemtion in order to to supply safe drinking and cooking water to all students and staff. This project would provide a permanent solution to providing safe and reliable drinking water and permit Waukena School to meet safe water standards.	10,000	5	230	12	Tulare	III	2007

222	1502549	1502549-001	POPLAR AVENUE COMMUNITY	Consolidation Project with City of Shafter	Project would consist of consolidation with City of Shafter. City of Shafter already has pipes in our service area. Project would consist of connecting all our customers to City of shafter water system. We will also destroy our well as part of the consolidation project.	F	20	C	We only have one well. The well showed total coliform bacteria in June 2008. In May and June 2008, we experienced total coliform problem in our distribution system. In June 2008, we failed the total coliform MCL and also had E.Coli +ve samples in the distribution system. We had to go on boil water order for several days in June 2008. Our main problem is total coliform MCL failures.	40,000	9	30	19	Kern	III	2008
223	5400523	5400523-003P	EL MONTE VILLAGE M.H.P.	El Monte Village Mobile Home Park Nitrate Remediation Feasibility Study	In order to provide lower nitrate water, El Monte Village Mobile Home Park proposes to address the stated problem by rehabilitating the existing well site serving residents of the mobile home park. Specifically, the project proposes conducting a feasibility study in order to determine the best possible alternative to addressing the nitrate contaminant issue at El Monte Village Mobile Home Park. Furthermore, should consolidation be identified in the Feasibility Study as the preferred alternative, the project will negotiate with key stakeholders from the City of Dinuba in order to pursue the consolidation alternative.	F	20	C	The El Monte Village Mobile Home Park proposes to address high nitrates in the water and end sporadic low pressure conditions. The El Monte Village Mobile Home Park located in Dinuba, California has a total population of approximately 150 residents and 49 service connections. Furthermore, on 5/24/2011 El Monte Village Mobile Home Park received a Notice of Violation from the Tulare County Environmental Health Department that their Maximum Contaminant Level (MCL) for nitrate contamination has exceeded 45 ppm. In addition, the nitrate violation required that the water system issue a public notification regarding the sites exceedence of the Chemical MCl. Additionally, the water systemwas required to issue a drinking water warning notice to inform pregnant women and women with infants that the drining water had exceeded the Chemical MCL and that it could cause harm to their children. The Notice of Violation is currently still in effect.	600,000	49	100	12	Tulare	III	2012
224	5400682	5400682-002	CENTRAL WATER CO.	Well Replacement and Nitrate Treatment	Water System is requesting funds to evaluate alternatives and to find the most cost effective solution to solving their water quality violation(s). The alternatives to be evaluated are as follows, and in no particular order: feasibility of consolidation with a nearby water system, centralized treatment, and replacement source(s).	F	20	C	Water System currently violates the Nitrate MCL.	500,000	42	170	12	Tulare	III	2012
225	5400957	5400957-005C	WEST GOSHEN MUTUAL WATER CO.	West Goshen Nitrate Remediation Feasibility Study	At this time, a feasibility and planning study is required to determine the best course of action. West Goshen is located approximately two miles from the town of Goshen (served by Goshen Community Services District), and therefore a consolidation project may be feasible and would be considered in an engineering study. Other possible solutions to be considered include drilling a new well or treatment. The feasibility study would examine the alternatives and recommend a solution, and then design the necessary facilities to solve the nitrate problem. West Goshen may also be a potential candidate for point-of-use or point-of-entry treatment systems as an interim solution.	F	20	C	West Goshen Mutual Water Company delivers water from one primary drinking water well, which recently exceeded the nitrate standard (with nitrated detected at 51ppm, over the MCL of 45ppm). The nitrate level has been steadily climbing in recent years. The water system also has a second backup well, and although it currently meets standards, it violated the nitrate standard in 2011 (50ppm).The water system is also without residential water meters. The system is stressed by too many connections, and as a result, the system periodically experiences low pressure conditions which can cause bacteriological contamination. Water meters would help to reduce water consumption.	500,000	69	200	12	Tulare	III	2012

226	1503558	1503558-002	El Camino Pines Lutheran Church	Resolution for high nitrate and fluoride problem in Well 01	We will request permission from Lake of the Woods Mutual Water Company (LOWMWC) to tie into their system. This work will involve trenching and pipe installation to reach LOWMWC's nearest pipes. We don't know exactly where that tie-in point would be, but believe it would be 200 to 500 feet from our system. Additional work would involve some reconfiguring of the present plumbing to separate the irrigation and fire protection systems from the potable water system, so that LOWMWC would only have to provide our potable water needs which are quite low. We would also need valves, meter, regulator, etc. We are a small church and estimate our average potable water usage inside the church at less than 200 gallons per day. We made a similar request of LOWMWC prior to establishing our own water system, but were turned down.In the event that we are turned down again by LOWMWC, we plan to resolve our water quality problem by installing a treatment system.	F	20	P	Last annual sampling in July 2010 showed a nitrate level of 50 ppm. The followup sample on August 12, 2010 showed 49 ppm nitrate. The fluoride has consististly hovered above the 2.0 ppm MCL.At this time we have posted a notice of high nitrate level, have removed the drinking fountain, and put a bottled water dispenser in its place.	250,000	1	70	19	Kern	III	2011
227	1900304	1900304-002	DEL SUR GARDENS TRAILER PARK	Nitrate Remediation	The proposed project is for installation of a new well and/or nitrate blending. Consolidation feasibility will be assessed during the planning phase as a preferred solution.	F	20	N	The water system is in exceedance of the Nitrate MCL and has a history of exceeding Coliform (TCR) MCL. They have been issued Violations.	325,000	20	25	16	Los Angeles	IV	2012
228	0001001	0001001-001P	Easton CSD	Easton Safe Drinking Water Project	The recommended solution is to provide a reliable source of drinking water for the community of Easton. The proposed project would include the installation of a water distribution system to serve the community. For a supply of potable water it is anticipated that at least one community water production well would be drilled and/or an intertie with other neighboring water systems would be installed. Potential intertie and/or consolidation entities are the City of Fresno, Washington Union High School and the Easton Estates Water System.Prior to construction activities it is anticipated that the Easton CSD would apply for feasibility study funding to investigate in more detail potential solutions to the community's water supply and quality issues. As part of this study, it is contemplated that the Feasibility Engineering Report prepared in July1997 would be updated. Also, the drilling of a test well, CEQA and LAFCO work as well as project design would be completed under the proposed feasibility study.Please note: This is NOT a pre-application for a public school water system. The "yes" button was accidentally clicked for question D. This is for a community water system.	F	20	Z	Easton is a small, unincorporated town, located about 5 miles south of downtown Fresno straddling old Highway 41. The community has a population of about 2,000 residents and is comprised of approximately 550 homes, an elementary school, a high school, several churches and a strip of commercial establishments along Elm Street (old Highway 41). The Easton Community Services District provides street lighting, storm drain, and park, and landscape services to the community and potentially may be able to provide water services as well. The vast majority of residents in the Easton utilize individual domestic water wells for water supply. Sewage disposal is provided by individual on-site septic tank systems creating a potential health hazard. The soil in and around Easton is sandy. There is historical information to document that the quality of water produced from Easton's wells has problems. In the 1990s some community wells were sampled and found to be contaminated. In addition, several small water systems in the community currently show that their water exceeds the Maximum Contaminant Level (MCL) for nitrate and DBCP. Examples of these contaminated wells serving regulated businesses within the boundaries of the Easton Community Services District are: Business Address Nitrate Level Sample DateExtreme Pizza 6072 S Elm 1800 Fa0273354 73.5 ppm 12/4/08 Korita's Restaurant 6130 S Elm 1800	500,000	550	2,000	23	Fresno	III	2012
229	3900579	3900579-001	CENTURY MOBILE HOME PARK	Century Mobile Home Park	The water system exceeded Nitrate in both Well #1 and the standby Well #2. The new well (Well #5) installed to mediate the Nitrate issue but the water exceeded arsenic. The strategy at this point is blend the two sources and destroy the Standby Well #3. Treatment may be necessary if blending fail to bring the water system into compliance.	F	10	C	The average of 4 sample results of the new well (#5) in 2007 was 13.5 ug/L, and exceeds the new MCL for arsenic of 10 ug/L, National Revised Primary Drinking Water Regulations, Federal Arsenic Rule, Section 141.62(b), 40 Code of Federal Regulations. The average of 4 samples in the old well (Well #1) in 2006 exceeded the MCL of 45 ug/L for Nitrate, California Code of Regulations, Title 22, Section 64431 (a).	10,000	16	50	10	San Joaquin	III	2008

233	5700707	5700707-002	ROLLING ACRES WAT MUTUAL	Rolling Acres Water System Repair and Upgrade	The RAMWC water system was installed initially as a fire protection system in 1969, but has been utilized for potable water for the developed subdivision since 1975. Upgrades to the system are necessary to make the system compliant with today's recommendations for drinking water. An engineering firm, West Yost Associates, was engaged to provide a proposed project for remediation of the problem, and in consultation with CDPH regarding non-compliance symptoms, it is proposed to rehabilitate the existing well, replace the pressure tank and all well site equipment. This will entail (1) removing the pump and performing video logging of well, (2) performing well cleaning, including acid and biocide treatment, swabbing, surging and brushing, (3) performing video survey to confirm well condition, (4) testing pump well, (5) sizing and selecting new vertical turbine pump powered by a 40-hp, 440-volt constant speed motor, (6) extend pedestal to required height, (7) install pump, (8) engineer and construct concrete pad for the tank and well, (9) replace electrical panel, and (10) re-gravel the well site. It is anticipated that these upgrades will eliminate the positive tests for total and fecal coliforms and help us to maintain DHS compliance. This approach for upgrading the system has been chosen, rather than converting the system to a more efficient variable speed (on demand) pump with small storage tank, to maintain the County	F	5	C	The well servicing the current members of the Rolling Acres Mutual Water Company (RAMWC) was drilled in 1969 as a mandate by Yolo County to provide the means to apply for subdivision status by the availability of water for required fire protection services. The well is 504' deep, 18" in diameter, with a current water level between 50-70'. It is sealed from the surface to approximately 50' depth. In 1975, the homeowners living in the subdivision and using the well for drinking water incorporated the existing system as RAMWC and maintained the facility to operate for potable home use as well as for fire protection serving over 50 local homes. A used 10,000-gallon supply tank was bought in 1975 to replace the original 5,000 tank, and was placed on an unengineered and inadequately structured tank base. There are currently 13 homes relying on the system for potable water with a total of 31 full time residents. Yolo County requires monthly testing of the RAMWC well for compliance with Title 22, California Code of Regulations, Chapter 15, Domestic Water Quality and Monitoring, maximum contaminant level (MCL) for total coliform and fecal coliform (E. coli) bacteria in drinking water. The MCL for coliforms is the confirmation of the presence of coliforms (total coliforms, fecal coliforms, or E. coli) by a certified environmental laboratory and is reported to DHS. Since inception of testing there has been chronic positive	185,650	11	33 09	Yolo	I	2009

241	4301004	4301004-001P	EMERALD VALLEY MUTUAL WATER COMPAN	Emerald Valley Estates Water Company New Wells Project	The following solutions to solve the high nitrate problem were evaluated: 1. Blending the water from the three wells 2. Reverse Osmosis system 3. Separate irrigation and potable water system 4. Drill new wells) Blending: Blending the water from the three wells would require installing a separate supply line from the wells to the storage tank. A new well would have to also be drilled to correct the Ohlone Well “work standard” problem and probably another well would be required to satisfy long term water requirements. The cost for this proposal was estimated to be $200,000. Due to the cost this solution is not being proposed.) Reverse Osmosis System: Installing a Reverse Osmosis System on the New Well would be an ideal solution, if the disposal of the “concentrate” from the RO System could be developed. Currently there is no sewer system available to accept this concentrate. Hauling the concentrate to a disposal site is cost prohibitive. Due to not having a solution for disposing of the RO concentrate this solution is not being considered.) Separate Irrigation & Potable Water Systems: Separate the current water system into an irrigation system and potable water systems. From a water conservation standpoint this would be an ideal solution, because it would allow the Water Company to use the existing water supply from the current New Well for irrigation. A new well would have to be drilled to solve the “work	F	0	C	Emerald Valley Estates Mutual Water Company, Inc. is a community water system located two miles northwest of the City of Gilroy, California. The Water Company was incorporated in 1979. The Water Company provides potable water (9,000,000 gallons annually) to approximately 50 residents through 15 active service connections. The community consists of 18 residential lots, 2 ½ acres or more, of which 13 of the lots have residences constructed on them. When the 4 empty lots have homes constructed on them, the water demand will be approximately 12,000 gallons.The Water Company accesses its water from the Llagas Subbasin. “Land use over the Llagas Subbasin is mostly mixed agricultural and rural residential development, with two main incorporated areas consisting of the cities of Morgan Hill and Gilroy. While the incorporated areas are served by municipal wastewater systems, the unincorporated areas rely on individual septic systems for sanitary waste disposal. Past land use also included a number of confined animal enclosures. Thus, just about every known source of nitrate is present, or was present at some time, in the Llagas Subbasin”.The Water Company consists of three active groundwater supply wells: Ohlone Drive Well, Day Road Well and New Well; one 37,500 gallon steel storage tank; and a distribution system. The Ohlone Drive Well has an output of 10 gpm. Its nitrate level average is 23 ppm.	125,000	13	35 17	Santa Clara	II	2012

243	2701241	2701241-002	ENCINAL RD WS #1	Encinal Rd. WS#1 Disinfection/Nitrate Removal System	Central Portable Exchange System - for Nitrate removal Quoted by Culligan July 23, 2007 $111,600 Cost of land and building to house system $100,000 Cost to bring in power $ 25,000 Cost to separate domestic lines from irrigation for treatment of domestic water only - to reduce cost $ 75,000 Engineering costs $ 38,400 Total Estimated Costs $350,000 The treatment system will include a disnfection component that will disinfect all domestic water using liquid Sodium Hypochlorite. Monitoring devices and controls will be an integral part of the system to bring it into compliance with Health Department requirements.	F	0	C	Encinal Road Water System #1 has one well serving businesses and homes with domestic and irrigation water. The system has one older Ag. well with no treatment and no storage. Nitrate levels in this system are increasing each year and a recent test showed 228 mg/l against an MCL of 45 mg/l. For the past several years every Coliform test was positive for total Coliform and each time the well requires disinfection. Due to the unique geological setting a new well can not be drilled below 450 feet due to a granite shelf. Therefore, Nitrate contamination can not be avoided by drilling a deeper well. The company is under a Compliance Order from the Monterey County Health Dept. to bring the system into compliance with all health requirements. This will mean that a treatment system must be installed. There are no known nearby systems with better water that would afford possible consolidation.	350,000	14	41 05	Monterey	II	2007
244	4300996	4300996-001	Valley View Ranches	Valley View Ranches Mutual Water Company	We would be installing anion exchange treatment equipment sufficient to treat 4500 gallons (75x 15 homes x avg 4 people per home) per day. We would also need to install storage tanks for buffering peak flow demands. We would also need a booster pump to pressurize the new distribution loop and possibly an electrical service upgrade. Then, 3000 feet of distribution pipe as a secondary distribution service to supply just potable water to each home. Landscape and fire hydrants and possibly fire suppression service will remain on the existing storage system and distribution loop. We may use the primary well as a source, or a secondary well, to be determined. We will run secondary service lines to each house and separate landscape service from potable water. We will need to install incremental backflow devices at each house.	F	0	C	CDPH is requiring us to come into compliance with the MCL for nitrates, which we have historically been significantly over. Our water company has made a proposal to come into compliance by installing distillation units in each home which would service multiple point of use taps. Distillation is certified by the EPA as a "Small System Compliance Technology" (SSCT). Despite that, CDPH rejected that plan. We also offered to installed point of entry anion exchange units. The EPA lists Anion Exchange as a Best Available Technology for nitrate treatment. CDPH also rejected that plan. Each home is currently treating drinking water with POU reverse osmosis systems. The EPA lists RO as a Best Available Technology for nitrate treatment. CDPH rejects that as a solution. CDPH has asked us to install an anion exchange unit at the common well. In addition to the anion exchange and storage equipment, this would require us to install a dual distribution system. This would require us to install roughly 3000 incremental feet of 4" pipe under our street since it would be prohibitive to treat all of our water (including landscape) . We would also need to install new service lines with incremental backflow devices to each house. Most of these secondary service lines will have to pass under significant installed landscaping, including hardscape such as driveways and walkways. Both of these latter two items will add significant expense over	290,000	15	45 17	Santa Clara	II	2008

The plant will include treatment for nitrates, monitoring equipment and tanks for containing any waste effluent. It is hoped that the System's current pump and distribution infrastructure can continue to be used.	F	0	C	For several years the nitrate levels in the Garlen Court Water System have been high. In December 2003 the Monterey County Health Department ordered the System to increase the frequency of sampling to quarterly due to the fact that a November 2003 sample had nitrate concentrations of 43 ppm, which exceeded 50% of the MCL in violation of Section 64432.1(a)(2), Chapter 15, Title 22, California Code of Regulations. A Bottle Water Order was also issued which has remained in effect until the present. A water sample taken in June 2008 showed nitrate results of 46 ppm. A confirmation showed nitrate results of 45 ppm. Based on these findings the Monterey County Department of Health issued Compliance Order No. 08-013 in early 2009 which found the System in violation of the provisions of the California Health and Safety Code (HSC), Division 104, Part 12, Chapter4, AKA the California Safe Drinking Water Act and California Code Regulations (CCR), Title 22, Chapter 15. The System was ordered to provide an acceptable permanent water source by pursuing for instance, "new well development, water system consolidation, water treatment, etc. The System decided that the alternative that would provide the best long term solution to the problem would be the installation of a treatment facility for the existing well. The System is requesting funding for a treatment facility.	178,000	23	69 05	Monterey	II	2009
253	1500494	1500494-001	WILSON ROAD WATER COMMUNITY	Nitrate Correction Project of Wilson Road Community/Intertie with East Niles CSD	A treatment or intertie with East Niles CSD is needed to solve the nitrate problem. 254	1500569	1500569-001	VALLEY VIEW ESTATES MUTUAL WATER CO	System 4 high nitrate levels - need for new well	It appears our community water system must replace Well #4 because of the nitrates contamination. This was the recommendation of Mr. Abdel Shurbaji of the California Department of Public Health, Division of Drinking Water and Environmental Management. Mr. Shurbaji inspected our system on July 23, 2007, after the cycle test results showed a high nitrate level averaging 58 mg/L. We predict from past experience a new well would need to be approximately 450 feet deep. Funding is also being requested for the pump, required electrical controls, utility pole, and necessary piping to connect the system. A new well is important in order to maintain our engineered GPM requirements. We are also requesting funding to move at least one and possibly two septic tanks which may be causing contamination.	F	0	C	Well #4 has a nitrate level that often exceeds the MCL of 45 milligrams per liter. Since August of 2006, nitrate levels have varied from 24 to 106 mg/L. A well cycle test was completed on July 11, 2007, and the average result of this test showed nitrates at 58 mg/L. We were required by the California Dept. of Public Health, as per Section 116450 of the Health & Safety Code, to notify customers of these results and the possible health risks--especially to infants less than 6 months old and pregnant women. We were also notified that we would be receiving a compliance order for the nitrate MCL failure.	58,000	39	79	19	Kern	III	2007

259	3900649	3900649-002	GLENWOOD MOBILE HOME PARK	Well Replacement and pressure tank to meet nitrate standards and MDD PHD requirements	Construct a 8-10 inch diameter well with a PVC casing to a depth that has tested below the MCL for nitrates. LPA records of notes wells constructed to a depth below 500 feet and sealed to 250 feet below surface grade, have tested for nitrates below the MCL. New Well will require a water meter, capacity test, full Title 22 water analysis, electrical drop from PG & E, subpanel, surface pad, new distribution line to the water system and 5 horse power pump.The Water System currently has two bladder tanks. A new Hydro tank that is capable to hold a MDD worth of water is required. Mobile Home Park serves 36-service connections with 72 occupants. Per HCD standards of 25 gallons per person per day, system requires at least 2700 gallons of water held in storage. System still does not have a meter installed to determine MDD and PHD flows.Consolidation is not an option. Water System is located several miles from the city of Stockton and any water utility service. The closest Small Public Water System is a mile away.	F	0	C	The system was confirmed over the nitrate MCL on November 24, 2009. The LPA issued a Notice of Violation for exceed the standards for nitrates. The owner was reuierd to conduct public notification to the residents and to submit a Complinace Agreemnt to the LPA for when and how the system would return into compliance. The water system begain public notification on January 1, 2010 and submitted a Compliance Agreement to the LPA indicating a new well would be drilled by June 2011. In March of 2011 the water system asked for an extension until March of 2012 to construct the well as he did not have the funds. As of June 27, 2012 the well has not beed constructed, due to limited funds.	50,000	50	100	10	San Joaquin	III	2012

260	2700738	2700738-001P	SAN MIGUEL WS #01	Well replacement and system upgrades	We have two wells that supply 34 houses. These wells are in need of replacement with deeper wells. We have researched extensively, and have determined that we can get quality water at a deeper depth.We were ordered to come into compliance due to high nitrate levels. Current levels are high 50's low 60's in both wells. We are on a bottled water notice from Environmental Health Dept., and are on regular testing requirements.We are in hopes of installing a new well(s) to 600' with a ten inch casing, and a much deeper seal to rectify our water quality issue. We are fairly confident that we will have a long term, potable supply of water. Along with drilling new well(s), we will be destroying our other well(s), so as to not contaminate our new source. We are also in need to recoating our storage tanks, and replace existing meters for the housing involved.	F	0	C	We have very high nitrate levels in both wells. Currently we are on a bottled water order from the Environmental Health Department. And we have been ordered to come into compliance to meet State standard MCL levels.Both of these wells are circa 1963 and 1975 respectively. Both wells have shallow sanitary seals. One well has only forty foot seal, and the other is only fifty feet down from ground surface. We feel that this is the issue with our water quality.Public nitification is currently in effect, and constant monitoring is also being enforced.	0	34	100 05	Monterey	II	2009
261	1502690	1502690-004	DUNE III Water Co., LLC	Duen III - Two well chlorination	This request is to provide safe drinking water. To install a chlorination devices to mitigate the coliform violations that have occurred. Consolidation would not be the best sollutions since the two wells are widely separated and introducting chlorination at one spot would not solve the problem of adequately getting it throughout the system. The two separate wells have their individaul storage facility. Since this is not a "circulating system" the chlorination would have to be introduced to each separate facility in order to solve the problem.	F	0	C	Our intent is to provide safe drinking water. However in 2011 it was cited for a violation of Total Coliform in two consecutive months. Our best determination was that it was caused by a possible backflow from a residence. This problem was handled by a manual application of chlorination into the distribution lines. It was suggested by the CDPH that we consider the installation of a Granular Calcium Hypochlorite, 65% available chlorine system. It would be required that all field maintenance staff be familiar with the installation procedures and operations. Also involved would be the building site requirements for the additional area for the equipment/supplies to be stored in a protected/housed environment. This request is to include two separate storage sites.	59,000	32	100 19	Kern	III	2012
262	4000501	4000501-001	HALCYON WATER SYSTEM	Ozone and filtering system	Central RO system or other treatment scheme to lower nitrate and selenium is needed.	F	0	C	water system exceeds the selenium and nitrate MCLs and is currently serving bottled water.	100,000	35	105 06	San Luis Obispo	IV	2011
263	2700665	2700665-001	OAK HEIGHTS W & R CO INC	Funding for Compliance Order # 08-002, Nitrate Contaminant Removal	The following are suggested solutions to address the Nitrate Contaminant problem: (1) A certified professional install a reverse omosis system under the sink of every Oak Heights Water and Road Company, Inc., residence (35 units) (2) Install an Ion Exchange system at the well source. (3) Drill a new well and hope that the nitrate levels are in compliance. This would require additional pipe, connections and electrical hook ups. (4) Install a Nitrate Removal system and capture pond at the well source. This would require the expensive removal of nitrate sludge captured in the pond, which is considered a waste hazard (not cost effective. (5) Hire a certified blend operator, which requires constant monitoring (not cost effective).	F	0	C	The Oak Heighats Water and Road Company, Inc., has been notified by the Monterey County Department of Health that they are in violation of the California Safe Drinking Water Act and California Health and Safety Code Regulations (Section 64431 CCR/Section116555 HSC). A Compliance Order No. 08-002 was issued to the Oak Heights Water and Road Company, Inc., on March 25, 2008. The water systems nitrate levels exceded the legally permissible level of 45 mg/L. The Monterey County Department of Health ordered the Oak Heights Water and Road Company, Inc., to come into compliance by October 1, 2008. The water system is comprised mostly of fixed income families or families earning less than $45,000 per year. The water system does not have the monetary reserves/resources to finance a new water source (drilling a well), purchase equipment for treatment and monitoring the water system or hiring a certified blend operator. The Oak Heights Water and Road Company, Inc., cannot comply with the Monterey County Department of Healths compliance directive, without financial assistance.	50,000	35	105 05	Monterey	II	2008

265	5700788	5700788-001	NORTH DAVIS MEADOWS	Connection of the North Davis Meadows County Service Area Public Water System to the City of Davis W	This Project for the Nitrate reduction within the North Davis Meadows County Service Area would be by induction into the much larger City of Davis Public Water System via pipeline connection. Currently the North Davis Meadows water system is made up of two 500 ft deep wells capped at 50 ft, and one above ground storage tank. The system is currently owned by the County of Yolo, but operated under contract by the City of Davis. The wells were drilled in 1996 and 1997 and there is a golf course irrigation well als connected to the system only to be used in an emergency. The distribution system is essentially looped between older and newer sections of the neighborhood and is comprised of PVC water pipes in 6 inch and 8 inch diameters that feed the 95 parcels in the subdivision. Nitrate levels have been monitored in the wells since inception, and multiple alternatives to fixing the nitrate problem have been reviewed. The City of Davis Public system is obviously a much larger system with 21 wells, etc. The connection via pipeline to this sytem, represents a much more stable environment with regards to nitrates and other contaminants. A pipeline connection would include trenching 8270 linear feet and installation of 12" Ductile Iron Pipe to the City's Water Main Tie-In. This connection would also include the necessary 1" water meters to the CSA's distribution system and all automatic control valves as well as Pipe	F	0	C	North Davis Meadows County Service Area Water System has experienced a problem with Nitrate contamination in both of its drinking water wells. It has had to shut off both 500 ft wells at one point due to contamination. Nitrate levels have been monitored in the wells since their inceptions and the levels have continued to escalate in the last 10 years. Currently there is one well that is not in use due to exceeding the nitrate minimum contaminant level. The second well was shut off at one point as well, and due to exceeding nitrate levels the County Service Area has decided to install a inlatable packer to block off the upper aquifer, as a temporary solution. This well is currently under the MCL level with the packer installed, however results also fluctuate. The source of the nitrate in the NDM wells in unknown, however there are septic systems in the area and the wells are surrounded by agricultural activities.According to CDPH this Category F project is one that would rectify the directive currently standing. This Nitrate Contamination is one that does not meet the Operational Requirements listed in Section 11655 of the Drinking water statute stating "Any person who owns a public water system shall ensure that the system does all of the following: (1) Complies with primary and secondary drinking water standards..."The Nitrate contamination is one that also exceeds California Code of Regualtions Tittle 22. Domestic	1,873,948	35	110 09	Yolo	I	2009
266	5400735	5400735-002	RODRIGUEZ LABOR CAMP	Rodriguez (California Camp) Water System Safe Drinking Water Project	The proposed project would be to consolidate with the Richgrove Community Services District water system. The project would include the purchase of capacity into the Richgrove system as well as the extension of a water main from Richgrove or the new well site to serve this farm labor community.	F	0	C	The Rodriguez (California Camp) Water System has one water well that provides water to the residents of this Farm Labor Camp. The well provides water that exceeds the Maximum Contaminant Level (MCL) for nitrate with levels in the range of 130 ppm. The system's owner has received Notices of Violation and Compliance Citations as a result of this high nitrate level, almost 3 times the MCL.	500,000	35	110 12	Tulare	III	2007

275	2010012	2010012-003	HILLVIEW WATER CO-RAYMOND	Raymond 2010012 Nitrate and Arsenic Compliance	Raymond Wells No. 8 & 9 both have Nitrate levels which exceed the Nitrate Maximum Contaminant Level. Raymond Well No. 8 is the largest water producer of all the Raymond wells. Several of the Raymond wells also have Arsenic levels which exceed the Arsenic Maximum Contaminant Level (MCL). Raymond has a total water supply which is marginal at best and the Nitrate levels in the blended well water exceed the MCL. We cannot remove Raymond Well No. 8 from service since it is the primary source for the Raymond system. We propose to develop several wells outside the existing service area and pipe the water into Raymond, expand the storage capacity to allow blending of all the sources prior to entering the distribution system.This solution will be more cost effective than trying to treat the existing wells for Nitrate or Arsenic and also will result in lower operational and maintenance costs.	F	0	C	Raymond Wells No. 8 & 9 exceed the Nitrate Maximum Contaminant Level. Well No. 8 is one of the primary wells in Raymond which has a marginal water supply at best. Arsenic is also a problem in several of the wells. The Nitrate level in the blended well water does exceed the Maximum Contaminant Level and Hillview is required to notice our customers quarterly of the violation. We are unable to take well No. 8 off line since it is the primary source of water for Raymond. Some customers also are supplied with water which exceeds the Arsenic standard since we are unable to blend those wells with wells which have little or no Arsenic prior to the distribution which serves these few customers.	1,999,650	80	243	11	Madera	III	2009

280	5410007	5410007-003	LSID - Tonyville	Tonyville Interconnection	A pipeline that interties the District and the City of Lindsay is needed to provide the District with water during canal water supply interruptions and eliminate the need to utilize nitrate-contaminated groundwater wells. The intertie also affords the opportunity for the District to pursue permanent domestic water system operations by the City of Lindsay. The proposed Project consists of the installation of an intertie pipeline between the Tonyville water distribution system and the City of Lindsay's water system. This intertie will allow Tonyville to receive water from the City of Lindsay during periods when the Friant-Kern Canal is out of service and cannot deliver water for the Tonyville water treatment plant. The Project provides a dependable water supply during canal outages in the Friant-Kern Canal. In addition, this intertie will enable the District to eliminate its use of nitrate-contaminated wells. The proposed Project will consist of the design and construction of the interconnecting pipeline. The District and the City of Lindsay will also need to develop the terms and conditions for the operation and maintenance of the pipeline. The Department of Health Services is encouraging the District to consolidate its small domestic water systems into nearby domestic	F	0	C	The Lindsay-Strathmore Irrigation District (District) provides water for domestic and/or agricultural irrigation purposes. The District utilizes imported surface water as their primary water supply. The District has a contract for Class 1 water from the Central Valley Project. The water is delivered via the Friant-Kern Canal. The District owns and operates a water treatment plant that serves the Tonyville Tract. The Tonyville system serves approximately 50 connections. The District utilizes five (5) groundwater wells for the Tonyville system when surface water is not available. These wells, however, have nitrate levels that exceed the regulatory maximum concentration level (MCL). The nitrate concentrations ranged from 43 mg/l to 65 mg/l in twenty samples collected quarterly in 2006. The nitrate concentrations of the well water averaged approximately 54 mg/l. One well has not been utilized since 2005 due to high nitrate levels. The Friant-Kern Canal is dewatered every two to three years during the winter months for maintenance activities. In addition, the canal is subject to unscheduled outages that would disrupt the water supply. These situations result in the District having to utilize its nitrate-contaminated wells to meet domestic water demands.	1,038,000	50	400 12	Tulare	III	2007

284	2701676	2701676-007P	SAN LUCAS WD	Well Replacement and Pipeline - San Lucas Water District	A "Hydrogeolic Characterization and Test Well Feasibility Analysis" was prepared in Sept 2010 regarding the Total Dissolved Solids issue. A supplemental Technical Memorandum regarding the Nitrate contamination issue was prepared in June 2011. Both reports recommended relocation of the well to a location approximately 1,800 feet west of the existing well. The first phase of implementation will be to acquire a temporary construction easement and drill a test well at the indicated location, and implement a comprehensive sampling and testing regime. If the testing program indicates the location is appropriate for a long-term reliable public water source, the next steps will be to prepare a Project Description, conduct CEQA environmental review, acquire permanent easements for the production well and pipeline, prepare final engineering plans and specifications, advertise for bids, and construct the improvements.	F	0	C	San Lucas is a small unincorporated rural farmworker community in southern Monterey County. The municipal water system has approximately 90 service connections, and is owned and operated by the San Lucas Water District. The current water supply is derived from a single groundwater well located in the center of an agricultural field approximately 1 mile south of town. All customers of the San Lucas Water District are presently on an indefinite "Do Not Drink" order from the Monterey County Division of Environmental Health due to excessive levels of nitrates in the District's well. Nitrate levels are currently running approximately 60 ppm.The groundwater from this well also contains excessive levels of Total Dissolved Solids (secondary standard). TDS levels are currently running approximately 2,000 ppm.The Monterey County Division of Environmental Health has directed the San Lucas Water District to implement a new source of water that meets all public water quality requirements as soon as possible. Until that time, the "Do Not Drink" order will remain in effect.	0	88	500 05	Monterey	II	2012

292	5400542	5400542-006	DUCOR CSD	Ducor Water Supply Project	Evaluate and develop water supply options to obtain and maintain clean, affordable and adequate water supplies (surface and/or wells). Locate sources of clean and adequate water (surface and/or wells). Design and develop the water supplies, storage and their related water distribution system. Ducor and other water users will benefit from a clean water supply and the prolonged life of their water wells and supplies.	F	0	C	The Ducor Community Services District (District) South Well has Nitrate contamination above the 45 ppm Maximum Contaminant Level (MCL).The Tulare County Health Department has cited the District for failure to meet the Nitrate MCL. Public notification for Nitrates has been in effect since January/February 2009. The South well is also operating at significantly reduced flows due to casing failure, leaving the District with a restricted and contaminated water supply since 2006.Many area residents, farms, homes and communities are faced with falling water tables and reduced water supplies due to contamination and overdraft of groundwater supplies.	1,500,000	125	850	12	Tulare	III	2011
293	5710004	5710004-003	Knights Landing Svc. Dist.	Well Replacement for Knights Landing Service District	The proposed project involves drilling a 6" test hole and generating an electric log to determine the depths and characteristics fo existing aquifer zones. Based on this information a well will be drilled and finished with 16" diameter casing. Based on historical information it is believed that the well will be approximately 500 feet deep. The well will consist of a a verical turbine pump , an electric motor in the 100hp range, and electrical controls. The well will make use of two existing hydropnuematic tanks. The controls of the tanks need to updated and the tanks will require sandblasting and recoating. The site work required will consist of an access road, gravel yard area and a fenced enclosure.	F	0	C	The proposed water well is needed to replace a 40 year old well (Railroad Street Well) in Knights Landing, California. The Railroad Street Well was completed in 1971. About 20 years ago the casing of the well cracked making it susceptible to shallow groundwater contamination. At the time the casing was repaired by inserting and expanding a sleeve in the well casing at the crack location. In year 2009 multiple successive water quality tests conducted by the Yolo County Health Department on samples taken from the well yielded positive results for total coliform. Subsequent chloring disinfections of the well failed to produce negative results for total coliform. Prior to 2009 and from 2009 to date water quality tests have periodically yielded positive results for total coliform. Inspections of the well have concluded that potential above-ground contamination sources do not exist. It is suspected that the repair of the cracked casing has failed. The combination of the wells age and casing problems has led the District to the decision that the well needs to be replaced in order to maintain a reliable water supply to the community.	500,000	287	1,300	09	Yolo	I	2012
294	5410026	5410026-002	Poplar Comm Service Dist	Water Supply Project - 2007	The Poplar Community Services District (District) has identified the need for a new groundwater well for domestic water supply purposes. The District's proposed project consists of designing and constructing a new groundwater well. The proposed Project will include the preliminary engineering necessary to complete the well including: technical design, reports, California Environmental Quality Act procedures, surveying and permits. The preliminary engineering will culminate with the preparation of final plans and specifications for bidding purposes. As part of the Project, the District will select a general contractor through a public bidding process. Finally, the Project will include the construction and start-up of the new well. The well will consist of approximately 400 feet of 14-inch diameter well casing, a 75 horsepower vertical turbine pump and associated piping and appurtenances. The District anticipates between 700 and 800 gpm from the new well. The new well will operate off of water supply system pressure.	F	0	C	An evaluation was conducted on the system's water demand and the system's capacity relative to the State's revised Title 22 Water Works Standards, effective March 9, 2008.In summary, the evaluation findings are as follows:1. Given available data, the present system water capacity is unable to meet the Title 22 Water Works Standards for meeting Maximum Day Demand (MDD) and Peak Hour Demand (PHD);2. The District's water consumption is higher than similar surrounding communities; 3. The south well nitrate concentrations exceed Title 22 Maximum Contaminant Levels (MCL's) since June 2007, seven (7) out of eight (8) samples; and4. Recommendations included verification of water demand and alternative projects to increase water production and provide water that meet Title 22 water quality standards.	1,873,000	555	2,200	12	Tulare	III	2007

295	0310021	0310021-003C	Amador County Service Area #3/Unit 6	Camanche Water Quality Compliance - Disinfection Bi-Products Requirement Improvements	The project proposes to construct a direct tie from the Wells 9 and 14 to the Storage Tank 9 which will provide the required Contact Time to meet Chlorine Disifection Bi-Product requirements prior to domestic service.	F	0	C	The North Shore Lake Camanche Ground Water System has had a history of issues with Ground Water Wells. This past year the Department of Health Services required the Agency to establish a new source for the service area prior to any additional connection. A total of wells (6, 8, 9, 10, 12, 12A, & 14) have been drilled and placed in operation over the years of which 3 have gone bad and one has lost 63% of its capacity. A new well was drilled spring early summer of 2007, well 14. It is expected to be fully operational within the next couple of months. Currently wells, 6, 9, 12A & the soon to be operational well 14 are sustaining the service area. Well 9 has had pass issues with bacteria tests. Well 14 has been established to be on the same aquifer and therefore it is anticipated to have similar bacteria issues. In addition these wells have chlorine treatment onsite at the well. These wells provide direct domestic water service to customers. There currently is no contact time for the chlorine treatment prior to this direct domestic service. Health & Safety Section 64426.1 of Title 22	0	723	2,386	10	Amador	III	2007
296	1510025	1510025-003	Stallion Springs CSD	Nitrate/Perchlorate Contaminant New Source Blending Project	The proposed project will consist of the following improvements together with the necessary, engineering, hydro-geology, CEQA processing, administration, land, right-of way and incidental items:1. A new water well with a target capacity of 500 to 600 gpm. A pilot hole will be drilled and water bearing zones will be isolated to test for water quality. Final well construction will exclude zones producing contaminated water. If the well yield and water quality are acceptable, a well pump, piping, well building, chlorination facilities and electrical will be constructed. A connecting pipeline to the District 12" Cummings Valley pipeline will be constructed. 2. A blending tank will be constructed in the Cummings Valley to blend water from each of the water wells before delivery to the Stallion Springs service area. The estimated required capacity is 200,000 gallons. The blending tank will be used to blend water from high nitrate wells (CV-1) with water from low nitrate wells (CV-2 and future well) to produce a blended water supply meeting all MCLs. 3. A new booster pump station will be constructed to pump water from the blending tank to the District service area. It is estimated that three 500 gpm capacity pumps will be required. 4. Replacement of the existing pumps and motors for CV-1 and CV-2 wells to meet the new head conditions that will occur as a result of using the blending tank. 5. Installation of	F	0	C	Stallion Springs CSD is a rural community located within the Cummins Valley Water basin that supplies its customers through local groundwater supply wells. Cummings Valley one (CV-1) the Districts largest producing well provides 90% of the source of supply for the District in the peak season. This well exceeds the MCL for nitrate at a range of 50 to 60 mg/L and perchlorate at 34 ug/L at initial startup, or whenever this well is idle during short duration of time. After extended and complicated flushing techniques have been completed District staff must adhere to strict sampling requirements to ensure the CSD does not violate the MCL for both forms of contaminants and as a measure to meet CDPHS standards. For the first few weeks of initial operation the CDPHS requires daily samples for nitrate with a hach field test kit, including weekly nitrate samples and daily perchlorate samples sent to a State certified lab. After the well has been operated continuously for about 3 to 4 weeks both nitrate and perchlorate drop to below the MCL. This amount of discharge is approximately 50 acre feet of water pumped to waste the District wishes to conserve, and cannot utilize due to high levels of chemical contamination.Water may be diverted to waste at anytime when demand is low or nitrate or perchlorate levels are elevated. With final permission from CDPHS, the well is put into service and operated	1,874,600	1,115	3,000	19	Kern	III	2008

298	5010008	5010008-011C	Hughson, City of	Well #7 Replacement Project	The Well #7 Replacement Project will consist of constructing a new deep well. Currently, City wells yield water from shallow zones, starting at approximately 200' below ground surface. The replacement well will target deeper zones in the 400' to 900' range. Since there is a confining clay zone between 300' and 370', surface contaminants will be reduced or eliminated. Construction of the deep well will ensure the City of Hughson has a long-term, reliable water supply that is not susceptible to surface contaminants. Since all existing City production wells are shallow, this project is vital to the City water supply program. Time is the essence as other wells could soon be lost to nitrate contamination, so constructing a replacement well is urgent. The project consists of (1) drilling a 900' exploratory well to identify deep water bearing zones and associated water quality (ensure exclusion of nitrates), and (2) constructing a deep well based on the exploratory well findings, and (3) site/mechanical improvements, as described below: (1) Exploratory Well: Like most municipal well projects, an exploratory well is required prior to production well construction. The exploratory well will be a special "casing hammer" type well so accurate water quality samples can be obtained. This process will confirm that nitrates have not migrated below the confining clays and that other water quality parameters are acceptable. The	F	0	C	The City of Hughson relies solely on local groundwater for its drinking water supply through the operation of five (5) high production water wells. Currently no alternative water source supplies are available for the City. In early 2012, the City of Hughson's Well #7 was removed from service due to an MCL violation for nitrates. Laboratory test results indicated water from Well #7 was consistently above the MCL. Equally as alarming, the City is also finding rising nitrate concentrations in other critical City production wells. In response, the City is proceeding immediately with construction of a replacement well. The replacement well will be designed to exclude surface contaminants including nitrates and DBCP.	1,165,000	1,779	6,082	10	Stanislaus	III	2012

301	3410016	3410016-003P	Orange Vale Water Company	OVWC Well No. 3 Perchlorate Treatment Project	This project would include treatment of groundwater from the newly installed Well No. 3 and potentially from existing Well No. 1 and would provide up to 2,000 AFY of reliable water supply for the OVWC. More specifically the tasks would include the additional well and treatment process permitting through the Department of Public Health (including a monitoring and reporting program), all water quality testing required for the design of the treatment system, and the design, construction material, installation, and startup of an ion exchange system to treat water from Well No. 3 and potentially Well No. 1. The most frequently used technology for perchlorate treatment is ion exchange. Ion exchange is a non-destructive phase transfer process where ions held electrostatically on the surface of a solid are exchanged for ions of similar charge. The media used for this process are typically strong-based monofunctional and bifunctional resins. The ion exchange process effectively reduces perchlorate concentrations to less than 4 µg/L and is employed at several drinking water systems in southern California.An accurate water chemistry analysis is vital to the success of any treatment system because the performance of individual resins change significantly with changes in the water chemistry. Published perchlorate treatment data is insufficient for design of a treatment system. In addition, an evaluation of	F	0	C	The Orange Vale Water Company (OVWC) is located in northeast Sacramento County, encompasses approximately 4.8 square miles and serves approximately 17,500 customers. OVWC now receives 100% of their supply from surface water supplies through its parent wholesale agency, San Juan Water District (SJWD). Two groundwater supply wells have been previously installed and used for emergency and dry year supply (Well No. 1 and Well No. 2); however, these wells have deteriorated over time which has resulted in the production of an unacceptable amount of sand, significantly reduced specific capacity of the wells, and Well No. 1 has now been impacted by perchlorate. Both wells are no longer reliable and OVWC has lost a combined 2,500 gallons per minute supply - even for emergency use. This makes OVWC vulnerable to lack of water supplies as well as providing conjunctive use supplies to SJWD. In 2007, through Proposition 50 grant funding and in coordination with the Regional Water Authority and SJWD, OVWC was awarded $400,000 in grant funds for the installation of a conjunctive use replacement well (Well No. 3) with a total cost of $1.4 M. The new Well No. 3 is located in the OVWC Corporation yard within approximately 300 feet of the existing Well No. 1. Well drilling and installation of Well No. 3 were completed in December 2007 with an estimated yield of approximately 2000	650,000	5,327	17,500	09	Sacramento	I	2008

302	1910038	1910038-004	EL MONTE-CITY, WATER DEPT.	Well No. 4 and Well No. 10 Blending	To bring Well No. 4 back to service condition, a blending operation between Well No. 4 and Well No. 10 water is proposed. Blending the flows of Well No. 4 to the nearest Well No. 10 is accomplished by construction approximately 3,700 linear feet of a new 12" pipeline connecting the two wells and then combining flow through a static mixer. Water in Well No. 10 has a low nitrate concentration (in the range of 15 mg/L as NO3) and can reduce the nitrate concentration of Well No. 4 through blending. The proper blending of the wells is accomplished by closing the existing valve (V-102) at Well No. 4 and throttling the existing valve (V-100) at Well No. 10. This action prevents flow from Well No. 4 from entering into the El Monte system directly. The proper amount of blend water is pumped from Well No. 10 through the new 12" pipeline and the flow is combined with the full production of Well No. 4. The blend water then passes through the static mixer to the water system. Operations personnel are responsible for manually throttling the valves (V-100 or V-101) at well No. 10 to ensure appropriate blending.New analyzers (AE-101, AE-102, and AE-103) will be integrated into the City of El Monte's SCADA system. During blending operations, Well No. 4 will be operated at full capacity and only the required blend water from Well No. 10 will be conveyed to the Well No. 4 site. Nitrate values recorded on AE-102 and AE-103 will provide the real	F	0	C	Water drawn from Well No. 4 in the El Monte water system has recently experienced a rise in nitrate concentration. The well was shut down in January 2008 when the nitrate concentration approached the MCL of 45 mg/L as NO3. Samples have been taken and currently the nitrate concentration is approximately 46 mg/L, above the state MCL level.	1,500,000	3,524	22,828	16	Los Angeles	IV	2009
303	1910143	1910143-006	SAN FERNANDO-CITY, WATER DEPT.	Centralized Nitrate Removal System at Well 4A	Prior requests for funds to DPH were predicated on a strategy to provide localized treatment at each of the affected wells exceeding the MCL for nitrates. Since then, due to increasing levels at the majority of the wells it has been determined that a consolidated approach with a geographically centralized nitrate removal system will better address current and future needs in a more cost effective manner. To date, the city has not received any grants through DPH to address this issue.The project consists of the installation of a nitrate removal system at Well 4A, which is geographically central to the other city well locations. Well 4A is also one of two sites containing the city's reservoirs. By being centrally located, water can be sent using existing water transmission lines to Well Site 4A for treatment as needed from Well Sites 3 and 7A. In order to treat water from the remaining Well Site 2A, the project will also include the construction of a new 1820 linear feet water transmission line to also send water to the reservoir at Well Site 4A as needed. Water from Well Site 2A can then be sent to Well Site 4A as part of a proposed blending plan for which the City would seek approval by DPH. The nitrate removal system will utilize conventional ion exchange with ion exchange columns, and a salt storage tank for regenerative brine. Nitrates will be removed to provide finished water with a maximum nitrate concentration of 27ppm (60% of the	F	0	C	The City of San Fernando was incorporated in 1911 primarily due to the fact that the City had local ground water rights to support its independence as a city. Since 1911, the City has exclusively relied on local water sources by right to meet 90% to 100% of its water supply needs. In January 1979 a Superior Court Case maintained the city's rights to local ground water sources through adjudicated rights to the Sylmar Water Basin. This basic right, which was the primary reason for the city's independence, is now threaten by rising nitrate levels which is expected to eventually terminate the use of the city's local water source unless a treatment system can be installed.There are four Well Sites that pump water from the Sylmar Basin and are identified as Well Sites 2A, 3, 4A and 7A. In May 2007 Well Site 7A was taken offline because nitrate levels exceeded the MCL. Due to this incident, this exceedence was posted to the public via the Annual Water Quality Report in June 2007. In November 2009, Well 3 had a nitrate reading in excess of the MCL that also required that it be shut down. Of the two remaining wells, Well 2A has seen a steady increase of nitrate levels with readings currently in the 36-38 range. Water samples for this well site are now conducted every two days to protect against a sudden spike in the nitrate levels. In February 2007, after extensive research and analysis, a consulting firm, Waterstone	1,000,000	5,049	23,564	16	Los Angeles	IV	2011

312	5401006	5401006-003	UC DAVIS-VET SCHOOL	UC Davis - Tulare Campus Well (New Potable Water Source)	UC Davis VMTRC proposes consolidation with the City of Tulare water system. The proposed project is to construct a new water well, built to City of Tulare specifications (1,000 ft deep; sealed to 300 ft.; 800 GPM), which will provide potable water and adequate volume for fire protection needs for the Tulare campus. The University and City of Tulare have discussed and agreed to the basic terms of joint development of this well. The City connection will be at the proposed annexation site which is adjacent to the UC Davis Tulare Campus (less than ¼ mile from the proposed well project). In addition to addressing the VMTRC's current critical need for potable water, new construction is scheduled for 2010, which will double the potable water requirements for the UC Davis Tulare Campus. The California Animal Health and Food Safety diagnostic lab will begin construction of their 37,000 sq ft diagnostic lab. With this new construction, it was determined that a more cost effective and long-term alternative was needed to address the needs of all UC Davis programs located at the Tulare site. Therefore, to resolve the current water contamination problems for all existing and future programs, the University is proposing this consolidation project with the City of Tulare water system.This new well and distribution system will serve less than 10,000 persons. However, the City of Tulare General Plan indicates considerable growth in this area	F	0	P	The VMTRC site is currently served by two existing water wells. Several years ago, these wells were found to be in excess of the State limits for nitrates and arsenic. Current water system exceeds the nitrate MCL (currently 46 ppm) and previously tested above the arsenic MCL (12 ppb). Currently tested at 9 ppb. After this time, the water produced by these wells was declared to be non-potable. Since this declaration, the VMTRC and all on-site staff have been require to utilize bottled water for all potable purposes. The Tulare County Health Department granted a special exemption for this bottled water use and has already granted one extension to this exemption (ending 06/06/09). Additionally, the current combined flow from these wells is insufficient to provide adequate fire protection pressure and volume in the event of emergency.In addition to providing potable water to over 45 UCD employees, our facility also provides drinking water to veterinary student housing; CDFA employees (Tulare Branch Office located on the East side of our facility); on-going middle & high school student tours; and College of the Sequoias students (20 – 30 students for evening classes; 3 – 4 times/week). Therefore, for public health and safety reasons, we are requesting construction funds to drill a Class I Water Well with the intent of consolidating with the City of Tulare in near future.The VMTRC is located in Tulare County, which according to	800,000	6	80	12	Tulare	III	2009

313	1900304	1900304-003	DEL SUR GARDENS TRAILER PARK	Del Sur Gardens Storage Tank Replacement	The proposed project is to remove the existing storage tank and replace it with a new poly tank meeting Title 22 and seismic requirements, and applicable codes.	F	0	N	The existing 20,000 gallon storage tank is leaking, very dilapidated, and needs replacing. It is also believed to be a source of TCR Coliform MCL exceedance resulting in Violations from LACoH.	40,000	20	25	16	Los Angeles	IV	2012
314	1907036	1907036-001	NEW APOSTOLIC CHURCH BOUQUET CANYO	Well water treatment system	Water treatment system to be installed where water enters building which will also require security cage to deter tampering. System will require regular maintainence and filter/tank replacement.	F	0	N	Water treatment system is required to treat well water bringing nitrate and arsenic levels to accepted levels for drinking. Currently, "Do not Drink" placards are placed at kitchen and two bathroom faucets, and have been in place for over 14 years. During this time drinking water has been supplied at two internal locations by Sparkletts bottle monthly service. A complete water analysis was completed in June 2009 and submitted for review to L.A. county dept. of public health. Quarterly bacterial sampling is also required.	10,000	1	40	16	Los Angeles	IV	2009
315	3600768	3600768-001P	Inst of Mentalphysics	POE Water Treatment for Joshua Tree Retreat Center	We are located in a rural area that has not been serviced by public water, and which the city has no plan to service, as it would be prohibitively expensive for the city to run the requisite miles of pipes.We will need to complete the research study we are currently involved in to determine the best solution, and then would need funding to implement that solution. Options under consideration involve:1) a reverse osmosis system that would be installed at the well. This would involve also installing much larger storage tanks than the ones we currently have, as the tanks would need to hold 2-3 thousand gallons. This system creates a lot of waste, so we would also need a stronger pump at each of our two pump stations, to pump more water through the system at peak times. The water would be pumped through a reverse osmosis membrane, and then a carbon filter, and would then need a second pump to re-pressurize it from the tank, especially important given that as a large residential facility we often have many people using water simultaneously. We would need to purchase and install all of this under this scenario.2) An ion exchange system involving plumbing in a water-softening unit at the well before the holding tank. This would involve a potassium chloride brine solution, a filter that would have to be rebedded on an annual basis, an enclosure that would have to be built around the unit, a way to run power to the unit, and a 5' x 5' drywell to dispose of	F	0	N	This project refers to the Joshua Tree Retreat Center. This is a large non-profit Center in Joshua Tree, which is very important to the local economy. The water on our facility comes from a well, which supplies all the water we use. It would be prohibitively expensive for the city to connect us to the local city water supply due to our distance from the main lines; furthermore, that supply has its own difficulties. Our water was found to be in excess of limits for nitrates as regulated by CCR, Title 22, Chapter 15 - the level here is 88 MCL, and we need to get it down to 45 MCL, as shown in table 64431-A. Research has shown that the most reliable way to do so is with Point of Entry water systems. This has been suggested by the Inspector for San Bernardino County Health Dept. who has placed us in violation. We have until June 2013 to get the nitrate level to code. We have 28 buildings that use water on the site, and have up to 5,000 people on the site for special events. Our current monthly usage averages 29,000 gallons.We are currently required to provide public notification of our Exceedance of Nitrate MCL.	50,000	1	70	13	San Bernardino	V	2012
316	5400548	5400548-001	KINGS INN MOTEL	Kings Inn New Water System	This system provides water for hotel and restaurant. Hotel provides free bottled water to guest, but when they see the Nitrates Water Warning sign they get akward feelings. Guest always shows concern (feeling) about the water to our employess. Many travelers come to hotel to rent the room as the get tired of driving on freeway, but when they see the posted Nitratres Water sign, they get turned away. Hotel and restaurant serves about 30,000 people annually. This funding would be use for installing new well, change new storage tank, and installing clorinzer.	F	0	N	This system has nitrates and contamantion (bactria) problems. We were able to solve bactria contamination problem, but we are not able to solve nitrates problem. Nitrates have constantly been exceeding the minimum level for past several years. We don't have any permanent solution to solve the problem with the existing well. The system is quite old (at least 20+ years). We have to drill new well to solve the problem.	16,334	1	130	12	Tulare	III	2007

317	0000541	0000541-001P	Monson Area Water Supply Study	Monson Safe Drinking Water Feasibility Study	The community of Monson currently obtains its potable water from private, domestic wells. Voluntary testing of twelve wells within the community was recently completed. All of the twelve wells tested showed nitrate levels in excess of the State MCL of 45 ppm. Several were as high as 130ppm. The average nitrate level detected was 105 ppm. No public water system is currently in place. The feasibility study would analyze a variety of potential solutions to the nitrate problem in Monson, including (but not limited to) consolidation or intertie with the nearby town of Sultana, formation of a community water system serving only the residents of Monson, or no action at all. The goals of the feasibility study include evaluating the alternatives so that the community may be equipped with the power of knowing what their choices are, and the County may help facilitate a solution. The feasibility study would also provide some preliminary design and cost estimates as well as environmental review, and would likely include the drilling of a water test well.	F	0	U	The unincorporated Tulare County community of Monson is not currently served by a public water system. Residents of approximately 25 homes obtain their drinking water from private domestic water wells, many of which are shared between multiple households. Nitrate levels in the area's groundwater have long been known to be high. Recent testing of a dozen domestic wells in the community revealed nitrate levels between 46 and 130 ppm, well over the MCL of 45 ppm. The average level of nitrate contamination among the wells tested was 105 ppm. All of the wells tested exceeded the MCL. Some of the wells also had coliform bacteria and low levels of DBCP are present. Monson is a low-income community, comprised mainly of farmworkers and their families. While the community is concerned about the safety of their water (indeed, most families spend scarce resources on buying bottled water), it is hard to know how to proceed. The County of Tulare wishes to pursue a feasibility study to examine alternative solutions to assist the community in obtaining a safe source of drinking water.	0	15	25	12	Tulare	III	2008
318	1600048	1600048-001	KETTLEMAN CITY ELEMENTARY	Kettleman City Elementary Water System Consolidation with KCCSD	It is the school's intention to connect to the Kettleman City Services District water system. The project will consist of a lateral, backflow prevention, and associated piping. The school wishes to maintain the current onsite well for irrigation of landscape and playing fields.	G	45	P	Kettleman City Elementary School has exceeded the arsenic MCL of 0.010 mg/L or 10 µg/L. As of the third quarter of 2008, the running annual average for arsenic in the school's well is 22.8 µg/L. Kettleman City Elementary School failed to comply with the National Revised Primary Drinking Water Regulations, Section 141.62(b)(16), Title 40, Code of Federal Regulations. The LPA has required the school to connect to the Kettleman City Service District as soon as practical so that the water provided by the school will meet current standards.The intent of the Kettleman City Services District is to construct a surface water treatment plant to solve the community's water quality problems. In addition, a consolidation with the school would solve the current problem of elevated arsenic in the water provided to the school from the school's well.	5,000,000	12	350	12	Kings	III	2008

320	3400364	3400364-001	HARVEY,JEAN SCHOOL	Connect Jean Harvie Community Center water system to existing SCWA system	Sacramento County Water Agency (SCWA) has provided a preliminary review of the Jean Harvie Community Center's water system and finds that the existing well is non compliant with State standards. SCWA recommends connecting Jean Harvie to the nearest township's water system, Walnut Grove. Installing a new well is not an option because of high Arsenic levels in the ground water. The option that Sacramento County Department of Regional Parks is pursuing is connecting Jean Harvie to Walnut Grove's water system. This water system is owned, operated and maintained by SCWA.The preliminary components of this project includes installing approximately 1,200 feet of 10-inch water main, one fire hydrant assembly, 2-inch water meter, backflow prevention assembly, zone-41 water connection permit, and other associated development fees and water easements.	G	45	N	According to the Sacramento County Environmental Management Department, the Jean Harvie Community Center is in violation of CCR, SECTION 64431. The average arsenic concentration of the well water based upon consecutive quarterly samples completed during August 2008 through May 2009 exceeds the arsenic maximum contaminant level of 0.010 mg/l (10 ug/l).Sacramento County, Department of Regional Parks owns and operates the Jean Harvie Community Center and the Caretaker House. The Jean Harvie Community Center, an early 1900's schoolhouse located in the heart of the Delta, offers a variety of opportunities for holding both large and small events. Well water is the only water source of potable water for this water system.Head Start, a non-profit and national program, uses two of the classrooms to provide comprehensive education, health, nutrition and parent involvement services to low-income children and their families. The Jean Harvey Community Center is also used to provide the community with health and wellness classes such as yoga, Pilates, senior exercise and children's gymnastics. The Community Center also houses historical records for the Sacramento River Delta Historical Society and serves as a U.S. Corp of Engineers disaster relief site for the California Delta.The water system is classified as a Non-Transient Non-Community water system and is subject to the arsenic maximum contaminant level of	143,000	2	25	09	Sacramento	I	2009
321	5110002	5110002-040	City of Yuba City	S. Walton Road Grace Baptist Church Water System	The requested funds would enable the City to purchase and install 1100 feet of 10-inch pipe, fittings and meter. The church serves a large number of residents each week and is concerned about the quality of the drinking water.	G	40	C	The Grace Baptist Church is experiencing deteriorating ground water quality and failure to meet regulatory requirements for arsenic and/or nitrates, iron and manganese is imminent. The system is located in the south western section of Yuba City and lies within the City's Sphere of Influence and Water Rights Place of Use. The Church leaders have expressed and interest in joining the City's clean drinking water municipal system. The connection would include installation of a water meter to meet the State's requirement. Yuba City has been declared a disadvantaged community by CDPH.	161,700	13,550	51,504	21	Sutter	I	2009

WATER SYSTEM	60th Street Water System Consolidation with Rosamond Community Services District	Consolidation with Rosamond Community Services District:Construction of a Rosamond CSD approved distribution system to serve the 60th Street water system area with clean water. Consolidation would also include water services, meters, valves, hydrants, annexation and capacity fees, legal, engineering and environmental expenses.	G	30	C	This small community water system serves 44 people in 10 homes west of Rosamond. The single well has water that exceeds the State Title 22 drinking water standards for Arsenic (10 ppb). Public notification will be in effect upon completion of the quarterly sampling and issuance of a CDPH Compliance Order.Prior public notification has been a conserve water notice due to the loss of water supply from a pump failure in April 2010.	350,000	9	44	19	Kern	III	2011
328	1502232	1502232-001	ROSAMOND MOBILEHOME PARK	Rosamond MHP-Rosamond	Contract with local water district to supply water to site location which is approximately 250 yards from main source. Engage local contractor to connect sytem and install individual sub meters. Upgrade underground water distribution system as needed. Use exisiting water well system for irrigation purposes only.	G	30	C	The exisiting well system supplies 79 mobile home/RV spaces. Recently the pump failed and was replaced at a cost of approximately $8000. It took several days to locate and repair the system and tenants were compelled to use bottled water supplied by park ownership. Due to many of the tenants being senior citizens this created a significant hardship as they were unable to locate transportion to the shower facilites that were offered at a nearby motel. In additon, a water supply truck loaded 8,000 gallons of potable water into the storage tank that the tenants depleted within 4 hours even though they had been warned that the water needed to last for approximately 3 days until the system was repaired. Select tenants had complete disregard for the notice asking them to conserve and in certain instances were seen watering their lawns or washing sdown their patios even though the water suypply was limited. A call was placed to the local water district to inquire about establishing service. It was communicated at that time it would cost a minimium of $250,000 to hook up the the exisiting system along Rosamond Blvd. Even though the pump is new, connecting to the local water district is highly desirable to avoid any disruption of service going forward. More importantly, the current	250,000	78	50	19	Kern	III	2007

330	5200550	5200550-002P	NEW ORCHARD MOBILE HOME PARK	Consolidation with Los Molinos CSD	Los Molinos CSD is currently seeking funding for construction of a water well that is to be completed in a zone where arsenic is below the MCL for that contaminant. The management of Los Molinos is open to the idea of consolidating not only the Orchard Mobile Home Park, but also the Mill Stream Mobile Home Park. The Los Molinos CSD and the Mill Stream Mobile Home Park are submitting Universal Pre-applications for this consolidation project. The project to consolidate the Orchard Mobile Home Park with Los Molinos CSD will necessarily include the construction of approximately 2,200 feet of 10-inch water main to connect to the existing 10-inch water main owned by Los Molinos CSD. Orchard Mobile Home Park engaged Nolte Engineering to develop preliminary engineering and cost estimates. The results of the preliminary engineering are summarized below:2,200 feet of 10-inch water main $220,000Crossing Tehama Vina Road $ 30,000Meters and connections $ 10,000LMCSD connection/assessment fee $ 80,000Total Estimated Project Costs $340,000It is important to note that their is an opportunity for cost sharing if all the potential users of the pipeline can come to an agreement. The Mill Stream Mobile Home Park, as well as Los Molinos CSD and Orchard Mobile Home Park will benefit from this project. Consolidation of Orchard Mobile Home Park and Mill Stream Mobile	G	30	C	Orchard Mobile Home Park is a senior park located in rural Tehama County. The park was established in 1974 under the current ownership. There are a total of 43 mobile home spaces of which 35 are occupied by seniors 55 years of age and older. The water system consists of two wells, one being 192 feet deep and the other 45 feet deep. Results for a series of quarterly samples in 2008 for arsenic are: North Well 22.5 ug/l and South Well 16.75 ug/l. Tehama County Environmental Health has issued a compliance order and directive that the water system must be in compliance with the arsenic standard no later than December 2010. The users of the water system have received notices of the violation with the arsenic standard.	500,000	43	56	21	Tehama	I	2009

334	1510018	1510018-006	ROSAMOND CSD	Northwest Rosamond Area Improvements	Lands of Promise will be connected initially with 3.2 miles of 12" PVC and DIP pipeline from an existing RCSD pipeline on Sweetser Road. Connecting to that pipeline at Tropico-Mojave Road and going north and then west to Fisher will be 5.3 miles of 12" DIP and PVC pipeline. Pump Station on south end exists but will need electrical upgrade for SCADA control. Pressure relief valves and controls will be needed at Fisher as the north terminus. Area north of Lands on Sweetser is primarily rock and hard digging. A new surge tank will be needed at each location. Engineering and design costs included in this estimate but acquisition of easements costs have not been. Most of the pipe route is in Kern County R-O-Way. Additional chlorination stations will be needed at both terminations. Additional booster pump station for Fisher will be needed north of Sweetser.	G	30	C	Fisher Memorial sits on foothill rock north of Rosamond Proper, with small single production well (24 gpm) & high arsenic. There are only individual private low production domestic wells in the area. Lands of Promise, also sits on rocky area, has 5 wells, 2 are down, all show high arsenic (max well production =250 gpm), & also is surrounded by domestic wells. Lands can be connected with 3.2 miles of 12" piping. Adding another 5.3 miles connects Fisher. Both systems will have higher pressure with RCSD connection, water meeting MCLs & alternate supplies from an established State Certified Operator controlled CSD. There are approximately 18 connections in Fisher and 50 connections at Lands. Neither system has resident Operators. Neither system can afford to improve their wells.	5,300,000	4,593	10,633	19	Kern	III	2007
335	5010028	5010028-006	Ceres, City of	City of Ceres Water System Consolidation Project	The construction of a water main line to ecxtend the current city service from Crow's landing Road and Hatch Avenue to Foy Avenue and West Monte Vista Road with resultant consolidation of distributed unconnected communities along this route is the primary thrust of theis project. The length of the proposed water main is approximatedly six miles, requiring all concurrent construction costs and associated management requirements to be purchased by the city. This includes the trench and back filling, a twelve inch main and assocuiated valves, monitoring equipment, pump station and booster pumps, storage tanks and metering. Also needed are the connections to some one hundred residences in the areas desribed in the project.	G	30	C	Several small communities within the south east side of the city of Ceres are currently utilizing unbsafe well water for private household consumption, and it is the hope that these communities can be connected to the main city system through a water main extending down Crow's Landing Road to West Monte Vista Road.The community of homes bordered by Crow's Landing Road to the east, San Joaquin Street to the north and Lathrop Street tot the south is the first unconnected community on the route. These homes are currently using well water for private household consumption. As the water main is extended south down Crow's Landing Road, it is hoped that these low-income homes can be consolidated into the Ceres system.Further down down Crow's Landing Road, and east on West Monte Vista, Monterey Tract Community Development comprises about thirty homes located off of Foy Avenue and West Monte Vista Road in the south east section of the city of Ceres. The Community is essentially a low-income group of homes. The City of Ceres is seeking funding to connect the Monterey Tract Community Development with the city water system in order to ensure safe water for this small community. The Monterey Tract Community Development currently use drinking water from two wells located within the confines of the development. The water from these sources has been found in violation of safe levels of arsenic and nitrates.	10,000,000	10,617	40,943	10	Stanislaus	III	2008
336	1310008	1310008-003P	Westmorland, City of	Feasibility study to address SWTP and DBP issues.	The project will require a preliminary engineering report, final design and right of way acquisitions and construction of a 4 mile 12 inch water pipe line from the City of Brawley to Westmorland's water treatment plant's water main connection.	G	25	C	The City of Westmorland has been cited by CDPH several times for exceeding the MCL for TTHM, most recently in the second quarter of 2011. Currently, Westmorland uses free chlorine as the primary disinfectant. The existing water treatment plant (WTP) has raw water that is settled within a raw water pond system with inadequate coagulation mixing and no mechanical sedimentation removal process. This decreases the effectiveness of coagulant chemicals and their ability to reduce organics from passing through the treatment process and reacting with the free chlorine. Westmorland's WTP is currently averaging Total Organic Carbon removal levels that are 30% of the required removal goals. This has contributed to the TTHM MCL exceedance.	8,000,000	601	2,444	14	Imperial	V	2012

337	5100172	5100172-001	Encinal Elementary School	Well water arsenic treatment system	This project will be the planning, purchase and installation of an arsenic treatment system.	G	25	P	This project is intended to address California Department of Public Health Compliance Order No. 01-21-10(O)51002. This is a Compliance Order for excessive arsenic in the well water serving the students and staff at Encinal Elementary School. Public notification is in effect and required at approximately 90-day intervals.	31,320	1	60	21	Sutter	I	2012
338	2800840	2800840-002	NAPA COUNTY SCHOOLS: POPE VALLEY	Pope Valley School DBP Project	Install monitoring instrumentation to measure changes in treatment process for effectiveness in reducing TTHM and HAA-5 levels that are exceeding MCL limits. Additional instrumentation (SCADA) will better monitor plant performance and replace limited monitoring-only system allowing timely adjustments and corrections to varing water conditions at this remote, rural school.	G	25	P	High disinfection by-products present in surface water tratment resulting in exceeding HAA-5 and TTHM limits resulting in multiple violations.	80,000	1	100	03	Napa	II	2008
339	2701227	2701227-004	SAN BENANCIO SCHOOL WS	San Benancio School Filtration Plant for Arsenic removal	The San Benancio Middle School/A.B. Ingham schools propose to install equipment to remove Arsenic and Lead & Copper from their water system using processes of co-precipitation, filtration, and pH control. Liquid ferric chloride and liquid sodium hypochlorite (chlorine) are injected into the water and the Arsenic is oxidized and adsorbed on the precipitated iron hydroxides. The precipitated hydroxides including Arsenic are removed from the water through a pressure filter containing a catalyzing agent - sand coated with manganese dioxide. The filter is periodically backwashed to remove the precipitated solids resulting in sludge which is accumulated in disposable cartridges which are stored for disposal in accordance with county and state regulations. After filtration pH control will be used to prevent Lead and Copper leaching from the water lines and fixtures into the drinking water. This will allow the schools to finally use water that meets all health standards for drinking and food preparation.	G	25	P	The San Benancio Middle School, 43 San Benancio Rd. Salinas, CA 93908, water system serves 2 schools, San Benancio and A.B. Ingham schools and a common campus with water from a single groundwater well. San Benancio M.S. is part of the Washington Union School District and A.B. Ingham School is operated by the County of Monterey for special needs students. The 2 schools serve over 500 students and staff. The water is currently chlorinated but there is no filtration. Recent raw water monitoring indicates that Arsenic exceeds the MCL of 10 ug/l ranging from 27 to 37 ug/l. The Monterey County Health Department has indicated that all systems exceeding the Arsenic MCL must reduce this contaminant to less than 10ug/l. In addition Lead & Copper have been found at unacceptable levels in the water system serving classrooms. These schools have been mandated to use bottled water for all students and staff for an extended period of time. They are in compliance with this mandate at a considerable annual cost.	200,000	2	100	05	Monterey	II	2009
340	5000273	5000273-001	GRATTON SCHOOL	Filtration Water System	To put in place a filtration system that will remove the arsenic from our water.	G	25	P	The Gratton School Water System exceeds the arsenic maximum contaminant level. California Code of Regulations, Section 644531(a). This problem requires public notification of an exceedance of the chemical arsenic. A drinking water notification has been hand delivered to each consumer and a proof of notification has been faxed to the Department of Environmental Resources. This notification is currently in effect and will continue on a quarterly basis until it is resolved.	80,000	2	110	10	Stanislaus	III	2009
341	1000182	1000182-001	BURREL UNION SCHOOL	Lead and Copper Improvement Plan	Funding is needed to initiate a water quaility study and implement any identified appropriate solutions.	G	25	P	Lead testing since 1999 shows exceedences of the Pb action level of 0.015 in 5 of 7 rounds of testing. School operations prohibit more accurate lead and copper sampling. Ageing fixtures are suspected to be major source of contamination.	250,000	1	120	23	Fresno	III	2011
342	1502607	1502607-002	PIUTE MOUNTAIN SCHOOL WATER	Piute Mountain School Well	To date we have explored options and contacted an engineer. One option would be to purify the water. This would require training, engineering, construction and monitoring in addition to purchasing the purification equipment. Option two is to abandon the current well and try to drill a new well.	G	25	P	Currently our well exceeds Flouride levels, and when levels change the end of this year our Arsenic levels will be too high, also. In addition to MCL failures, we have issues with lack of water. We have mailed out notices and posted them throughout the school.	50,000	3	200	19	Kern	III	2009

343	5100139	5100139-002	Franklin Elementary School	Elevated arsenic levels Franklin School - Planning Study	The Franklin Elementary School District is requesting funding to conduct a planning study in an effort to determine the most effective method to reduce the levels of arsenic in the well serving the students of Franklin School. Currently the arsenic levels are averaging around 13 ug/L and steps need to be taken to determine the most cost effective method to eliminate the presence of arsenic in the drinking water. Franklin School is a single K-8 school district located on the outskirts of Yuba City, CA. Currently Franklin School serves a student population of around 470 students, with approximately 40 additional employees on site during the school day. Franklin School has approximately 25 drinking fountains located inside the buildings with an additional 5 drinking fountains outdoors. All of the water that comes out of these fountains originates from a relatively new well that was installed in 2006.	G	25	P	On November 3, 2009, the Franklin Elementary School District had an arsenic concentrtion of 13.9 ug/l. Since this was in excess of the 10 ug/L allowed by the U.S. Environmental Protection Agency, the District was required to monitor for arsenic on a quarterly basis beginning with the first calendar quarter of 2010. The District has monitored the arsenic levels since November of 2009 and all results indicate an arsenic level of around 13 ug/L. Since it is obvious that the District will need to take the appropriate steps to ensure that the water is safe for the students of Franklin School, a planning study is necessary to determine the lowest cost alternative.	10,000	1	468	21	Sutter	I	2011
344	5400519	5400519-001	PALO VERDE SCHOOL	Palo Verde School Safe Drinking Water Project	Palo Verde School's water well has shown varying results in levels of contamination, and this project would allow the school to determine what level of contamination is present and what level of remediation needs to be undertaken. The school will proceed with quarterly water testing. If funded, this project would include the drilling of a test well that will determine if there is an adequate supply of potable water to meet the school water system's demand. The test well would identify aquifers that produce safe drinking water and those that should be excluded from the design of a succeeding production test well. If the test well is successful, the project would include the drilling of a new production well with installation of a pump and storage facilities. The water well facilities would then be tied in with the existing school water distribution system.	G	25	P	Palo Verde School's well has historically tested high in arsenic levels. Recent tests in 2005 and 2007 have shown arsenic levels at 10ug/L, and the school has been advised to start doing quarterly testing, and it is anticipated that quarterly testing will reveal arsenic levels above the MCL of 10ug/L. In 2002, arsenic levels of 20ug/L were detected; in 2000 and 1997, levels of 12ug/L were detected. Wells at other schools in the area also have high arsenic levels. There is also a concern regarding a nearby sewage treatment plant. Local farmers are spreading sludge on fields, which may eventually result in elevated nitrate levels in drinking water for Palo Verde's well.	900,000	26	500	12	Tulare	III	2007
345	5100149	5100149-001	Barry Elementary School	Barry Elementary School well arsenic treatment project	This water system serves a rural public school at some distance from any other water system so consolidation is not appropriate. The system is currently working with a qualified engineer to develop an appropriate treatment plant for a system of this size. This will include absorptive treatment equipment, with media tanks, storage tanks, pumps, and new distribution piping to modify and connect to the exising system.	G	25	P	This public school water system is in violation of CH&SC Section 64432(a) relating to exceeding the arsenic MCL. This water system is temporarily providing bottled water due to a DOH compliance order for exceedance of the arsenic MCL. Notification is required. The compliance order requires the system to develop and implement a plan to bring the system into compliance no later than December 31, 2010.	500,000	1	560	21	Sutter	I	2009

346	0706028	0706028-001	KNIGHTSEN ELEMENTARY SCHOOL	Treatment for Arsenic Removal	The water system serves a public school with approximately 600 students. The primary water source (Well # 3) was installed in March 2005 to replace the North Well (elevated Gross Alpha levels) and the South Well (fluctuating nitrate levels). The North Well and South Well are currently used for irrigation only.The proposed project would include installation of treatment facilities for arsenic removal. The treatment facilities would include pre-chlorination, minimum of 2 pressure vessls with selective media, flow meters, and distribution piping. Security housing/structure to be installed around the treatment system.Alternatively, Well #3 could potentially be blended with the North Well or South Well depending upon the current monitoring results for the two irrigation wells which were at one time the primary water sources for the system. The blending altrernative would require initial monitoring for the supplemental source(s), flow meters, blending valve and finished water storage tank.	G	25	P	The water source for the system has exceeded the Arsenic MCL based on a Running Annual Average of 12.5 ppb. The system is in violation of CCR, Title 22, Section 64431 for delivering water above the MCL for Arsenic - 10 ppb.Public Notification - Exceedance of a Chemical MCL was required and is currently in effect.	90,000	3	600 04	Contra Costa	II	2009
347	3901169	3901169-001	MUSD-NILE GARDEN SCHOOL	Manteca USD - Nile Garden	The Manteca USD - Nile Garden School Water System has exceeded the Federal MCL for arsenic. The school is exploring treatment as the option to bring the water system back into compilance because there are no municipal water available in the area for consolidation, and the school is apprehensive about drilling a new well which water may still fail regulatory standards. If the school chooses treatment, there will be the cost of on-going monitoring of the treatment system, regular replacement of the filters, disposal of the filters which may be considered hazardous waste, in addition to the start up cost of the treatment equipments such as pipings and tanks. If treatment is not cost-effective, drilling of new source well may be the only reminding option.	G	25	P	The average of 4 sample results of the well in 2006 and 2007 was 23.75 ug/L for arsenic, and exceeds the new MCL for arsenic of 10 ug/L, National Revised Primary Drinking Water Regulations, Federal Arsenic Rule, Section 141.62(b), 40 Code of Federal Regulations.	500,000	3	804 10	San Joaquin	III	2008
348	1900961	1900961-003	WINTERHAVEN MOBILE ESTATES	Winterhaven Mobile Estates	The Water system is in need of an additional water source to meet the demands of the community, and to reduce arsenic concentrations. i.e. new ground water well.	G	20	C	Water Quality from Well #1 has ARSENIC concentrations that exceed the 0.050 milligrams per liter (mg/L) National Primary Drinking Water Standard Maximum Contaminated Level. The water system has insufficient water storage for fire protection.	500,000	20	27 16	Los Angeles	IV	2008
349	2100579	2100579-001	NICASIO VALLEY RANCH MUTUAL	Nicasio Valley Ranch / Arsenic Mitigation	The goal of the project is to identify a new source for domestic water or for treatment of the exisiting source for arsenic removal. The project will include engineering, design, installation of treatment systems, or conveyance of new source water. The project may include consolidation of two or more nearby non-compliant systems.	G	20	C	Current post-treatment arsenic levels exceed the Primary MCL. Secondary standards for iron, manganese, and color are exceeded as well. The complex water treatment system includes centralized, point-of-use, and point-of-entry components. Consequently, the system has not been able to comply with all monitoring directives including Section 64432 (b) (2) and (d), Federal requirements for POE, LPA requirements for POU. The system has yet to obtain a wastewater discharge permit for disposing of byproduct water from the MTM/Greensand backwash cycle. The Nicasio Valley area is characterized by the LPA as one of the three most problematic areas in the county for water availability and quality.	500,000	17	51 18	Marin	II	2007
350	4900643	4900643-002	Mount Weske Estates Mutual Water Compa	Consolidation With Adjacent Water District	Interconnect the distribution system with a supply pipe & a booster pump from the Town of Windsor Water District. The installation woul be very similar to that which Windsor already provides to the Shiloh system.	G	20	C	The Arsenic content exceeds the MCL of 50 ug/L & has done so ever since the water system was approved by the regulating authorities in 1974	765,000	21	62 18	Sonoma	II	2007

351	4901195	4901195-003	Moorland Avenue Apartments	Regional Consolidation with City of Santa Rosa (Arsenic)	Regional consolidation of the Moorland Avenues Apartments with the City of Santa Rosa. Other systems involved in the consolidation include Sequoia Gardens MHP, Lancelot MHP, Rancho Santa Rosa MHP. *Note as of 6/29/2012: this Regional project has been issued a Prop 84 Feasibility Funding Agreement to design the P&S, CEQA, etc for the project. The FA is with the City's legal staff for review and acceptance.	G	20	C	Arsenic levels in well exceed the MCL.	161,337	16	64	18	Sonoma	II	2012
352	4900855	4900855-001	Lancelot Mobile Home Park	Lancelot Mobile Home Park	CONNECT TO THE CITY OF SANTA ROSA AND MAKE NECESSARY DISTRIBUTION SYSTEM IMPROVEMENTS	G	20	C	WATER EXCEEDS FEDERAL MCL FOR ARSNIC. NO TREATMENT AT PARK.	276,000	29	75	18	Sonoma	II	2007
353	4900786	4900786-001	Rancho Santa Rosa MHP	RSR Well	The project will result in abandoning the current ground water source in favor of connecting to the City of Santa Rosa water distribution system. This will require construction of approximately 5,000 feet of 6-inch water line to connect the Rancho Santa Rosa MHP to the City's system. In addition to pipeline construction, the project will include appropriate backflow prevention, fire protection, metering, and destruction of the contaminated well.	G	20	C	The arsenic concentration of the finished water exceeds the Federal Maximum Contaminant Level. Consequently, the system is in non-compliance for the primary arsenic standard. The system serves 82 residential connections and no commercial connections. The total number of service connections severely limits the system's treatment options with respect to overall cost of treatment and limited revenue from water sales.	775,000	80	175	18	Sonoma	II	2007
354	0600011	0600011-002P	Del Oro Water Co.-Walnut Ranch	Del Oro - Walnut Ranch Construct Intertie and/or Construct Water Treatment Facility	To construct a system intertie with an adjacent water utility (Colusa Industrial Park) or construct a water treatment facility, including a new well.	G	20	C	Arsenic level in drinking water exceeds the MCLNotices (Exceedance of a Chemical MCL) to the customers have been mailed directly the the customer and posted on Del Oro Water Company's website.	0	78	182	21	Colusa	I	2012
355	1500378	1500378-001	MAHER MUTUAL WATER COMPANY	Consolidation with Vaughn Water Company to resolve issue with high arsenic in Well 01	The Maher Mutual Water Company wants to resolve the issue of arsenic in well water by connecting to Vaughn Water Company which is located less than 1/2 mile away from the Maher Mutual Water Company. The project will need upgrading of the Maher MWC's distribution system if required by Vaughn Water Company as part of the consolidation.	G	20	C	Our system well produces water exceeding the new federal arsenic MCL of 10 ug/L.	213,380	50	192	19	Kern	III	2007
356	5410034	5410034-003	Pine Flat Water Company	Pine Mountain/Flat Water Treatment Blending Facility	The proposed project include construction of water distribution piping to route water from each of the three wells to a common manifold. The blended water will then be treated by a uranium treatment system which has been designed to treat the observed uranium and gross alpha contaminant levels for all the wells. Chemical injection of sodium hypochlorite will be included. The currently designed blending facility configuration will allow for 95% removal of uranium and gross alpha regardless of individual well stream concentrations and will meet CDPH water quality requirements.	G	20	C	The groundwater wells in the Pine Mountain / Pine Flat service area are currently affected by high levels of Radiological contaminants - specifically uranium and gross alpha. The District has recently drilled a new well with the hope of blending non-contaminated water from the new well with MCL contaminant water from two existing wells. The new well, however, also contains radiological contaminants above the MCL. For this reason the CDPH has required the District to issue public notification of the uranium/radiological levels.	500,000	223	200	12	Tulare	III	2009
357	2400108	2400108-001	MCHA LOS BANOS CENTER	Los Banos Migrant Center Water Supply Replacement	The Housing Authority has contacted the City of Los Banos for a water service connection to the Migrant Center and the City has agreed to provide service. The project will include installing water distribution system improvements and a storage tank.	G	20	C	The Los Banos Migrant Center has an existing well that has high levels of uranium, arsenic, iron and manganese which exceed the MCL's. Other wells have been drilled in this area by the City of Los Banos but acceptable water could not be found.	1,200,000	80	270	11	Merced	III	2007
358	4900676	4900676-001	Sequoia Gardens Mobile Home Park	Regional Consolidation with City of Santa Rosa (Arsenic)	Regional consolidation of Sequoia Gardens MHP with the City of Santa Rosa. Other systems involved in the consolidation include Moorland Ave. Apts, Lancelot MHP i.e. Westfield Community, and Rancho Santa Rosa MHP. 359	5101009	5101009-002	Wildwood East Mutual	Consolidation of Wildwood East water system with Franklin School District	I am assuming that all of the above is covered by the overall grant . The project will include each addition to the Franklin grant. All of the additions including Wildwood East are located north off Franklin blvd. The plan is to run a water line from the main feeder water line on Franklin down each street in each area to which the individual homes will be connected. The connection to each home will be part of the grant. The connection from the well that currently provides water will be disconnected. However, the well water will continue to be used for landscaping by hooking into the outside water lines already established.	G	20	C	The Wildwood Water District would like to be included in the Franklin School District grant along with the three other small private water systems already included in the grant. We have been informed that our water purity is no longer in compliance with the EPA standards for the amount of arsinec allowed in the water which is 10pbb. We have been notified that our present test results for arsinec is 13ppb. We understand that future tests are requried to average 10.4 or above.This score is no surprise as we have been aware of the gradual increas in the arsinec contamination over the past years.When tested for arsenic the Wildwood East Water district has tested:5ppb in year 2000, 5 ppb in 2001, 12 ppb in 2002, 8.8 ppb in 2005 and 2006. 9.7 ppb in 2008 and 2009, 10.0 ppb in 2010 and 13 ppb in2011 which puts our District out of compliance like the other water districts (trailer park, El Margarita Water District, and Wildewood Water District). Now all of those areas exceed the State standard for contaminent and, because of this, fall under a grant for the Franklin Elementary School District. Given that our District is no longer in compliance, Wildwood East Water District would like to be included in the grant for the Franklin Elementary School District. We are geographicly located in the middle of the other applicants, our kids attend Franklin Elementary. Moreover, since the group that is most likely to be affected the most by arsenic are	1,000,000	49	350	21	Sutter	I	2012
360	1500409	1500409-004	BROCK MUTUAL WATER COMPANY	Brock Mutual Water Company-Consolidation with Vaughn WC	The consolidation Project will connect to Vaughn Water Company's pipeline which is less that 1000 ft. from Brock Mutual Water Co. As part of the project, new distribution system, meters and service line will be installed.	G	20	C	Brock Mutual Water Companys well produces Arsenic above the MCL of 10 Mg/L and is in violation.	1,600,000	155	500	19	Kern	III	2012
361	2410002	2410002-003	DOS PALOS-CITY	Water treatment plant replacement project	City of Dos PalosWater Treatment Plant Replacement ProjectThe existing water treatment facility is over 60 years old and has fulfilled the expected life of the facility. The community needs to replace the facility to come into compliance with directions from the California State Department of Public Health – Drinking Water Division and provide a new reliable treatment facility for the service area. The existing facility has had two violations due to the inability of the facility to operate effectively during high demand periods of the year. These peak usage periods during the hotter months of the year cause the treatment facility to become out of compliance with required regulations in the state's guidelines for the treatment process. The production quantity of the facility has also dropped by nearly 25% from the original design and operation of the facility. The facility was original designed for a daily treatment flow of 3 million gallons and presently the operator is only able to produce 2.2 million gallons per day and this high production level can usually only be maintained for a short period during the peak period of a couple of weeks. The new project site is at the southern end of the service area and would be adjacent to the transmission pipeline from the California Aqueduct, this is the water source for the community. The new plant would treat the surface water at this location and use the existing transmission pipeline from	G	20	C	City of Dos PalosWater Treatment Plant Replacement ProjectThe existing water treatment facility is over 60 years old and has fulfilled the expected life of the facility. 362	5410006	5410006-007P	Lindsay, City of	Lindsay - 14 Dibromochloropropane (DBCP) Mitigation Project	The City has developed a cost estimate for granular activated carbon (GAC) treatment for Well 14. While the GAC treatment process is a historically proven method of filtration, part of the planning process would be to explore other potential forms of DBCP removal.The final desired outcome of the planning process would be identification of the most effective, long term remedy of DBCP removal.	G	20	C	In the last 2 quarters of 2011, City of Lindsay Well 14 has experienced levels of DBCP that exceed the State maximum contaminant level (MCL). On March 16, 2012, the City was issued a "Compliance Order for Violation of the Dibromochloropropane (DBCP) MCL; Order No. 03-12-12O-003". The Order states that the City is to cease and desist from failing to comply with CHSC Section 116555 (a)(1) and (3) and CCR Section 644431; that the City must submit plan and time schedule for improvements to the water system to correct the DBCP problem; that the City submit quarterly progress reports to the CDPH commencing April, 2012; that the City provide Tier 2 public notification for its inability to meet DBCP MCL and continue public notification each quarter Well 14 is in violation.The City of Lindsay has limited access to water supply. We rely on a long term contract with the United States Bureau of Reclamation (USBR), Wells 14, 15 and 11 and provide the water supply for the City and surrounding areas that are connected to our domestic water system.Our long term USBR contract amount is capable of sustaining City demands but is constantly in flux. Recent allocations to San Joaquin River Restoration, unpredictable drought patterns which have reduced the City contract allotment are immense impacts to a constant, reliable water supply. The USBR contract water is delivered to the City via the Friant Kern Canal (FKC). The FKC	0	2,335	11,450	12	Tulare	III	2012
363	1910070	1910070-056	LOS ANGELES CO WW DIST 4 & 34-LANCAST	NE Lancaster Small Water System Consolidation	Public Works proposes to interconnect three small mobile home park water systems (there is a fourth small system that could also be connected) and the Los Angeles County Waterworks District No. 40's (District) existing Beverly Martin small water system with the District's Region large water system, which serves the City of Lancaster. The water delivered to the Lancaster area is supplied by imported water from Antelope Valley East Kern Water Agency and from groundwater wells. This system meets all drinking water standards.The proposed project includes the installation of approximately 56,000 linear feet of 12-inch diameter water mains designed as a looped system. The proposed looped pipeline network will mitigate potential water quality issues such as low chlorine residual and trihalomethane formation. Interconnecting all of the systems will also: 1) reduce long-term maintenance costs, 2) provide system reliability, and 3) enhance fire protection. The new system will have additional capacity to support future interconnections from other small water systems within this region. In addition to the water main loop, Public Works proposes to construct a new groundwater well, situated and designed to produce water that meets all State and Federal drinking water standards. This new well will provide a backup source of supply to all of the interconnected systems. The well will be located	G	20	C	California Department of Public Health officials have indicated to the County of Los Angeles Department of Public Works (Public Works) staff that several small water systems serving mobile home parks located northeast of the City of Lancaster, California have reported high levels of arsenic concentrations in their source groundwater wells. Some of these small systems have reported arsenic concentration levels that exceed the 10 parts per billion (ppb) maximum contaminant level (MCL). Furthermore, all of these small systems lack adequate flow for fire-fighting purposes (fire flow) and do not have access to a reliable water supply source. 2010 census data shows that this census block group has a median household income of $22,804.	16,335,000	46,878	144,215	16	Los Angeles	IV	2012
364	4901267	4901267-001	True to Life	Arsenic	Our Arsnic labe results have been going up steadily over the last 8 years. As of 3/26/07, our results are 9.90ug/l. The MCL for Arsenic is 10. We are concerned about this.We would also like to mitigate the noticeable sulphur smell in our well water.	G	20	P	Over the last 8 years we have noticed that our Arsenic lab tests results have been going up. As of 3/26/07, our lab results came in at 9.90 ug/l. The MCL for Arsenic is 10ug/l. We are concerned about this.We would also like to mitigate noticeable sulphur smell from the well.	50,000	4	35	18	Sonoma	II	2012

365	1000577	1000577-001P	Dunlap Academy	Dunlap Leadership Academy water project	Kings Canyon unified school district needs to conduct a planning and feasibility study on Dunlap leadership Academy (System No.1000577-001) and Dunlap elementary school (System No. 1000184-002) to see if it's feasible to combine the two facilities to one water source. Currently they are about 1 mile apart and their current water well which is providing good drinking water is disinfected with chlorine. The well construction was approximately 40 to 50 years ago and may not provide an adequate source of water for both facilities therefore it may need to be reconditioned. The project should also look to providing back up power generation for the drinking water well for both facilities in this case because the facilities are used in emergency situations.	G	20	P	Dunlap leadership Academy (System No.1000577-001) is a school that is proposed to grow this project is intended to fix the drinking water capabilities of the school. It is currently dealing with uranium and gross alpha issues that have exceeded the MCL set by both state and federal regulations (Section 64442.64432(h)(3), And have prompted the California department of public health to issue a citation (Compliance Order No.03-23-11O-005) . The school is currently providing bottled water for students and staff and requires quarterly exceedance of chemical MCL notification.	750,000	3	75	23	Fresno	III	2012
366	5100180	5100180-001P	Grace Baptist Church	GBC Water Project	The city of Yuba City is planning to extend their water system past our property. Our plan is to connect to their system and use surface water instead of our well for domestic use. The city is expecting approval of a grant which will allow a majority of the costs to be covered. Our anticipated costs include a tap fee and necessary plumbing to connect our facilities to the main line run by the city.	G	20	P	Arsenic concentration exceeded maximum contaminant level. CH&SC, Section 64431 (a): The average arsenic concentration at Well No. 1, based upon four consecutive quarterly samples completed during the third calendar quarter of 2008, exceeds the arsenic maximum contaminant level of 0.010 mg/l (10 ug/l).Public notification required was quarterly notices stating that we had levels of arsenic above the drinking water standard. These notices were issued from May of 2007 through July of 2008. At that time a point of use device was installed on the one location where we have water for public human consumption. We are currently operating on a permit that allows us to use this one POU device with bottled water available for human consumption.	0	1	200	21	Sutter	I	2011
367	2000828	2000828-001	SHADY OAKS MOBILE HOME PARK	Shady Oak Mobile Home Park Water Treatment	Installation of treatment, filtration, and monitoring equipment capable of handling a 60 gpm facility.	G	15	C	Contaminants have been discovered during routine testing. Laboratory testing showed higher than normal levels of Uranium putting water system out of local compliance.	35,000	21	40	11	Madera	III	2007

369	1009172	1009172-001	VAQUERO FARMS	Vaquero Farms - TTHM Compliance	installing 40,000 gallon storage tank	G	15	C	will not meet contact time	90,000	18	70	23	Fresno	III	2009
370	3900711	3900711-001	SIDHU MOBILE PARK WATER SYSTEM	Sidhu Mobile Park Water System	If possible and preferably (unknown at this time), Sidhu Mobile Park Water System should connect to City of Stockton. If extension of city water to the facility is not possible, drilling for a new source or treatment will be the remaining options. The water system also has a history of bacterial monitoring violations and non-compliance, and cross-connection issues due to existing structural limitations and sewer / water line layout. Connection to city water would eliminate that.	G	15	C	The average of 4 sample results from the water system is 12 ug/L, exceeding the new MCL for arsenic of 10 ug/L, National Revised Primary Drinking Water Regulations, Federal Arsenic Rule, Section 141.62(b), 40 Code of Federal Regulations.	500,000	23	75	10	San Joaquin	III	2008
371	1900520	1900520-002	SMITH'S VILLAGE MOBILE HOME PARK	Arsenic Treatment	The system proposes two options, depending on most cost effective and feasible solution;1) drill a new well, install a storage pressure tank and arsenic treatment and monitoring equipment, and enclose the perimiter with security fencing; or2) consolidate with a nearby water system. Lancaster is a possibility, but the distance to a connection point is not known at this time.Either option would supply a safe reliable water source that is not in exceedance of the federal Arsenic MCL.	G	15	C	This water system has one well and no backup water supply source. The only well is ~30 years old, does not have a backup power source, and exceeds the Federal Arsenic MCL. If the well fails, the system will be without drinking water. The current supply is not a safe reliable source.The LPA has issued a Notice of Violation for federal Arsenic MCL exceedance.	850,000	34	75	16	Los Angeles	IV	2008

372	1000248	1000248-002	DOUBLE L MOBILE RANCH PARK	Uranium MCL Feasibility Study	The anticipated project includes the evaluation of alternatives and development of plans and specifications for the selected alternative. Currently, a new source, treatment, or a combination of the two, are being considered. The City of Kerman is approximately 3 miles away; consolidation is not expected to be economically feasible. The Water System imagines any project would provide additionally reliability in the case of source of supply failure, through either a secondary source (through the replacement of current primary source) or added source capacity.	G	15	C	This public water system is a community system that serves approximately 80 individuals through 37 service connections. The water system is believed to be a disadvantaged community located in rural Fresno County, east of the City of Kerman. The Water System completed initial radiological monitoring in the first quarter of 2011; gross alpha ranged between 17.0 and 31.0 pCi/L and uranium ranged between 18.5 and 33.0 pCi/L, from the sole source of supply. Following the initial monitoring, running annual averages for gross alpha and uranium exceed primary drinking water standards. CDPH issued Compliance Order No. 03-23-10O-004 to the Water System on 8/1/2011 for violations of the uranium MCL. The Water System currently operates with the single source of supply; should the well fail or water quality further deteriorate, the Water System would be left without a water source.	500,000	37	80	23	Fresno	III	2012
373	2000538	2000538-001	CEDAR VALLEY MUTUAL WATER CO	Cedar Valley Mutual-Arsenic removal from single groundwater source	Hire consultants and/or engineers to find the best fit solution for arsenic either by drilling a new well, treatment or consolidation. Project for single source is to drill a new well or consolidate with another water system, if feasible.	G	15	C	Water system is located in the mountain areas of Madera County. Water system is served by a single spring source that is out of compliance for the Federal arsenic rule. The running annual average noted on the Notice of Violation is 0.01525 ppm. This water system is also vulnerable to water outages caused by drought because it is served by a single source.	100,000	80	137	11	Madera	III	2008
374	5400544	5400544-003	ALLENSWORTH C.S.D.	Allensworth Arsenic Compliance Project	If funded, the proposed project would design a method to use Allensworth's existing wells and a new storage/blending tank to achieve a finished water product that consistently meets the MCL for arsenic. The project would require planning funding, to hire an engineer and hydrogeologist to design the blending system and tank site. It would also include environmental review. Once designed, the project could progress to a construction phase, where a tank site would be acquired, the tank constructed, and a remote SCADA system installed (anticipated) that would help ACSD more precisely control their remote wells, which are located three miles outside of town.	G	15	C	Allensworth Community Services District is equipped with two drinking water wells and a 42,000-gallon storage tank at the ACSD yard. Both wells are periodically in violation of the EPA arsenic standard, varying above and below the MCL of 10 parts per billion. The newer well, Well #2, was constructed to allow future isolation of water strata. It is believed that changing the casing in this well, combined with a precise blending strategy, would enable the Allensworth CSD to deliver water which consistently meets the Arsenic MCL.	1,000,000	110	400	12	Tulare	III	2011

375	3600036	3600036-001	Calico Ghost Town	Calico Ghost Town Water System Improvements	The project aims to seek the consultation with a hydro-geologist to evaluate the current wells in order to diagnose production issue and advice of adaptation to exist well or the possible addition of a new well location as needed to improve production and reduce contaminant input levels. The project will construct the new well and/or all other recommendation to rehabilitate the existing wells. Additionally the project with consult with engineers to provide design plans, specification and recommendation to construct a new treatment facility for the water system in order to remove the minerals and metal deposits as noted in recent testing of the current system and likely to be present in any new well. The project shall then construct the treatment facility based the plans via a pubic bid and shall be constructed with new and efficient technology to remove the current noted minerals and metals as well as remove any new deposits that may be found in the future and ensure a healthy viable source of water to supply the Park Site for many years. The project shall also construct modification to the existing system to tie the new well and treatment facility to the system as well as to improve flow dynamics and for fire purposes, this shall include improvement to the old water system and service including replacement and adding piping, isolation valves and looping for pressure and service	G	15	P	The water system at the park site is over 40 years old and although newer wells been installed recently as the system has expanded and newer connections have been made the system still relies upon the original design and equipment. In addition, current wells that service the system, including a new well of approximately five years old, have experienced production problems and although planned in a location intended to remove chances of contamination all contain contaminants based upon the composition of the local aquifer. Minerals and contaminants from years of prior mining operations and possibly more recent distance industrial uses have resulted in the entire local aquifer containing contaminants as it percolates down from those mine and industrial sites. The current discovered contaminant levels may likely increase over the decade or new contaminants may be additionally leached into the system. The project aims to evaluate the current wells, possibly locate a new well as needed to improve production and reduce contaminant input levels, provide engineering and installation of new treatment facility for the water system in order to remove the minerals and metal deposits as noted in recent testing of the current system and likely to be present in any new well. The treatment facility will be designed with new and efficient technology to remove the current noted minerals and metals as well as remove any new	809,200	75	10	13	San Bernardino	V	2009
376	2000614	2000614-001	OAK CREEK INTERMEDIATE SCHOOL	Oak Creek Intermediate School-Uranium Removal	Hire consultants and/or engineers to find best fit solution for Uranium either by drilling a new well, treatment or consolidation.	G	15	P	Water system is served by two wells. One well is used as a "standby" source. Uranium levels in the wells are over the MCL. Water system has a water softner connected to the system.	100,000	3	213	11	Madera	III	2008
377	5400713	5400713-001	OAK VALLEY SCHOOL	Oak Valley Union School District Safe Drinking Water Project	The proposed project will include the drilling of a test well, which would determine if there is an adequate supply of potable water to meet the demands of our school's water system. Following the test well, if it is determined that a successful production well can be drilled on site, then that production well would be drilled and adequate storage facilities would be constructed, and a new pump installed. The new well facilities would then be tied into the existing school water distribution system.	G	15	P	The average arsenic levels from the last five tests is approximately 18. Because the MCL was lowered from 50 ppb to 10 ppb, our water is now above the prescribed MCL. We have looked into treatment possibilities, but we have been told that this would be difficult because our water is too soft. In addition, on-going operational costs and disposal requirements would also negate the feasibility of treatment.	850,000	7	300	12	Tulare	III	2007
378	2000592	2000592-002	TWO TWENTY FOUR MOBILE HOME PK	Main replacement and uranium removal	We need to remove 3000 feet of old water line . A shorter rerouting of the new water lines would reduce the amount of new lines, possibly by 1000 feet.As for the uranium flitration system, I have no knowledge of reguirements or cost for that. Lourdes Mertens of Madera County Env. Heathh @559-675-7823has been working with us about the uranium and she may be able to answer questions you may have.	G	10	C	It is time to replace the old water lines for the park. At the same time we would like to have a uranium flitration system installed in the park since we do have a uranium problem with our main well.The water lines are at least 30 years old. There are currently only 15 spaces in use at the park. expansion is not possible until we can address the current issues.	100,000	15	30	11	Madera	III	2009
379	2000592	2000592-001P	TWO TWENTY FOUR MOBILE HOME PK	New Well	Hire consultants and engineers to evaulate best fit solution to remove Uranium contamination of the water supply either through a treatment, construction of a new well or consolidation with nearby water system.	G	10	C	The water system is served by two hardrock wells, both exceed MCL for Uranium. The water system serves a low-income community and increase in water rates will be a hardship.	100,000	15	30	11	Madera	III	2008

380	0400058	0400058-001	RANCHO VILLA MOBILE ACRES	Rancho Villa Mobile Acres-Preapp	The existing well system will be updated with a new above ground filtration and monitoring system to keep the levels of Arsenic to conform with the new regulations.The installation would include new cement slab , new electrical wiring, and the new plumbing to accommodate the new filtration system . It would have to have adequate housing to protect the filtration system as well and the tenants of the trailer park and meet all county codes. The trailer park houses low income families. This job is imperative to be accomplished soon since most of these families do not have the means for other housing or could not bear the expense of moving if we do not get in compliance soon.	G	10	C	The State of California Department of Public Works has changed the level of contamination from 50 parts per billion down to 10 parts per billion.Rancho Villa Mobile Acres current level of Arsenic is 10.75 thus with the lower levels of contamination in affect we are now out of compliance.Rancho Villa now has approximately one month till we have to send out notifications to our tennants that the water is sub-standard and to boil drinking water an or use bottled water. Rancho Villa will also have to submit to the county a plan of recourse to correct this situation with a new filtration system.	37,000	21	32 21	Butte	I	2009
381	1900038	1900038-001	LANCASTER PARK MOBILE HOME PARK	Lancaster Park Mobile Home Park	The Water system is in need of an additional water source to meet the demands of the community, and to reduce arsenic concentrations. i.e. new ground water well.	G	10	C	Water Quality from Well #1 has ARSENIC concentrations that exceed the 0.50 milligrams per liter (mg/L) National Primary Drinking Water Standard Maximum Contaminated Level. The water system has insufficient water storage for fire protection.	500,000	21	53 16	Los Angeles	IV	2008

Kern Mobile Estates will connect to Rosamond CSD through a master meter.	G	10	C	Kern Mobile Estates has one active well and one standby well. Both wells produce water having arsenic at levels exceeding MCL.	500,000	60	58 19	Kern	III	2008
383	0900102	0900102-003	GOLD BEACH PARK	Adding treatment plant for arsenic and lead	We plan to install treatment works that will maintain the arsenic at a safe level. We need assistance from CRWA to determine the best treatment system to install. For lead, we want to replace piping in the park that may be causing the elevation of lead....followed by treatment if necessary.	G	10	C	Our drilled well exceeds the MCL for arsenic, public notification is being done quarterly to our users and in our CCR.We have also exceeded the action level for lead. Lead notification is in the process to be issued.	100,000	50	100 09	El Dorado	I	2009
384	1500405	1500405-003	AERIAL ACRES WATER SYSTEM	Arsenic removal & waterline replacement	Installation of a water treatment system to remove Arsenic from the systems two wells. A building will be installed to protect the treatment system from the heat and freezing temperature extremes of the desert. The The Mutual also plans to install about 3,300 feet of 6 inch water line, 6-inch gate valves and 3 hydrants that will replace the old leaking line and loop the distribution system. The rural community of Aerial Acres is located in the Mojave Desert about six miles north of North Edwards, in Kern County. In 2002 a special income survey was conducted by Self-Help Enterprises documenting a 2001 community Median Household income of $18,400.	G	10	C	Failure to meet the Arsenic Safe Drinking Water Standard of 10 PPM. Well #1 has an arsenic level of 24 ppm and well #2 has an arsenic level of 27 ppm. These water supplies violate State and Federal safe drinking water standards. The Mutual has no other supply of water.	600,000	62	114 19	Kern	III	2007

385	3601055	3601055-001	Roadrunner Mobile Home Pk	Roadrunner MHP-Morongo Valley	Installation of a water filteration system located at the well pump and storage tank area. Due to the inability to secure an estimate prior to the application deadline the details of installing the filters is not available. However it was mentioned that it would most likley consist of a series of filter cartridges placed on some type rack stystem that would be serviced on amonthly basis.	G	10	C	The water system for Roadrunner MHP currently services 59 mobile home spaces and 2 cottages. During the past 12+ months the uranium count contiuned to increase and has remained above recommended guidelines for the past several months. According to correspondance dated March 2, 2007 from Environmental Health Services the average quarterly samples were 26pCi/l vs the recommended level of 20 pCi/l. This is in violation of California Civil Code Section 64441. Contact has been made with a "water filtration company" to provide an estimate for the installation of a water filtration system. As of this date the estimate has not been received. An alternative is to intergrate with the "standby system" however the monthly cost to the tenants will be significant therfore the lower cost of adding a filteration system to the existing well is preferred. In additon, if an agreement is reached with the local water company to access the stand by system then each space would need individual sub meters and the underground water distribution system would need to be upgraded to handle the increase in water pressure. The estimate of $35,000 for installation of the filtration system has not been confirmed and does not include the monthly service cost which could range between $1200-$1500 per month. The funding request is strictly for the installation of the system and the first year of monthly service costs. After such time, and with	50,000	59	150	13	San Bernardino	V	2007
386	4000512	4000512-002P	BELLA VISTA MOBILE LODGE	Wells 1 & 2 arsenic treatment project	Installation of treatment equipment to bring arsenic level to within California Department of Public Health guidelines.	G	10	C	Exceedance of a Chemical MCL and public notification is currently in effect.	0	84	200	06	San Luis Obispo	IV	2009
387	2410012	2410012-003	HILMAR COUNTY WATER DISTRICT	Hilmar County Water District Arsenic Treatment	The District intends to install an above ground storage tank and arsenic removal equipment.	G	10	C	The District presently has two wells (which provide 100% of their water) with arsenic concentrations that exceed 10 ppb.	3,500,000	1,566	5,000	11	Merced	III	2007
388	1510006	1510006-010	East Niles CSD	Kern Citrus 600,000 Gallon Water Tank	This project involves the construction a 600,000-gallon welded steel tank with ringwall foundation, including valves and yard piping within the tank site. The project includes engineering work - design, construction inspection and administration. The intent is to use this location for blending of five groundwater sources (of which three are currently exceeding the MCL for Arsenic) to meet the arsenic MCL.	G	10	C	The District has two 210,000-gallon water storage tanks that were erected in the late 1950's that have exceeded their useful life. Multiple leak repairs and structural repairs have been made in the last 10 years. The District at this time is unable to coat the interior of these two tanks because of the structural integrity of the two tanks. These two tanks receive water from 5 groundwater wells and the aging pump station at this location is the entry point to the distribution system for all five wells. Three of the five groundwater wells that pump to this location are above the MCL for Arsenic. The intent is to use this location for blending of sources to meet the arsenic MCL.	800,000	7,338	25,500	12	Kern	III	2009
389	5010028	5010028-003	Ceres, City of	City of Ceres Replacement Wells Project	Costs included in this project include:Geological analysis, Well drilling costs,Wellhead construction and infrastructure, Connective pipe runs to the city system, Valves, MonitoringTreatment if necessary, andProject and construction management costs	G	10	C	The City of Ceres needs two new wells to replace the currently active wells numbers 19 and 22. These wells are located at:Number 19 - 1511 Giddings @ Paramount Ave. Currently operating at approximately 1000 gallons per minuteNumber 22 - Arthur Way behind 1904 Hollister Street. Currently operating at approximately 1300 GPM.Both wells have been found to be in violation of maximum contaminent levels for uranium and nitrates. The production output of these two wells when combined is equivalent to roughly one quarter of all well water production available to the City of Ceres, and the replacement and allocation of a commensurate amount of water is vital to the continuing operation of the City of Ceres water system.	500,000	10,617	40,943	10	Stanislaus	III	2008

390	5010028	5010028-012	Ceres, City of	Well Replacement - Smyrna	This project is designed to install a new closed bottom, gravel packed well to mitigate the uranium and nitrate contaminant problem and replace the existing well in order to provide much needed potable water without treatment in an ideal location--in a large park in the center of town.The project includes:• design specifications for new test hole, monitoring well and production well• specification of new screen and gravel pack• new wedge wire screen, pack and drilled well• new well head and annualar seal to water well standards• new well motor & pump• disinfection, flushing and testing of new well• new pump to waste drain (to comply with water well standards)• conversion of old well to a monitoring well• Security fencing, controls and ancillary infrastructure for a well site• standby power generator• online water quality analyzers to monitor water quality and SCADA system	G	10	C	Smyrna well exceeds uranium and nitrate maximum contaminant levels (MCL). Arsenic and manganese are also high. This well is very important to the City's ability to meet peak water demands. In 2006 and 2007, this well was used to meet peak water demands (with public notification), although it exceeded the uranium MCL.During the summer of 2008, the city designed and constructed a blending station to blend Smyrna well with higher quality water from the distribution system and meet contaminant levels. This was successful but in the fall of 2008, this old open bottom well began producing unacceptable amounts of sand. We have now overdeveloped the well and reduced the sand production to almost undetectable amounts.The city can now reintroduce the water into the system but will need to be blended at lower production levels in order to maintain water quality and stay well below the MCL. A downhole video shows that the casing is failing. The hydrologist recommended that this well be replaced immediately.	1,000,000	10,617	40,943	10	Stanislaus	III	2009
391	5010028	5010028-009	Ceres, City of	Repairs to Arsenic and Manganese Treatment Plant	funding for a building will significantly extend the operational life and reliability of this million dollar treatment facility. Improved controls and analyzers will improve the quality of the effluent and reduce operator workload. this project includes:a buildingsecurity systemsafer offloading facilities for chemical deliveryonline SCADA systemBack up controlturbidity, chlorine and effluent analyzers to better monitor plant effluent.	G	10	C	The City Arsenic and Manganese Well Head treatment plant requires upgrades to improve reliablity, online avalability and reduce staff work load while improving safety to the public drinking water effluent.Currently the plant is exposed to the elements and experiences shutdowns due to high temperature (control system overheating), heavy rain (motor bearing rusting) and sunlight degradation of pipes (plastic) and computer screens. The SCADA system has only six channels and needs to be upgraded to allow remote monitoring. Instrumentation to monitor the effluent will provide an improved monitoring and or sample rate to take the system offline in the event of a plant malfuntion or upset.	200,000	10,617	40,943	10	Stanislaus	III	2009

393	3410011	3410011-005	Galt, City of	Golden Heights Water Treatment Facility Phase 3 Project	The Monterey Bay Well along with its raw water pipeline to the Golden Heights WTP has recently been constructed and needs additional treatment equipment in order to meet current and new drinking water regulations before it is put into service.The City plans to construct the third phase of the Golden Heights Water Treatment Plant project which will consist of arsenic treatment for the existing on-site well, and groundwater treatment including iron, manganese, and arsenic for the off site Monterey Bay Well. The project also includes the addition of a permanent stand-by generator and booster pump station upgrade. The project will provide reliable water supplies to City of Galt water users and brings the water treatment site into compliance with the new arsenic regulations.	G	5	C	The project will address arsenic treatment for the existing Golden Heights water treatent facility and the newly constructed Monterey Bay well. Both wells exceed the new federal arsenic rule that has been recently adopted by the State of California which has been changed from a maximum contaminent level of 50 to 10 ug/l. The CDPH directive to the City of Galt is to provide modifications to the existing water wells within the City that are out of compliance with the new arsenic MCL limits. The City has been issued a notice of vilolation by CDPH and must provide public notification until the arsenic problem is resolved. The City of Galt is currently in design phase of the project and anticipates construction to begin in late 2009.The project will address arsenic treatment for the Golden Heights facility that will include treatment for Golden Heights well and the newly constructed Monterey Bay well. The current treatment system at Golden Heights consists of filtration and disinfection with arsenic treatment added for the Golden Heights well. In addition, a filtration system including arsenic treatment and disinfection will be added at the Golden Heights site to treat raw water from the Monterey Bay well. To maintain reliability, the project also includes a new generator to supply power for the the existing system as well as for the future improvements.	1,600,000	7,872	22,982	09	Sacramento	I	2009
394	1910087	1910087-017	Metropolitian Dist. of So. Cal.	Enhanced Bromate Control Program	Implementation of the Enhanced Bromate Control Program will require engineering design, construction, as well as equipment purchase. This includes modification of existing chemical feed systems, chemical storage tanks and other facilities.	G	0	C	Metropolitan's current treatment process utilizes ozone to comply with disinfection by-product regulaiton. During certain source water conditions, the current treatment process may elevate bromate to undesirable levels. In some cases, the bromate levels have approaches CDPH compliance levels. Metropolitan Staff, working with CDPH Field Office, have successfully piloted a modified treatment process resulting in less chemical feed and compliance with the Enhanced Surface Water Treatment Rule. This treatment process is referred to as the Enhanced Bromate Control Program. Metropolitan is hoping to install these facilities at each of its 5 surface water treatment plants.	20,000,000	647	0	16	Los Angeles	IV	2012
395	5403103	5403103-001	TRACT 327 MUTUAL WATER CO.	Tract 327 Mutual Water Company New Well Proposal	Tract 327 Mutual Water Company currently has two wells. The main well (well number 1) which supplies the needed volume of water has always testes high for Uranium and therefore has never been below the State's maximum allowed number. Our second well does not produce much of a volume of water and we do not have the storage available at that location to make it a viable contributor, we only use it in emergencies if well #1 is being worked on. With this grant we would be able to drill another well near where the main well resides and hopefully therefore not have the Uranium problem to which we currently have. We would also be able to add the needed storage to well #2 and be able to utilize it for water delivery at all times within the system.	G	0	C	Tract 327 Mutual Water Company, since mandatory monitoring has been initiated has experienced high levels of Uranium. The well is of a "wagon wheel" type that was developed further and made for use in 1959 when the housing tract was built. The levels of Uranium vary from different times of year but the levels have never been close to being below the State Standards. In the 1980's another well was drilled but only delivered a very small volume of water and was abandoned until 2006 when it was reopened and a pump was installed. It was found that the well produced good quality water but only delivered about 12 gallons per minute, not near enough for the needed quantity. The well has been used in emergencies only to supply low volume of water if the main well was inoperative.	20,000	15	24	12	Tulare	III	2008

399	1500458	1500458-002	R.S. MUTUAL WATER COMPANY	Consolidation with CWS Kernville	The proposed project is to consolidate with CalWater-Kernville; Replace approximately 800 ft of 6-inch PVC distribution lines and install 2 master meters, 4 hydrants and 23 meters and services.The existing well will be abandoned.	G	0	C	The system distributes water exceeding the primary MCL of 20 pc/L for uranium and the new federal and state Arsenic MCL of 10 ug/L. Nitrate is marginallly below the MCL of 45 mg/L. Compliance orders have been issued.The existing distribution system is more than 40 year old galvanized 1.5 to 2 inch pipe, and has frequent leaks.	327,800	22	25	19	Kern	III	2009
400	1500458	1500458-001	R.S. MUTUAL WATER COMPANY	Consolidation Project with CWS-Kernville System	As part of this project, we will consolidate with nearby CalWater's Kernville System. The project would consist of 50' of 6-inch pipe to connect with Cal Water, replacing 2000' of old galvanized pipe with new 6-inch water mains, and meters for each service connection. The project will also include destruction of our existing well in accordance with the Kern County Standards.	G	0	C	Our system well produces water exceeding the primary MCL of 20 pci/L for uranium and the new federal arsenic MCL of 10 ug/L. Nitrate is marginally below the MCL of 45 mg/L. Our distribution system has 40 years old galvanized steel pipe which is also undersized with diameter ranging from 1.5 to 2-inch.	115,000	22	25	19	Kern	III	2007
401	3400433	3400433-002	EDGEWATER MOBILE HOME PARK	Edgewater MHP Arsenic Correction	We are exploring filtering to remove arsenic, or drilling a new well.	G	0	C	The well has been identified as having a level of arsenic in excess of the 10 ppm as defined by the EPA.	100,000	35	29	09	Sacramento	I	2009
402	1500436	1500436-001	HUNGRY GULCH WATER SYSTEM		All groundwater wells will be pumped into a storage tank and then filtered to remove arsenic .	G	0	C	Arsenic level in the systems wells exceed the current MCL	925,000	17	30	19	Kern	III	2006
403	1500436	1500436-002	HUNGRY GULCH WATER SYSTEM	Consolidation with Boulder Canyon	The proposed project is to construct approximately 1000 feet of 4 inch schedule 80 PVC pipeline connecting the two systems with a booster pump, appropriate appurtenances, and replacement 10,000 gallon storage tank. Line would be along Hungry Gulch Rd and the tank would be on an existing site once the failing tank is removed. Once the connection is made the assuming system, Hungry Gulch, will begin efforts to seek funding to install a treatment system addressing arsenic issues.Boulder Canyon has administratively consolidated with Hungry Gulch and the new system name is Hungry Gulch Mutual Water Company Inc. They are retaining their original water system numbers 1500521 & 1500436 respectively until the physical interconnection line is installed. At that time they will be a single water system and will apply for a single system number with the state.	G	0	C	The system frequently runs short of water and needs to consolidate Hungry Gulch and Boulder Canyon. Both systems have arsenic exceedances and are currently using POU treatment, but they need funding to install a POE system. System has already administratively consolidated with Hungry Gulch Inc and share Boards, Bookkeeping, and Rate Structure. The installation of a connecting line resulting in elimination of the Boulder system will finalize the consolidation.CDPH Violations and Compliance orders have been issued for both systems.	25,000	17	30	19	Kern	III	2009

404	5000218	5000218-003	COUNTRY VILLA APTS	North Well Arsenic Treatment Facility	This project provides for the design/ installation of a permanent Arsenic Treatment facility for the North Well. The North Well currently has an Arsenic level of 22 ppb. Built in 2007, the North Well was constructed with a 10 HP pump, 2500 gallon hydropneumatic tank and designed in a layout to accomodate easy installation of a future Arsenic Treatment facility. Although the Owners privately funded the design and construction of the North Well, pump, and hydropneumatic tank, there is insufficient funding available to complete the remaining necessary improvements to the water system including the installation of a permanent Arsenic Treatment facility.Project participants include the Owner of Country Villa Apartments, Robyn Dorius, a licensed California Professional Engineer and a Certified Water Distribution Operator.	G	0	C	Country Villa Apartments, built in 1950 in an unincorporated area of Stanislaus County, has a single well (North Well) that serves 23 service connections (approximately 75 residents). The 400 foot deep North Well, 10 HP pump, 2500 gallon hydropneumatic tank, and related piping were all installed in 2007 to replace an older well that repeatedly violated the Total Coliform MCL. The North Well is in violation of the State of California Drinking Water Regulation for Arsenic (allowable MCL is 10 ppb). The North Well currently has an Arsenic level of 22 ppb that requires public notification to all residents every 90 days.Due to lack of adequate funds, the Owners must seek outside funding to complete the following water system upgrades: 1) Arsenic Treatment Study, 2) Arsenic Treatment Filter, 3) Wellhead Protection Improvements, 4) Emergency Back-Up Electrical Generator, 5) Underground Distribution Piping Replacement, and 6) Renovation of Out-of-Service Back-Up Well.To correct the Arsenic problem, a permanent Arsenic Treatment facility will need to be installed on the North Well. This project proposes to fund the design/ installation of permanent Arsenic Treatment facility for our North Well.	120,000	23	30	10	Stanislaus	III	2009
405	1500521	1500521-002	BOULDER CANYON WATER ASSOCIATION	Consolidation with Hungry Gulch	The proposed project is to construct approximately 1000 feet of 4 inch schedule 80 PVC pipeline connecting the two systems with a booster pump, appropriate appurtenances, and replacement 10,000 gallon storage tank. Line would be along Hungry Gulch Rd and the tank would be on an existing site once the failing tank is removed. They are retaining their original water system numbers 1500521 & 1500436 respectively until the physical interconnection line is installed. At that time they will be a single water system and will apply for a single system number with the state.	G	0	C	The system runs short of water frequently and needs to consolidate Hungry Gulch and Boulder Canyon. Both systems have arsenic exceedances and are currently using POU treatment, but they need funding to install a POE system. System has already administratively consolidated with Hungry Gulch Inc and share Boards, Bookkeeping, and Rate Structure. 407	5000218	5000218-001	COUNTRY VILLA APTS	North Well Arsenic Treatment Pilot Study	The proposed Pilot Study consists of the design/installation of a small scale Arsenic treatment facility which will be installed on the North Well. For the purpose of the Pilot Study, the treatment facility will consist of a series of 3 Arsenic filters which will be installed in 3 parallel lines. Each filter will have a production volume of approximately 5 gpm. Each filter will have a unique type of Arsenic filter media. A portion of the water produced by the North Well will be diverted to the series of filters and then blended back into the distribution system after filtering. A separate sample tap will be installed following each filter so that unique water samples can be taken from each filter.By monitoring the water quality (each month) after each filter over an 18 month period, the data collected will allow us to determine the most effective, as well as the most economical, filter media for Arsenic removal for the water chemistry in our area.The data collected is of great public interest and will serve a public purpose as there are numerous public wells in our immediate area as well as the greater Central Valley area that currently exceed the allowable mcl for Arsenic.The project participants consist of the Owner of Country Villa Apartments, Robyn Dorius, a licensed California Professional Engineer and a Certified Water Distribution Operator (Grade D1). (By the time the Pilot Study is started, Robyn Dorius will have D2 and T2 operator	G	0	C	The North Well is the sole source of drinking water for the Country Villa Apartments community (80 residents). It was built in 2007 to replace an older, failing drinking water well. The North Well is in violation of the State of California Drinking Water Regulation for Arsenic. The allowable mcl for Arsenic is 10. The North Well has an Arsenic level of 21. The North Well has a production volume of 80 gpm.To correct the problem, an Arsenic treatment facility will need to be installed on the North Well. By completing this proposed Pilot Study program, we will be better able to design the most effective and economical Arsenic treatment facility.	25,000	23	30 10	Stanislaus	III	2008
408	1500449	1500449-002	FOURTH STREET WATER SYSTEM	Arsenic Treatment System	Install arsenic treatment faciliuty.	G	0	C	Arsenic in source exceeds MCL.	100,000	24	35 19	Kern	III	2007
409	1500449	1500449-004	FOURTH STREET WATER SYSTEM	New water source	The selected alternative is to drill an additional well to provide an adequate quantity of water to meet dry cycles and to locate the well in an area that will produce water meeting the arsenic MCL. With primary use of a new well meeting the arsenic MCL and blending from the existing wells as needed to meet peak demands, the water system may be able to meet the water quality standards without treatment.The nature of the groundwater in the adjacent area is typically higher arsenic levels in the lower elevation areas due to natural materials. The FSWC wells have much lower arsenic levels than other water systems in the area at lower elevations. Therefore, a new well at a different location or higher elevation may likely have water quality meeting the arsenic maximum contaminant level (MCL).	G	0	C	The water supply wells have an arsenic level of 12-20 µg/L which is not in compliance with the new drinking water standards. Only Well No. 2 and the storage tank are currently in use.Well No. 1 production has declined in this dry period until it is now off-line and the water system is without a backup well as required by the Waterworks Standards. A new well is needed to provide the system an adequate water supply.Violations have been issued.	250,000	24	35 19	Kern	III	2009
410	1900785	1900785-003	MITCHELL'S AVENUE E MOBILE HOME PARK	Mitchell's Avenue MHP	The Water system is in need of an additional water source to meet the demands of the community, and to reduce arsenic concentrations. i.e new ground water well.	G	0	C	Water Quality from Well #1 has ARSENIC concentrations that exceed the 0.50 milligrams per liter (mg/L) National Primary Drinking Water Standard Maximum Contaminated Level. The water system has insufficient water storage for fire protection.	500,000	24	35 16	Los Angeles	IV	2008
411	3900732	3900732-001	V & P TRAILER COURT	V & P Trailer Court (Arsenic Compliance)	The Water System is seeking to install a new water source or treatment. City water probably not availble due to location. A new well may be more cost-effective than treatment, but there is no guarantee if the water of a new well will may standards. Treatment would include initial equipment such as tanks and filter materials and piping, but will also include monitoring cost and filter replacement and disposal of used filter materials.	G	0	C	The average of 4 sample results of the well in 2006 and 2007 was 12.5 ug/L for arsenic, and exceeds the new MCL for arsenic of 10 ug/L, National Revised Primary Drinking Water Regulations, Federal Arsenic Rule, Section 141.62(b), 40 Code of Federal Regulations.	500,000	15	35 10	San Joaquin	III	2008

413	1000445	1000445-001	LINDA VISTA FARMS	Uranium Violation	Planning study to identify the solution- potential solution drilling a new well that meets all primary drinking water standards.	G	0	C	The Water System has one groundwater source that has exceeded the uranium MCL concentration since 2006. In addition, the well also exceeds secondary MCL for sulfate, specific conductance, TDS and manganese.A Compliance Order NO. 03-23-10O-010 was issued to the Water System On November 29, 2010 for non-compliance with uranium MCL. It requires the water system to provide quarterly notification to all users of the vilaton until the problem is corrected and submti proof of notification to CDPH Fresno district office.	500,000	26	40 23	Fresno	III	2012
414	1009258	1009258-002	SAN ANDREAS FARMS	TTHM Planning Study	Funding is needed to initiate a Planning Study to identify appropriate alternatives to resolve the TTHM CO.	G	0	C	The Water System has received Compliance Order No. 03-12-08O-034, issued November 3, 2008. The Water System began quarterly monitoring in the 1st quarter of 2008. The Water System's TTHM sample in third quarter of 2008 (sample: 09/11/2008) resulted in a TTHM RAA of 0.082mg/L, which exceedes the MCL of 0.080 mg/L.	250,000	10	40 23	Fresno	III	2011
415	1009222	1009222-001	TERRA LINDA FARMS	TTHM Planning Study	Funding is needed to initiate a Planning Study to identify appropriate solutions to resolve the TTHM CO.	G	0	C	The Water System has received Compliance Order No. 03-12-08O-028, issued October 30, 2008 for noncompliance of Total Trihalomethane MCL. The Water System began quarterly monitoring for TTHM when CDPH took over regulatory jurisdiction from Fresno County (3rd quarter 2007). The Water System's TTHM sample in the second quarter of 2008 sample (sample: 06/18/2008) resulted in a TTHM RAA of 0.127 mg/L, which exceedes the MCL of 0.080 mg/L.	250,000	10	40 23	Fresno	III	2011
416	1600507	1600507-001	HARDWICK WATER GROUP	Drill new well	Drill a new well and upgrade distribution system	G	0	C	Uranium above MCL. The existing water well was drilled in the 1960's on a small residential parcel owned by the water Company. Original well had a 12 inch casing which in later years was refitted with an interior 10 inch casing due to a break on the original casing. Depth of exisiting well is estimated at between 160 to 170 feet. A 7.5 hp submersible pump installed in 1978 burned out and was replaced in 2007.Water System Pressure is kept at a lower level due to concern of leakage in the old distribution system.Water quality from the well exceeds the MCL of 20 pc/l for uranium with test results in the past few years ranging from 42 to 49 pc/l. Results from 16 individual private water wells serving homes in the community tested for uranium indicated that 13 of the 16 exceeded MCL of 30 ppb (ranging anywhere from 36 to 260 ppb). (description from 2009 preapp)	10,000	16	40 12	Kings	III	2007
417	1502597	1502597-002	DEL SOL WATER CO-OP	Del Sol Water - High Uranium - Treatment, Consolidation, or New Well	Construct a pipeline Inyokern CSD. If that is not feasible, consolidate with another small water system. If that is not feasible, provide treatment or construct another well.	G	0	C	Del Sol Water Coop has a single well that produces water that contains uranium at a level exceeding the primary MCL.	1,000,000	12	40 19	Kern	III	2008
418	1009232	1009232-001	SUMNER PECK RANCH	Peck Ranch Water System	To increase storage size to meet CT.	G	0	C	To small of storage for CT.	120,000	21	42 23	Fresno	III	2009
419	2000534	2000534-001P	LEISURE ACRES MUTUAL WATER COMPANY	Leisure Acres Mutual-single arsenic in single source	Drill a new well or consolidate with another water system for single source problem. Hire consultants and/or engineers to find best fit solution for arsenic either by drilling a new well, treatment or consolidation.	G	0	C	Mountain community is served by a single groundwater source. Availability of only one source make water system vulnerable to water outages caused by drought. Also, arsenic level in this groundwater source is over the Federal Arsenic MCL of 10 ppb. Water system is currently monitoring quarterly to determine running annual average and compliance with Federal Arsenic Rule.	0	23	45 11	Madera	III	2008

420	0707602	0707602-001C	BEACON WEST	Beacon West M-26 Well Project	The most cost effective solution at this time is to develope a monitoring well 180' deep and test for arsenic and water quality samples for three months. If the arsenic and water quality test are below standards we will convert the monitoring Well into a production Well for Beacon West customers. If the arsenic and water quality levels are above the MCL's DWD will not convert the monitoring well. DWD will use the well for continued monitoring. DWD has tested the nearest well approximently 1 mile away for Arsenic levels and the results was non-detection. A every important fact is Beacon West Well is 260' deep and the non-detected well is 180' deep indicating that a well depths of 180' could have lower Arsenic levels. The cost to maintain a new production well will remain the same verses a new water arsenic removal treatment system which will add and addtional cost of $19,000- $40,000 annually.DWD would like to have two phases for this project. Phase 1:Develope a monitoring well and test the arsenic and Title 22 contituents stanards for 3 months. Monitoring Well cost:$70,000.Phase 2: DWD/CCC Enviromently Health Dept. will evaluate the monitoring well. If both agencies agree that the arsenic and other constituents are within acceptablilty limits this phase will be to convert the monitoring well into a production well for Beacon West water system. If the arsenic and constituents are not acceptable DWD will not convert	G	0	C	Contra Costa County (CCC) was original owners of Beacon West water system. In 2002 CCC gave ownership to to Diablo Water District (DWD) of Beacon West Water System, to maintain and over see the small water system. DWD recieves billing from CCC Tax Assesment and operates it's budget through the Tax Assesment. In 2008 Beacon West Well water had been tested for a Arsenic level of 29ppb (CDPH MCL for Arsenic is 10ppb or below). Also a Arsenic Advisory Notice was issued to Beacon West Customers through CCC Enviromental Health Dept. Since 2008 DWD has researched treatment systems, well development and ran pilot systems to evaluate a cost effective plan to comply with the Arsenic Standards of 10ppb. This has been a chellenge to justify the capital and annual cost with a small water system. DWD will be asking 100% Funding for this disadvantage community of the 2010 census.	80,000	17	45 04	Contra Costa	II	2012
421	2700536	2700536-001	CORRAL DE TIERRA ESTATES WC		Abandon and close the auxiliary well.	G	0	C	Arsenic levels above 80ug/L. Water production and water quality of the auxiliary well are poor.	2,500	16	45 05	Monterey	II	1998
422	0707615	0707615-001	DOUBLETREE RANCH WATER SYSTEM	Doubletree Ranch HOA Water System Arsenic Mitigation Project	The best solution for reducing our Arsenic levels has been identified as the Adsorption technology. We will be operating a pilot plant to determine the best media for our particular water chemistry, possible media include, iron, alumina, titanium, and resins. We will also need to implement an acidification system to reduce the Ph of our water from 9.0 to 7.0 for the adsorption media to be optimally effective. Once the optimal media has been determined we will scale up the pilot plant to an operational 20 gpm Arsenic removal system. The 20 gpm system will be located in our primary tank house. The final configuration is envisioned to consist of an array of tanks containing the active media an a 20 gpm pump that will pump the raw water from storage tank #1 (7500 gal.) through the Arsenic Removal System. The Arsenic free water will be collected in storage tank #2 (7500 gal.) and distributed from there via gravity feed to our communities water users. The total cost of the system to reduce the Arsenic levels in our water from 25ppb to below 10ppb has been estimated at $80,000. This includes the 20 gpm pump, the media and media tanks and associated pumping and valving. The monitoring will be perform off site by a chemical analysis lab. The storage tanks and distribution system are already in place and will not need to be modified.Consolidation is not an option because the nearest public water system is over 5 miles	G	0	C	The Doubletree Water system is currently operating under a Compliance Order from Contra Costa Health Services to reduce the levels of Arsenic in our drinking water to below 10 ppb. The Arsenic levels are currently at around 25ppb. We are required to post a quarterly public notification of our Arsenic levels and a recommendation that all water users drink bottled water.	60,000	18	49 04	Contra Costa	II	2009
423	1502724	1502724-001	Quail Valley Water Dist-Eastside System	Arsenic Problem Solution	Drill new well or install treatment to remove arseinc.	G	0	C	Source water exceeds MCL for arsenic.	10,000	30	50 19	Kern	III	2007
424	2000800	2000800-001P	MAHAL APARTMENTS	Mahal Apts.- New well construction	Hire consultants and engineers to find best fit solution - either to drill a new well, consolidate with another water system or provide treatment.	G	0	C	This water system serves a low income community , dependent on a single source that exceeds the MCL for Gross Alpha. There is also no storage capacity on site. The water system consists of 20 apartment units.	100,000	20	50 11	Madera	III	2008

425	5000033	5000033-001P	COBLES CORNER	Cobles Corner Arsenic Well replacement and addition	At present we feel it would be cost effective to drill a second well and blend the water. We expect to get nitrates from the deeper well with no arsenic contamination. If we blend the two we may be able to lower the arsenic contamination level and remain below the Nitrate mcl. I believe this will require a new well, a holding tank to mix and circulate the water from both wells, a small pump station, monitoring equipment and test ports, as well as the removal of some of the older equipment. The distribution line to the main supply for the Park and the corner market, (Mo's Oasis), will need to be removed and replaced also, (about 100 ft).	G	0	C	Coble's Corner MHP is currently contaminated above the mcl of 10 ug/l. Our four-quarter average is 12.3 ug/l with samples taken from September 2008 to June 2009. As yet we are not required to supply bottled water but Stanislaus County Dept. of Environmental Resources has made a "strong recommendation" that we do so. Sampling is done every quarter as instructed and notifications are sent to the tenants every quarter also. We have been doing this faithfully for almost three years now. When we filed our previous pre-app we expected to be consolidated with Hughson City Water System. They have informed us that at present they have no plans to supply water to the outlying county communities. This statement was made after we submitted the original pre-app. Therefore we are presently looking at either drilling a new, deeper well and blending the water to lower the arsenic contamination, or installing an arsenic removal system. We do not have the means to do either one on our own. We are not able to decide which way to go because we don't have the resources to pay for a contractor for consultation on construction costs, or an engineer to draw up the plans and take care of all the environmental documentation, etc., etc. We feel that the best way to handle this issue is to drill a second well and blend the water.	62,440	20	50 10	Stanislaus	III	2009
426	2000785	2000785-001P	VALLEY TEEN RANCH	Valley Teen Ranch - new well	Dril a new well and/or provide "point of entry" Arsenic treatment. 432	4900575	4900575-002	Loch Haven Mutual Water Company	Loch Haven Mutual Water Company - Arsenic Treatment Project	Loch Haven Mutaul Water Company has 19 water connections to residences on the system. Currently the Loch Haven Mutual Water Company has been evaluating the best long term solution and has been working with an engineering firm, water treatment companies and venndors to scope out the appropriate treatmernt options. POE is a feasible option or the construction of a whole small water company treatmnet system. A Whole System solution is exteemely costly as it would give cause to upgrade the existing main size from 4" to 6" and install C900 water main pipeing material and aquire right of way for an area sized appropriatly to construct the whole system treatment facility.Currently POE is the least costly planned route for treatment for the removal of Arsenic and Manganese to the required MCL's. Flowmeters are required to be installed for the primary and reserve wells and a disinfection treatment must also be implemented. The disinfection treatment proposed would intruduce chorine into the entry of the water system at the source in the pump house and therfore be a primary disenfection treatment and an arsenic pretreatment binder. There would be a total of 19 POE systems required, one for each residence or metered service. The POE system consistes of the chlorination which occurs previously as a disinfectant and binds to one species of arsenic, a pre-filter for silica, a water	G	0	C	The Loch Haven Mutual Water Company is currently out of compliance with the State of California Arsenic Maximum Contaminant Level (MCL) which was recently adopted in December of 2008 and has subsequently received a compliance order 02-18-08CO-006 from the State of California Departmernt of Public Heath. The Loch HAve Mutual Water Company's Running Annual Average for arsenic is 0.019 mg/L which exceeds the newly adopted MCL for the State of California of 0.010mg/L.THe Loch HAven Mutual Water Company has been and is current on sending quarterly public notifications to all the residents. A subsequent Inspection Report dated August 28, 2009 has been submitted to the Loch Haven Mutual Water Company which has additional requirements to be in compliance with the Callifornia Health and Safety Code and California Code of Regulations whiche requires;1) flow meters be installed on Well 01 and Well 02 with monthly production recording. 2) Lead,Copper and Asbestos Monitoring. 3) Construct 4.5'x4.5' Well Surface seals by September, 30 2009. 4) Have Backflow detection devices tested annualy and a cross connection control survey performed by December 31, 2009. 5) Investigate Manganese Removal Treatment and incorporate with Arsenic removal to below respctive MCL's. 6) Investigate and install a disinfection treatment for the water system by December 31, 2009. 7) Hire a	250,000	19	50 18	Sonoma	II	2009

434	2702148	2702148-003	ASOLEADO MWC	Fluoride Contamination Solution/New Well	Project Description:PROJECT 1. Resolving Fluoride Contaminant Problem:Various water treatment options to correct excessive fluoride problem in newest well were explored and ultimately ruled out because of the long term maintenance costs beyond what Asoleado community budget could sustain. It was therefore determined that drilling a new well (600 - 1000 feet down) on the Asoleado ridge at approximately 2000 feet elevation was the most likely successful and cost effective solution as recommended by Granite Drilling Company, who identified two potential drilling sites. In addition to the expense of drilling a new well, the project would involve additional telemetry and pipes to connect the well to the existing system of distribution. There are two possible connection sites for cost effectiveness. We favor the site that would allow for maximum use of gravity feed which, in the long term, would reduce energy consumption and cost as well as extend the lifespan of the water system pumping components. PROJECT 2: Increased Water Storage Capacity: Increase storage capacity with additional underground tank to maintain necessary fire protection while facilitating adequate water distribution to all households. PROJECT 3: Emergency Back Up Power Source:During the recent Basin Complex Fires and Indians fires, the Fire Department and Fire fighting agencies who uses AMWC water system to refill their	G	0	C	Asoleado Mutual Water Company (AMWC) is a small rural non- profit community water system located in Carmel Valley, California. Asoleado community, its complex water system and the Asoleado Mutual Water Company was established in 1984. In the last 10 years with a board of directors' volunteer support, dedication and careful management of our limited budget, we have worked closely and successfully with all government agencies to achieve exemplary compliance with water quality standards. In 2002, following water distribution concerns expressed by the county regarding new construction in Asoleado, we applied and qualified for a 10 year State loan to drill a new well in proximity to our existing wells at 950 feet elevation. However the new well has fluoride levels that vary from 3.42mg/L to 8.7mg/L, which causes Asoleado to be in violation of water quality standards as dictated by state agencies. In a continued diligent effort to comply with water quality standards and requirements, and protect the health of our residents, the AMWC has adopted the practice of "blending" the output of our wells with strict monitoring, in order to reduce the fluoride levels to safe levels. Even before the increased population (human and livestock) experienced in the last couple of years, not to mention the projected new construction on currently vacant lots, the fact that this well can only be used about three months a year, this only under	350,000	35	52 05	Monterey	II	2008

440	5000086	5000086-002P	COUNTRYSIDE MOBILEHOME ESTATES - ADL	Internal Water System an Arsnic Treatment Project	Countryside Mobile Estates is located at 4042 W. Barnhart Road, Turlock,CA. Stanislaus County. We are a 44 space SENIOR facility with a house in front of the park.The seniors in our facility are disadvantage low income with less than 35,000.00a year income.Our water system has been out of compliance since the 10ug/L was adopted. Notification has routinely been sent to residences with regards to this matter. Arsenic levels range from 10.5-16.ug/l from 10/12/2006 to today.With a new well,well head (with a filtration system if needed) tanks to hold approximately 1,800 gallons of water (we are in a rural fire dept district) to supply tenants an 2 fire hydrants.Also water distribution systems and risers thru out the facility. Our single source system is lacking water meters to help promote conservation an meet the governors 2020 act' .Asphalt an Concrete will need repaired or replaced .Lines moved or replaced as needed.Additional cost's for Engineering,Plan's, Contractor's ,equipement rental, Permit's,Local water Operation firm, WATER an services for tentants	G	0	C	Countryside exceeds MCL for ARSNIC see attached out of compliance letter.Letter of 11/21/2007 from Stanislaus County signed by Tom Wolfe,Sr.REHS followed up in 2008,2009,2010 by j. Mein ,SR.REHS. I have continually sent notices to residences regarding this .We are still currently out of compliance ranging from 10.05 to 16 ug/L. Life expediency of storage an internal distribution system has rapidly been approaching .Our single source system is lacking service connection for water meters to help promote conservation an meet the governor's 2020 Act.We have approximately 44 connections at our facility.Water is currently included in rent. We supply housing for disadvantage& low income seniors who's income is vastly below $35,000.00 a year.I am hoping to obtain a grant to allow the senior to remain in their homes. Our single source system which has exceeded the mcl for arsenic and is rapidly approaching it's life expectancy is home to many seniors who have no place to go. I understand that if I get a grant I will have to employ an engineering firm get permits,hire Contractors ,equipment and local water operations firm. While still seeking advice from the state.Without a grant I feel that I can not financially do this project.I have approached the city's of Turlock an Keyes's for water an sewer and been turned down being not cost effective.	0	44	60 10	Stanislaus	III	2011
441	4000637	4000637-001P	COUNTRY HILLS ESTATES	Country Hills Estates Arsenic	This system has two wells, both of which have arsenic levels of about 24 parts per billion. The piping system would require installation of two separate treatment units for arsenic OR major reconstruction of the distribution system. Connection to the city of Arroyo Grande water system is a much more reasonable and permanent solution.	G	0	C	This system has two wells, both of which have arsenic levels of about 24 parts per billion. The system piping layout would require installation of two separate treatment systems OR connection to the city of Arroyo Grande water system.	0	28	60 06	San Luis Obispo	IV	2008

442	3400138	3400138-001P	LOCKE WATER WORKS CO (SWS)	Locke Community (blue water project)	Locke Water company currently has 55 connections serving the town of locke with a well and storage tank. Specifications: 1) Gallons per minute - 150 gallons 2) Pressure from the well - 40 lbs 3) Kind of pump - Submersive 4) Water table depth - 10 ft. Our project will entail treating the water as it leaves the storage tank in order to bring the levels of arsenic to an acceptable level of 10ppb or less. Our tank will also be evaluated for possible repair/replacement. We have met with a broker who will assist us in choosing the right system based on the chemistry of our water and our usage. Our estimate of costs is based on our initial meetings with a system analyst.	G	0	C	Our current level of arsenic is approximately 32ppb , the new regulation requires that the water not exceed levels of 10 ppb. We have an existing pump and holding tank, but will need to improve the system to lower the current level of arsenic in the water.	0	44	65 09	Sacramento	I	2008

472	3400164	3400164-002P	VIEIRA'S RESORT INC	Arsenic Treatment System	Arsenic treatment	G	0	C	The system received a Notice of Non-Compliance for Federal Arsenic MCL Violation from the County of Sacramento Environmental Management Department. Vieira's Resort was directed to provide public notification of the arsenic violation as a Tier 2 violation. Vieira's was required to provide notice to their customers no later than December 3, 2008 and repeat every three months as long as the violation exists. Vieira's was required to submit to the EMD a plan to provide water that meets the Federal Arsenic Rule by one of the following options by December 3, 2008.a. Pursue a connection to a permitted water source; b. Provide a new water well source that will meet the water quality and construction standards of a public water system supply water well; or c. Treat the source to meet the Public water system water quality standards. Vieira's has chosen option c and is working with Burleson Consulting, Inc. to complete a Technical Report for a designed Arsenic Treatment System and associated plans, specifications, permits, and environmental documents.	162,570	107	150 09	Sacramento	I	2009

473	5400629	5400629-001	TRAILER ISLE PARK	Trailer Isle MHP Safe Drinking Water Feasibility Study	The proposed Feasibility study would include an analysis of options to provide a reliable source of potable water for the Trailer Isle MHP. In order to determine if a sufficient supply of potable water can be found, at least one test well would be drilled. Sampling at various levels would determine the availability of water by depth and its quality. The analysis of these test well results would result in the design of a future production well that meets Title 22 standards. The study would also include the preliminary engineering and environmental assessment necessary to evaluate the costs and other considerations of drilling a new water well versus other available options. Assuming the results of the test well are favorable, the preliminary design of the production well and storage would be prepared by a licensed engineer.	G	0	C	The Trailer Isle Mobile Home Park provides water to its residents near the unincorporated Tulare County community of Three Rivers in the Sierra Nevada foothills. The water system has one well which exceeds the Maximum Contaminant Level (MCL) for arsenic of 10 ppb. The most recent test result from the well has an arsenic concentration of 11 ppb.	100,000	57	150 12	Tulare	III	2007
474	1009179	1009179-001	BRITZ/FIVE POINT SYSTEM	TTHM Planning Study	Funding is needed to initiate a Planning Study to identify appropriate solutions to resolve the TTHM CO.	G	0	C	The Water System has received Compliance Order No. 03-23-09O-022 in October 2009 The Water System began quarterly TTHM monitoring in the 1st quarter of 2009. The Water System's TTHM RAA in 3rd quarter of 2009 (sample: 09/17/2009) was 0.096 mg/L which exceeds the TTHM MCL of 0.080 mg/L.	250,000	25	150 23	Fresno	III	2011
475	3700041	3700041-002	BARRETT LAKE MH AND RV LLC	Treatment of water source for removal of radionuclides	Propose to install radionuclide treatment on the well with the highest level of radionuclides and highest water well yield. Once treated, the source water wells will be blended to bring the system water below the EPA MCL. Proposed treatment is an inline filtration system consisting of a "filter resin" to reduce the levels of radionuclide contaminants below the MCL. Currently the two wells are connected to pump directly to the storage tanks and no water service connections lie between the wells and storage tanks. Project will incude the treatment filter vessel with media/piping, housing structure and slab, plumbing and related electrical controls and well head upgrade.	G	0	C	Both water wells exceed the EPA MCL for Gross Alpha and Uranium of 15 pCi/l and 20 pCi/l, respectively. A Tier 2 Public Notification was issued on March 25, 2009 and remains in effect.	80,000	94	160 14	San Diego	V	2009
476	5000077	5000077-001P	CERES WEST MHP	Well Replacement and Arsenic Treatment	Water System is requesting funds to evaluate alternatives and to find the most cost effective solution to solving their water quality violation(s). The alternatives to be evaluated are as follows, and in no particular order: feasibility of consolidation with a nearby water system, centralized treatment, and replacement source(s).	G	0	C	Water System currently violates the Arsenic MCL.	500,000	46	161 10	Stanislaus	III	2012
477	2700612	2700612-001	LAGUNA SECA WC		Install disinfection equipment. Upgrade storage and distribution lines.	G	0	C	Primary and standby wells are both above the arsenic MCL. Disinfection and pumping equipment is needed for improved system reliability.	55,000	56	162 05	Monterey	II	2006

478	1000042	1000042-002P	FCWWD #40/SHAVER SPRINGS	Assess alternate water sources for WWD 40	As mentioned on the previous question, the funds will be use to conduct hydrogeological tests on each of the identified wells from a prior feasibility study and on any new well that we identify that may be located closer to the District. The hydrogeological study would then be used as part of the application packet to obtain a water permit through CDPH.	G	0	C	All 5 wells that served WWD 40 have been contaminated with uranium, nitrates, or run dry. As a result, the District no longer possesses drinking water. Currently, bottled water is being consumed by the residents of the District. A feasibility study indicated that there are some privately owned wells in the area with adequate production. WWD 37 is located 2 miles away from the District. Hydrogeological tests must be conducted on each of the identified wells to ensure that they can be used for public consumption. We are seeking funding to conduct the hydrogeological tests on each of the wells identified within the feasibility study. Additionally, we seek funding to evaluate other alternatives.	0	51	172	23	Fresno	III	2008

G	0	C	The problem is we currently exceed the MCL for fluoride and we were directed by the county EHS to provide treatment for fluoride removal. Distribution lines will need to be changed to support the treatment plant. The public notice has been given on the Bi-monthy water bills and yearly CCR. We also announced it at the Annual Stockholders meeting on June 10th, 2012.	500,000	81	200 13	San Bernardino	V	2012
489	2000551	2000551-002	MD#07 MARINA VIEW HEIGHTS	Uranium and Arsenic exceedance	CONSTRUCT A SURFACE WATER TREATMENT PLANT TO TREAT WATER FROM BASS LAKE.	G	0	C	SYSTEM WELLS EXCEED THE URANIUM MCL.	50,000	74	200 11	Madera	III	1998
490	3400332	3400332-002P	OXBOW MARINA	Oxbow Marina Mutual Water Co. - Treated Water Transmission Main	The Oxbow Marina Mutual Water Company (OMMWCo) is proposing to purchase treated water from California American Water at Isleton, CA. This would require the construction of an 8" transmission main approximately 1.1 miles long to connect the Isleton water system to the OMMWCo local distribution system. The 8" transmission main would parallel Isleton's existing 10 inch sewer force main, beginning with a connection to the Isleton distribution system, with a master meter, and end with a connection to the OMMWCo's existing distribution system. The Isleton system would also need to be upgraded, in the form of a new storage facility (350,000 Gal) and a booster pumping station to provide adequate pressure at Ox-Bow Marina. This storage facility and booster pumping station will serve both Isleton and Ox-Bow Marina.The greatest benefit of this alternative, is that it would eliminate the need for the OMMWCo to construct and operate a complex arsenic removal treatment plant with its associated high maintenance costs. OMMWCo personnel would continue operate the distribution system consisting of 4 and 6 inch mains and services.The existing well system, consisting of two wells, two reservoir tanks and two pressure tanks would cease to provide drinking water and the system will be converted to provide water for the extensive landscaping on Marina property.	G	0	C	The EPA has set the Arsenic standards for drinking water at 10 parts per billion to protect consumers served by public water systems from long term, chronic exposure to Arsenic. The Oxbow Marina Mutual Water Company currently has water that tests at 20 to 35 parts per billion for Arsenic. An Arsenic MCL (Tier 2) violation was issued to OMMWCo on January 24, 2008. Public notification is in effect and has been since receipt of the violation notice. Notifications, in accordance with the California Department of Public Health, are continuing every three months while the violation exists.	1,000,000	95	200 09	Sacramento	I	2009
491	1900100	1900100-003P	METTLER VALLEY MUTUAL	Mettler Valley Mutual	The Water system is in need of an additional water source to meet the demands of the community, and to reduce arsenic concentrations. i.e. new ground water well.	G	0	C	Water Quality from Well #1 has ARSENIC concentrations that exceed the 0.50 milligrams per liter (mg/L) National Primary Drinking Water Standard Maximum Contaminated Level. The water system has insufficient water storage for fire protection.	0	98	200 16	Los Angeles	IV	2008

492	2701926	2701926-003	MORO RD WS #09	Nitrate Blending	Install a direct pipeline from the lower transfer tank to the upper storage tank at the top of the hill in which the water from well #3 is being pumped. It is estimated that the pipe will need to be six inches in diameter and the distance from the transfer tank to the storage tank is approximately 2600 feet. This will provide blending to decrease the nitrate and arsenic levels of the water being delivered to the consumers in the system.	G	0	C	Moro Road Water System #9 consists of 3 ground water wells, a 10,000 transfer tank, 2 transfer pumps, three 20,000 gallon and three 17,000 gallon storage tanks, and a hydropneumatic tank with 2 booster pumps.Water from wells #1 and #2 is pumped into the transfer tank. From here water is transferred to the upper 6 tanks (a distance up hill of approximately 2600 feet) using the transfer pumps which are activated by level sensors in one of the upper tanks. The transfer main also provides water to the distribution system. Well #3 is located next to the 6 upper storage tanks and water is delivered to the top of the 6th tank. This well was constructed in an attempt to develop a low nitrate source. Indeed, the nitrate level is lower in this well (average 8mg/L over past 3 years).The problem occurs when water in being pumped to the upper tanks & there is a demand in the system. At that point the consumer will receive water only from the 2 lower wells. The blended water from the 2 wells is tested monthly. The maximum contaminant level was exceeded once in 2010 and twice to date in 2011. The contaminant level was between 40 – 45 mg/L eleven other times in 2010 and four other times thru September in 2011.Additionally, there exists an elevated arsenic level in well #3, while wells #1 & #2 are low in arsenic. The water in well #3 is tested quarterly, exceeding the maximum contaminant level once in 2010	200,000	70	210 05	Monterey	II	2012
493	4600019	4600019-002	Sierra Co. W.W.D #1 Calpine	Water Source Improvement Project	Find a new source of water without the arsenic contamination. Treatment of current source possible but well pump tests show this source is not a dependable one.	G	0	C	We have arsenic at 22ppb in our primary water source.	500,000	142	225 02	Sierra	I	2007
494	2000512	2000512-001	EAST ACRES MUTUAL WATER COMPANY	East Acres Mutual - Arsenic MCL exceedance	Hire consultants and/or engineers to find best fit solution to Arsenic MCL exceedance and water system distribution improvements either through drilling a new well, consolidation with another water system or treatment.	G	0	C	The water system serves a low income community, consist of 2 wells with one well exceeding MCL of 10 ppb and other well with borderline Arsenic sample results. Both wells are conducting quarterly sampling for Arsenic. One of the wells had issues with iron and manganese. Pipelines are old and corooded and need to be repalced.	100,000	81	250 11	Madera	III	2008
495	3301380	3301380-001	Saint Anthony Trailer Park	St Anthony Trailer Park - Arsenic compliance	We will need treatment equipment and monitoring equipment will possible contruction of new distribution system to aid treatment equipment.	G	0	C	Violation of arsenic level standards-filtration device is needed to treat water and provide ongoing monorting. 50 MCL was the arsenic maximum, St Anthony tested at 20 MCL, the new level is 10 MCL. We have exceeded the maximum arsenic levels by 10 MCL.	80,000	60	250 20	Riverside	V	2007
496	5100109	5100109-002	Wildwood Mutual Water Company	Water system consolidation to meet groundwater regulatory compliance	Consolidate community drinking water system with near by City of Yuba City public water system to meet drinking water regulatory compliance.	G	0	C	Community water system currently exceeds arsenic MCL and has been issued a California Department of Public Health compliance order. Back up well currently exceeds regulatory limits for both nitrates and arsenic. The City of Yuba City has agreed to add this community to their public water system.	2,125,000	85	255 21	Sutter	I	2009
497	2000561	2000561-002P	MD#08 NORTH FORK WATE SYSTEM	Madera County Maintenance District No. 8 arsenic violation	Install oxidation with hypochlorite, co-precipitation with ferric chloride followed by filtration for arsenic removal. Drill new high production well. Replace parts of distribution system and storage tank to meet fire flow requirements.	G	0	C	System is currently exceeding MCL for arsenic of 10ppb with a current detection level is 12.43ppb. The system has significant infrastructure failure and does not meet fire flow and fire storage requirements.	318,750	80	264 11	Madera	III	2007
498	2000561	2000561-001	MD#08 NORTH FORK WATE SYSTEM	Construct Arsenic Treatment Plant	Construct a water treatment plant to remove arsenic.	G	0	C	Well exceeds the revised arsenic MCL of 10 ppb.	1,308,750	80	264 11	Madera	III	2007

499	1910066	1910066-002	LEISURE LAKE MOBILE HOME PARK	Arsenic Treatment	The final project will depend on best engineering practices and the most cost effective method for providing water below the Arsenic MCL. The system proposes to construct an Arsenic treatment facility with monitoring, disinfection, and pressure boosting equipment at well 3; install approximately 4000 feet of 6" PVC pipeline to deliver untreated water from wells 1 and 2 to the treatment plant at well 3; construct a new additional 50,000 gallon storage tank for the treated water; and enclose the plant and tank perimeter with security fencing.Consolidation is not an option. This water system is 5-10 miles from the nearest water system.	G	0	C	The system has three wells. Wells 2 and 3 have Arsenic levels exceeding the federal MCL. The Arsenic concentration in Well 1 is increasing. Well 1 and 2 are currently blended to produce water with 9 ug/l Arsenic. Well 3 is not in use for the domestic water supply due to Arsenic exceedance.The CDPH has issued a Notice of Violation for Well 3. Well 1 and 2 are not in violation due to the temporary blending practice.	500,000	211	300	22	Los Angeles	IV	2008
500	2000509	2000509-005P	CASCADEL MUTUAL WATER SYSTEM	Well Replacement, Radionuclide Contamination ER	The Project would consist of drilling an 8" well approximately 1,000 feet deep and installing a 10-15 hp pump capable of pumping 30 gpm. Costs of connecting the well to the distribution line and bringing power to the wellsite are included. The well would include automatic controls.	G	0	C	The project proposes to replace two wells contaminated with radionuclides. The two contaminated wells represent 50% of the system's supply. These sources exceed the MCL's for Gross Alpha and Uranium by three fold. These sources can not be blended with other sources because they do not have automatic controls.	0	137	300	11	Madera	III	2009
501	5400754	5400754-002	SO KAWEAH MUTUAL WATER CO	Arsenic Removal	There is sufficient space on the well easements to install the ADI Media G2 treatment tanks (adsorbtion). The three wells will be piped to the treatment tanks (longest pipe run 170 feet), and the treated water piped back into the distribution system. Any well producing water will discharge through the treatment tanks without valve changes as the wells rotate operation automatically. Backwash from the treatment tanks is non-hazardous and will drain to an adjacent swale. Spent treatment media is non-hazardous for disposal. Given the low exceedance of the MCL, the media should be long-lasting before exchange. Sampling and testing to determine treatment efficiency will be conducted by the current contract laboratory, FGL.	G	0	C	South Kaweah Mutual water supply comes from three wells in the same vicinity. The long-term average arsenic content is 12 ppb. State and Federal MCL is 10 ppb. Up until now, there has been no economic treatment method identified. Quarterly public notification of the exceedance of the arsenic MCL has been on-going. Quarterly Notices of Violation are issued by the Tulare County Environmental Health Department. It now appears that the ADI Media G2 treatment technology can resolve the problem at an affordable operating cost. The water system has $50,000 set aside for arsenic treatment capital. The installed cost of the treatment system is estimated at $150,000. Water rates will be adjusted as necessary to cover operating cost of the treatment system.	100,000	105	300	12	Tulare	III	2009
502	2000293	2000293-002	MD#46 AHWAHNEE RESORTS	Well Replacement and Arsenic Treatment	Water System is requesting funds to evaluate alternatives and to find the most cost effective solution to solving their water quality violation(s). The alternatives to be evaluated are as follows, and in no particular order: feasibility of consolidation with a nearby water system, POU/POE, centralized treatment, and replacement source(s).	G	0	C	Water System currently violates the Arsenic MCL.	500,000	90	300	11	Madera	III	2012

503	5100107	5100107-007	Sutter Co. WWD#1 (Robbins)	Construction of a New Robbins Water Treatment Plant and Arsenic Removal System	In order to achieve compliance with primary and secondary MCLs, the existing water treatment plant must be moved to the larger Sacramento Valley Boulevard site to accommodate new water treatment equipment. Water is distributed through a system of mains ranging from 3" to 12" in diameter. The current system is comprised of approximately 4 miles of water piping and valves, and 94 lateral connections. A new public water well will be drilled and developed at a new site. Currently, the County is leasing 0.06 acres from Wagner Aviation for the existing well site. The new well site is located on Sacramento Valley Boulevard. The land is owned by the County and is approximately 0.67 acres.Major equipment at the new water plant will include: a new drilled well, arsenic filtration system, iron and manganese removal equipment, a backwash tank, a water storage tank, well pump equipment, booster pump station, electrical supply equipment, chemical feed system and a hydro pneumatic tank. However, before construction of the new water treatment plant can begin, the existing water tower located at the Sacramento Valley site will be demolished.	G	0	C	The Sutter County – Water Works District No. 1 (WWD#1) is responsible for providing water service to the Community of Robbins. The water system currently operates one active ground water well (Wagner Well), one backup ground water well and one storage tank that provides the Community's residents with potable water. The active ground water well incorporates treatment for iron and manganese. The system provides municipal drinking water to approximately 336 year-round residents. The total system was designed to meet all health standards when constructed; however, due to a recent change in the Federal arsenic limit, the system does not meet the new primary Maximum Contaminate Level (MCL) for arsenic. The Wagner Well also exceeds secondary MCLs for chloride, specific conductance, and manganese. Currently, the one active ground water well is located on land leased to WWD#1 by Wagner Aviation. The "Maximum Contaminant Level" (MCL) for arsenic in drinking water was recently lowered from 50 parts per billion (ppb) to 10 ppb. The existing filter media at the water treatment plant was not designed to reach this level of arsenic removal, and is not meeting either State or Federal requirements for the removal of arsenic. Similarly, the existing filter media is not meeting secondary standards for manganese, chloride, and specific conductance for treated water. On January 2, 2009, the California	2,409,000	94	336	21	Sutter	I	2011

506	3610017	3610017-004	HAVASU WC	Treatment Plant Out Of Comliance And TTHM Violation Since 2006	1. A GAC system placed in front of th existing five filters and prechlorination point. This will eliminate TOCs that lead to high TTHM formation with chlorination. Monitoring equipment, new plumbing and electric. 2. To be in comliance with the LT1ESWTR, new turbidimeters and printers for the filter tanks are needed. New printers must be continuous and print out every fifteen minutes. New poylmar system, a new continuous chlorine monitor is needed. 3. A new backwash pond needs to be constructed to handle over flow with security fence. New pumps needed for ponds. 4. The chlorine room is to be replaced with a more secure building and the chlorine gas system upgraded to safer liquid chlorine. Safety equipment purchased.5. New housing with insulation and air conditioning for all filtration , monitoring equipment etc. with work area and storage space. Right now two bodys can't pass each other in the filter room without rubbing together. Engeeners have been consulted. A local contractor is available for construction of a new building to house the system.	G	0	C	1. Since December 28, 2006 HWC has been in viotation of TTHMs. Have received Violation Notices. Cusomers are sent a notice every quarter warning them that some people who drink water containing TTHMs more than the MCL over many years may experience liver, kidney, or central nervous system problems, and may have an increased rick of cancer. As of the fourth quarter of 2008 the annual running average is 94ppb. In 2008 the TTHMs ranged from 74.5ppb to 111.2ppb. MCL 80ppb. HWC consumers are very unhappy campers. 2. The treatment plant needs up grading. It is out of compliance with LT1ESWtR monitoring requirements. The continuous chlorine monitor is not working. New turbidity meters and printers are needed for continuous monitoring and printing every fifteen minutes. 3. The Chemehuevi Indian Tribe has complained about the sump ponds over flowing, there is not adequate fencing around the ponds. The CDHS has advised additional backwash ponds and security fence. 4. The chlorination room is made of plywood and coming apart. It contains 150# gas chlorine tanks that are hard to handle and a hazard. Safety equipment is needed. 5. The housing for the existing filtration and monitoring system is a metal storage unit, looks like a box car. There is no insulation and can reach 120 degrees inside during the summer. Not good for equipment or people.	400,000	211	350	13	San Bernardino	V	2009

513	1210024	1210024-003P	Westhaven C.S.D.	DBP precursor treatment (planning)	The proposed project is the purchase and installation of a packaged 50 gpm ion exchange filter plant to remove the DBP precursors after filtration of the water and before chlorination.Maximum day demand in the system is approximately 40 gpm, and maximum source capacity from the springs is 50-60 gpm at the times of maximum day demand.The funding request includes $300,000 for the ion exchange filter unit purchase and $50,000 for engineering, site preparation, piping and appurtenances.	G	0	C	The water system relies on surface water collected in a rewood forest which is treated with slow-sand filtration and sodium hypochlorite disinfection. The source water contains chemical precursors that, when combined with sodium hypochlorite, cause the formation of disinfection byproducts (DBPs) in the finished water. The slow-sand filter is thought to remove few, if any, of the precursors. The levels of DBPs found in the distribution system vary somewhat seasonally, with the levels of precursors being influenced by amounts of rainfall. Eleven consecutive quarters of distribution system sampling have shown DBPs in exceedance of the state MCL. Individual samples for Trihalomethanes (TTHM) have exceeded the state MCL, while the annual running average for TTHMs has not exceeded the MCL recently. Most of the samples for Haloacetic Acids (HAA5) have exceeded the MCL, and the current running annual average for HAA5s also exceeds the MCL. Sampling results are as follows - units are in ug/L:TTHMMCL----------80System Max----- 110System Min-------10System Avg.------58R. Annual Avg.---59HAA5MCL----------60System Max----- 181System Min-------12System Avg.------80R. Annual Avg.---76	130,000	213	490 01	Humboldt	I	2009
514	0600008	0600008-001C	Colusa Co. W.D. #1 - Grimes	CCWD #1 Arsenic Removal System	The Colusa County Water District #1, located in Grimes CA, is ready to move forward with the construction of an arsenic treatment plant. Upon receipt of funding the District would first have a fully developed engineering design completed. This design will address the completion of 1) site preparation, 2) infrastructure, 3) arsenic treatment plant, 4) relocation of existing main and auxiliary production sites, and 5) a new storage tank.Site preparation will include 1) demolition and removal of the existing auxiliary well shed, 2) demolition and removal of the existing maintenance shed, 3) tree removal and 4) site grading.Infrastructure will include a new 20' x 20' 6" reinforced concrete pad , a 20' x 20' x 12'h steel building to house the new treatment plant, a 6' fence to enclose the new site, all piping, valve tie ins and electrical (single phase, 3 20 amp circuits).The treatment plant will consist of an absorptive media based technology capable of treating arsenic in the 26 ppb range at 60 gpm. The new plant will run on a programmable logic controller (PLC) based automation.A new storage tank will be constructed adjacent to the tratment plant. The new storage tank will be approximately 50,000 gallons which replaces the existing 6,000 gallon pressure tank. The new tank will be located on a reinforced concrete slab to specifications. Dual variable frequency pumps will be installed to control flow to the delivery system.The plan	G	0	C	Arsenic in the Grimes community water system well water exceeds the current federal standard of 10 ppm. The average concentration found in our well is approximatly 24 ppm. The community of Grimes volunteered to participate in an EPA funded demonstration project to use point-of-use filtration starting in 2002. The California Department of Public Health informed the District that this method of protection was not going to be a long term solution to treat arsenic, which neccesitates Grimes to install a central treatment facility. With the improvements and monitoring of the current pou system the CDPH will allow Grimes to continue with this form of treatment until December 31, 2010.	1,656,800	104	500 21	Colusa	I	2009

515	1510052	1510052-006	NORTH EDWARDS WD	NEWD, Trailer Park & Dunes Water System Consolidation and Arsenic Reduction	Our water system project will include the installation of an arsenic treatment plant, new water lines to the dunes apartments and fountain trailer park (about 1mile). The installation of additional water storage capacity for the additional services will also be included. North Edwards Water District will also need a new booster pumping station at wells one and two, due to the additional services, additional piping distances and systems flow reconfiguration. A third well will need to be drilled in order to provide supplemental water supply during high consumption and still be able to fully treat supply water through the arsenic treatment plant and have sufficient storage capacity. Several fire hydrants will be installed to the dunes apartments and fountain trailer park to meet fire flow requirements. A median Household Income (MHI) survey was completed by an independent agency with-in the last 6 months. The North Edwards Water District has been deemed a disadvantaged community.	G	0	C	North Edwards Water District "NEWD" (Public), Dunes Apartments and Fountain trailer park (Both private) exceed the EPA MCL of 10ppb for arsenic. Currently NEWD arsenic levels are 32 and 36ppb from our two wells. We are required to notify the public that we exceed the MCL for arsenic on a quarterly basis. We provide notification through the mail during the billing cycle of that quarter. The notification is currently in effect.	5,836,000	222	597 19	Kern	III	2009

522	2110001	2110001-033	Inverness Public Utility Dist	Water Treatment Facilities Improvements: Control of Chlorine Disinfection By Products	The Inverness Public Utility District (IPUD) contracted with SPH Associates Consulting Engineers (SPH) of Cameron Park, CA to have SPH evaluate potential solutions to remove disinfection byproducts (DBPs) from IPUD treated drinking water and thereby gain compliance with State and Federal Maximum Contaminant Levels (MCLs) for DBPs. SPH's report recommends IPUD combine 1) granular activated carbon (GAC) to remove most organics from raw water, and 2) enhanced chemical coagulation further reduce organic load. The combination of these two methods is a successful practice that is widely used in the drinking water treatment industry used to meet State and Federal MCLs for DBPs. GAC is effective in removing organics through the process of adsorption, and enhanced chemical coagulation reacts with water to enable removal of soluble organics.The IPUD System is comprised of two separate water treatment plants, both in Inverness: one at Perth Way and one at Sir Francis Drake Boulevard. Implementation of the SPH recommendations requires modifications to these existing facilities that are well within the scope and feasibility of IPUD operations. This solution involves installing GAC contactors at each treatment facility, as well as chemical feed pumps. Cost estimates provided by SPH to implement improvements:Perth Way Water Treatment PlantEngineering/Design: $10,000Granular	G	0	C	The Inverness Public Utility District (IPUD) is in non-compliance with treated drinking-water maximum contaminant levels (MCLs) for disinfection byproducts (DBPs) set by both State and Federal Drinking Water Quality Standards. Total Trihalomethanes (TTHMs), a disinfection byproduct, in IPUD treated drinking water exceeds MCLs established by the EPA Stage 1 DBP Rule MCL for TTHMs. IPUD treated drinking water also exceeds TTHM MCLs established by Section 64533 of the California Code of Regulations. IPUD has been in violation of TTHM disinfection byproduct MCLs starting in April 2006. The IPUD raw water supply is obtained primarily from streams, with a small increment of water taken from wells during low stream flow periods. Water from the collection system is filtered (using Memcor Continuous Microfiltration) and is disinfected with chlorine. Naturally occurring organic matter in the raw water not removed during the filtration process reacts with the chlorine to form TTHMs that exceed State and Federally mandated MCLs for TTHMs. IPUD's entire water system income and budget is derived from metered water usage and a bimonthly basic charge. Due to the size of the IPUD water system, income derived from customer usage and basic charges do not allow for funding a capital project that will solve IPUD's non-compliance with State and Federally mandated DBP MCLs. Therefore, IPUD is requesting funding assistance	279,000	501	702 18	Marin	II	2008
523	1510054	1510054-003	PINON PINES MWC	Pinon Pines MWC Water Treatment Plant Regulatory Required With System Improvements	Install a water treatment plant to correct excessive MCL of fluoride. Plant will be a stand alone package unit. Treatment system will require construction of evaporation ponds to allow disposal of treatment medium. Interconnecting pipelines between the treatment plant into the distribution system and to the evaporation ponds need to be constructed. One storage tank is deteriorated with approximately 30% of the interior lining missing. We propose to remove the deteriorated tank and an adjacent small tank and replace with one large tank to increase water system storage. Drill a new well to replace a well that has failed, to increase system capacity and allow additional blending to reduce fluoride MCL. Mechanically clean approximately 22,000 linear feet of main distribution pipe lines to remove sediment and contaminant buildup and assure maximum flow volume.	G	0	C	Water provided by the system exceeds the allowable MCL of fluoride. Blending with another well does not bring fluoride into compliance with MCL. CDPH requires quarterly notification that will continue until exceedance of fluoride MCL is corrected. A storage tank is badly deteriorated and needs to be replaced.	4,000,000	247	740 19	Kern	III	2009

G	0	C	Current wells are in marginal compliance with MCL's for uranium and fluoride, if an existing well exceeds a primary compliance it must be shut down, then there is not enough capacity for existing system.	0	243	830 19	Kern	III	2009

529	5710011	5710011-001	Wild Wings Golf Community	Arsenic Treatment for the Wild Wings County Service Area Water System	This Project for Arsenic Removal within the Wild Wings County Service Area for the 2,000 gpm system would incorporate the use of filter vessels. The AS Removal system utilitzes two 14 foot diameter vessels in parallel. They will utilize Bayoxide Pellets, and 946 cubit feet of media quantity. The backwash volume will be approximately 26,000 gals/vessel with a 2000gpm supplemental backwash rate. Average treatment would be approximately 1,840,000 gals/day. The media cycle life would be approximately 52.1 months.Essential from Well Pump water would go to Disinfection then to both Absorbers (media) and out to Storage or distribution as treated. This process would be one that would filter and remove As and allow the well in current danger to be placed off of standby and again as a usable domestic supply source which is essential to the Wild Wings Community. This could also potentially allow users in nearby areas to utilize the system in case of capacity and toxic issues in their own neighborhood should it be allowed by the water system authorities in the future. The areas surrounding the Wild Wings community are rural and are often using outdated and in some cases could be non-compliant wells. The could potentially be a benefit to more than these over 1,000 users currently incorporated into the system.This process would resolve the current violations according to both the Title 22 California Code of Regulations MCL requirement for	G	0	C	Wild Wings County Service Area Public Water System is experiencing a problem with Arsenic contamination in one of its 2 drinking water source wells. Currently this well is not in use and will need to be changed to a standby source. The problem with this is that this public water system can not have this well become a standby source because there is only one other drinking water well that is available for the supply of domestic water to over 1,000 users in the system. The facility is a 2 mgd water treatment facility and Arsenic would be treated on a large scale. According to CDPH this Category G project is one that would rectify the directive currently standing. This Arsenic Contamination is one that does not meet the Operational Requirements listed in Section 11655 of the Drinking water Statute stating"Any person who owns a public water system shall ensure that the system does all of the following: (1) Complies with primary and secondary drinking water standards..." The Arsenic contamination is one that also exceeds California Code of Regulations Title 22. Domestic water quality and montioring regulations Article 4 primary standards inorganic chemicals maximum contaminant levels. The well source with the arsenic problem has been fluctuating over the MCL requirement for a running average standard. The well has hit over 10 ppb for this running average.	600,000	346	1,187	09	Yolo	I	2009
530	4710007	4710007-003	City of Montague	Filter and UV disinfection upgrade	The City of Montague recently undertook an enginneering study to determine the best options for dealing with the problems outlined in the previous section. The following reflect recommendations outlined in that study.The existing pressure filters should be replaced with new granular media gravity filters. This will provide more effective filtration and will eliminate turbidity spikes presently occurring. This should provide treated water meeting the LT1ESWTR.The construction of a new filtered water pump station, to deliver filtered water to the existing storage tank, will be required to allow for the change from pressure to gravity filtration.The installation of a UV disinfection system. This will provide an additional barrier to microbial contaminants. It provides effective control of cryptosporidium. Use of a UV system will decrease the use of chlorine and should, combined with more effective filtration, reduce the formation of disinfection byproducts.Installation of electrical and control system components associated with the above systems will be necessary. Monitoring equipment necessary to comply with CFR141 141.570 will be installed.Site grading and piping necessary to the project will be required.	G	0	C	The purpose of the project is to reliably meet current and future turbidity and giardia/cryptosporidium regulations dealing with Montague's surface water supply.The City of Montague Water Treatment Plant includes two pressure filters that are nearly 35 years old. These filters have visible evidence of corrosion damage to the pressure vessel walls and are expected to fail in the next few years. The existing filters produce water that meets the existing filtered water standards that apply to older water treatment facilities. However, these filters do not produce filtered water that meets all of the requirements included in the Long Term 1 Enhanced Surface Water Treatment Rule that apply to newer water treatment plants serving fewer than 10,000 people, including producing filtered water with less than 0.3 NTU in at least 95 percent of the samples collected during each month of operation. The maximum filtered water turbidity has also exceeded the maximum turbidity level permitted by the LTESWTR of 1 NTU in past occasions. The filters operate in a start/stop mode based on the call for water from the storage tank. These cycles can occur several times daily. Each start-up causes short term turbidity spikes, providing an opportunity for pathogenic organisms to pass through the filters. Due to regulatory changes, there has been a significant reduction, from original design, in the volume of water which the filters are	2,000,000	504	1,495	01	Siskiyou	I	2009

531	1910246	1910246-002P	LAND PROJECT MUTUAL WATER CO.	Wells 1,3,4 and 5 Arsenic treatment plan	The system has several options including: Installing transmission piping to interconnect old wells with potential new well(s) to provide blending; Installing new wells that are potentially in compliance with MCL's; Or installing arsenic treatment such as RO at each well site. The project scope will be determined by best engineering practices and fiscally responsible treatment.	G	0	C	The community water system has four groundwater wells that supply approximately 500 service connections. As of June 18, 2007, all four wells exceed the arsenic MCL, ranging from 8.6 ug/l to 20 ug/l, and have since 1998. There are no current arsenic violations. Well #4 is the only exception, with three of five samples below the MCL. Two samples on well #4 have results of 8.6 ug/l (5/18/04) and 9.7 ug/l (6/18/07). The system infrastructure is currently not conducive to blending. Additionally, the system is unsure if they are within the MHI to be considered a disadvantaged community.	1,190,536	520	1,500 07	Los Angeles	IV	2007
532	5210003	5210003-001P	Los Molinos Comm. Services Dist.	Arsenic Compliance and Consoidation Project	District staff, with the assistance of Calif. Rural Water Association and the District's Engineer, performed a prliminary review of the alternatives for achieving compliance with the arsenic MCL requirement of the finished water from Well #4. LMCSD has chosen to develop an additional water source that can be used to blend down the arsenic concentration to required levels.LMCSD has two additional wells each with arsenic concentrations below 5 ppb, however, both wells would require several miles of underground piping to be used. Therefore, LMCSD will seek fuding for development of an additional water source for blending by drilling a new well within 100 feet of Well #4. Preliminary e-log evaluations from Well #4 indicates an adequate quantity of water above the confined quifer that contain water that can be used to blend with Well #4 water to achieve the desired results.The project would begin by hiring a geological consultant and a project engineer to provide expert consultation, recommendations, specifications, and to assure compliance with industry standards. The next step would be to drill a test well approximately 100 feet from Well #4. The test well would provide the opportunity to run an e-log to evaluate the quantity water available, it would also allow the District to take water samples to assure the new well would meet the Title 22 water quality requirements and provide a low	G	0	C	The California Department of Public Health has issued a Notice of Non-Compliance for the Districts Well #4 because it exceeds the MCL for Arsenic. Well #4 was drilled in 1996. The District is currently required to mailing a quarterly notification for the exceedance of a chemical MCL to each landowner.Well #4 was designed and developed to be the primary water source for the community of Los Molinos, which consists of 350 service connections. The well was drilled and sealed deep to avoid the potential nitrate contamination caused by the communities individual septic systems. The seal consists of 24" steel pipe to a depth of 101 feet. The well consists of 14" solid steel casing to a depth of 456 feet, and from 456 to 536 with 80 feet of gravel packed stainless steel Johnson well screen with .040 slots. All the water produced comes from depths between 456 feet and 536 feet. It appears that the water produced is pumped from a confined aquifer since the static water level is 2 feet below ground level; much higher than surrounding shallower wells. As the primary water source well #4 is equipped with a 212,000-gallon storage tank and a 100 hp booster pump to provide the communities fire protection flows of 1000 gpm's for two hours. This well also provides the Districts only backup power supply. LMCSD relies heavily on the production from Well #4.It appears that the water produced from the confined aquifer contains higher levels of arsenic	63,091	358	1,500 21	Tehama	I	2009

535	2210001	2210001-006	MARIPOSA PUBLIC UTILITY DIST	Water Main Extension To Address MTBE Contamination	Mariposa County and MPUD propose to extend the public water main from the existing water distribution system in the town of Mariposa to the PW facility. This will include the installation of approx. 10,00 feet of 8" water main with appertanances and a pressure regulating station.Mariposa County has applied for funds through the CDPH Drinking Water and Research Fund (DWRF) for this project. CDPH staff has indicated that the DWRF program may provide partial funding for the project. SRF Stimulus funding may be reduced if DWRF funds are committed to the project.The extension of the MPUD public water system in the area of Mariposa Co. PW provides for the pontential of another public water supply to consolidate. The preliminary design places the proposed water main within 1000 Feet of the Mariposa County Fairgrounds, public water system #2201070. The Mariposa County Fair staff is currently considering the economic feasability, primarily monthly service charges, to determine if they will participate in the project.	G	0	C	The Mariposa County Public Works (PW) facilities are located within the Mariposa PUD LAFCO Sphere of influence. The water supply for the PW facility has been provided by an on-site well, CDPH system # 2210937. For more than three years the water supply well has been contaminated with MTBE. The source of the MTBE is alegedly from nearby underground gasoline tanks. The extent of the MTBE plume is unknown. Drilling of a new well is not considered a viable option. A new well may tap a water source already affected by the MTBE plume or the pumping of a new well in the area may draw the MTBE plume into the new well. Analysis results of the most recent well water samples indicate that the well water is still contaminated with MTBE. The owner of the underground tanks has provided a treatment system and paying for the pumping of the well and operation of the treatment system for at least three years. The treatment system is providing adequate removal of the MTBE for ultimate disposal of the pumped ground water to surface water. Drinking water is currently trucked from the MPUD water system to a temporary storage tank at the PW facility.	1,100,000	671	2,000	11	Mariposa	III	2009
536	5710007	5710007-006C	Esparto C.S.D.	Well Replacement	Drill a test well approximately 600' to sample for water quality and quantity. If the test location proves viable, then: (1) drill and construct a new well, (2) develop well to maximize production and (3) tie into existing distribution and SCADA systems.	G	0	C	Our system has three (3) active groundwater wells. Running all three (3) wells 24 hrs/day, we have a maximum production capacity of 1.5 MGD. We have had 30 day periods with demand averages as high as 1.3 MGD. We are in desperate need of adding source capacity to create a reserve as well as prevent overdraft of the water table at existing wells.We originally had five (5) active groundwater wells. Well #3 was abandoned in 2000 when contaminants from an equipment maintenance yard were detected in the well water. Well #4 produces sand, despite several attempts at repair and has been out of service since 2003.	425,000	688	2,000	09	Yolo	I	2012
537	1010039	1010039-009C	Caruthers Comm Serv Dist	Well 05 Arsenic Treatment	Granular Ferric Hydroxide (GFH) is an adsorption process using ferric-based media to sorb arsenic and other heavy metals from raw water supplies.	G	0	C	Arsenic levels in excess of the MCL in the drinking water for Caruthers Community Service District.	0	672	2,103	23	Fresno	III	2002

538	1010039	1010039-012	Caruthers Comm Serv Dist	New Well and Water Treatment Facility	The recommended project includes construction of a new well and abandonment of existing Wells No. 1 and 4. The existing Well No. 5 would remain in use and the water produced would be piped to the new well site. A new well would be constructed with the intent of obtaining at least 1,000 gpm to replace the capacity of Well No. 1 and No. 4. The new well would be designed and constructed with the intent of avoiding arsenic concentrations above 5 ppb, to allow the flows from both wells to be blended. A storage tank will be constructed on the new well site and is anticipated to be approximately 0.75 MG to provide for blending. Booster pumps will be required, along with additional onsite and offsite piping to transmit water from the existing well to the new well site and then deliver water to the water distribution system. A standby generator will also be required. However, if the new well does not produce water that has an arsenic concentration that is sufficient for blending, a coagulation filtration plant will be constructed on the new well site to treat water from Well No. 5 and the new well if required. Additional equipment will be required to be installed; a backwash tank, a pre-oxidation tank, a pH adjustment tank, additional on site electrical, a control building, dewatering facility, etc. This project could be phased.	G	0	C	The existing water supply facilities for Caruthers include four (4) wells, Numbers 1, 3, 4, and 5. Well No. 1 (flow rate of 350 gpm) is not used except in the summer months. The four (4) wells have a pumping capacity of 3050 gpm, which is adequate for the current population. The water from Well No's 3, 4, and 5 have Arsenic levels of 8, 20, and 12 ppb, respectively, with Well No's 4 and 5 being above the new Federal limit of 10 ppb. These existing 2 wells require treatment for Arsenic removal. The arsenic is in the form of arsenite (As III) and must be pre-oxidized to form an arsenate (As V) species for highest removal efficiency. In general, the pH of the water must be reduced to approximately 7.5 to facilitate conversion to arsenate.	7,174,450	672	2,103	23	Fresno	III	2009
539	1010028	1010028-002C	Riverdale Public Utility District	Achieve compliance with Revised (10 ug/L) Arsenic Standard.	Plan, design and construct media filtration systems at each well.	G	0	C	PUD's existing three wells exceed revised (10 ug/L) Arsenic standard.	5,905,000	866	2,416	23	Fresno	III	2005
540	1510002	1510002-001P	BORON CSD	Arsenic treatment plant	Arsenic Removal treatment, AVEK water is currently available as a secondary source with low arsenic	G	0	C	Arsenic in the system wells is above the new federal MCL of 10 ug/L,	5,000,000	839	2,500	19	Kern	III	2007
541	5410009	5410009-010	Pixley Public Util Dist	Wells 1, 2A, 3A Arsenic Treatment	The project would entail construction of three new well to replace the existing three wells that are not in compliance with the EPA Arsenic thresholds. The existing three wells would be properly abandoned. Depending on the quality of water obtained from the three new wells, arsenic treatment systems would be constructed on each new well site to treat the source water prior to distribution. Additional on-site and off-site piping is required to deliver finished water to the water distribution system. A standby generator would be included at each well site.	G	0	C	The current water system utilizes four wells (1, 2A, 3A and 4) to provide the water supply for the community. The four wells have Arsenic levels of 22, 23, 21 and 4 parts per billion (ppb), respectively. Wells, 1, 2A, and 3A exceed the Environment Protection Agency standard of 10 ppb.	6,575,350	801	2,793	12	Tulare	III	2009

543	3610002	3610002-002	ALPINE WATER USERS ASSOCIATION	Alpine Water Users Association, Uranium Treatment Compliance Order 05-13-11CO -002	The Alpine Water Users Association, in conjunction with our contract Engineer Mr. John Egan with Engineering Resources of Sothern California, have conducted an Engineering Report (as required by CDPH outlined in Compliance order 05-13-11CO-002), and have determined that Ion Exchange treatment is the most realiable means of removal of the contaminant from the drinking water.A copy of the engineers report has been submitted to Mr. Sean F. McCarthy, P.E., Senior Sanitary Engineer, CDPH on February 9, 2012.	G	0	C	The CDPD has issued compliance order No. 05-13-11CO-002 to the Alpine Water Users Association for the following violations.1) California Health and Safety Code, Section116555 (a)(1); Specifically, the Association has failed to provide water that complies with primary drinking water standards.2) California Health and Safety Code, Section 116555 (a)(3); Specifically, the Association has failed to ensure that the system is providing a reliable and adequate supply of pure, holesome, healthful, and potable water. 3) Title 22, California Code of Regulations, Section 64442 (a). Specifically, the Association does not at all times deliver water to all customers that complies with the uranium maximum contaminant level of 20 pCi/L.AWUA had exceeded the uranium maximum contaminant level (MCL) from the fourth quarter of 2010 to the third quarter of 2011 for ground water wells No. 1 and 12. therefore CDPH has required the Association to conduct Tier 2 public notifications for each quarter that the Association was not in compliance with the uranium MCL. Currently, the wells that exceed the uranium MCL have been turned off and can no longer be used as a reliable source of water for the community. AWUA is seeking funding for water treatment facilities for water wells that exceed the maximum contaminant levels of uranium and once again become self reliant and not be required to purchae water from the California State Water Project,	242,121	932	3,000	13	San Bernardino	V	2012
544	2610003	2610003-002C	BRIDGEPORT PUD	Arsenic Removal System	Install treatment system to meet future MCL.(2006)	G	0	C	Arsenic level in twowells are high (0.039 mg/l)	10,000	227	3,000	13	Mono	V	2004
545	2010007	2010007-008	HILLVIEW WC-OAKHURST/SIERRA LAKES	Oakhurst-Sierra Lakes 2010007 Uranium-Arsenic Compliance & Fire Flow	The Oakhurst/Hillview Water system is currently under a compliance order for Uranium & Arsenic for the water produced in this area. A project bringing on 6-700 gallons per minute of new source out of five new wells, including the raw water line to the current treatment facility has just been completed. However, the area water is not in compliance with uranium or the new arsenic standards. The solution is to install uranium removal treatment on the wells that are the highest in uranium and then blend the treated water to go well below compliance levels. The solution for the arsenic problem will require separate treatment of a larger quantity of the source water with a separate treatment operation that will then blend the treated water back into the storage tanks at below compliance levels. This will require replacement of the existing 500gpm iron and manganese removal treatment facility with a 1500gpm arsenic, iron and manganese removal treatment plant.Increasing fire flow will be done by adding storage. Since all sources in the area are ground water, increasing storage is a more reliable and cost effective solution for fire flow. A 250,000 gallon storage tank will replace two 40,000 gallon tanks at the arsenic treatment facility; a 500,000 gallon storage tank will be added at the location of the existing 420,000 gallon storage tank and the 420,000 gallon and 40,000 gallon water tanks will be refurbished.The funding would be	G	0	C	Treatment for Uranium: On September 8, 1997, the Department of Health Services (DHS) issued Hillview Compliance Order No. 03-11-970-002 for failure to comply with the Uranium Maximum Contaminant Level and failure to insure that customers are provided with a reliable and adequate source of pure, wholesome, healthful and potable water. Treatment for Arsenic: On January 26, 2009, the California Department of public Health (CDPH) issued Hillview Compliance Order No. 03-11-090-001 for Arsenic Maximum Contaminant Level exceedance. CDPH (DHS) has ordered Hillview, among other things, to develop a project that will correct the water quality problems. Hillview has developed such projects and now seeks funding by this application.Additionally, this water system is in a fire danger area and Hillview's system would be the only water source available for fire fighting in the area. No part of the system will meet fire flow requirements during peak consumption periods and in some areas of the system fire flow cannot be met at all. Since all sources in the area are ground water, increasing storage is a more reliable and cost effective solution for fire flow.	5,482,300	1,007	3,006	11	Madera	III	2009

546	1610001	1610001-009	Armona Community Services Dist	Well 2 Replacement	The project would consist of drilling a replacement well for Well No. 2. The goal is to drill a new well that would not require treatment, producing water with Arsenic concentrations below the maximum contaminant level. The replacement well would require property acquisition, drilling a test well, installation of a permanent production well, appurtenant site facilities, and construction of a new water main to connect to the existing distribution system. Additionally, the project may include treatment facilities and a transmission main to Well No. 2 for blending if the new well does not produce a sufficient amount of water with desirable water quality characteristics.	G	0	C	Well 2 is in violation of the Federal Drinking Water Standards of 10 ppb for Arsenic. The USEPA has issued an Administrative Order requiring corrective action. The problem must be addressed to remain compliant with the California Department of Public Health Supply Permit.	6,970,000	1,179	3,239	12	Kings	III	2009

These up-grades will meet the required pumping demand and the new capacity.Expansion of the Sodium Hypochlorite Disinfection system, expansion of the coagulant (Polymer) Chemical system and coagulant aid (Polyferric Sulfate). This is another up-grade component that will complement the solution for the TTHMs.Relocation of the Backwash Pump Station and construction of a backwash basin pump station, construction of an incline settling plate clarifier, construction of Sludge drying beds, construction of a recycled water backwash pump station. Due to the high solids content in the canal water it is necessary to modify all this components to increase the treatment capacity.Expansion of the existing operations building, demolition and construction of additional site piping, expansion of electrical and instrumentation facilities,	G	0	C	Phase III Water Treatment Plant up-grade from 2MGD to 6MGD.Problems:-The Potable water exceeded the MCLs of the TTHMs. for 1st, 2nd 3rd Qtrs of 2005-The Water demand exceeded the water treatment plant capacity.-The raw water ponds don't meet the 6 days raw water supply.-The existing raw water pumps do not meet the actual capacity.-The treatment filter units can't be taken out of service for maintenance. - The water supply will last only 1 1/2 days in case of emergency; this after the completion of the Phase I - 3MG pre-stressed concrete reservoir, placed in service in May 2008, project phase paid by the impact capacity fees. CDPH permit 05-174-08-PA-040.Phase II - 36" reliable raw water trasmission pipeline. The construction of 9,100 feet of Raw Water Pipeline from the IID Central Main Canal from the Colorado River - to the Water Treatment Plant. - Funds commited by USDA.	6,150,000	1,420	3,508	14	Imperial	V	2009

549	5510008	5510008-011	LAKE DON PEDRO C S D	Clarification Basin Building Completion	Pour a concrete foundation with drainage system for the metal building that will be placed over the clarification basin. Construct the metal building that has already been purchased. Most of the engineering work has been completed for this project. With the required funding in place, this project can be started immediately.	G	0	C	The district is currently out of compliance with our Trihalomethanes (THM). They are above the Drinking Water Standard. We should be at 80 micrograms per liter. Last quarter we reported a level of 83.6. The standard is set to be lowered in the future so we will be even further out of compliance. By covering our open clarification basin, it will reduce the entry and growth of organic material and increase the effectiveness of our polymers, reducing our THM levels. The metal building has been purchased and is on site, but funds are not available to complete the project. Our district is facing our fourth year of constrained revenues due to the economic downturn in our isolated, rural community which has resulted in three years of unbalanced budgets. The Department of Public Health is requiring us to complete this project as a part of upgrading our facilities in order to meet the water quality standards they desire.	140,000	1,442	3,600	11	Tuolumne	III	2009

552	4910011	4910011-005P	Sebastopol, City of	Well 06 Arsenic Treatment	Blending water from another water zone with Well 06 is proposed to meet arsenic regulatory compliance. Installation of about 400' of water main and booster pumps with variable frequency drives to boost water into source to blend water is proposed. Monitoring will be required on a weekly basis per CDPH to ensure regulatory compliance. Prior efforts to install an inflatable packer to isolate arsenic laden areas in the well have not been successful. This is the most cost effective solution in our incremental effort to remediate arsenic levels in this well.	G	0	C	Arsenic standard of 10 ppb is exceeded in Well 06. Public notification has not yet been required as the well is off line until it can meet regulatory compliance.	400,000	2,885	7,750	18	Sonoma	II	2009
553	4910011	4910011-004	Sebastopol, City of	Well 6 & Well 7 Arsenic Treatment System	Purchase and install adsorption arsenic treatment system designed for treatment flow rate of 2,000 gpm, average arsenic influent level of 15 ppb, effluent target arsenic level of 8 ppb, and a 100% well utilization rate.Project will involve reconfiguration of water mains for plumbing into the treatment system.	G	0	C	Water System problem is in violation of U.S. EPA Arsenic Rule of 10 ppb at two System Wells, #06 & #07. These System Wells exceed the arsenic standard by 5-8 ppb. Currently issuing quarterly Public Notice to customers for arsenic violation, per Compliance Order from California Dept. of Public Health.	2,169,000	2,885	7,750	18	Sonoma	II	2009

554	0310012	0310012-006C	AWA Buckhorn Plant	CAWP - Buckhorn WTP Disinfection By-Products Compliance	The project proposes to install a UV system at the WTP and 3- post Chlorine Stations within the system. This will reduce the chlorine dosage at the WTP and will therefore conform to the Disinfection Bi-Product Requirements	G	0	C	The Buckhorn Water Treatment Plant (WTP) provides both retail and wholesale domestic service to communities in the Eastern part of Amador County. Currently 2- of the Wholesalers have been cited by the Department of Health Services for non-compliance of HAA5 and TTHM of the Disinfection Bi-Product Rule. Although, the Agency has exceed the individual site requirements its retail service, the system's data has been average out, it has therefore collectively met the Disinfection Bi-Product Rule. In 2008, averaging will no longer be allowed and therefore it is expected that the system will be in violation of the Disinfection Bi-Product Rule.	0	2,558	8,508	10	Amador	III	2007
555	3610112	3610112-005	HELENDALE COMMUNITY SERVICE DISTRICT	Arsenic Supply Alternatives- New Source Development	The Helendale Community Services District assumed operations from the County of San Bernardino Special District's Department on April 1, 2007. The water supply consists of seven production wells. There are three main production wells that exceed the Maximum contamanent Limit (MCL) for Arsenic. Nothing had been done previously to address the Federal Environmental Protection Agency's (EPA) MCL of 10 ppb. Additionally, a fourth well exceeds the MCL for Manganese. Progress to date: The Board of Directors understands the need to comply with EPA's requirement and immediately the Board of Directors hired a consultant to review the water quality data and evaluate the potential alternatives available to the Helendale CSD. The study evaluated three alternatives which included blending, filtration and new well development. It was determined that new well development would be the best long-term solution to meet the MCL. It is important to note that the District is located within an adjudicated groundwater basin with no available surface water treatment to supplement the groundwater supply. 556	1510018	1510018-004	ROSAMOND CSD	Arsenic treatment for Wells 8 & 9	Install package arsenic removal plant at one well that will be used to remove arsenic from water of two wells (Wells 8 and 9). Blend this water with other well water to get arsenic level below 10 ug/L.	G	0	C	Rosamond CSD has four wells and all of them are 10 ug/l or higher for arsenic, thereby exceeding the new federal arsenic MCL of 10 ug/L	950,000	4,593	10,633	19	Kern	III	2005
557	1510018	1510018-005	ROSAMOND CSD	Arsenic treatment for Well 7	Install package arsenic removal plant at one well that will be used to remove arsenic from water of two wells (Wells 8 and 9). Blend this water with other well water to get arsenic level below 10 ug/L.	G	0	C	Rosamond CSD has four wells and all of them are 10 ug/l or higher for arsenic, thereby exceeding the new federal arsenic MCL of 10 ug/L.. Well #7 water exceeds MCL for arsenic.	250,000	4,593	10,633	19	Kern	III	2006

558	1510018	1510018-009	ROSAMOND CSD	RCSD Regional CDPH Arsenic Compliance Project	Connect all water systems mentioned in the "Problem Section" to the RCSD water distribution system in order to provide potable water that meets all applicable state and federal water quality standards. Grouping of these subprojects together resolves their common water quality problems in an economical way. The largest proposed subproject will satisfy a number of CDPH concerns of the Lands of Promise and WFM users and the CDPH: The water delivered to the WFM customers will be below the arsenic MCL levels of 10 ppb; water volume and pressure will meet RCSD, Kern County, and CDPH standards; water volume will be adequate to provide fire fighting water; piping and appurtenance land purchases will be minimized while easements and public lands usage will be maximized; two systems (WFM and Lands of Promise) can be connected with one common water main system; booster pumps will be surface mounted thereby eliminating hazardous enclosures and areas; water sources will be from recognized and tested groundwater wells, treated surface water wholesalers (AVEK), and by groundwater banking. Re-chlorinating stations will be provided at the booster station and at a 2.0 MG steel reservoir. Both WFM and Lands of Promise will become extensions of RCSD. The water supplies to the new customers will be as dependable and safe to drink as is the rest of the RCSD supplied water. No operational difficulties are	G	0	C	RCSD is planning to annex the following: William Fisher Memorial Water System (WFM), First Mutual MWC, and Lands of Promise MWC to lower their high arsenic levels. At the same time, RCSD would like to connect Kern Mobile Estates, Rosamond High School, Desert Breeze Mobile Home Park, Rosamond Mobile Home Park, Rose Villa Apartments and Antelope Valley Mobile Estates to the RCSD system. All these water systems, except Desert Breeze MHP and Rosamond MHP, also currently experience arsenic levels above the allowed MCL. Rosamond MHP currently exceeds the uranium MCL. The Desert Breeze MHP well is less than 100 feet away and is very likely to also be in violation of the MCL in the near future. Other than WFM, First Mutual and Lands of Promise, all other entities are within RCSD boundaries.The financial ability of all the water systems is limited. The capital, operation, and maintenance cost of wellhead arsenic treatment for the three mutual water companies is beyond their shareholders means. The remaining water systems have similar problems. They are located close to existing RCSD water distribution facilities. However, the construction costs, fees, and charges to connect to the RCSD water system are also prohibitive. No funding is available for the Rosamond High School to separate its onsite water system in order to connect to RCSD's water system for domestic uses and retain the wells for irrigation uses.	15,600,000	4,593	10,633	19	Kern	III	2009

561	3910015	3910015-006	CITY OF LATHROP	Removal of Arsenic and Bacteria from Well 21	Installation of a oxidation filtration system to remove the arsenic and installation of pipng to flush the bacteria from the well which is contained in a localized area of the well. Additional treatment to removed the bacteria is included if the flushing does not adqequately remove all of the bacteria. the major equipment to be installed is Chemicla feed pump, Chemicla storage tank, flow meter,solids pump and piping, filter press and solids storage bin.	G	0	C	Well 21 was recently constructed. the well has bacteria contamination and the groundwater also does not met the new regulation for aresenic levels. This project will provide for the removal of arsenic and the bacteria. So that this water well can be part of the City's water supply.	2,000,000	3,675	12,427	10	San Joaquin	III	2009
562	1910005	1910005-003P	LOS ANGELES CO WW DIST 40 Reg 38 Lake L	Dist 40 2850 Zone Tanks (Lake Los Angeles)	The proposed project consists of constructing two 1 MG water storage tanks and appurtenances south of the intersection of 164th Street East and East Avenue P in the community of Lake Los Angeles. The proposed tanks will provide storage to the 2850 pressure zone to reduce the need to pump water to reservoirs at a higher pressure zone. This additional storage would reduce the monthly energy cost. The proposed site will require land acquisition and need preliminary site grading.	G	0	C	District No. 40 Region No. 38 has three pressure zones. The 2850 pressure zone supplies drinking water to approximately two thirds of the customers in the region. Currently, the water from two wells at the 2667 pressure zone is pumped to the 3.2 million gallon (MG) reservoirs in the 2992 zone to service both the customers in the 2992 and 2850 pressure zones. The customers in the 2850 zone have no dedicated storage, therefore additional energy is needed to pump water to the 2992 zone to supply customers in the 2850 zone.	905,000	3,526	12,609	16	Los Angeles	IV	2011
563	1510012	1510012-006	Lamont Public Utility Dist	Well 12 Arsenic Treatment Project	Well 12 was found to exceed the MCL for arsenic early 2008.The goal for this project is to purchase treatment that will include ion exchange to address the issue of arsenic. This will begin with the installation of a 900 GPM BWiX/Ion Exchange, or absorption treatment/removal system for arsenic.	G	0	C	Well 12 Arsenic Treatment Project will address the issue of high arsenic levels.The drinking water standard violated is for exceeding the MCL for arsenic.	1,000,000	3,603	13,296	12	Kern	III	2008

564	3510003	3510003-001C	Sunnyslope County Water Dist	Ventures Estates Mutual Water Company Consolidation & Mainline Extension	The project consists on connecting the distribtuion systems of the Sunnyslope County Water District to the Venture Estates Mutual Water company. The mainline connecting the two systems will consist of a large diameter mainline of 300 feet of a 12" diameter main, and 4500 feet of a 24" diameter main located in the existing rights of way. Sunnyslope County Water District will be constructing additional well capacity to serve this project and other projects as a separate project.	G	0	C	Currently the Venture Estates Mutual Water Company is supplied by only one well which has malfunctioned from time to time. At various times Venture Estates Mutual has been completely out of water due to the malfunctioning of their only well. The water supplied by the Venture Estates well exceeds seccondary standards for total dissolved sollid (well about 1000 mg/liter TDS). Venture Estates has discontinued treating this well for TDS due to malfunctioning equipment, and the residents of Venture Estates currently drink water which exceeds secondary standards for hardness and total dissolved solids. Finally, Venture Estates has difficultly employing a propely qualified water treatment operator at a price they can afford to pay and the existing equipment at Venture Estates is reaching the end of its useful life. For the abover reasons, Venture Estates desires to connect to the Sunnyslope County Water District to improve water quantity deficiencies, and water quality deficiencies, and increase reliability by connecting to the Sunnyslope potable water system which has several groundwater sources, surface water treatment, a a staff of licensed operators.	500,000	5,241	16,713	05	San Benito	II	2009

566	3410011	3410011-002	Galt, City of	Arsenic Treatment Project-Carillion, Golden Heights, Fumasi, and Gateway	The City of Galt water treatment plant's for this project are known as Carillion, Golden Heights, Fumasi, and Gateway. These sites that are in need of arsenic treatment currently have a greensand/limestone filtration system in place for the removal of manganese and iron. Implementation of the arsenic treatment removal process requires retrofitting our current well treatment systems. Based on current engineering design, a chemical feed system consisting of ferric chloride, carbon dioxide, and sodium hydroxide is needed for arsenic removal. Utlizing the existing filters, ferric chloride will be added as a coagulant to cause the arsenic to combine with and precipitate out with the iron. To aid in the coagulation process, the pH of the water must be lowered in order for the iron and arsenic to combine with each other, which will then allow the arsenic to be removed during filtration. To accomplish this a carbon dioxide chemical feed system will be installed to lower pH to allow for proper coagualtion and flocculation before filtration. To adjust the pH back to normal levels, a post filtration sodium hydroxide chemical feed system will be installed before treated water enters the storage tank. The monitoring and instrumentation equipment includes PLC controllers, pH meters, turbidity meters, and a SCADA system. In addition, the sites will be monitored by an alarm system in SCADA to notify operations staff in the event of alarm	G	0	C	The project will address arsenic treatment at 4 city ground water treatment plants where 5 of the City's wells are treated and are currently out of compliance with primary drinking water standards for arsenic. California's adoption of EPA's Arsenic Rule has changed the maximum contaminent level from 50 to 10 ug/l (parts per billion). For each entry point to our water distribution system the level of arsenic in the water must be at or below 10 ug/l (parts per billion). In the City of Galt, where each ground water treatment system must meet this requirement, five of the city's nine water wells are out of compliance with the new Arsenic Rule.CDPH directive is for the City of Galt to provide modifications for arsenic removal at the ground water treatment plants for the wells that are out of compliance. These well sites that are not in compliance will remain offline until a system is installed that will treat arsenic to new MCL limits.	1,822,000	7,872	22,982	09	Sacramento	I	2008

567	3410011	3410011-006P	Galt, City of	Kost Well Project	This Kost well project includes site exploration, test hole/monitoring well construction, well design, plans and specifications preparation, and well construction. Installation of the test hole/monitoring well and final design is anticipated to be completed by June 2009. the construction of the Kost well is anticipated to be completed in the fall of 2009.This installation of Kost well will provide available drinking water supplies to make up for the lost water production currently experienced at the existing Creekside and Quail Hollow well sites. It is also anticipated that this deep well will produce water that is within the new adopted arsenic limitations and reduce capitol costs as well as future O&M costs for arsenic treatment.	G	0	C	Most of the City of Galt wells have historically required iron and manganese treatment to meet state drinking water standards. In addition, most of these same wells now require arsenic treatment to meet new drinking water standards recently adopted by the State of California that lowered arsenic limits from 50 ppm to 10 ppm. The City of Galt was issued a Notice of Violation (NOV) by CDPH for arsenic levels above the MCL and provided public notification per the NOV to its users until the problem is resolved. This new arsenic standard will significantly impact the cost for providing water service to Galt residents as arsenic treatment is emerging as a very costly treatment process in addition to current cost for iron and manganese treatment. The City of Galt's water wells are typically drilled to a depth of approximately one thousand (1,000) feet. City of Galt staff has recently learned that the City of Elk Grove has drilled to a new aquifer at a depth of approximately one thousand seven hundred (1,700) feet. This deeper aquifer has had no detectable limits of arsenic and produces a higher water flow yeild. Preliminary research indicates that this deeper aquifer exists near the proposed Kost well site in Galt. Although the capitol cost in drilling a deeper well is higher, and pending successful monitoring/test well results, the need for arsenic treatment as part of the new water treatment plant could be eliminated. The elimination would save	0	7,872	22,982	09	Sacramento	I	2009
568	1610005	1610005-006	Lemoore, City Of	Disinfection Byproducts Reduction Study	Conduct a study to identify solutions to reduce the disinfection byproducts. The study will include but not be limited to types of disnfections avaliable, storage tank retention times, reducing dead end lines, and reviewing the organinc loadings at each well site.	G	0	C	The City of Lemoore has recieved compliance order 03-12-11O-003 for non compliance of Total Trihalomehanes (TTHM) maximum contaminant level.The order requires public quarterly notifications of its inability to meet TTHM during any calendar quarter that the four-quarter running annual average exceeds MCL.California Health and Safety Code (CHSC) and Code of Regulation (CCR)violations listed in the order:CHSC Section 116555 (a)(1)CHSC Section 116555 (a)(3)CCR Section 64533	150,000	5,597	24,500	12	Kings	III	2012
569	4910017	4910017-036	Windsor, Town of	Bluebird Replacement Well System Evaluation and Hook-Up	The scope of work to be completed in the proposed project involves several tasks; these are as follows:Task 1: Well Redevelopment - This task is necessary due to the time that has elapsed since well installation.Task 2: Water Quality Testing – This task is necessary to collect up-to-date water quality samples to (1) meet CDPH requirements for permitting of the replacement well as a new water supply; (2) provide information as to the geochemical processes in the screened aquifer; and (3) to provide data necessary for wellhead treatment design.Task 3: Aquifer Pump Testing – This task is necessary to reconfirm the capacity of the redeveloped well and to meet CDPH requirements for permitting of the replacement well as a new water supply.Task 4: Preliminary Design Report – In this task, existing equipment at the wellhead (i.e. chlorination system, submersible pump) will be evaluated for potential reuse, and the existing site layout evaluated for redesign. A Preliminary Design Report will be prepared following this evaluation to provide the basis for design of the wellhead treatment system and piping system and to identify any data gaps.Task 5: System Design – Under this task, designs, plans, and specifications will be prepared for the wellhead treatment facilities and piping layout necessary for hooking up the replacement Bluebird well to the Town's water system. Pilot testing of the treatment system will also occur during this task	G	0	C	The Town of Windsor is currently facing potential cutbacks to its primary water supply, the Russian River, as a result of a Biological Opinion published in 2008. In anticipation of these cutbacks, the Town recently replaced its existing Bluebird well with a new, deeper well. This well was replaced primarily due to the age and condition of the existing Bluebird well, which has been subjected to a significant amount of silting and production drop-off in recent years. Based on water quality data obtained during installation of the replacement well, groundwater in the replacement Bluebird well contains elevated concentrations of arsenic (above the primary MCL of 10 ug/L), manganese (above the secondary MCL of 50 ug/L), and possibly iron (above the secondary MCL of 300 ug/L). To that end, wellhead treatment is required before groundwater from this well may be used as part of the Town's potable water supply. While a treatment system is currently present at the Bluebird wellhead, this treatment system is not designed for arsenic removal, nor is it appropriate for the anticipated production rate from the replacement well.	1,107,000	8,697	26,432	18	Sonoma	II	2011

570	4910017	4910017-035	Windsor, Town of	Esposti Park Replacement Well Evaluation and Hook-Up	The scope of work to be completed in the proposed project involves several tasks; these are as follows:Task 1: Well Redevelopment - This task is necessary due to the time that has elapsed since well installation.Task 2: Water Quality Testing – This task is necessary to collect up-to-date water quality samples to (1) meet CDPH requirements for permitting of the replacement well as a new water supply; (2) provide information as to the geochemical processes in the screened aquifer; and (3) to provide data necessary for wellhead treatment design.Task 3: Aquifer Pump Testing – This task is necessary to reconfirm the capacity of the redeveloped well and to meet CDPH requirements for permitting of the replacement well as a new water supply.Task 4: Preliminary Design Report – In this task, required wellhead treatment systems and equipment (i.e. chlorination system, submersible pump) will be determined and a piping/connection layout developed for the site. A Preliminary Design Report will be prepared following this evaluation to provide the basis for design of the wellhead treatment system and piping system and to identify any data gaps.Task 5: System Evaluation – Under this task, designs, plans, and specifications will be prepared for the wellhead treatment facilities and piping layout necessary for hooking up the replacement Esposti Park well to the Town's water system. Pilot testing of the treatment	G	0	C	The Town of Windsor is currently facing potential cutbacks to its primary water supply, the Russian River, as a result of a Biological Opinion published in 2008. In anticipation of these cutbacks, the Town recently replaced its existing Esposti Park well with a new, deeper well. This well was replaced primarily due to the age and size of the existing well. Based on water quality data obtained during installation of the replacement well, groundwater in the replacement Esposti Park well contains elevated concentrations of arsenic (above the primary MCL of 10 ug/L), and manganese (above the secondary MCL of 50 ug/L). To that end, wellhead treatment is required before groundwater from this well may be used as part of the Town's potable water supply. Furthermore, the replacement Esposti Park well has a production capacity far greater than the existing well. Environmental documentation (project-level EIR analysis) is currently being prepared to evaluate the maximum rate at which this well can be operated long-term. As such, the larger capacity of the replacement well will be considered in the development of a treatment system for that well.	1,108,000	8,697	26,432	18	Sonoma	II	2011
571	1510029	1510029-003	Vaughn WC INC	Regional Consolidation Project-planning phase		G	0	C	Nitrate and/or arsenic in wells of adjacent water systems	500,000	8,931	28,100	12	Kern	III	2010
572	1510029	1510029-007P	Vaughn WC INC	Heath No. 1 Well Arsenic Treatment	The project involves an existing water well site - the Heath No. 1 facility. The well site will be modified to install a well head arsenic treatment system to treat a maximum flow of 1,000 gpm utilizing coagulation-filtration. The raw water will be pumped from the well and receive sodium bisulfite, ferric chloride, sulfuric acid, and sodium hypochlorite additon at the appropriate locations in the system and enter into the reaction vessels. The water is then directed through filter vessels and into the system. A backwash supply is provided to backwash the filter vessels. The backwash water will be directed to a storage tank where the solids can be settled out and periodically removed while the decant is pumped back to the headworks of the well site. This will greatly reduce the amount of water wasted. The solids in the tank will be cleaned annually, at a minimum, and be transported to an approved landfill site. The existing site will require modifications to the deep well pump and motor, site piping, valving, electrical and controls to accommodate the treatment system.	G	0	C	The Heath No. 1 water well is a 1,000 gpm well in the west area of the Vaughn Water Company system. It is located near the intersection of Heath Road and Rosedale Hwy in Kern County, California, T29S, R26E, M.D.B.&M. The arsenic in the Heath No. 1 well has been sampled for the past four quarters and the average arsenic concentration is above the chemical MCL at 10.5 ppb. The problem is a water quality issue and if the well has to be abandoned due to exceeding the chemical MCL the water company will experience low pressure problems and complaints during peak hour demand.	0	8,931	28,100	12	Kern	III	2009

573	1510017	1510017-004	INDIAN WELLS VALLEY W.D.	New Construction - Arsenic Treatment and Blending Facilities	To bring the arsenic levels at these four wells into compliance, the District plans to construct two treatment facilities, one at the site of each of the two wells with the highest arsenic levels. Water from the two wells with the lower levels will be blended with the higher level water and then treated. The filtration system at each treatment facility will be capable of removing arsenic from the raw water supply to an arsenic level below the MCL but above non-detection levels. Chemical feed systems will deliver chlorine (as an oxidant), ferric chloride (as a coagulant) and hydrochloric Acid and caustic soda (for pH adjustment) to each facility in liquid form where they will be stored in onsite double-walled tanks. The chemical sotrage tanks, feed pumps and accessories, as well as the electrical panels, controls and instrumentation that will monitor and automatically operate the treatment facilities, will be housed in a masonry block building. Each treatment plant will include a backwash water supply system, including storage tanks and pumps. This will allow the plants to operate while backwashing is in progress. Since treated water is required for backwashing operations, the supply water would be provided by an onsite treated water storage tank and two backwash supply pumps (one duty and one standby).	G	0	C	Four of the 11 active wells in the District's system exceed the 10 ug/L arsenic maximum contaminent level (MCL) as established by the US Environmental Protection Agency and the California Department of Public Health. The average arsenic levels for two wells are over 18, while the levels for the other two wells are 12 or less. These four wells produced 30% of the water distributed in the service area during 2008.	8,000,000	11,688	30,000	19	Kern	III	2009
574	5110002	5110002-041	City of Yuba City	Wildwood/Marguerite Water Systems	The requested funds would enable the City to extend its existing distribution system to connect these 228 homes and businesses to the City's safe surface water system. The project would include Engineering costs, the procurement and installation of the necessary piping, meters, and related necessary equipment. The project would use approximately 6000 feet of water main 12" pipe and 2100 feet of 14" pipe plus additional smaller connection pipes to each unit. This would also bring 228 more homes and businesses in compliance with the states metering requirements.	G	0	C	Five small community water systems, with a combined 228 connections, are experiencing deteriorating water quality and are failing to meet regulatory requirements for arsenic, nitrates, iron and manganese. The El Margarita Estates water system, with 50 connections, was found to contain Perclorate. These systems are located within the City of Yuba City's Sphere of Influence and Water Rights Place of Use. Yuba City's system meets all regulations for clean drinking water. The current small community systems lie south of highway 20, north of Franklin Road, and along either side of George Washington Boulevard.	2,739,000	13,550	51,504	21	Sutter	I	2009
575	5010019	5010019-003	Turlock, City of	Well-Head Arsenic Treatment	The first phase of the project will be to determine which treatment approaches will be the best fit for the water quality found in the affected wells. Parameters that will be considered in the treatment systems chosen include the effectiveness of arsenic removal, equipment capital cost, annual operating cost, chemical storage requirements, equipment foot print (how large an area is needed for the treatment system), residuals disposal (if any), and the staff time needed to maintain and operate the system. Based on the results from the first phase study, a pilot plant will be installed using two or three of the best system approaches. The pilot plant study will be used to determine which one of these systems will be the most effective based on overall cost and removal efficiencies.The final portion of the project will be to purchase and install the arsenic removal system. The two well sites that are affected have sufficient room for equipment installation so additional land purchases will not be required.	G	0	C	Several City drinking water wells have arsenic levels that are close to the MCL of 10 ppb and they currently are being sampled on a quarterly basis. Two of the wells have exceeded the MCL on the first three quarterly analyses and due to the high levels of arsenic found, both will require treatment in order to consistently meet the arsenic limit.	1,500,000	16,691	64,215	10	Stanislaus	III	2011

576	1910070	1910070-031	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Arsenic Treatment in Well 4-83	This project will reduce arsenic levels from the groundwater pumped from Well No. 4-83 ensuring compliance with the new arsenic standard of 10 ppb. To accomplish this goal, the District proposes using one of the commercially available ion exchange systems for arsenic treatment. Ion exchange is designated as the Best Available Technology by the US EPA for the removal of arsenic from drinking water sources. Several ion exchange treatment systems have already been permitted by the California Department of Public Health and are in operation in the State. A typical ion exchange treatment system is simple, robust, compact, easy to automate, and can be operated on demand. The treatment goal is to reduce the arsenic in the effluent (treated) water to less than 4 ppb. The proposed packaged wellhead arsenic removal system includes a treatment module, pre-filter assembly, salt/saturator tank, brine processing unit, and brine wastewater storage tank(s). Details of each component that is sized to treat the flow rate from Well No. 4-83 at 1,000 GPM are as follows. The treatment module (i.e., ion exchange system) uses multiple columns of ion exchange resin operating in parallel to remove the arsenic from the well water. The columns are installed in a 10'W x35'L x 9'H mobile container, eliminating the need for a building or other housing structures. The ion exchange resin is regenerated using a sodium chloride	G	0	C	This project targets arsenic contamination in drinking water. Arsenic has been shown to negatively impact human health and is considered one of the primary causes of cancer in the world. The Safe Drinking Water Act Amendment of 1996 required the United States Environmental Protection Agency (USEPA) to establish a new drinking water standard for arsenic. In January 2001, the USEPA adopted a new arsenic standard of 10 parts per billion (ppb). The new standard became effective in January 2006.The Los Angeles County Waterworks District No. 40, Antelope Valley, Regions 4 & 34, Lancaster and Desert View Highlands (Regions), serves approximately 145,000 people through over 47,000 service connections in the Lancaster and Palmdale areas of the Antelope Valley. During 2007, groundwater made up approximately 39 percent of the water supply in the Regions. The groundwater is extracted from 33 wells drilled into the aquifers in the Lancaster Subunit of the Antelope Valley Groundwater Basin which is impacted by arsenic found naturally in rocks and minerals. In order to increase water supply reliability, the District recently drilled Well No. 4-83 at 419 West Avenue J, Lancaster. This well is projected to provide water at the rate of 1,000 gallons per minute (GPM). However, analysis of a water sample collected on December 12, 2007 showed an arsenic concentration of 9.53 ppb, just below the new standard by 0.47 ppb.	632,034	46,878	144,215	16	Los Angeles	IV	2008
577	1910070	1910070-039	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Improving Water Quality in the Ana Verde Tanks	The purpose of the proposed project is to thoroughly mix the water in the tank to eliminate temperature stratification and stagnant water conditions, which will provide a uniform, short water age. To accomplish this goal, the District proposes using one of the commercially available tank mixing devices. The mixing device has little to no energy cost and requires virtually no maintenance, since it is powered by a solar panel placed on the top of the tank. This system efficiently mixes all the water in the tanks by creating a near-laminar flow pattern, which will reach and eliminate all the dead spots. The device will also be equipped with Supervisory Control and Data Acquisition (SCADA) output signals that allow for real-time monitoring of the tank; and a chlorine injection system that will help maintain appropriate disinfectant levels in the tanks.This mixing device, which consists of three floats in triangular pattern with total float buoyancy of 600 pounds, floats on the water surface with a down intake hose to draw water. The variable length hose automatically adjusts for peak performance at any water depth. The intake remains stationary just above and in contact with bottom of the tank, preventing the mixer from moving out of place or rotating. This device is capable of pumping about 10,000 gallons per minute for mixing. By using this mixing device, fewer chemicals will be needed when boosting and TTHM formation will	G	0	C	The Los Angeles County Waterworks District No. 40 receives its water supply from the Antelope Valley-East Kern Water Agency (AVEK) and the District's wells in the Antelope Valley Groundwater Basin. AVEK gets its water from the Sacramento River/San Joaquin Delta via the State Water Project. The water supplied by AVEK is currently disinfected with chlorine and AVEK plans to switch disinfection to chloramines in 2009 Within the District, the Ana Verde tanks located at 2700 Moonwort Court have a total capacity of 4,260,000 gallons; 2 tanks with 2,130,000 gallons. Long storage times and the lack of mixing of water in the storage facilities often promote formation of disinfection byproducts that may cause liver, kidney, or central nervous system problems and may increase the risk of cancer. Once chloramination begins in 2009, the situation is likely to foster nitrification that occurs when the chloraminated water has excess ammonia present in the distribution system. Nitrification can have adverse effects on water quality, including a loss of total chlorine, an increase in heterotrophic plate count bacteria concentration, and potential increases in total coliforms. A violation of the USEPA Disinfection Byproduct Rule (DBPR) and/or Total Coliform Rule may lead to severe customer illness throughout the District.Air temperature in the District is consistently high during the summer months, averaging 89, 95, 95, and 88 degrees Fahrenheit in June, July,	40,000	46,878	144,215	16	Los Angeles	IV	2008

578	1910070	1910070-033	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Arsenic treatment in Well 4-82	This project will reduce arsenic levels from the groundwater pumped from Well No. 4-82 ensuring compliance with the new arsenic standard of 10 ppb. By using this mixing device, fewer chemicals will be needed when boosting and TTHM	G	0	C	The Los Angeles County Waterworks District No. 40 receives its water from the Antelope Valley-East Kern Water Agency (AVEK) and the District's wells in the Antelope Valley. AVEK currently disinfects with chlorine but plans to switch to chloramines in 2009. Within the District, the three M-5E tanks located at 41956 5th Street East each have a storage capacity of 3,000,000 gallons. The tanks have a common inlet/outlet connection. This connection is sized for throughput capacity at minimum head loss, resulting in a very low flow velocity into the tank during filling. This low velocity results in poor mixing within the tanks, leading to stagnation. In addition, the freshest water added to the tank is the first to be drawn out. This process leads to thermal stratification within the tank since fresh cold water stays near the base and warmer, older water stagnates near the top. Long storage times and lack of mixing water in the storage facilities promotes formation of disinfection byproducts that may cause liver, kidney, or central nervous system problems and may increase the risk of cancer. Once chloramination begins in 2009, the situation is likely to foster nitrification that occurs when the chloraminated water has excess ammonia present in the distribution system. Nitrification can have adverse effects on water quality, including a loss of total chlorine, an increase in heterotrophic plate count bacteria concentration, and	52,500	46,878	144,215	16	Los Angeles	IV	2008

580	1910070	1910070-035	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Improving Water Quality in the Tierra Subida Tanks	The purpose of the proposed project is to thoroughly mix the water in the tank to eliminate temperature stratification and stagnant water conditions, which will provide a uniform short water age. To accomplish this goal, the District proposes using one of the commercially available tank mixing devices. The mixing device has little to no energy cost and requires virtually no maintenance, since it is powered by a solar panel placed on the top of the tank. This system efficiently mixes all the water in the tanks by creating a near-laminar flow pattern, which will reach and eliminate all the dead spots. The device will also be equipped with Supervisory Control and Data Acquisition (SCADA) output signals that allow for real-time monitoring of the tank and a chlorine injection system that will help maintain appropriate disinfectant levels in the tank.This mixing device, which consists of three floats in triangular pattern with total float buoyancy of 600 pounds, floats on the water surface with a down intake hose to draw water. The variable length hose automatically adjusts for peak performance at any water depth. The intake remains stationary just above and in contact with the bottom of the tank, preventing the mixer from moving out of place or rotating. This device is capable of pumping about 10,000 gallons per minute for mixing. By using this mixing device, fewer chemicals will be needed when boosting and TTHM	G	0	C	Los Angeles County Waterworks District No. 40 receives its water from the Antelope Valley-East Kern Water Agency (AVEK) and the District's wells in the Antelope Valley. AVEK currently disinfects with chlorine but plans to switch to chloramines in 2009. Within the District, the two Tierra Subida Tanks located at 38301 N. Tierra Subida West have a total storage capacity of 4,800,000; 2,800,000 and 2,000,000 gallons. The tanks have a common inlet/outlet connection. This connection is sized for throughput capacity at minimum head loss, resulting in a very low flow velocity into the tank during filling. 584	1910070	1910070-032	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Arsenic Treatment in Well 4-84	This project will reduce arsenic levels from the groundwater pumped from Well No. 4-84 ensuring compliance with the new arsenic standard of 10 ppb. To accomplish this goal, the District proposes using one of the commercially available ion exchange systems for arsenic treatment. Ion exchange is designated as the Best Available Technology by the US EPA for the removal of arsenic from drinking water sources. Several ion exchange treatment systems have already been permitted by the California Department of Public Health and are in operation in the State. A typical ion exchange treatment system is simple, robust, compact, easy to automate, and can be operated on demand. The treatment goal is to reduce the arsenic in the effluent (treated) water to less than 4 ppb. The proposed packaged wellhead arsenic removal system includes a treatment module, pre-filter assembly, salt/saturator tank, brine processing unit, and brine wastewater storage tank(s). Details of each component that is sized to treat the flow rate from Well No. 4-84 at 500 GPM are as follows. The treatment module (i.e., ion exchange system) uses multiple columns of ion exchange resin operating in parallel to remove the arsenic from the well water. The columns are installed in a 8'W x20'L x 9'H mobile container, eliminating the need for a building or other housing structures. The ion exchange resin is regenerated using a sodium chloride	G	0	C	This project targets arsenic contamination in drinking water. Arsenic has been shown to negatively impact human health and is considered one of the primary causes of cancer in the world. The Safe Drinking Water Act Amendment of 1996 required the United States Environmental Protection Agency (USEPA) to establish a new drinking water standard for arsenic. In January 2001, the USEPA adopted a new arsenic standard of 10 parts per billion (ppb). The new standard became effective in January 2006.The Los Angeles County Waterworks District No. 40, Antelope Valley, Regions 4 & 34, Lancaster and Desert View Highlands (Regions), serves approximately 145,000 people through over 47,000 service connections in the Lancaster and Palmdale areas of the Antelope Valley. During 2007, groundwater made up approximately 39 percent of the water supply in the Regions. The groundwater is extracted from 33 wells drilled into the aquifers in the Lancaster Subunit of the Antelope Valley Groundwater Basin which is impacted by arsenic found naturally in rocks and minerals. In order to increase water supply reliability, the District recently drilled Well No. 4-84 at South East corner of Avenue H-8 and 5th street East, Lancaster. This well is projected to provide water at the rate of 500 gallons per minute (GPM). However, analysis of a water sample collected on March 26, 2008 showed an arsenic concentration of 12.7 ppb, exceeding	449,345	46,878	144,215	16	Los Angeles	IV	2008
585	1910067	1910067-052c	LOS ANGELES-CITY, DEPT. OF WATER & POW	North Hollywood Ammoniation Station	Plan, design and construct the North Hollywood Ammoniation Station to add aqua ammonia to form a chloramine residual disinfectant in the water being supplied to customers via the North Hollywood Pumping Station Complex.	G	0	C	North Hollywood Ammoniation Station is required for Phase 3 of the system-wide conversion to chloramine disinfection. This station will treat groundwater produced by North Hollywood, Rinaldi-Toluca, and aeration wells. Conversion to chloramine disinfection is necessary for two reasons: (a) to reduce the level of disinfection byproducts, including THMs, in the water served to consumers and (b) to comply with the requirements of the Federal Stage 2 Disinfectants and Disinfection Byproducts Rule which became effective on March 6, 2006.	35,639,983	686,422	4,071,873	15	Los Angeles	IV	2012
586	1910067	1910067-032c	LOS ANGELES-CITY, DEPT. OF WATER & POW	Manhattan Wells Ammoniation Station	The Manhattan Wells Ammoniation Station project consists of the construction of a single story concrete or concrete block building (approximately 32 ft. by 50 ft.) to house ammoniation and water softener equipment. The building will house two 3,200 gallon steel aqua ammonia storage tanks, ammonia scrubber, aqua ammonia transfer and metering pumps, residual analyzers and controllers, water softener, and electrical control equipment.	G	0	C	The Stage 2 Disinfectant/Disinfection Byproducts Rule lowers the maximum contaminant level for TTHMs and HAAs to 0.080 milligram per liter (mg/L) and 0.060 mg/L respectively. In order to meet these requirements the Department of Water and Power is converting from free chlorine to chloramine residual disinfectant. The Manhattan Wells are currently disinfected using chlorine only. Ammonia must be injected into the well water along with the chlorine in order to form chloramine and allow the water to blend with the other chloraminated water in the distribution system.	6,646,395	686,422	4,071,873	15	Los Angeles	IV	2009

587	1910067	1910067-035	LOS ANGELES-CITY, DEPT. OF WATER & POW	99th Street Wells Ammoniation Station	The 99th Street Wells Ammoniation Station project consists of the construction of two concrete or concrete block buildings to house the ammoniation and water softener equipment. The project also includes replacing the existing sodium hypochlorite system with a new sodium hypochlorite generation system. The first building would be a single story approximately 17 ft. by 32 ft. to house two 3,200 gallon steel aqua ammonia storage tanks, transfer pumps and ammonia scrubber. The aqua ammonia metering pumps, residual analyzers and controllers and other minor appurtenances would be retrofitted into the existing pump station building. The second building would be a single story approximately 6 ft by 20 ft. to house the water softener equipment.	G	0	C	The Stage 2 Disinfectant/Disinfection Byproducts Rule lowers the maximum contaminant level for TTHMs and HAAs to 0.080 milligram per liter (mg/L) and 0.060 mg/L respectively. In order to meet these requirements the Department of Water and Power is converting from free chlorine to chloramine residual disinfectant. The 99th Street Wells are currently disinfected using chlorine only. Ammonia must be injected into the well water along with the chlorine in order to form chloramine and allow the water to blend with the other chloraminated water in the distribution system.	6,732,830	686,422	4,071,873	15	Los Angeles	IV	2009
588	1910067	1910067-051	LOS ANGELES-CITY, DEPT. OF WATER & POW	Tank & Reservoir Nitrification Control Plan	The project includes the installation of mixers in some 30 – 40 priority storage tanks and reservoirs to allow fro easier treatment of the water should nitrification begin in these facilities. Also additional on-line analyzers will be installed at numerous locations to monitor the total chlorine level to prevent having to breakpoint chlorinate the water which would produce disinfection byproducts. An additional step may include the development and installation of ultraviolet blacklights in a number of tanks and reservoirs to inhibit the effect of nitrifying bacteria in the water.	G	0	C	The LADWP has determined that it must change from a free chlorine residual disinfectant in the water distribution system to a chloramine disinfectant in order to meet the Stage 2 Disinfectant/Disinfection Byproducts Rule. When this change occurs there are approximately 30-40 priority tanks and reservoirs which have longer than 5 day residence times and will therefore be prone to nitrification due to the presence of ammonia in the water.	3,636,177	686,422	4,071,873	15	Los Angeles	IV	2012
589	1910067	1910067-043c	LOS ANGELES-CITY, DEPT. OF WATER & POW	Los Angeles Aqueduct Filtration Plant Ultraviolet Treatment Process	Add an ultraviolet light treatment process to help achieve the disinfection requirements and reduce the formation of disinfection byproducts and bromate at the Los Angeles Aqueduct Filtration Plant.	G	0	C	To meet the regulatory requirements set by the Stage 2 Disinfectants and Disinfection Byproducts Rule along with the maximum contaminant level for bromate.	67,432,227	686,422	4,071,873	15	Los Angeles	IV	2012
590	1700698	1700698-001	Larsen s Office Complex	Treatment for Aluminum Compliance	system now has dual sand filters. we would develop a pre filter of variable cartrige filters to remove all particles to 2 micron. process thru sand filters as we do now. then thru a large R.O. filter system with disinfection. prior to injection of clh. for line disinfection and finish water storage.....all this because of system size.	G	0	P	to design and install water treatment for the removal of aluminum and other more minor contaminates from well water. Because system is so small, conventional type treatments are impractical....Large R.O. treatment may be the most cost effective method. we notify a warning on use of water because of high aluminum content.	40,000	4	25	03	Lake	II	2011
591	2702050	2702050-002P	CHURCH OF THE GOOD SHEPHERD WS	Episcopal Church of the Good Shepherd in Corral de Tierra PreApp	We are planning on fitting our system with a Culligan ASM2-2 lead/lag configuration Arsenic Exchange Tank System Includes totalizing water meter, 20" pre sediment filter, pressure gauges, sample ports, and piping. We will then have an Independent Testing Lab verify the effect of the treatment.	G	0	P	Water System is contaminated with arsenic, and is therefore a hazard for anyone to drink, and even use to any great extent.	13,000	1	50	05	Monterey	II	2007
592	4000774	4000774-001P	PLEASANT VALLEY ELEMENTARY	pleasant valley school	We are still looking into various solutions but need to make a decision as quickly as possible.... We will need additional storage and plumbling with additional pressure pumps to adapt to a treatment devices. We have researched cities and other water districts but still have concerns on waste disposal and the proper system to meet our needs. Our estimate is based on preliminary proposals only...When we select a system upgrade with the approval of our county health department we will go out bid to remedy our situation.	G	0	P	Pleasant Valley School district has its own water source... Water well in a rural setting which supplies water to our school community. We are considered a water district. We are currently experiencing a level of Arsenic which is above the tolerant levels... We are researching for a treatment system to provide clean and safe water to all our students. Current research indicatates we need a total system upgrade which could be in the range of 20-30,000 dollars. Our current school population is 140 with staff at 20 and community access at times as large as 225. We are in need and would greatly desire the monitory assistance needed to provided clean drinking water.	0	1	100	06	San Luis Obispo	IV	2008

593	0900210	0900210-002	MILLERS HILL SCHOOL	Millers Hill Pipeline Project (planning)	Consolidation is not feasible as the nearest water system is EID and it is about 7 miles away. We are not contiguous to thier service area and it is not likely that EID will be expanding in our direction any time soon.The school district has invested in the installation of holding tanks/ infrastructure and has the ability to seperate the potable source from irrigation/ fire protection. We currently have four wells of which only one complies with the current arsenic standards. We now need to replumb the good quality water (well #3) to the potable tank and redirect the current supply (well #4) to fire protection and insure no cross contamination of the sources in the process.Miller's Hill school needs new water lines to reidirect well #4 to fire protection and to redirect well #3 to potable. The major components of the system are in place, tanks, pumps, etc.If the quality or quantity of water in well #3 was to deteriorate we would also need a treatment plant to remove the arsenic from the water. At that time we may possibly need to treat water from well #4 to insure supply.	G	0	P	New water lines to transport the potable quality water from west side of property (well #3) to the potable tank. Well #3 currently qualifies under Safe Drinking Water arsenic standards with a recent test of 7.7. During the same process we will divert the current water supply (well #4)which does not qualify under arsenic standards to fire protection storage. We will insure that there is no cross contamination of the potable water by this source.Miller's Hill School is currently violating the arsenic standard for potable drinking water.	500,000	7	120 09	El Dorado	I	2009
594	2702030	2702030-002	CYPRESS COMMUNITY CHURCH WS	Arsenic filtration and removal for Cypress Community Church & School	Cypress Community Church proposes to install equipment to remove Arsenic using a process known as co-precipitation and filtration. Liquid ferric chloride and liquid sodium hypochlorite (chlorine) are injected into the water and the Arsenic is oxidized and adsorbed on the precipitated iron hydroxides. The precipitated hydroxides including the arsenic are removed for the water through a pressure filter containing a catalyzing filter medium sand coated with manganese dioxide. The filter is periodically backwashed to remove the precipitated solids and this sludge is accumulated in disposable cartridges which are stored for disposal in accordance with county and state regulations.	G	0	P	The Cypress Community Church water system is a small water system serving a community church and pre-school. The system relies on one groundwater well for production. At present the system has no disinfection or filtration. Raw water is pumped to storage then distributed. Recent raw water monitoring indicates that Arsenic exceeds the MCL of 10 ug/l at about 19ug/l. The Monterey County Health Department indicates that all systems exceeding the Arsenic MCL must reduce this contaminant to less than 10ug/l. This system is on a mandatory "Bottled Water Order" and is in compliance with that order.	150,000	4	200 05	Monterey	II	2009

Prepare a Source Water Assessment and submit to CDPH for review and approval. Draft copies of plans, specifications, and estimate of probable construction to be prepared for test hole, submit to CDPH for review and approval. Prepare bid documents. Perform a topographic survey of the property in the vicinity of new well location. Prepare a topo survey of the entire football stadium site showing building outlines, fencing and other specific surface features necessary to identify the various water pipeline connections to the School distribution system and buildings as required for this project. Contact utility company (PG&E) for new service request to accomodate the addition of the new electrical loads from the proposed well. Employ a construction contractor to oversee construction of test hole and production well, log drill cuttings, collect water samples, ship water to labratory. Contractor shall collect water samples for analysis to provide preliminary compliance with state drinking water standards. The following water quality analyses are expected to be performed. General mineral, Inorganic Chemical, General physical, Gross alpha and uranium, Organic Chemicals, Radium - 228, Perchlorate. Easton High School and the stadium next to it is a main hub of the Easton community. This	G	0	P	Washington Union High School is located in Fresno County at 6041 S. Elm Avenue in the unincorporated community of Easton California. Easton is a few miles southwest of Fresno, California. Easton is a predominantly rural community. However, approximately 30% of Washington Union and Easton High School students live in the urban west side of Fresno, California. Easton can be characterized as a highly impoverished area. 70% of the high school students qualify for free and reduced lunches. 43% of students are English learners. According to a Columbia University study, out of the 436 congressional districts, ours is the poorest. Washington Union High School is the oldest high school in Fresno County. The School currently owns three domestic wells that supply potable water for domestic and irrigation uses. Two of the wells are located at Washington Union High School and a third is located at the Easton High School. The well located at the Easton High is used for supplying water to classrooms, restrooms and concession stands. This well is also used for irrigation of the athletic fields.The School was notified by the California Department of Public Health (CDPH) to stop domestic water supply from the well at the Easton High School due to levels of DBCP above the maximum contaminant level (MCL). The School is planning the construction of a new domestic well at this site to meet the DBCP MCLs. The	537,901	19	1,150	23	Fresno	III	2009

612	1010035	1010035-004C	DEL REY COMMUNITY SERV DIST	Water Meter Installation Project	The project consists of new 1-inch water meter installations for 225 existing service connections. The project would include the meters, meter box, handheld meter reader, meter billing software, and software training. It would also required right-of-way encroachment permits from the County of Fresno.	H	25	C	Del Rey Community Services District (District) provides a variety of services including water to the community of Del Rey, CA with a population of approximately 1,200. The District provides potable water to residential, commercial, and industrial users through approximately 320 service connections. A recently constructed 20 acre Self-Help residential and multi-family development is already metered and along with industrial/commercial users are charged a volume-based rate. Approximately 225 connections within the District's service area are unmetered and therefore charged a flat rate only. As a result of the District inability to implement a community-wide volume-based rate program, the uncontrolled water usage by unmetered customers not only has left the community divided because of unfair water fees charged to water-saving-conscious and metered costumers, but it has also contributed to the depletion of the area's groundwater supply due to the extended current drought experienced within the State. Water conservation is greatly needed due to the capacity, age, and condition of the District's existing wells. Three of the District's existing wells are on standby or are inactive due to groundwater contamination from DBCP, Uranium, and recurring bacteriologic problems.The installation of water meters and implementation of a volume-based rate program community-wide will help educate the residents on controlled water usage which	793,980	402	1,100	11	Fresno	III	2009

615	5410001	5410001-004	Cutler PUD	Cutler PUD Water Meter Installation Project	The proposed project would reduce water use by making users more accountable for their water use, and enable the District to charge users fairly and appropriately for actual water used. The community has already obtained funding for approx. 25% (390) of the meters, and is requesting the balance of the connections to be metered (710) with funds from this request for assistance.Cutler is a Disadvantaged Community and is a Census Designated Place with a 2000 Census Meidan Household Income (MHI) of $24,330.	H	25	C	The Cutler PUD provides water to the town of Cutler and its residents. Water is supplied by two deep (approx 500') wells. The Community has about 1200 connections and the two wells are hard pressed to keep up with demand. The reason is that this impoverished community has a problem with overcrowding, with multiple families packed into single-family dwellings. Under these conditions many "single family" houses are using much more water than they are paying for with their flat fee rate.	500,000	1,197	6,200	12	Tulare	III	2009
616	1010023	1010023-002C	ORANGE COVE CITY OF	Orange Cove Water Meter Imovements	The project involves the installation of 1,450 water meter devices throughout the City. The meters are necessary in order to conserve water use. As well, the City needs to move forward with installation water meters in order to comply with the State of California mandate for water meter installation beginning in 2010.	H	25	C	The City of Orange Cove is ranked as one to the five poorest communities in the State of California. Per the 2000 Census, City MHI is $22,357, 44% of the population lives below the poverty level and the community reflects a 25% unemployment rate. Orange Cove is an extremely poor community. This project involves the installation of 1,450 water meters in the community. This project is part of a long term multiphase City Water Improvement Plan that was begun in the early 2000s. The Improvements encompassed several phases which included enhancements and replacement of water mains (approx. $3,100,000) in the community and installation of water meter devices (approx. $1,580,000) in the community. According to engineering estimates the water meters should result in a 20% to 30% reduction in current water usage, as residents will be shifted from a flat rate billing system to a metered rate billing system. Of course, as well, the State of California has mandated that all cities move to metering of all water services starting in 2010. The City of Orange is moving forward to coplying with this edict. The new meters will be those with a new radio technology that can be read remotely, and thus saving costs versus the traditional manual meter reading method. The City has tested these meters and found the meters can detect water leaks from a remote location. The City will use this information to send notices to residents and	0	1,503	8,500	11	Fresno	III	2009

617	5410004	5410004-001	Farmersville, City of	Farmersville Water Meter Installation	The City of Farmersville proposes to install 2717 water meters in order to create a 100% metered water distribution system. The current system only provides water on a flat rate basis. The project falls under Category H in the Project Priority List, "water systems which do not provide meters for the water delivered to customers." In order to achieve this goal, the City will utilize its standard procurement process to obtain bids and select the best purveyor to provide the most appropriate meters, software, and other necessary equipment. Preliminary estimates have been provided by numerous manufacturers. A final implementation schedule will be prepared and environmental clearance will be obtained by June 2009. It is anticipated that the project will be categorically exempt from NEPA and CEQA, because in all cases the meters will be installed at previously disturbed sites. The project will be ready for implementation by August 2009 and complete within 1 year from the actual start date.Equipment costs are estimated at $624,470. Equipment needed includes:• 1600 3/4" water meters, • 1100 1" water meters• 6 1 ½" water meters• 11 2" water meters• 1 Radio Read hand-held devise and related software Labor costs for installation are estimated at $37,530 which includes 1,390 hours at a rate of $27 per hour. In obtaining initial estimates for this project, City staff has found it to be most cost effective to implement this	H	25	C	The City of Farmersville serves a disadvantaged population of approximately 10,500 residents. The median household income in Farmersville in 2007 was $33,068. (www.city-data.com) The City is not supported by a strong retail tax base, and as a result, at times, struggles to provide even basic services to its residents due to financial constraints. The City's Public Works Department provides water to approximately 2700 households and structures. At this time, all of the water is provided on a flat rate basis. This is due, in large part, to the fact that the great majority of existing meters in Farmersville are more than 20 years old, non-functional, (broken dials) and have reached the end of their useful life. Flat rate billing for water service is simply the only option for Farmersville at this time. State law will require approximately one third of Farmersville water customers to be metered by the end of this year. All of the City's water customers will need meters by 2025. Empirical evidence has proven that flat rate water billing encourages excessive and wasteful water use, since the customer has no knowledge of exorbitant use or the financial cost associated with it. Installing current technology would enable the City to accurately and efficiently read meters and charge accordingly for water usage. The City of Farmersville recognizes that installing new meters will have multi-faceted benefits. These advantages include a greater consciousness of	662,000	2,374	10,672	12	Tulare	III	2009
618	1510019	1510019-011	Shafter, City of	Shafter Water System Meter Upgrade and Retrofit	The project would upgrade existing manual read meters (appr. 1,500) to automatic meter reading (AMR) meters and retrofit existing unmetered connections (appr. 2,500) with AMR meters as well. The City has already adopted and tested a new water meter standard that will assure a proper data link to its Itron AMR handheld data collector. The collector will upload meter reads into the City's Eden billing software program. Existing water meters have already been inventoried with the City's Geographical Information System (GIS) with documented locations and specific information about each meter (make, model, serial #, etc.) to determine which need complete replacements and which may only need new registers and radio transmitters added to them. The project will be advertised for bidding and contracted with the lowest responsive bidder that is qualified and State-certified to complete the work in a timely matter.Those benefitting from the project include City residents as well as over ten outlying communities and unincorporated areas (North Farm Labor Camp, Mexican Colony, Cherokee Strip, etc.) that have consolidated with the City system over the years.	H	25	C	Regulations adopted per the passage of State Assembly Bill 2572 require that the City use meters currently installed on existing service connections for service billing purposes by 2010 plus install and read meters on the other connections that are currently without meters by 2025. The City's water utility is not currently funded for the operational and capital costs needed to comply with these regulations. The Public Works Department will be recommending new water service rates to the City Council in September, 2009, but the City's status as a disadvantaged community, escalating energy costs, pending additions of treatment facilities and other factors have severely limited what the new rates can realistically deliver for meter upgrading and retrofitting. To minimize staff time used for reading meters now and into the future, automatic meter reading (AMR) handheld hardware and software have already been purchased with the intent of eventually using them to read new meters equipped with radio data transmitters. The City has also changed its service connection standard to require an AMR assembly on all new connections. However, the large scale of retrofits for unmetered connections (appr. 2,500) and upgrades for existing metered connections (appr. 1,500) is cost prohibitive for the City's water customers at this time.Funding the project will enable the City to expedite the conversion to meters which will promote better	2,500,000	3,863	15,609	12	Kern	III	2009

619	1310001	1310001-007C	Brawley, City of	Water meter installation project for commercial and industrial businesses	The meter project would allow the City of Brawley to purchase and install water meters to commercial accounts, 500 commercial accounts ranging in size from 1 inch to 12 inch diameter. The meters will be installed in city right of way and be owned and maintained by the City of Brawley. The City has recently finished the purchase and installation of residential meters however the city has no additional funds to proceed with the commercial accounts. This project is an important part of the existing City of Brawley's water conservation plan. Commercial accounts will be able to conform and apply water conservation programs within their operations, which is a requirement of the State of California in its efforts to reduce water consumption. In addition the City completed a water rate study and fulfilled the requirements of Proposition 218 during the Fall of 2008 to be able to apply equitable rates to the residential and commercial accounts. The purchase and installation of the commercial water meters will assist the City to determine accurate water usage and will provide the City a tool to recuperate operations and maintenance costs, as well as enforcing its water conservation plan.	H	25	C	Commercial and industrial businesses are not currently metered and require meters to properly determine water usage and invoice upon consumption.The meters will encourage water conservation and enable industries to adopt measures to conserve water. There are approximately 500 industrial and commericial accounts. Meter sizes range between 1 inch to 12 inch. The city at this time charges a flat rate for commercial, and industrial businesses and can not determine actual water usage.This makes it difficult to address water conservation and properly determine water usages for the commericial, industrial businesses, city parks and school districts. Water meter project will enable the city to properly project water demands in their 5 and 10 year capital improvement projects, water master plans, the states Urban Water Management Plans.	0	5,530	26,513	14	Imperial	V	2009
620	5602108	5602108-001	GARDEN ACRES MUTUAL WATER CO	New Water Meter Installations	Garden Acres is now on a flat monthly fee for water service. This results in a huge amount of wasted water. We propose to install water meters in our service area. This will reduce our infrastructure costs and save valuable grount water. We will install new meters and meter boxes. We will also purchase a hand held computer to read the meters and a new computer system to down load the information and prepare the bills.	H	20	C	We plan to install water meters for the service area controlled by Garden Acres Mutual Water Co.	150,000	110	795	06	Ventura	IV	2011

623	2010001	2010001-011C	CHOWCHILLA CITY WATER DEPT	Install water meters	The City will install approximately 2000 residential, commercial and industrial meters. When the project is complete all customers will be metered.	H	20	C	The City is in an area that for the last several years has experienced an overdraft of our water aquifer. We have instituted water conservation water ordinances and engaged in public education to encourage responsible use of the water supply. As staffing limitations have allowed, we have made an effort to find wasting, educate and assist the homeowners with their irrigation management. We have imposed fines. Through these efforts we have made some advancements but, we are still experiencing a significantly higher than average water consumption in the community. Absent installing water meters the City has been unable to find a successful means to encourage responsible use of this valuable resource. We have included a requirement for the installation of meters for new construction since 1994. We currently have meters in approximately one third of the homes in the community. These funds would allow for the installation of meters in the remainder of the community.By having meters and instituting a tiered rate for the water use that, increases the cost for high volume users, other communities have been able to achieve significant reductions in the water use. Reducing water use would have the following benifits to the community and the State: It will reduce the enviromental impacts created by the overdraft conditions;It will assist the community in maintaining a	0	3,073	10,682	11	Madera	III	2009
624	1010018	1010018-002	Kerman, City of	Kerman Water Meter Replacement	Kerman has successfully installed meters for the majority of its customers. In order to complete the project and come into compliance with State mandates, water meters must be installed for the rest of the City's water customers. The City has the necessary equipment and processes in place for metered billing for both commercial and residential customers, and has only to install meters at the older homes and businesses that do not yet have meters.The City must install 1,400 residential meters in older neighborhoods, at an estimated average cost of $643 per meter for installation. This $643 estimate does not include the purchase price of $230 per ¾ inch residential water meter. The City anticipates that the installation of the meters will likely require the removal and replacement of old obsolete water lines, the installation of meter boxes and the integration of the new meters into the current radio-read water billing system.	H	20	C	The City of Kerman has embarked on a project to install water meters throughout the City. To date, Kerman has successfully installed meters for approximately 60% of its water customers.All homes that were built since 1992 now have automated water meters installed. The cost of these meters was paid for primarily from deposits that were made previously by the homeowners for that purpose. Volumetric water charges for all metered customers took effect on September 1, 2010. The remaining 40% of water customers will continue to be billed a flat rate until they have meters installed at their locations. These homes without meters are located in older neighborhoods in which residents are predominantly lower-income. This project also calls for the purchase and installation of meters for commercial customers, but to a much smaller extent.In order to comply with AB2572 and meet State requirements of mandatory water metering for the entire City, meters must be installed in the older neighborhoods and in small businesses that do not yet have meters. The City of Kerman is eager to comply with AB2572 and these State requirements and to provide the remainder of residents with meters, but lacks the necessary funds. With the appropriate funding for this project, not only will the City be able to comply with State mandates, but low-income residents that live in these neighborhoods will be able to take advantage of cost-savings	1,500,000	2,882	13,878	23	Fresno	III	2011

627	3410001	3410001-011	Sacramento Suburban Water District	SSWD - Water Meter Retrofits	The District is currently retrofitting approximately 1,325 residential flat rate customers each year with water meters. At the present time, meters are being retrofitted and installed on customer service lines that connect to water mains already located in the street in front of the customer's homes. This situation is very convenient for retrofitting. The retrofit consists of replacing the existing curb stop and installing a new meter setter and meter box. In some areas district service lines are constructed of plastic, which does not meet District specifications and has a tendency to leak over time. If plastic lines are found, they are replaced per District specifications with a more durable copper pipe. Placement of the new meter boxes is located to within one-foot back of walk. All disturbed hardscape and landscaping is restored to its existing condition.The average cost for these meter retrofits currently ranges from $1,250 to $1,500 per service assuming a ¾-inch meter. This includes the cost for materials and labor including a meter setter, meter box and a ¾-inch meter with a radio read transponder.	H	20	C	The District currently has approximately 32,550 single-family residential lots that remain un-metered. These customers are on a flat rate billing and are billed the same amount each month regardless of water usage. In June 2003, the District signed the Sacramento Area Water Forum Agreement which requires complete metering of all flat rate accounts by the year 2030. Subsequently, in 2005, Governor Arnold Schwarzenegger signed Assembly Bill 2575 (AB2575) which requires residential metering in California to be completed by 2025. To meet the 2025 deadline, the District has developed a Water Meter Retrofit Plan that will retrofit approximately 1,325 residential flat rate customers each year with water meters. In addiiton to meeting State law, these water meters will help promote water conservation; will place each District customer on a fair, usage-based billing structure; and will help the District comply with Water Forum requirements for water conservation Best Management Practices (BMP's), including BMP # 4 on residential meter retrofits. One concern with the meter retrofits is that the District still has many residences that are served by water mains located in rear or side-yard easements. Out of a total of 700 miles of water mains within the District, approximately 150 miles are located in these rear and side-yard easements. As part of a separate project, the District is currently installing 6 to 8	5,000,000	44,744	177,000	09	Sacramento	I	2008
628	0707501	0707501-003	ANGLER S RANCH #3	Installation of Residential water meters and study of water treatment	Install water meter at system main and at each property. reroute pipes on 8 properties so each is serviced directly from water main through their own meter. Investigate treatment options to meet secondary water quality standards.	H	15	C	Need for meters to encourage conservation of water and to change billing from flat rate to use based. Also, investigate storage and treatment to meet Secondary Water Quality Standards.	100,000	30	60	04	Contra Costa	II	2009
629	2210906	2210906-002	Mariposa Pines Mutual	Add Water Meters to Mariposa Pines Water Water System	The major work will be done at the water main service conection. The water meters will be installed with in one foot of the corporation valve at each service conection. Each water meter will be install in such a way as to facilitate ease of repair and calibration. A water meter box with lid will be place over each water meter and transceiver. Each water meter box will have adequate drainage and will be flush with ground level. The remote data collection equipment will collect data and prepare billing information.The following are the labor, equipment and material costs for 120 connections:Labor $57,139.20Equipment $56,371.20Materials Parts $39,574.80 Data Collection $12,553.13 Tax $ 4,039.91 Total $169,678.24The cost for current 86 service connection wil be $122,290.33.	H	15	C	Due to Assembly Bill AB 975 Mariposa Pines Mutual Water Co., Inc. will be required to install 120 water meters. The Mariposa Pines subdivision has 120 lots to service with 84 exesisting and two recent connections for a total of 86 current connections. The water system is built on the west side of Snyder Ridge on a slope of 200 feet elevation and undulating terrain. This make it very difficult for heavy equipment access. The water mains are located at the rear or front of each lot.This water system modification will require a backhoe, plumbing, and water meters with transceivers and a data collection unit. These resouces will have to be brought into Mariposa County as there are no D1 certified backhoe operators or plumbers in Mariposa County.All Mariposa Pines Mutual Water customers will be notified of the requirement for the Company to install water meters. No public notifications are currently in effect however while new water meters are being installed each customer will be notified when their service will be effected. The proper desinfection proceedures and notification will be followed as a part of the each water meter installation.	122,291	84	168	11	Mariposa	III	2009
630	1400070	1400070-005	Sierra Grande Estates Mutual Water Co. 632	1700554	1700554-002	Lake County CSA 13 - Kono Tayee	Metered Service Project - Purchase/Install 90 Water Meters	This project involves the purchase and physical installation of 90 Sensus 3/4" cuft water meters within the CSA #13 service area.	H	15	C	The water meter project is designed to finish installing water meters throughout the Kono Tayee (County Service Area #13) water system to allow transition to metered service.This will show compliance with the CDPH directive for metered service.	20,000	136	333 03	Lake	II	2009
633	5100107	5100107-008	Sutter Co. WWD#1 (Robbins)	Water Meter Installation Project	The current system is comprised of approximately 4 miles of water piping and valves, and 94 lateral connections. The active ground water well incorporates treatment for iron and manganese. The system provides municipal drinking water to approximately 336 year-round residents. The project will also include the purchase and installation of 94 water meters and associated appurtenances on the existing water distribution service laterals. Installation of the water meters will encourage water conservation, improve equitable billing and is required under state law.Replacing the galvanized water mains would be necessary before water meters could be installed.Lacking a source of funding for infrastructure improvements, WWD#1 could be in a position where it is unable to continue providing municipal water service in the next few years. There are no other sources for municipal drinking water near the community of Robbins. Absent this project, the community of Robbins may lose municipal water service, affecting nearly 100 families.	H	15	C	The community is under a mandate to install water meters under California law. Water meters will allow more equitable billing (as opposed to flat rate billing which benefits larger water users) and will encourage water conservation. The majority of the homes in Robbins are currently without water meters. The existing distribution system currently charges its customers a flat monthly fee for water consumption. Sutter County has had problems with excessive use and waste of the community's water supply. The County has installed several meters to monitor customers, revealing a water consumption of over three times the national average. The County intends to remove the flat-rate fee structure in place of a tiered metered-rate system to promote conservation, fair and equitable fees, as well as conservation of the community's aquifer source water supply. Water meters will enable the community to decrease the demand on the system, decrease operation and maintenance costs by reducing pumping costs, increase the life cycle of the existing equipment, reduce the quantity of chemical treatment, aid in the detection of leaks and preserve and monitor the groundwater aquifer.	150,000	94	336 21	Sutter	I	2011
634	2010009	2010009-002	MADERA CO SA NO 19-ROLLING HILLS	Water Meter Installation	The project would entail installation of water meters at each service connection to promote water conservation. The addition of meters will allow the system to establish a tiered water rate to generate revenues to maintain and upgrade the system's facilities and infrastructures.	H	15	C	The current water system does not include water meters, leading to increased water usage by the customers. The current system serves 361 connections.	722,000	333	727 11	Madera	III	2009
635	5310003	5310003-005	Trinity Center M.W.C. .	Trinity Center Install individual meters to all service connections	Install customer meters at each individual service connection. (approximately 250 connections) The installation of meters along with a rate structure that rewards conservation efforts will reduce daily demands and permit the sizing of the proposed new treatment and storage facilities to be based on consumption typical of a metered system.Comment from Mey Bunte/CDPH Redding Klamath District:The installation of meters meets the Economic Recovery Bill's aim for 20% green infrastructure. Meter installation would result in water conservation through a decrease in usage. The importance of water conservation is underscored by California's current drought.	H	15	C	The water system is not currently metered and revenue is collected based on a flat rate. The system experiences unusually high demand because there is no incentive to conserve. Additionally, the water system is concerned about future source capacity - flows are expected to be lower given reduced precipitation in recent years.Demand needs to be reduced to acceptable levels such that sizing of the proposed new filtration system and storage is based on typical daily demands of a metered system. Reduction in demand would reduce operating costs signficantly.	400,000	220	729 01	Trinity	I	2009
636	1805007	1805007-003	Herlong Utilities Incorporated	Herlong water meter program	Install AMR system on individual residences, area is metered by master meter and an wholesale intertie. Would allow for customers to be aware of individual consumption and financially responsible for their own useage.	H	15	C	Install 260 meters on existing homes. 155 homes are non metered and the Distrcit bills the CSD from which they recieve potable water service. The CSD is not capable of providing any service beyond water availablity; they have no certified operator or provide any means for a customer to be financially responsible for their own use.	76,500	1	1,200 02	Lassen	I	2008

637	2010008	2010008-002	Madera County M.D. #10A - Madera Rancho	Water Main Replacement	The proposed solution to the failing water mains is to replace the with 8" PVC C-900 water mains in the street rights-of-way and connect the homes from the front rather than the rear of the house. Additionally, water meters will be installed on each house. The installation of water meters and replacement of the failed mains will provide a tiered metered rate to encourage conservation of water and supply capital for future improvements and maintenance of the system.	H	15	C	The current system has no water meters and approximately 50,000 linear feet of 4-inch steel pipes that are over 60 years old. Recently it has been determined that the pipes are leaking severely and have 1-inch to 2-inch holes where the pipe has rusted completely through, every 3 to 4 feet. This poses a significant health risk due to contamination from the surrounding soil. A review of the distribution system's bacteriological monitoring results from December of 2004 through December of 2006 shows that, on several occasions, when total coliform bacteria have been detected in the distribution system.	5,332,875	922	2,255	11	Madera	III	2009
638	5010028	5010028-011	Ceres, City of	Meter Retrofit Program	This project will allow the city to expedite implementation of the Demand Management Measures (DMM#4 - Metering with Commodity Rates for All New Connections and Retrofit of Existing Connections) established in our approved 2005 Urban Water Management Program.Under this two-phase project, the city will 1) retrofit water meter boxes that have been installed since 1992 with remote-read water meters and convert to a metered water rate system; and 2) retrofit all pre-1992 water connections to metered services with remote-read water meters. The city anticipates that this conversion will result in as much as a 25% reduction in water consumption.This project will include:• project engineer to write specs and quality control for project and provide for project oversight and management• purchase and installation of meters, boxes and fittings as required for metering 11,000 homes• automated meter reading with water conservation, leak detection, backflow alarm and tampering alarms• water conservation and education to equip a conservation staff person to read high use meters and educate customers on water saving measures (water audit software)	H	15	C	The city currently possesses sufficient groundwater resources to meet average demands; however, the city's ability to meet peak demands has been stressed by the loss of critical wells due to water quality concerns (exceeding maximum contaminant levels) or reduction in treatment capacity of critical well sites. During peak demand periods, system pressures have been less than desirable due to the lack of peak water production capacity.Since 1992, the city has installed meter boxes and some meters but does not currently bill residential water use according to metered usage. Thus, the city cannot properly record water usage and adequately curb water wasting. The City Council has approved a conversion to water meters and metered billing. The city has received quotations to install all meters in a six month period. The city lacks the funds to fund the meter conversion project.	3,200,000	10,617	40,943	10	Stanislaus	III	2009

639	4410011	4410011-003	Watsonville, City of	Elimination of Zone 1 Floating Cover Reservoirs	The project will address these solutions:Solution 1: The floating cover reservoirs will be eliminated from the system to improve system security, as well as the reliability of the entire system. In order to eliminate the existing floating cover reservoirs, a number of significant infrastructure changes will be required. These changes will allow the City's network of existing groundwater wells to respond instantaneously to demand, utilizing the groundwater basin as a reservoir. Groundwater storage and above-ground steel tanks will replace the floating cover reservoirs.Solution 2: In order to achieve compliance with the disinfection requirements of the Water Works Standards, new back-up generators and chlorination equipment will be installed at well sites 10, 14, and 15.Solution 3: The existing booster pump station will be eliminated from the system. The distribution system wells will serve as booster pumps by using variable frequency drives and modern control strategies. This will improve the energy efficiency of the operations and improve the overall system reliability.Project Details: The most important modification will be to convert all wells to variable frequency drives. The Zone 1 well control scheme will be upgraded to be intelligently controlled by local pressure as well as the remote master SCADA computer. Additional storage capacity and pumping capacity will be added to the Zone 2 reservoir and	H	15	C	Problem 1: The City's existing floating cover reservoirs are antiquated and vulnerable. Floating covers have both maintenance problems and on-going security issues which require constant diligence and sizeable capital resources. The City's 2004 Vulnerability Assessment has identified the floating cover reservoirs as the most vulnerable part of the entire water system, and this susceptibility must be addressed. The reservoir has been vandalized on numerous occasions, including slashing of the hypalon cover. Since staff has been unable to determine if there was contamination of the reservoir associated with cover vandalism, the City's only response is to isolate and drain the reservoirs each time. The City's floating cover reservoirs include two bermed in-ground reservoirs with capacities of 5,300,000 gallons and 700,000 gallons. In 1979, hypalon liners and floating covers were installed on both reservoirs. The floating covers have been repaired and replaced several times, but continue to need additional repairs. Problem 2: The City's water system lacks needed reliability features, and has disinfection deficiencies that violate current Water Works Standards. Several of the existing well sites do not have back-up power sources, and as a result, during the City's frequent power outages, produce and distribute water that has not been disinfected. This project would include providing back-up power generators at several	3,800,000	15,448	51,703 05	Santa Cruz	II	2009
640	0910002	0910002-014	South Tahoe PUD - Main	STPUD Water Meter Installation Phase 4	The project STPUD is seeking assistance for is Phase 4 of the district-wide water meter installation program. Phase 4 targets the water zones in South Lake Tahoe of East Stateline, West Ralph, Heavenly and Keller. These water zones represent approximately 2139 water meters to be installed. This project consists of design, development of plans and specifications, hiring a contractor to locate the position of the water meter on each property, order the meter boxes and meters, install both and provide the necessary restoration on each property. At approximately $2000 per meter, Phase 4 will cost $4,278,000. STPUD plans on installing these water meters over a 2 year period due to the limits on construction in the Tahoe Basin.	H	15	C	South Tahoe Public Utility District (STPUD) has 13,956 water service connections in the disadvantaged community of South Lake Tahoe, CA. Approximately 5400 of these water service connections are metered. In order to meet AB 2572, a 2004 California State law requiring water suppliers to install water meters on all customer connections by January 1, 2025, STPUD must begin implementing water meter installation programs immediately. Due to the large amount of meters to be installed, (approximately 8556) STPUD has planned this project in 4 phases. Each of the four phases targets specific water zones in STPUD's service area. Currently, due to the severe weather conditions in our community, it costs approximately $2000 per meter to install as they need to be placed in special meter boxes that withstand freezing temperatures. In addition, due to the Tahoe Regional Planning Agency construction ordinances, we can only place meter boxes in the ground between May 1 and October 15. Once the meters have been installed, STPUD will begin a metered billing rate for each customer and feels the transition from a flat rate service fee to a volume-based service fee will go more smoothly if the meters are installed in water zone neighborhoods.	4,278,000	13,635	60,000 09	El Dorado	I	2012

641	0910002	0910002-015	South Tahoe PUD - Main	STPUD Meter Installation Phase 3	The project STPUD is seeking assistance for is Phase 3 of the district-wide water meter installation program. Phase 3 targets the water zones in South Lake Tahoe of West Stateline, West Gardner Mountain and Montgomery Estates. These water zones represent approximately 2139 water meters to be installed. This project consists of design, development of plans and specifications, hiring a contractor to locate the position of the water meter on each property, order the meter boxes and meters, install both and provide the necessary restoration on each property. At approximately $2000 per meter, Phase 3 will cost $4,278,000. STPUD plans on installing these water meters over a 2 year period due to the limits on construction in the Tahoe Basin.	H	15	C	South Tahoe Public Utility District (STPUD) has 13,956 water service connections in the disadvantaged community of South Lake Tahoe, CA. 648	3901348	3901348-003	FAIROAKS PWS #44	CSA-44 FAIROAKS, METERS	The work in general consists of the installation, by contract, of 239 San Joaquin County provided radio-read type meters on the unmetered connections and the installation of radio-read modules on an additional 121 meters.	H	10	C	exThe CSA-44 Fairoaks Water System provides domestic drinking water and fire protection to a 360 connection residential subdivision located in an unincorporated area of San Joaquin County. Water services are a mix of metered and non-metered services. Metered services are manually read and are billed quarterly based on usage. Non-metered services are assessed annually and the assessment is unrelated to water use.Water metering is a proven water conservation tool. As California enters the third consecutive year of drought, the County is seeking to fully master its water systems. In addition, the County has purchased a drive-by "Automated Meter Reading" system. Installation of water meters conserves water. Use of the AMR conserves labor, fuel, equipment use, and traffic congestion during meter reading cycles.	282,700	314	1,036	10	San Joaquin	III	2009
649	5710007	5710007-003	Esparto C.S.D.	Esparto CSD - Balance of Water Meter Installations	The installation of approximatly 230 1 1/2 inch Water Meters to complete the federal requirement of metering by a certain date and to meet the water conservation program in the District.	H	10	C	e are in the process of going to the metering program for our services, we have installed 630 Water Meters at this point but need to install the 1 1/2 inch Water Meters to complete this project. The District has discovered we do not have the funds for this section of the Project.	200,000	688	2,000	09	Yolo	I	2009
650	2610003	2610003-004	BRIDGEPORT PUD	Water Meters	The proposed Arsenic Mitigation and Associated Improvements project has 4 related parts as described below. Part 1 - Arsenic Treatment, is the highest priority and could be completed without Parts 2–4 if funding is not available. However, the additional parts are beneficial to the Bridgeport Public Utility District in that they correct existing problems and reduce capital and O&M costs for arsenic treatment. All parts are ready to go to final design and construction. Part 1 – Arsenic Treatment $2,058,845 Arsenic treatment is the major portion of the project and is a centralized coagulation/filtration water treatment plant to treat the maximum day demand of 651 gpm, reducing the arsenic concentrations from the current flow weighted average of 26 µg/L arsenic to less than 10 µg/L. The treatment plant will be located on two adjacent parcels owned by the BPUD. It will include skid mounted coagulation/filtration treatment units in an approximate 700 square foot heated building. Part 1 will also include the necessary piping changes within the system to allow centralized treatment; an exterior sludge settling/storage tank; electrical; and site improvements associated with the treatment. Part 2 – Water Meters $407,675Water meters will be installed on the 77 existing non-residential services. Then, a rate structure put in place that promotes conservation with the goal of reducing demand on the non-residential connections by	H	10	C	The Bridgeport Public Utility District (BPUD) obtains water from 3 groundwater wells within the community. The water from all wells exceeds the drinking water standards for arsenic and there are currently no facilities for removal. The State of California, Department of Public Health issued Compliance Order 05-13-09CO-001 on February 13, 2009 requiring compliance. In response to the Order the BPUD has completed a Preliminary Engineering Report (PER) that evaluates different options for arsenic mitigation and presents preliminary plans and estimated costs for the preferred option as described in the Project Description portion of this Pre-application. Additionally, the CEQA environmental for the preferred option has been completed.The BPUD is within a disadvantaged community (76% of California MHI) and has virtually no capital available to finance the project. They were recently unsuccessful in obtaining ARRA funds through Rural Development Services. An application is pending with RDS for the next fiscal year but preliminary indications are that at best only a portion of the project will be funded. Upon determining that funding is available the complete CDPH application will be submitted within 30 days. The preparation of final plans and specifications will take approximately 90 days with bid solicitation and construction to follow immediately subject to the conditions placed on funding. There are 3	407,675	227	3,000	13	Mono	V	2011

651	5010021	5010021-006	Denair Community Services District	Denair Community Services District 2009 Water Meter Installation Project	The Denair Community Services District 2009 Water Meter project will complete the installation of water meters with remote reading capabilities on all residential and commercial water services through out the District.This process will allow the District to become a metered service District which will increase revenues and help minimize the waste of water from un-metersusers.	H	10	C	The Denair CSD is currently operation as a flat rate municipal provider of domestic water. The District will be required to provide meters in the upcoming years due to State and Federal regulations. This project addresses the issue.	1,500,000	1,294	3,225	10	Stanislaus	III	2009
652	1900158	1900158-007	LITTLE BALDY	Distribution meters	Install 7 Pressure reducing valves in the distribution system in locations that prevent system pressure from getting higher than 85 psig. The pressure at the bottom of the system without pressure reduction would be 400 psig. Install 38 water meters and shut-off valves.	H	5	C	LBWC currently has no customer meters in their system. Only recently have meters been added to the wellheads, along with a Master meter. This will help in monitoring production of the individual wells, and monitor line loss. Since the water is billed at a flat rate, the benefits to be derived from metering the connections would be to track water loss, conserve water, and reduce excessive use.Every time the wells are shut off, the distribution pipe drains, and the pressure drops to zero. Each time that happens, a potential of contamination occurs. This method of operation of the distribution system violates California Water Works Standards. The system elevation differences result in an operational pressure of 70 psig at the highest point in the service area 400 psig at the lowest point.	40,000	27	76	16	Los Angeles	IV	2009
653	0310002	0310002-002	AWA, City of Ione	Ione WTP Clear Well Cover Replacement - Geodesic Dome	An aluminum, geodesic dome will be constructed over the Ione reservoir. The existing cover will be removed. Turnkey construction will be used for this project. The duration for design through completion will be 25 weeks. The Ione reservoir will not be taken out of service during the construction period.	H	5	C	A blue, 9,160 square-foot, hypalon cover encloses the 750,000-gallon, 108-foot diameter Ione clearwell. The Ione clearwell cover is equipped with a pier tension system and one automatic rainwater pump. The cover rises and falls with the water level in the clearwell. Wind borne debris collects in the folds of the cover. An electric fence surrounds the clearwell to keep foxes from jumping on the cover to take a drink from the pool of water that collects on it. Section 64585 of Title 22 of the California Code of Regulations outlines specific criteria for distribution reservoirs. When operated and maintained properly, distribution reservoirs with floating covers meet these criteria. However, covers fatigue and crack due to the up and down movement of stored water. Birds peck holes in the covers and wind borne debris collects in the folds of the cover. Rain water collects on the cover. Operators must walk out on the covers to repair, inspect, and clean the cover and pumps for rainwater removal. Although the site is enclosed with a chain link fence (with barbed wire), the covers could easily be cut with a knife or falling tree branch from a significant rain event, exposing treated water for distribution to the elements. Replacement of the floating covers with a new geodesic dome significantly reduces the potential for violation of total coliform maximum contaminant level per Section 64426.1 of Title 22 of the California Code of	560,000	1,497	4,940	10	Amador	III	2009

654	0310003	0310003-015	AWA Sutter Creek	Tanner Water Treatment Plant Clearwell Cover Replacement	A truss supported, geodesic, aluminum roof will be constructed over the Tanner reservoir. The existing cover will be removed after the new roof is in place. Construction will include a new perimeter footing and wall to support the roof load. Turnkey construction will be used for this project. The duration for design through completion will be 28 weeks. The Tanner reservoir will remain in service during construction. Without funding, the Agency will replace the existing floating cover this fiscal year. The new floating cover will be operated and maintained in accordance with Section 64585(b)(3)(B) of Title 22 of the California Code of Regulations.	H	5	C	A 40,170 square-foot, tan, polyethylene cover protects treated water stored in the 2-million gallon Tanner clearwell. Seventy-nine tension piers support the cover. The tension system traps leaves and debris in the folds of the cover. The cover has been repaired with fifty-nine patches. The depressed cover collects rainwater which is pumped off the cover by 5 automatic pumps. Section 64585 of Title 22 of the California Code of Regulations outlines specific criteria for distribution reservoirs. When operated and maintained properly, distribution reservoirs with floating covers meet these criteria. However, covers fatigue and crack due to the up and down movement of stored water. Birds peck holes in the covers and wind borne debris collects in the folds of the cover. Rain water collects on the cover. Operators must walk out on the covers to repair, inspect, and clean the cover and pumps for rainwater removal. Although the site is enclosed with a chain link fence (with barbed wire), the covers could easily be cut with a knife or falling tree branch from a significant rain event, exposing treated water for distribution to the elements. Replacement of the floating covers with a new geodesic dome significantly reduces the potential for violation of total coliform maximum contaminant level per Section 64426.1 of Title 22 of the California Code of Regulations. Although floating covers are allowed per Section 64585(b)(3)(B) of Title 22 of the	3,000,000	1,654	5,458	10	Amador	III	2009
655	0310012	0310012-013	AWA Buckhorn Plant	CAWP Ranch House Storage Tank Replacement	The Ranch House Tank is part of the Central Amador Water Project ('CAWP') system, located along Highway 88 in Amador County. The Ranch House Tank is fed by the CAWP main, serving three existing subdivisions (Ranch House, Pine Park East, and Gayla Manor), plus one subdivision with entitlements (Mokelumne Bluffs) and a California Youth Authority facility.A 8,200 square foot hypalon cover encloses an existing 750,000-gallon conical shaped, partially recessed Ranch House Tank. The Ranch House Tank floating cover is equipped with a tension pier system and three surface drains. The existing conical shaped tank will be removed (portion underground will be backfilled) and replaced with a new storage tank (approximately 30 feet in height and 72 feet in diameter), with a volume of 825,000 gallons. The recessed portion of the existing conical tank will be backfilled and the new tank will be constructed completely above-ground. The tank will be equipped with features such as modernized system controls; inlet, outlet, and overflow pipes; air vent; manway; liquid level gauge; and tank ladder with guardrail.This project will significantly reduce operator time spent maintaining the floating cover and increase the reliability and safety of drinking water by significantly reducing the potential for violation of total coliform maximum contaminant level per Section 64426.1 of Title 22 of the California Code of Regulations.	H	5	C	A 8,200 square foot hypalon cover encloses an existing 750,000-gallon conical shaped, partially recessed treated water storage reservoir. Section 64585 of Title 22 of the California Code of Regulations outlines specific criteria for distribution reservoirs. When operated and maintained properly, distribution reservoirs with floating covers meet these criteria. However, covers fatigue and crack due to the up and down movement of stored water. Birds peck holes in the covers and wind borne debris collects in the folds of the cover. Rain water collects on the cover. Operators must walk out on the covers to repair, inspect, and clean the cover and pumps for rainwater removal. Although the site is enclosed with a chain link fence (with barbed wire), the covers could easily be cut with a knife or falling tree branch from a significant rain event, exposing treated water for distribution to the elements. Removal of the floating covers with a new storage tank significantly reduces the potential for violation of total coliform maximum contaminant level per Section 64426.1 of Title 22 of the California Code of Regulations. Although floating covers are allowed per Section 64585(b)(3)(B) of Title 22 of the California Code of Regulations, the Stockton office of the Department of Public Health has reported their concerns over the continued use of floating covers, and has recommended replacing floating covers.	1,780,000	2,558	8,508	10	Amador	III	2009

656	3410004	3410004-009	Carmichael Water District	Carmichael Water District La Vista Well and Tank Replacement Project	This project will include planning, design, permitting, environmental compliance, and construction of replacement of Carmichael Water District's (District) existing aging La Vista groundwater well, storage tank, and booster pump station facility. The new facility will be consistent with the objectives laid out in the Regional Water Authority's 2005 Integrated Regional Water Management Plan. This project will also better equip the District to address the threat of Aerojet/Gencorp Corporation groundwater contaminant plumes and local plumes through continued efforts to manage groundwater extractions and increase the use of surface water when available. The specific project components are described as follows: Groundwater Well Replacement – The existing La Vista well will be destroyed and redrilled on site. The new well will be selectively screened in layers of the aquifer to minimize the likelihood of future impacts from migration of the Aerojet groundwater contaminant plumes and local Potential Contaminating Activities. The new well will also be used as a long term groundwater source to offset some of the effects the loss of the Barrett Road Well in the north part of the district to contamination. The reconstruction of the La Vista well will improve the District's reliable source water production capacity. 4 Million Gallon (MG) Storage Tank and Booster Pump Station - This project will include demolition of the	H	5	C	To date, five of the eight Carmichael Water District (District) groundwater supply wells have been impacted by contamination from multiple sources, primarily perchlorate and Tetrachlorethylene (PCE). Other contaminants, including n-nitrosodimethylamine (NDMA), trichlorethylne (TCE), and 1,4 dioxane are known to be present in the aquifer underlying District and also present long term threats to the sustainability of a high quality groundwater source. The primary known source of contamination in the District service area is from historical activities at Gencorp/Aerojet Corporation's (Aerojet's) aerospace and rocket engine manufacturing facility. The Aerojet plume is a Superfund site administered cooperatively by the USEPA, California Department of Toxic Substances Control, and the Central Valley Regional Water Quality Control Board. There have been ongoing remediation efforts within the District's service area, however the contaminant plume is still not fully contained and is migrating westerly towards the District's groundwater wells at an estimated rate of 500 feet per year. Following is a description of the contaminants that currently impact District supply sources: Over the past 5 years, perchlorate has been detected in three (3) of the District's wells over a range of approximately 1 to 4 parts per billion (ppb), approaching the California Maximum Contaminant Level (MCL). The perchlorate is	5,000,000	11,548	40,000	09	Sacramento	I	2009
657	0910001	0910001-013	El Dorado ID - Main	El Dorado Irrigation District	(Dolomite) Replace floating cover with rigid cover. Involves design and construction.	H	5	C	Reservoir is covered with a floating cover, which has defects.	2,300,000	36,244	112,000	09	El Dorado	I	2006

665	3301045	3301045-001	BLYTHE MOBILE HOME ESTATES	Meters for service connections	Install water meters. (System has one 4" well & 220 gal pressure tank to serving 23 connections. County reports that system is rent controlled and needs to present cost issues to the Rent Control Board for review.))	H	0	C	Water testing costs, permits, & well maintenance costs are prohibitive & escalating - We do not charge for water.	12,000	23	30	20	Riverside	V	2002

666	2702026	2702026-002	APRICOT LN WS	Water meters	To fix the problem, install water meters . Installation of water meters near the main line for every house would resolve this issue.	H	0	C	Lack of water meters to reduce overall household water usage. Currently homeowners are on a flat rate and can use however much water they want to. There is also no incentive to conserve water, fix leaks or report water line leakage or breaks. Just recently a water leak on a homeowers line leaked for over two weeks prior to it being fixed. This also required the shut down of the entire water system since no shutoff valve existed on this line where the break occured.	75,000	24	72 05	Monterey	II	2011
667	0500027	0500027-002	LILI VALLEY WATER CO.	Lili Valley - Installation of water meters	The project would include:1) Planning2) Engineering3) Purchasing of water meters4) Securing a County permit5) Installing the water metersWe don't think that consolidation would be the best option for our members. We think consolidation would further increase water assessments. We think the best solution to our problem is installing water meters on the new system that was just updated by the USDA loan we received.	H	0	C	The project will address the lack of water meters for the 70 properties in the Lili Valley Estates located in West Point, Ca. All properties are members of the Lili Valley Water Company (LVWC). In 2007, the LVWC entered into an agreement with the USDA to upgrade our water system after we were cited several times for a chlorination problem. The upgrade cost a bit over $1 million dollars. The USDA provided a grant of $770,000 and the LVWC secured a 40 year loan for $280,000 to pay for the upgrade. This upgrade had a significant impact on the water bill, raising it by $223 per year. (Bills are now $488 for an undeveloped lot and $644 for a developed lot per year.)We would like to install water meters but won't be able to do it without raising rates again. This will be a hardship for our shareholders who just had a significant rate increase in their water assessment in 2008. The LVWC is located in Calaveras County and many of our members have incomes below the poverty level. We would appreciate funding for the installation of water meters because we are on a flat rate now and believe that going to water meters will require our members to better conserve water.Thank you for your consideration.	25,850	70	99 10	Calaveras	III	2012
668	2701257	2701257-007	GARRAPATA WC INC	Installation of water meters in entire system to convert system from unmetered, flat rate system	The project includes the furnishing and installation of Neptune R9-00i radio read water meters on each customers service line at the agreed service point which is normally within a few feet of a company main. Said meters will be installed with new saddles on the main, brass corporation stops, brass meter stops, and new meter boxes. A signal receiver and the software to convert that to a billing statement is included in the project. The expected savings in the cost of meter reading and billing will quickly offset the additional costs of the equipment required. Our service area is spread over a mountainous square mile of territory. It is not a nice flat subdivision with the meters all in a row. Our service area goes from sea level to 1000 feet above sea level and includes numerous gates and other obstacles to traditional meter reading.	H	0	C	This water system has never been metered since its inception in 1962 and has always billed the customers with a flat rate. The State Water Resources Control Board granted an appropriation permit for 35 acre feet per annum to the company in 2000. We are now getting considerable pressure from said Board and from the County and CPUC to meter the system as it is needed in order to implement conservation of water measures and to aid in the finding of leaks in the system and the customers service lines. A complaint is pending before the SWRCB against the company for civil penalties and a restraining order because our appropriation of water has exceeded the 35 acre feet each year for several years past. Meters also provide greater equity among the customers. We must make this conversion to a metered service and the company has no funds with which to accomplish this. The potential liability of the company for civil penalties is not included in this preapplication for a grant.	93,466	50	150 05	Monterey	II	2009

669	2000506	2000506-003	SIERRA LINDA MUTUAL WATER CO	Sierra Linda MWC - Meter Installation project	A project will be designed and bid to install meters on each connection in the water system. Some pipeline relocation work may be needed to locate meters and waterlines in accessible easemenet areas. Because of the extra workload of reading meters and billing specific quantities the project will include electronic meters and a meter reading wand.	H	0	C	The water system does not have water meters and has been billing on a flat rate. The water supply wells are marginal during the late summer season and flat rate billing is problematic to water conservation. Also due to the water quality problems it is likey that a treatment plant will be needed and meters will be essential for equitable billing of the treated water used by each customer.	90,000	75	180	11	Madera	III	2012
670	4900660	4900660-005	Yulupa Mutual Water Company	YMWC Water Meters Project 2011	The project will consist of replacing the existing service from the main to the back side of the existing meter if there is one or near the roadway including, new saddle, corp stop, service lateral piping, angle meter stop, meter, customer side shut off, connection to existing private service piping box and electronic meter reading module. Construction will be monitered by Brelje and Race Consulting Civil Engineers.	H	0	C	At this time the YMWC system has no water metering capability. This makes it impossible for the Company to monitor leakage, encourage conservation and minimize waste. Given that the membership own large rural parcels, summer water usage increases dramatically over winter usage averages. The Company intends to institute a tiered rate structure commensurate with other local water utilities to encourage conservation of both water and electricity.	380,000	60	200	18	Sonoma	II	2012
671	1700501	1700501-002	Adams Springs Water District	Adams Springs Meter Installation Project	We have water meters and the parts to install them, we would like to have the funds to install them.	H	0	C	Labor costs to have water meters installed	10,000	71	200	03	Lake	II	2009
672	2600546	2600546-002	CROWLEY LAKE MUT. WATER DIST.	Water meters for 67 connections (CLMWC) per AB 2572 requirement.	1) Site survey / engineering evaluation to locate the current inlet water location of each of the 67 connections serviced by the CLMWC and determine the optimum installation location for all proposed water meters.2) Installation of water meters on each of the 67 connections (residences) serviced by the CLMWC, (potential automated meter reading system requirements TBD).	H	0	C	Crowley Lake Mutual Water Company (CLMWC) services 67 connections (residential properties) in the residential development of Lakeview Unit #1. The monthly Water fee is billed to each connection at a flat rate due to the fact that all 67 connections (residences) lack water metering of any kind. This request for funding through the Safe Drinking Water State Revolving Fund (SDWSRF) is intended to:1) conserve water by changing from the current 'flat rate' monthly charge to 'volume based' billing with metering of the actual water used by each individual connection,2) conform to state law (AB 2572) that requires the installation of water meters for all water customer services.	147,000	67	250	13	Mono	V	2012
673	2800530	2800530-001	MEYERS WATER CO.	Edgerly Island Community Water System Metering Project	Installation of Sensus Water Meters, meter reading equiptment and back flow valves (including testing) on all 100 homes in the community. Installation of concrete Cristie Boxes for viewing of the meters and patching all concrete, asphalt, landcaping etc. to original condition is included.	H	0	C	Currently the community water system is a Flat Rate payment by the homeowners. There is no incentive for them to conserve water. All attempts to encourage water conservation have been unsuccessful. Recently we had an incident where a homeowner purposefully ran their garden hose at full bore for a 24 hour period and wasted 10,000 gallons, a neighbor called and alerted us to the situation. Our normal useage for the 100 homes is approx. 15,000 gallons per day during the winter months. Another incident was when the local community Sewer District had very high flows coming into their system and they finally had to hire a Video Camera service to find our exactly who was inundating their sewage lines.They found the house and discovered two leaking toilets, the tenant, a renter, had informed the landlord of the problem 4 months earlier but she never did anything about it. The Sewer District was saddled with the costs of the extra flows and hiring the special Video equiptment, costing them many thousands of dollars to discover this problem. All water systems will be required to be metered per State Law to conserve both water and energy.	290,000	75	260	03	Napa	II	2009

674	3110043	3110043-007	Madden Creek Water Company	Water Conservation and metering project.	Installing meters at all customer service sites. This would involve locating and exposing service lines. These service lines are on average 3 feet deep due to freeze potental making installing a meter a significant project.	H	0	C	Very few of our customers are metered. Complete Metering would encourage all to conserve. The cost of metering would be prohibitive for us.	300,000	154	300 02	Placer	I	2011
675	3110042	3110042-008	Tahoe Swiss Village Utility	TSVU service meter installation program	Install electromic meters, yokes and boxes to every water service in the service area. Included in that will be the computer program and eletronic meter reading devices. Additionally, install three new electronic production meters at the sources so that all water produced can be accounted for.	H	0	C	The State of California's water users are requested, by the Governor of California, to reduce water consumption by 20%. Water Meters are an excellent and the most practical water conservation tool that water purveyors have.	715,000	378	300 02	Placer	I	2009
676	1700526	1700526-002	Pine Grove Water System	PINE GROVE METER PROJECT	There are already existing service connection, this project will add a meter valve, a standard service meter, and a meter box, plus labor. Metered rates have already been processed through the Prop 218 process, and accounts will coverted from the flat rate on a block by block basis. There are ninety-one (91) hookups, any future hookups will be metered and will be paid for from the hookup fee.	H	0	C	The Pine Grove Water System is a private system that has been placed under court ordered receivership by the Department of Public Health. The receiver is the Cobb Area County Water District (1710012). The project is to install water meters meters in a system that is currently using flat-rate billing, and has historically had shortages in the dry months, to the extent that supply must be subplimented.annexation into the Cobb Area County Water District is forthcoming.	22,750	91	304 03	Lake	II	2009
677	4400598	4400598-001	PURESOURCE WATER, INC	Water Meter Installation	The project is to physically locate all 79 service connections at the curb stop, then install “drive by” remote meters, curb stops, meter boxes and lids, plus the meter-reading equipment and software.This will permit the use of tiered rates and thus encourage water conservation. During periods of restricted usage, it will provide a means of monitoring use and of any violation of use restrictions. It will also permit leak detection for individual consumers and for the system as a whole.	H	0	C	Currrently the system is un-metered and only flat-rate service is offered. Project is to install drive-by remote-read meters all necessary at all service connections and appropriate billing and record-keeping software, etc. This is to comply with CDPH and CPUC, as well as Federal efforts to reduce water consumption.	70,000	79	450 05	Santa Cruz	II	2009
678	3103836	3103836-002	HIDDEN VALLEY COMMUNITY ASSOCIATION	Hidden Valley Community Assoc Domestic Supply System Replacement	Install residential meters for all 163 homes to promote domestic conservation.	H	0	C	Hidden Valley Community Assoc (HVCA) urgently requires complete replacement of 60-year-old Domestic Water Distribution Lines. HVCA owns a water plant supplying both irrigation lines of canal water, and domestic water supply to 163 full-time residence homes. Domestic Supply system has mixed pipe types: 4-in PVC glued bell, and 4-in asbestos cement pipe (AC), with some 6-in AC at meter. And 6-in and 4-in steel, badly rusted. All domestic water to 430 residents flow through rusted steel and AC sections. Many leaks are on glued bell 4-in pipes. There are no CWA standard gasketed bells. No water meters are on exiting system beyond delivery point, as raw water was initially purchased for treatment by HVCA.	200,000	161	499 02	Placer	I	2012

679	3110019	3110019-007	Squaw Valley Mutual Water Comp	Metering of homes in SVMWC area	The project will be to install automatic reading meters (ARM) at every service connection. We currently have 263 connections. Some of the service boxes are being improved as part of the system improvements, so the number of service box improvements will not be the same as the number of meters needed. In the Auerbach master plan, the engineers used the cost estimate of $2,500 per service box installation. The ARMs will need to be powerful enough to transmit through four to eight feet of snow (depending on location) during the winter months. The system will also need handheld readers, and computer program to handle the data management for billing.Service boxes 207@2500 515,500Meters 263@ 400 105,200Readers and computer program 1,000Subtotal 621,700Construction contingency 155,375 Construction cost 777,075Engineering, Admin, Legal 233,122 Total Project Cost $ 1,010,197	H	0	C	The Squaw Valley Mutual Water Company (SVMWC) was built in the late 1950s and early 1960s in order to service a subdivision being developed on the northern side of Olympic Valley, CA. Pipes of varying sizes – from 1 inch to 10 inches – and of varying kinds - AC, steel, PVC and ductile iron were installed. Some fifty years later, these pipes are leaking and no longer provide the flow and water pressure needed for to meet modern public health and fire suppression standards. In December 2008, the SVMWC Board adopted a master plan for the water system developed by Auerbach Engineering. They computed the SVMWC average daily demand (ADD) at 431 gallons/day. The estimated Maximum Daily Demand (MDD) is 1,230 gallons/day. At this time there are no water meters in the system. Not having water meters means that we cannot quickly locate leaks in the system, provide feedback to our members on their water usage and potentially move to a tiered water rate system that rewards water conservation. Because the SVMWC serves a mix of second homes and full time homeowners, the issue of water meters has been very controversial. However, with the increasing price of servicing the system second homeowners are increasingly calling for water meters. Global warming will increase the challenge of providing unlimited water to our members, and therefore it is necessary to begin educating them on the extent of	500,000	263	500 02	Placer	I	2009
680	2710023	2710023-002	TASCO Spreckels Water Company	Install water meters for 210 residential connections -Spreckels WS	The Spreckels Water Company has developed installation costs and has generated standard specifications and details for meter installation at the 210 currently unmetered connections. No CEQA review is required for the installation of water meters on existing services. Procurement, installation and final testing will be completed prior to December 31, 2009. Cost breakdown follows: Engineering & Administration - $ 1,500.00Procurement & installation - $157,500.00Testing, certification & closeout $ 1,000.00Contingency at 15% $ 24,000.00Total Cost $184,000.00	H	0	C	The Spreckels Water Company serves a small unincorporated community in Monterey County. The system was installed in the early 1900's. Meters for the 200 + homes in the older sections of town have never been feasible. Water services are clustered in groups of 3 in yards and adjacent to streets and sidewalks. Significant excavation and replacement of sidewalks, curbs, etc. will be required to separate and install meters for each home. Monterey County has serious water shortage and quality issues and the installation of meters will greatly assist in water conservation to the benefit of the aquifers underlying the Salinas Valley. This updating of the infrastructure will provide benefit for this small working class community as well as the surrounding areas sharing the ground water supplies. This project will allow for an accounting of all purchased water, encourage conservation, and provide data for determination of system water losses. The system serves predominantly single family homes and currently has a high usage rate for the climate and demographics.	184,000	212	660 05	Monterey	II	2009
681	1510054	1510054-004	PINON PINES MWC	Water System Improvements	Due to the lack of control over customer usage, PPMWC would like to replace all the flat rate services with radio read water meters. The tasks include disconnecting each flat rate service from the system and installing the meter, meter box, and transmitter for each service and reconnecting to the PPMWC system and the customer system.	H	0	C	Currently Pinon Pines Mutual Water Company (PPMWC) serves its customers with a flat water rate per service connection. This does not allow the PPMWC to have control over the amount that the customers use each month. They would like the ability to be able to monitor the usage by installing water meters.	302,000	247	740 19	Kern	III	2012

682	4710001	4710001-006P	City of Dorris	Dorris Water Meter Project	City would need Preliminary engineering done to install meters on all or our service locations.The environmental review would have to be performed to install all meters on our current locations. Construction would be the next task for installation of the meters.	H	0	C	The City of Dorris has mandated that any new water service or any building that is being reconstructed 50 percent or more is requred to have a water meter installed. That still leaves approximately 460 services without a meter and the City budgets can not afford to install that many meters.As a disadvantaged community our residents can not afford to pay for meter installation.The meters would make our residents accountable for the amount of water used and through their education, water resources would be saved as less water would be used through efficient use and recycling efforts.With less water use, the City's only well would be capable of serving the community for several years.	0	481	887	01	Siskiyou	I	2012
683	5610001	5610001-001	DEMPSEY ROAD MUTUAL WATER CO	Install water meters in all homes.	We would like to install meters on the 300 homes in our water company. We need to pay for the meters, labor, training to read the meters, and training for the billing department on how to charge appropriately.	H	0	C	Our problem is that we don't have water meters on the properties. We charge a flat rate and some homes are overpaying while other homes are not paying enough. A family of two pays the same as a family of 6. We are concerned with our senior citizens paying too much because they are considered one family in the home while a young family can have up to 5-8 people living in the home.	350,000	300	900	06	Ventura	IV	2011
684	1010042	1010042-013	MALAGA COUNTY WATER DISTRICT	Malaga CWDInstallation of water meters	Although not mandated for a District the size of Malaga, the Residential Metering for Project will expedite compliance with the State requirement that all residential water services be metered by 2025 and provide data for residential conservation and management of the water system. Meters will be installed on approximately 232 existing unmetered residential services that currently pay a flat fee for unlimited water use. Residential customers will have an incentive to conserve water and will benefit by being able to control water costs through conservation efforts. Meters will provide data for budget based revisions to the existing rate structure and improve water system management through annual water audits. Conservation resulting from the project will not be growth inducing, almost all residential parcels in the community have been developed. Remaining undeveloped parcels are zoned for commercial and industrial use.Some MCWD wells have been removed from service due to Nitrate and DBCP contamination. Reduced groundwater pumping may reduce the potential migration of the DBCP plume and preserve water quality in non-impacted areas. The project will reduce the potential of poor water quality contributions from standby wells pressed into service by high water demand. Installation of water meters on all residences is identified as a Planned Activity in the Groundwater	H	0	C	An Infrastructure Rehabilitation Program Feasibility Study, funded by a Department of Water Resources (DWR) Proposition 13 grant, was conducted in 2004 by MCWD to identify water losses within the District. The feasibility study identified that a significant amount of water was unaccounted for in the system. A Leak Detection Report and a Metering Study were performed as a part of the study. The Leak Detection Report concluded that leaks from pipes, valves, hydrants and risers were not the source of unaccounted for water. The Infrastructure Rehabilitation Program Feasibility Study conducted in 2004 estimated that 20% of the water in the system was unaccounted for. Metering all service connections will allow water audits to identify locations where water wasting is occurring and assist in identifying leaking fixtures within residences. Reduced pumping will conserve groundwater reserves. Water savings are estimated to be 3.9% to 5.4% of total system usage approximately 95 AF/yr.	498,400	472	900	11	Fresno	III	2012
685	0510005	0510005-002	C.C.W.D., West Point	new clearwell	Construction of two new treated water storage tanks	H	0	C	See Attached	1,750,000	556	1,400	10	Calaveras	III	2001
686	2410011	2410011-008	LE GRAND COMM SERVICES DIST	New Water Meter InstallationLe Grand CSD	Le Grand CSD has prepared the improvement plans and specifications for the installation of water meters for the customers of the District. The ability to install the water meters is dependent on funding, which the District is currently short on to complete the project.	H	0	C	The proposed project is to install water meters and purchase meter reading equipment for the customers of the District. The District customers currently do not have water meters. The District has prepared project plans and specifications for the water meter installation and is ready to put the project out for bid with a grant for funding on the project. The District has located all of the water service laterals to the individual residential customers and determined the meter size and meter box size and type of installation.	600,000	501	1,700	11	Merced	III	2012

687	3610048	3610048-004C	TERRACE WATER CO	Terrace Water Co. Meter Installation	Terrace Water Company is seeking support from the CDPH Economic Recovery funding program to install water meters on all of our approximately 600 service connections. Since its establishment in 1890, Terrace Water Company has billed on a flat rate system. With rising operating costs and emergency drought situations, we can no longer afford to operate with this rate structure. We are seeking funding to install meters on every service connection--residential and commercial. Over the last year, the Company has been surveying the service connections and installing shut-off valves where they previously did not exist. Nearly two-thirds of this project, the first step in installing meters, is complete. We are looking to install 5/8x3/4 meters on the majority of the services with mobile reading capabilities. Terrace Water Company currently has one staff member and cannot afford the added cost of hand meter reading. A radio frequency system allowing meter reading via drive-by is the most efficient manner of data collection.Installation will also include all meter boxes, brass fittings, collection equipment and software, as well as a computer to run the application. The installation of system-wide meters will result in water conservation, higher revenues, and the a more stream-lined billing procedure.	H	0	C	Terrace Water Company is seeking install meters on the entire system. The entire Terrace Water Company service area is without water meters and each of the connections, regardless of property use, is charged on a flat rate system. During 2008, Terrace Water Company pumped 264,870,000 million gallons of water for 600 service connections. This averages to 1,200 gallons a day per house, which is nearly 3 times the average usage. In 2006 our well level was 190 feet, and only 2 years later it is 230 feet. The Board of Directors has repeatedly requested conservation by its customers, but with no viable consequences, water wasting continues.Terrace Water Company was founded in 1890, and many of the lines in the current system are more than 50 years old—several date back more than 100 years to the inception of the Company. The 1950s resulted in great growth for the Terrace service area, with the building of hundreds of homes. Terrace Water Company currently services approximately 600 connections—the majority of which are single-family homes, though there are several commercial properties as well as a mobile home park. When water was bountiful and customers few, this system made sense, however after several years of drought and the state of California's water supply, this system is no longer feasible.In addition to the extreme need for conservation, Terrace Water Company is losing valuable	600,000	574	2,200	13	San Bernardino	V	2009
688	3610048	3610048-005	TERRACE WATER CO	Terrace emergency tie and system conservation improvements	Project will replace failing distribution lines, create an intertie with a nearby system and install meters to help better manage and enforce water conservation.	H	0	C	System currently experiences frequent failures due to old and failing lines. During failures there is no backup water source thus leaving customers without water during repairs. It has no means to accurately measure water usage by customers resulting in a high water waste factor.	200,000	574	2,200	13	San Bernardino	V	2009
689	1010028	1010028-006C	Riverdale Public Utility District	Riverdale Public Utility District Water Meter Project	The proposed project will consist of installing new water meters on all of the 930 existing services including the Riverdale High School. The addition of water meters would allow the District to monitor usage and identify potential leaks or other wasteful usage from its customers. Accurate metering from all of the customers would allow the District to switch to a metered rate. A metered rate would give incentive to existing customers to conserve water and would likely decrease wasteful usage. An increase in customer conservation would help to ensure that costly chemicals used in the new water treatment facilities are not being wasted.	H	0	C	Riverdale Public Utility District does not currently have any way of accurately monitoring water usage from all of their customers or detect leaks in the distribution system. The District must charge their customers at a flat rate. At present, the District does not have the infrastructure to accurately meter all of their customers and therefore cannot charge their customers at a metered rate.The Riverdale High School is one of the Districts largest customers and is currently unmetered. This makes it difficult for the District to identify potential leaks and overall usage from one of its largest customers.As part of a separate project, the District is currently in the process of designing new water treatment facilities for two of its water supply wells. The chemicals used to treat the water are costly and wasteful usage from the customers would result in uneconomical operation of the new treatment facilities.	650,000	866	2,416	23	Fresno	III	2012
690	3110013	3110013-005	Tahoe Cedars Water Company	Meter Install	instal approx 1000 meters.installing meters will require locating and excavating a hole approx 3.5 feet in depth at each home.	H	0	C	system has few metered services, it is believed that system will be required to install meters soon. installing meters would curb waste.	1,000,000	1,114	2,775	02	Placer	I	2009

691	3910017	3910017-003	San Joaquin County-Mokelumne Acres	Mokelumne Acres Maintenance District Meters	The work, in general, consists of the purchase and installation by contract, of 1140 radio read type water meters on all unmetered connections in the Mokelumne Acres Maintenance District.	H	0	C	The Mokelumne Acres water system provides domestic drinking water to 1140 connection residential subdivision located in an unincorporated area of San Joaquin County. The water system is currently unmetered and properties are assessed annually for water service. The assessment is unrelated to water use. As California enters the third consecutive year of drought, San Joaquin County is seeking to fully meter its water systems. In addition, San Joaquin County has purchased a drive-by "Automated Meter Reading" system. Installation of water meters conserves water. Use of the AMR conserves labor, fuel, equipment use, and traffic congestion during meter reading cycles.	1,140,000	1,103	3,640	10	San Joaquin	III	2009
692	3110009	3110009-002	Meadow Vista County Water Dist		Replace two (2) 2mg reservoirs with welded steel tanks.	H	0	C	Storage reservoirs have floating covers which apparently are no longer permitted by DHS.	2,259,000	1,370	3,640	02	Placer	I	1998
693	1710015	1710015-005	Hidden Valley Lake CSD	Automatic Meter Reading System	Install fixed network communicators (data collection hardware) throughout the District, replace registers with automatic meter reading devices, replace old meters, install software, which interfaces with existing billing software and install a GPS system to interface with software program. Water conservation is critical more than ever. The Fixed Network project would be an efficient and effective addition to the District's current water conservation program.	H	0	C	The District has leak detection issues relating to the customer and the water system. With the Fixed Network meter reading system the District would be able to detect leaks 24/7 in the water system and on the customers' side. This program overlays with a GPS program to enable mapping of the water system to detect leaks within 2 feet. Being a small agency the District also encounters meter reading staffing issues. This would relieve Field Operations staff to continue to run their daily operations without interruptions. Currently, meter reads ties up our entire Field Operations for 3-4 days.	1,100,000	2,433	6,971	03	Lake	II	2009
694	5010006	5010006-001	City of Modesto, DE Waterford	Waterford Citywide Meter Installation	The City of Waterford will be fully metered and billed according to metered water usage. This will include installing meters and automated meter reading equipment on over 1,100 water services. As meters are installed by contractors, up to one-half of the sites will require complete service replacement where old galvanized pipes currently exist from the water main to the residence. A meter, meter box, and automated reading device will be installed at each site. Once meters are installed, a leak audit will be performed to locate water wasting leaks in the system so that they can be repaired. With a fully metered system and leak detection and repair, the daily water demand for the City of Waterford can be reduced 20% to 30%. This will produce more water volume and pressures for domestic use, school uses and emergency fire protection. The regional ground water beneath the City of Waterford will be protected from depletion and water waste will be in check.	H	0	C	The City of Waterford Water System is owned and operated by the City of Modesto. The water system for the City of Waterford derives its water solely from six ground wells. The system is more frequently close to violating State requirements to maintain above 20lbs. pressure throughout the system. During peak day usage in the summer months, all wells are operating at full capacity. There is no storage capacity or surface water available at this time for the Waterford system to utilize. There are over 2,200 water services in the Waterford system. About one-half of these services are billed on a flat rate and do not have water meters. Water production for Waterford is nearly double that of nearby communities that are billed on actual water consumption using meters.A recent consultant study of the system has suggested that water meters be installed throughout the system to reduce water consumption. Until meters are fully installed, it is impossible to conduct an efficient water audit to find unaccounted water usage, leaks and unauthorized water use. Currently the City of Waterford is restricted from growing due to the water situation. Best management practices have been implemented to conserve water without meters, including daily water use restrictions, however these programs have not been effective where no meters exist.	1,000,000	2,214	7,897	10	Stanislaus	III	2009

695	0310012	0310012-012	AWA Buckhorn Plant	CAWP Jackson Pines Storage Tank Replacement	The Jackson Pines Tank is part of the Central Amador Water Project ('CAWP') system, located along Irishtown Road, near Highway 88 in Amador County. The Jackson Pines Tank is fed by the CAWP main, serving the Jackson Pines subdivision plus one subdivision with entitlements (Black Oak Ridge).A 2,400 square foot hypalon cover encloses an existing 270,000-gallon conical shaped, partially recessed Jackson Pines Tank. The Jackson Pines Tank floating cover is equipped with a tension pier system and three surface drains. The existing conical shaped tank will be removed (portion underground will be backfilled) and replaced with a new storage tank (approximately 10 feet in height and 76 feet in diameter), with a volume of 300,000 gallons. The recessed portion of the existing conical tank will be backfilled and the new tank will be constructed completely above-ground. The new tank will be equipped with features such as modernized system controls; inlet, outlet, and overflow pipes; air vent; manway; liquid level gauge; and tank ladder with guardrail.This project will significantly reduce operator time spent maintaining the floating cover and increase the reliability and safety of drinking water by significantly reducing the potential for violation of total coliform maximum contaminant level per Section 64426.1 of Title 22 of the California Code of Regulations.	H	0	C	A 2,400 square foot hypalon cover encloses an existing 270,000-gallon conical shaped, partially recessed treated water storage reservoir. Section 64585 of Title 22 of the California Code of Regulations outlines specific criteria for distribution reservoirs. When operated and maintained properly, distribution reservoirs with floating covers meet these criteria. However, covers fatigue and crack due to the up and down movement of stored water. Birds peck holes in the covers and wind borne debris collects in the folds of the cover. Rain water collects on the cover. Operators must walk out on the covers to repair, inspect, and clean the cover and pumps for rainwater removal. Although the site is enclosed with a chain link fence (with barbed wire), the covers could easily be cut with a knife or falling tree branch from a significant rain event, exposing treated water for distribution to the elements. Removal of the floating covers with a new storage tank significantly reduces the potential for violation of total coliform maximum contaminant level per Section 64426.1 of Title 22 of the California Code of Regulations. Although floating covers are allowed per Section 64585(b)(3)(B) of Title 22 of the California Code of Regulations, the Stockton office of the Department of Public Health has reported their concerns over the continued use of floating covers, and has recommended replacing floating covers.	1,060,000	2,558	8,508	10	Amador	III	2009
696	1010001	1010001-005c	BAKMAN WATER COMPANY	Bakman WC - Installation of Water Meters	Water lines need to be moved into customers property lines, in most cases large lots have been split several times and existing lines would need to be separated for individual meters to be installed. On apartment complexes and businesses the plumbing in the ground would need to be located and split to allow for individual services as many lines were put in without being documented on maps or have been misstated in past developments recorded documents.	H	0	C	Our customers live below the poverty line and would be severely affected if CPUC increases rates to comply with the State Law requiring water meters. In addition we would be able to show great amounts of water conservation by implementing water meters on our Apartment Complexes and business that are currently on flat rate. If we could receive amounts at this time to only comply with water meters for Apartment Complexes and business we would be able to complete this portion with a grant of approximately 2 million.	3,093,750	1,910	8,865	11	Fresno	III	2012
697	2910003	2910003-007	Truckee-Donner PUD, Main	Water Meter Box Retrofit Project	water meters	H	0	C	The District subject to the requirements of AB 2572 regarding reading of water meters and the implementation of volumteric billing.There are approximately 4,000 existing customers where water meter boxes do not exist or must be upgraded to accommodate the installation of a water meter. Once these meter boxes have been upgraded, the District will install new water meters to all full compliance with AB 2572.The District has also issued a Request for Proposals for a consultant to develop a new volumteric rate structure.Upon completion of the project and implemenation of the volumteric rate structure, the District anticipates a system wide reduction in water consumption of between 10 and 20 percent.	10,000,000	12,271	14,300	21	Nevada	I	2009

698	3410011	3410011-007	Galt, City of	Galt Water Meter Installation	The tasks associated with this project would consist of engineering, installation, and inspection of installation of water meters (and replacement of existing laterals where needed) and fixed network communication system, such that all customers in the City of Galt Water System are metered. The vendor/supplier of the meters and fixed network equipment have not been selected. This selection would be based on bids received by the City in response to bid documents. Plans and specifications have not been written, and costs of this task would be covered in the budget for this project.When complete, the system will consist of antennas (associated with fixed network collectors) and a host computer. Signals from the water meters will be sent wirelessly, captured by the collector and sent to the host computer. The data will then be downloaded into the City's utility billing system, thereby reducing the labor cost associated with reading meters. The system will continuously measure flow, and will allow for notification of customers that have a water leak. Other featues could be incorporated to allow for customers to review their water usage daily. These features would encourage water conservation and reduce leaks, helping the City to approach the requirements of 20% water reduction by 2020.	H	0	C	Almost all commercial customers are metered. In addition, water meters have been installed at all residential units constructed in 2005 or later. However, meters are not in place at over 80% of the residential customers in the water system. In 2008, the City embarked on a Water Meter Implementation Plan, which identified costs associated with a fixed network metering system. This plan has been completed, and construction/installation costs from the report are the basis for the cost estimate. This project would provide funding for installation of water meters at over 6,600 residences. Approximately half are deemed "meter ready", meaning that a meter can be installed with minimal effort. The remaining are deemed semi-meter ready or not meter ready, meaning that replacement of a portion or all of the service lateral will be needed in order to install a meter and meter box. In order to construct these services, roads and/or private landscaping may be excavated. Project budget would cover costs of replacing to existing conditions at the end of the project.	8,600,000	7,872	22,982	09	Sacramento	I	2012
699	1510005	1510005-007	Delano, City of	City of Delano New Water Meters	The City of Delano will install new Automated Water Meters (AWM) to the existing 3,620 unmetered water accounts currently receiving flat rate bills. The installation of meters for the project is expected to result in water savings of 487 acre-ft annually. The project will result in quantifiable and sustained water savings, improved local water management, enhanced leak detection, and accurate measurement of water consumed by customers. In order to find a cost effective and time efficient method of water metering, the City has researched different AWM technologies and found that the Mobile Radio technology, or AMR, uses technology most effectively to minimize labor costs in comparison to the Manual Read, Touch Read and Fixed Network Radio. The City of Delano has chosen to use a residential meter produced by Badger. The specific type of meter chosen is the 1-inch Recordall Cold Water Engineered Polymer Disc Meter, Model 40PN. All the Recordall meters are compatible with a Badger AMR system, with the addition of a transmitter or an encoder register. The Badger system is based upon narrow band communication and utilizes one-way communication. The Badger AMR system will greatly minimize the labor, maintenance and operation costs of Delano's municipal water utilities.	H	0	C	The City of Delano (City) currently utilizes existing groundwater, as its sole source of water supply. Groundwater is drawn from the Kern County Subbasin aquifer via eleven (11) groundwater wells scattered throughout the City. As population grows and water demand increases, additional wells are being drilled to augment the existing water supply. By 2013, the water supply system will have seventeen (17) active wells.According to survey work done of the 2010 Urban Water Management Plan, there were 8,848 service connections within the City service area: 59 percent of the service connections are metered and 41 percent are unmetered. The combined annual volume pumped into the system was 2,045 million gallons. The City Water System service area population (water users served) was 48,957. The City is a member of the California Urban Water Conservation Council (CUWCC) since 2007 and is a signatory to the Memorandum of Understanding regarding Urban Water Conservation in California. As a CUWCC member, the City is committed to water conservation. Water conservation practices are implemented within the City's service area with emphasis on Best Management Practices (BMPs)/Demand Management Measures (DMMs) that conserve water and increases the public awareness on water conservation and other water-related issues.The City recognizes water conservation and BMPs/DMMs	3,150,000	8,670	53,855	12	Kern	III	2012
700	5710006	5710006-024	City of Woodland	Woodland-Water Meter Phase 3	The project involves the installation of meters on 10 condominiums.	H	0	C	There are about 10 condominium that are yet to be metered, this proect would provide metered connections to these condominiums	900,000	14,065	56,000	09	Yolo	I	2012
701	3410020	3410020-033	City of Sacramento	Complete metering of water system	Meter project	H	0	C	Meter project is necessary to meet the requirements of Assembly Bill 2572 by installing water meters on existing water services within the Cityof Sacramento. This law set a deadline of 100% metering of all residential and commercial accounts by 2015	5,000,000	137,886	407,018	09	Sacramento	I	2010

702	1910067	1910067-044	LOS ANGELES-CITY, DEPT. OF WATER & POW	Lower Franklin Reservoir Floating Cover - Replacement	This project removes the existing cover and designs and installs a new floating cover. The project includes modification to the inlet and outlet structures to provide better cover fit and performance. The project would also install reservoir perimeter fire hydrant system to provide wash down capability for improved maintenance.	H	0	C	The floating cover at Lower Franklin Reservoir is well beyond its 20 year design life. Maintenance of the cover has become increasingly more difficult as the Hypalon material has degraded to a point that the integrity cannot be maintained by patching. The cover must be replaced in order to maintain water quality standards that protect public health, and to meet State Waterworks regulations which require that all distribution reservoirs be covered. The reservoir was recently inspected by the California Department of Public, Health Drinking Water Program and it was recommended that the cover be replaced as soon as possible. While recent budgetary reductions have pushed this project out 10 years, estimate will be revised to reflect accelerated project schedule.	6,884,127	686,422	4,071,873	15	Los Angeles	IV	2012
703	1910067	1910067-045	LOS ANGELES-CITY, DEPT. OF WATER & POW	Green Verdugo Reservoir Floating Cover - Replacement	This project removes the existing cover and designs and installs a new floating cover. The project includes modification to the inlet and outlet structures to provide better cover fit and performance. The project would also modify the mixer location to improve chloramine treatment.	H	0	C	The floating cover at Green Verdugo Reservoir is beyond its 20 year design life. The cover must be replaced in order to maintain water quality standards that protect public health, and to meet State Waterworks regulations which require that all distribution reservoirs be covered. The reservoir was recently inspected by the California Department of Public Health, Drinking Water Program and it was recommended that the design of the new floating cover begin as soon as possible. While recent budgetary reductions have pushed this project out 10 years, estimate will be revised to reflect accelerated project schedule.	124,178,781	686,422	4,071,873	15	Los Angeles	IV	2012
704	1300555	1300555-001	MITCHELL'S CAMP FAMILY ASSOC.	Mitchells Camp Meter Project	Connection meters so we will better be able to manage water usage and support water conservation.	H	0	N	We have been told by the CDPH that our well needs to be augmented and storage increased to meet daily demands and fire flow. We cannot regulate water usage by individual customers because we do not have meters for each house. We also fluctuate on the boarderline of exceeding the MCL for arsenic.	50,000	62	80	14	Imperial	V	2012
705	0910024	0910024-002	Glenridge Water Company	Glenridge Water Meter Project	Install approximately 42 3/4" water meter setters with insulated boxes at or near property line. Since 1992 new construction has required the utility to install 3 meter setters on the new service connection.The installation will include all valves and meters that are low lead, compliance with California Law and NSF 61 non-lead. Meteres would be an acceptable remote type of read either Hersey, Badger or equal. The meter project will require a computer program to allow for "drive-by" data collection. At the office the data will then be converted to a water invoice to the customer.	H	0	N	There are inequalities in the supply of water in a flat rate system. Since the water system has very slow or non-growth there will not be major increases in population. It is a State Law by 2020 to install meters on all connections but there maybe variances for systems 500 connections or less. Water Meters are the best conservation tool available to utilities.Since the electronic remote read meter is the only type to be considered in snow and freezing conditions. The useage would be able to be regularly ,bi-monthly, read. Thereby, potentially conserving water and at least customers would pay for what they use.	97,000	43	130	02	El Dorado	I	2011

706	5510001	5510001-008	TUD - Sonora/Jamestown Water System	Water Treatment Plant Regionalization Study	TUD proposes to hire engineering and planning consultants to increase water treatment plant reliability, facilitate compliance with current and upcoming disinfection and log removal regulations, reduce the regulatory burden on the state DHS and TUD, and reduce costs to ratepayers. The consultants will evaluate the possibility of constructing a regional water treatment plant, intended to serve the majority, if not the entire TUD service area. TUD currently owns property of adequate size and situated in a location to facilitate such a treatment plant or plants. The consultants will also evaluate the concept of multiple sub regional water treatment plants, ultimately reducing the number of permitted systems from 14 to approximately 4. The scope of the consultant's analysis will include site opportunities and constraints, cost benefit and constructability of a regional or sub regional plant approach. Raw water quality will be evaluated and an appropriate treatment plant design technology proposed. Deliverables from the evaluation will include identification of the preferred site(s) for the regional/sub regional plant(s), determination of the appropriate treatment plant technology, a preliminary site layout, detailed cost estimates for each option as well as a cost benefit analysis for each. For the selected preferred alternative(s), an Environmental Impact Report will be prepared for CEQA compliance, as well as	I	45	C	The Tuolumne Utilities District (TUD) currently operates 14 separate DHS permitted water systems, 13 of which are served by treated surface water from separate water treatment plants located on the TUD ditch system. The majority of these small independent systems were acquired by TUD from private and mutually owned water companies and special districts which were financially or managerially unable continue system operation due to failing infrastructure and/or drinking water standards violations. The wells serving one of the TUD systems have been diminishing in production and have tested positive for Uranium. The remaining TUD well systems are nearly all in excess of the secondary standard for Iron and Manganese and are diminishing in production capacity. The TUD surface water treatment plants are located on small parcels with no room for plant expansion, currently operate at or above treatment plant capacity and DHS filtration rate standards during the summer months. TUD has routinely requested authorization to exceed DHS maximum treatment plant flow requirements, thus jeopardizing finished water quality and system supply reliability. Limited opportunity exists for connection to adjacent TUD owned systems due to the fact that each adjacent treatment plant is at or near production capacity. Expansion of each of these plants is required within the next 5 to 10 years to facilitate compliance	500,000	4,342	10,294	11	Tuolumne	III	2007
707	5510010	5510010-006	TUD - Crystal Falls Water System	New Crystal Falls SWTP	Construct a new SWTP.	I	30	C	The Crystal Falls SWTP operates at filtration rates that exceed the SWTR during peak demand periods.	15,000,000	2,232	5,301	11	Tuolumne	III	2007
708	1200671	1200671-007	Benbow W.C.	Water Treatment Plant Clarifier	Install .3 MGD clarfier with surge storage and boost pumps and convert existing pressure roughing filter to multi-media filter.	I	25	C	The existing surface water, direct filtration treatment plant does not have sedimentation or clarification. A single media, roughing filter is the only pre-treatment and is ineffective during the frequent, winter high river levels with associated high influent turbidity.	265,000	101	150	01	Humboldt	I	2009
709	5410007	5410007-002	LSID - Tonyville	Tonyville Water Quality Improvement Project	The District believes that the construction of a new water supply pipeline for the Tonyville System will result in lower disinfection by-products (DBPs). The new pipeline will enable the District to provide unchlorinated water to its treatment plant which should reduce the formation of DBPs. The District does not have, however, supporting data that would establish anticipated DBP levels resulting from changes to its raw water supply and associated pipeline configuration. The District proposes to conduct a 12-month feasibility study to establish probable DBP levels resulting from an unchlorinated water supply. The District proposes to install a temporary pipeline from an adjacent district's irrigation water supply service turnout to the Tonyville Water Treatment Plant for testing purposes. The adjacent district only provides unchlorinated water for irrigation purposes. Elements of the proposed feasibility study consist of: design and construction of the temporary pipeline; monthly testing for DBPs at various locations; daily monitoring for chlorine residual and flow for CT compliance determinations; routine monitoring of the adjacent irrigation district's water lateral and service turnouts for chemical addition; and a technical report summarizing the study findings. This approach will provide the District the opportunity to confirm the anticipated	I	25	C	The Lindsay-Strathmore Irrigation District (District) provides water for domestic and/or agricultural irrigation purposes. The District utilizes imported surface water as their primary water supply. The District has a contract for Class 1 water from the Central Valley Project. The water is delivered via the Friant-Kern Canal. Since the surface water is used for non-potable domestic purposes, in addition to agricultural use, the District is required to provide disinfection. The District chlorinates all of their water supply to achieve disinfection. Chlorination occurs at the District's Friant-Kern Canal turnout and at the District's High Level Reservoir. The District owns and operates a water treatment plant that serves the Tonyville Tract. The Tonyville system serves approximately 50 connections. Surface water travels in the District's conveyance pipelines approximately 5 miles from the District's turnout to the Tonyville water treatment plant. The water treatment plant receives water from the District's nearby 12-inch diameter irrigation water main. The District utilizes a 60 gpm (86,400 gpd) water treatment plant to produce drinking water for the Tonyville system. The facility was completed in 1995. The treatment plant is a conventional, packaged	125,000	50	400	12	Tulare	III	2007
710	1210022	1210022-006	Resort Imprvmt. Dist. #1	Surface water treatment plant improvements	Develop plan and specifications and complete construction.	I	25	C	Need to upgrade water treatment plant facility. System relies on prefiltration to meet disinfection requirements.	935,000	513	1,500	01	Humboldt	I	1998

711	0310021	0310021-007	Amador County Service Area #3/Unit 6	Lake Camanche Surface Water Treatment Plant	This project inicludes the supply transition from wells to surface/aqueduct source water. This alternative includes the following:1) A 2.0 MGD Regional Water Treatment Plant located at South Shore Lake Camanche that would provide service to EBMUD, CCWD, and AWA customer in the South and North Camanche Lake vicinity.2) A regional transmission pipeline crossing Lake Camanche to bring water across the lake to the north shore for service to Camanche Village and EBMUD.3) A transmission pipeline to bring supply water from the lake crossing to Tank 9, which will supply the entire AWA WID #7 by gravity.	I	25	C	Numerous feasibility studies and engineering reports have been conducted over the past ten to fifteen years by Amador Water Agency, EBMUD & Calaveras County Water District ('CCWD') to either initiate or improve potable water service in the Camanche area of Calaveras and Amador Counties. A conclusion to each of the studies is that the most reliable source and cost effective benefits would be achieved through a new regional surface water supply, 2 MGD membrane water treatment plant at South Shore Lake Camanche, a water supply line from EBMUD's existing Aqueducts and distribution system including a treated water pipeline across the lake to serve North Shore Lake Camanche. This water treatment plant would serve the three districts above in addition to the service areas described below and Camanche WID #7. See the KASL Feasibility Study: Camanche Regional Water System, October 1999, Appendix S and the KASL Preliminary Engineering Report: Camanche South Shore Water Treatment Replacement, December 2000, Appendix T.The community served by AWA has now reached a critical need to secure a reliable water source and provide treatment meeting current and future State Treatment Rules and Regulations. The Water Agency could own and operate the regional WTP, providing retail and wholesale service, which represents a cost effective alternative to the independent upgrade, modification,	1,930,000	723	2,386	10	Amador	III	2009
712	1710001	1710001-006	Clearlake Oaks County Water District	Install Backwash Holding Tank	Install a 400 KW generator with electrical switching system	I	25	C	Recycled backwash water to headworks shall be restricted to 10% of total production	145,000	1,667	2,458	03	Lake	II	2007
713	5510012	5510012-011	TUD - Upper Basin Water System	Sierra Pines Water Treatment Plant	The proposed project includes the design and construction of a WTP that would consolidate four water systems, provide for permanent interconnections of adequate volume to supply the needs of two additional public water systems and eliminate four to six WTP's. The new WTP will produce treated water in compliance with all current and future water quality regulations. TUD currently owns property of adequate size and situated in a location to facilitate construction of this project. This new WTP will be an integral part of the water supply for all current customers of the District within the County. This land is at the intersection of the Main PG&E canal and the start of the TUD ditch water distribution system.	I	25	C	The District owns and operates 14 water treatment plants (WTP) that serve 13,000 treated water customers. The majority of these WTPs are of limited treatment capacity and capability. There are an excessive number of water treatment plants for the number of customers primarily due to the fact that these once independent systems were acquired by TUD from private and mutually owned water companies and special districts which were financially or managerially unable continue system operation due to failing infrastructure and/or drinking water standards violations. Due to the chlorination contact time required under the Enhanced Surface Water Treatment Rule and state maximum filtration rate standards, two of the existing WTP's, Upper Basin and Crystal Falls, do not have capacity to meet the need of current customers and committed vacant parcels within their service areas and have had to receive State approval to exceed the ten State standards for filter rate in order to meet the needs of existing customers during the summer months. These plants along with Willow Springs and Cedar Ridge do not have the land space and / or the technology to meet currently adopted and proposed standards by the State and Federal government (L2 ESWTR).	7,684,875	1,455	3,446	11	Tuolumne	III	2007

718	1710022	1710022-006	Lake County CSA 20 - Soda Bay	CSA# 20 Soda Bay Water System Infrastructure Improvements	The project description includes the installation of a pre-treatment clarifier, capable of processing .5 MGD. The clarifier will be located in an existing vacant area at the north side of the water treatment facility, adjacent to the raw water intake piping. The location will allow convienent connection of valves and piping to facilitate the pre-treatment process and disposal of clarifier residuals to the backwash storage ponds. Included in the project is increasing the storage capacity of the backwash storage ponds by 20% by raising their berms, replacing and increasing the storage capacity of one redwood tank with larger steel tanks, replace the existing chlorine gas disinfection system with a liquid chlorine based system and replace the filter media of the trident package plant units.	I	20	C	The Soda Bay Water Treatment Facility treats surface water from Clear Lake to drinking water standards for the customers in CSA# 20. The treatment process is significantly challenged by summer algae blooms and seasonal water demand and insufficient storage capacity. The extended treatment and semi-continuous backwash cycles have resulted in a CDPH directive to accomodate increased backwash water. This application for pre-treatment equipment (pre-treatment was omitted in the original design and construction) which will remove organics prior to the water treatment process, solving the need to continuously backwash, eliminating the cause of the excess volume of backwash water, and need for additional backwash water storage. The water distribution and storage system has redwood tanks that leak and insufficient water storage capacity.	1,500,000	596	1,342	03	Lake	II	2009
719	1710021	1710021-002	Lake County CSA 21 - North Lakeport	Liquid Oxygen Supply System	The Liquid Oxygen system consists of one steel storage tank and feed system. The liquid oxygen storage tank (8'x15', approx 3000 gallon steel) will be anchored to a poured concrete slab, located adjacent to the treatment building. Associated pipes, controls, and evaporator unit will be installed to connect the liquid oxygen system to the supply ports on the ozone generators. It is intended that the tank will be equipped with telemetry to enable the liquid oxygen supplier to automatically monitor and re-supply.	I	20	C	The North Lakeport Water Treatment Facility supplies water for customers within County Service Area #21. The facility treats surface water from Clear Lake to drinking water standards. Part of the treatment process includes ozone treatment. The existing source of oxygen for the ozone generation systems is compressed air. When the compressed air system fails, ozone generation stops, and treatment stops. Regulatory requirements demand an adequate supply of clean heathful water for its' customers at all times. The Liquid Oxygen System will replace the obsolete compressed air system with oxygen to produce ozone at the current installed capacity of 40 lbs/hr., and fully comply with DPH goals and requirements.HEALTH BENEFITs include a reliable supply of oxygen to the ozone generation equipment and treatment process, free from the mechanical burden and potential aerosol contaminents of the air compressor system. The reduced electicity use will be an additional benefit to the environment (reduced greenhouse gases and other contaminenets) as well as lower PG&E costs for operations. ECONOMIC BENEFIT includes construction (engineering, equipment supply, and labor to install), and ONGOING economic benefit (supply and delivery of liquid oxygen). This liquid oxygen system will benefit internal operations through increased reliability and improve ozone generation efficiency.COMPLIANCE BENEFIT will be	102,500	1,204	2,868	03	Lake	II	2009

720	5410006	5410006-008	Lindsay, City of	Water Treatment Disinfection By-Product Mitigation Project	While modifying the current gas chlorine treatment process to a chloramine treatment process is a historically proven method of primary disinfection, part of the planning process would be to explore other potential methods of THM compliance.The final desired outcome of the planning process would be identification of the most effective, long term compliance of THM compliance.	I	20	C	The City of Lindsay has used gas chlorination as primary disinfection for many years and has complied with the current THM regulation. There has however, been a recent case where the annual average for the Lindsay water system to be out of compliance. This was the second quarter reporting for the Page-Moore area.In preparation of the 2013 Phase II THM Compliance, the City is seeking alternate primary disinfection processes. The City of Lindsay has limited access to water supply. We rely on a long term contract with the United States Bureau of Reclamation (USBR), Wells 14, 15 and 11 and provide the water supply for the City and surrounding areas that are connected to our domestic water system.Our long term USBR contract amount is capable of sustaining City demands but is constantly in flux. Recent allocations to San Joaquin River Restoration, unpredictable drought patterns which have reduced the City contract allotment are immense impacts to a constant, reliable water supply. The USBR contract water is delivered to the City via the Friant Kern Canal (FKC). The FKC schedules general maintenance which impacts the ability of the City to draw water from the canal. When this occurs, it creates a greater reliance on our very limited groundwater supply.The City's largest and most reliable water supply will soon not meet State regulations. It is the intent of this application to remedy the disinfection by product problem.	585,000	2,335	11,450	12	Tulare	III	2012
721	5510002	5510002-006	TUD - Ponderosa	Ponderosa Hills UV Installation	The Ponderosa water treatment plant is a conventional treatment plant with pressure filters. The District has reviewed several options which included replacement of the pressure filters with membrane filters, the addition of membrane filters, the addition of ozone, source water protection, GAC and various combinations all of these options. The length of the PG&E and district ditch systems from the South Fork of the Stanislaus River to the treatment plant is over 8 miles and passes through many dozens of private properties, with septic systems, as well as public and private timber lands. The probability of protecting the water quality without piping the entire system is extremely low. A project that would include piping the ditches would be cost prohibitive and an extreme CEQA challenge. The cost for new or additional membrane filter and ozone equipment is greater than UV equipment. The most economical and expedient way to address the increased disinfection requirements of LT2 will be the installation of UV units. There is adequate space and power on the treatment plant site for the new equipment. There is no other water system in the area that this system could be connected to.	I	15	C	The Ponderosa water treatment plant serves approximately 1,430 customers in the Ponderosa Hills area of Tuolumne County. The treatment plant source water originates in the South Fork of the Stanislaus River and is conveyed to the treatment plant though PG&E's and Tuolumne Utilities District ditch systems. The District has recently started testing for giardia and cryptosporidium in its ditches. Giardia has been found in all locatins tested in the District's ditch water and cryptosporidium in the source water for the Ponderosa water treatment plant. In the first five months of testing the source water for the Ponderosa plant has had 4 positive tests for cryptosporidium with results as high as 32 ocysts per sample. This level and frequency of the cryptosporidium detection indicates that the Ponderosa treatment plant will be in bin four for compliance with EPA LT2.	650,000	611	1,461	11	Tuolumne	III	2009

722	2010003	2010003-003	BASS LAKE WATER COMPANY	Willow Creek Surface Water Treatment Plant	In 2005, Boyle Engineering prepared a water treatment plant expansion feasibility study for BLWC. That study recommended that BLWC construct a new surface water treatment plant and raw water intake to replace the existing WTP.Based on the Boyle report, BLWC is proposing to replace the existing direct filtration Willow Creek Water Treatment Plant with a microfiltration treatment plant located along the northeast corner of Bass Lake. The proposed project would include demolition of the existing WTP facilities, which are located approximately 0.1 mi east of North Fork Willow Creek, and construction of new water treatment plant facilities immediately north of the County Road 432 Bridge at North Fork Willow Creek. New facilities would include a treatment plant building (3250 ft2) housing two packaged membrane treatment units, a 67,200 to 195,100-gallon chlorine contact tank, two backwash tanks, a 75,000-gallon raw water storage tank, a chemical neutralization tank, water intake pipe and screen along North Fork Willow Creek, 10 inch diameter treated water distribution pipeline, wastewater sewer pipeline connection, 20 ft wide access road (500 ft length), raw water pump station, and a standby generator. Site work includes grading and paving, site drainage and erosion control upgrades, site perimeter fencing, power and phone utilities (addition of a single pole and transformer), earth retaining walls, water and	I	15	C	The domestic water supply for the Bass Lake Water Company (BLWC) is provided by a direct filtration surface water treatment plant (WTP) and several wells. In order to supply enough water to meet peak demand periods during the summer months, BLWC must operate the WTP at a filtration rate of almost 4 gpm/ft2, which exceeds the 3 gpm/ft2 limit established in the Surface Water Treatment Rule (SWTR). In 1993, the California Department of Public Health issued Compliance Order 03-187 to BLWC requiring BLWC to bring the WTP into full compliance with the SWTR. BLWC has received temporary approval from the California Department of Public Health to operate the WTP at the higher filtration rate while plans are made to bring the WTP into compliance with the SWTR or to construct a new treatment plant.In addition to being out of compliance with the SWTR, the existing WTP utilizes an approximately 1,600 foot long raw water pipeline that is over 60 years old. The unlined steel pipeline traverses extremely rugged terrain, follows a very indirect route, and is in extremely poor condition. BLWC has attempted to repair the pipeline's numerous leaks with pipe clamps, wraps, and plugs, but new leaks appear as soon as the old ones are repaired. A major rupture in the raw water pipeline would quickly leave customers without potable water and fire protection once the treated water storage reservoirs are drained.	3,500,000	989	2,800	11	Madera	III	2009
723	5510013	5510013-012	TUD - Columbia Water System	Columbia WTP UV Project	The Columbia water treatment plant is made up of three up-flow clarification units. Each unit is .5MGD. The District has reviewed several options which included replacement of the up-flow clarification units with membrane filters, the addition of membrane filters, the addition of ozone, source water protection, GAC and various combinations all of these options. The length of the PG&E and district ditch systems from the South Fork of the Stanislaus River to the treatment plant is over 15 miles and passes through dozens of private properties, with onsite sewage disposal systems, as well as public and private timber lands. The probability of protecting the water quality without piping the entire system is extremely low. A project that would include piping the ditches would be cost prohibitive and an extreme CEQA challenge. The cost for new or additional membrane filter and ozone equipment is greater than UV equipment. The most economical and expedient way to address the increased disinfection requirements of LT2 will be the installation of UV units. There is adequate space and power on the treatment plant site for the new equipment.	I	15	C	The Columbia water treatment plant serves approximately 3,653 customers in the Columbia and Gibbs areas of Tuolumne County including the Columbia State Historic Park. The treatment plant source water originates in the South Fork of the Stanislaus River and is conveyed to the treatment plant though PG&E's and Tuolumne Utilities District ditch systems. The District has recently started testing for giardia and cryptosporidium in its ditches. Giardia has been found in all of the District's ditch water and cryptosporidium has been found in the source water for the Columbia water treatment plant. In the first five months of testing the source water for the Columbia treatment plant has had 2 hits for cryptosporidium up to 3 ocysts per sample. The level and frequency of the cryptosporidium detection at this location and other locations within the District indicates that the Columbia treatment plant will probably be in bin four for compliance with EPA LT2.	725,000	1,548	3,646	11	Tuolumne	III	2009

This level and frequency of the cryptosporidium detection indicates that the Ponderosa treatment plant will be in bin four for compliance with EPA LT2. Additionally the WTP is old and is need of upgrading. The filters are rusty and the building is rotting. The pant and it's components are near the end of their useful life.	2,200,000	611	1,461	11	Tuolumne	III	2009
727	3310012	3310012-013	Elsinore Valley MWD	Canyon Lake Water Treatment Plant Ultraviolet Disinfection Project	The UV Disinfection Project (Project) consists of constructing two parallel in-line UV Generators with a capacity of 9 mgd in the finished water piping between the filter gallery and chlorine contact tank at the Canyon Lake Water Treatment Plant for primary disinfection. Ultraviolet radiation effectively inactivates common protozoan pathogens such as Cryptosporidium and Giardia and most bacterial pathogens with much lower disinfection byproducts (DBP) formation than chemical disinfection. Following UV disinfection, chloramines will be added as part of a multi-barrier disinfection strategy to destroy viruses and maintain a residual in the system. The Project will ensure compliance with the Stage 2 DBP Rule as UV radiation does not create significant levels of disinfection byproducts and the anticipated chloramines dosage of 1.5 mg/l will have a minimal effect on disinfection byproducts levels.In accordance with Elsinore Valley Municipal Water District's (EVMWD) Water Resources and Urban Water Management Plans, EVMWD intends to maximize the local water resources including groundwater and surface water to meet the recent increase in water demands. However, without this project, EVMWD will not be in compliance with the Stage 2 DBP Rule and will have to further rely on imported water from the State Water Project and Colorado River Aqueduct to meet its water demand.	I	10	C	Elsinore Valley Municipal Water District (EVMWD) obtains its potable water supplies from local groundwater, local surface water from Canyon Lake, and imported water from Metropolitan Water District of Southern California. The Canyon Lake Water Treatment Plant (CLWTP), with a capacity of 9 million gallons per day, accounts for approximately 10% of EVMWD's water supply.Canyon Lake, with a storage capacity of 12,000 acre-feet, impounds water from the 750 square mile San Jacinto River watershed. Failing septic systems in Quail Valley have resulted in polluted water in the community and in downstream Canyon Lake. The Riverside County Department of Environmental Health observed in its February 2005 study that there are widespread instances and evidence of septic system failures in the Quail Valley area. The surfacing groundwater in the Quail Valley area also shows high pathogenic contamination.Due to the local water runoff from the San Jacinto Watershed and in particular from Quail Valley into Canyon Lake, total coliform concentrations usually exceed 1,000 MPN during runoff events. Therefore, it is required to increase the chlorine disinfection at the CLWTP to achieve the required additional log inactivation of giardia. One of the byproducts of chlorine disinfection is trihalomethanes (TTHMs) and haloacetic acids (HAA5). These disinfection byproducts (DBP) are	2,000,000	36,817	121,420	20	Riverside	V	2009
728	1503341	1503341-005	TEJON-CASTAIC WATER DISTRICT	TTHM reduction	Coagulation injection.	I	10	P	DBPR compliance, high TTHM levels.	590,000	15	1,000	19	Kern	III	2007

729	1503341	1503341-006	TEJON-CASTAIC WATER DISTRICT	Tejon-Castac Water District DBP Compliance	This project will include a pretreatment system to reduce the DBP formation potential. A Rapid Small-Scale Colum Test (RSSCT) will be performed to evaulate the variablility of the raw water and determine the best long term solution. Most probable treatment options will be enhanced coagulation and GAC in addition to the current membrane filtration.	I	10	P	The problem addressed in this project is DBP formation. The Tejon Castac Water District uses surface water supplied by the State Water Project treated by PALL microfiltration, and 12.5% sodium hypchlorite as a disinfectant. The State Water Project is commonly known for its high TTHM formation potential. Additional problems identified in the project are: no pretreatment, relatively low demand in the distribution system, and a large clear well with extremely long residency time. The drinking water standard violated is the Stage 1 Disinfection/Disinfectant Byproduct Rule.	1,500,000	15	1,000	19	Kern	III	2007

734	1910087	1910087-012	Metropolitian Dist. of So. Cal.	Robert B. Diemer Treatment Plant Filter Media Replacement	The project consists of removal and disposal of existing anthracite coal and the upper one-half of the underlying silica sand layer in all 48 filter units; furnishing and installing new filter media; and other appurtenant work. Replacement of the manganese-contaminated filter media with fresh media will allow use of biological filtration coupled with ozonation to control DBPs. Only partial media replacement will be conducted. The Diemer filters contain high levels of manganese only in the top anthracite coal layer, due to the lower applied ferric chloride dosages, shorter duration of ferric chloride coagulation, and other plant-specific conditions. Replacement of the manganese-containing filter media with new media will then allow all of the benefits of ozone coupled with biological filtration to be realized with the use of either alum or ferric chloride containing negligible manganese.	I	0	C	Unacceptably high concentrations of manganese remain on the filter media at the Diemer plant, and, without mitigation, consumers would receive colored water when biological filtration is initiated in 2012. In response to the USEPA's Stage 1 D/DBP Rule, Metropolitan is currently constructing ozone facilities at the Diemer plant; these facilities have a scheduled completion date of early 2012. Upon completion, the water treatment process will include raw water ozonation, coagulation, flocculation, sedimentation, biological filtration, and final disinfection using chlorine and ammonia. The oxidation retrofit project is designed to use biological filtration to minimize the presence of many ozone DBPs and to produce biologically stable water. Biological filtration will: (1) reduce the formation of chlorinated DBPs, (2) remove ozone DBPs, (3) reduce the decay rate of chloramines, and (4) reduce the ability of microorganisms to re-grow in the distribution system. Biological filtration is initiated by halting the continuous application of chlorine onto the filters which are downstream of ozonation. Specifically, chlorine is not added to the treatment process until after the filters.When biological filtration commenced at Metropolitan's Mills plant in November 2003, the plant effluent turbidity increased and a number of colored water complaints were received from consumers. Investigation revealed that soluble manganese was	4,000,000	647	0	16	Los Angeles	IV	2009

735	1910128	1910128-010	COVINA IRRIGATION CO.	Temple WTP UV Treatment for Regulatory Compliance and Regional Reliability	Alternate methods using granulated activated carbon, magnetic ion exchange resin, chlorine, ozone, and chlorine dioxide have been considered and ruled out, either due to the excessive cost, insufficient space requirements, or an inability to meet regulatory requirements. This construction project to improve the Temple WTP is currently under contract, and is in the permitting and detailed design stage. It is expected that design will be complete and the project will to go to bid in mid-2009. The project will consist of augmenting the existing hypochlorite addition facility, adding a permanent ammonia addition facility, moving the point of chlorination, and a post-filter implementation of UV disinfection facilities. The Temple WTP is intended to be a base-loaded regional plant, and the facilities will be designed for the current plant capacity of 12.5 MGD. The conceptual design calls for one duty UV reactor and one standby UV reactor. This project is a joint effort between Covina Irrigating Company and the Upper San Gabriel River Municipal Water District, which is the MWD member agency in the area and the agency responsible for alternative supplies if the Temple WTP is unable to operate.	I	0	C	The Temple WTP is a 12.5 MGD conventional water treatment plant that treats either local surface water, supplies from the State Water Project (SWP), or blends of the two sourcewaters. The Temple WTP as originally configured used sodium hypochlorite for both primary and residual disinfection, and this is sufficient when treating local supplies. However, when supply constraints limit local supplies, for instance in times of drought or during maintenance activities, the Temple WTP treats supplies from the SWP, for which it was not designed. Due to the high organic matter content of the SWP, very high concentrations of trihalomethanes (THM) are formed, which is a regulated disinfection byproduct (DBP). This scenario was recently realized, and the Temple WTP was forced to shut down to avoid a regulatory compliance problem under the Stage 2 DBP Rule. This event also required surrounding utilities to make up this supply, and due to the structure of MWD's rates, represented a significant cost to these utilities. It is highly likely this supply scenario will be replicated in the future, and it is in fact re-occurring this summer. In order to mitigate the formation of THMs and bring the plant into compliance with the Stage 2 D/DBP rule, an alternate method of disinfection has been sought. The UV disinfection process and a conversion to chloramines for residual disinfection were recommended to solve this problem. This upgrade to the Temple WTP will	5,500,000	12	0	15	Los Angeles	IV	2009
736	1910087	1910087-008	Metropolitian Dist. of So. Cal.	Mills Treatment Plant Ozone System Reliability Upgrade	The project consists of constructing structures and facilities to upgrade the ozone system; making connections to existing facilities; testing and commissioning; installation of the Ozonia North America-furnished equipment (see next paragraph); and performing all appurtenant work.In November 2007, Metropolitan's Board awarded a procurement contract in the amount of $3,403,950 to Ozonia North America. The ozone equipment procurement package includes one ozone generator which matches the three existing units, one power supply unit, one 34,000-gallon liquid oxygen storage tank, one nitrogen injection system, three ambient ozone analyzers, two ambient oxygen analyzers, two ozone contactor control panels, and support equipment. The package also includes testing, installation oversight, equipment start-up, training, and extended on-site services. The equipment is currently being fabricated.The existing Mills ozone generation system was constructed with provisions to easily accommodate additional equipment to increase ozonation capacity. These provisions include space reserved within the Ozone Generation Building for a fourth generator and its power supply unit; space reserved in the liquid oxygen (LOX) tank area for a third LOX tank; sizing of major electrical, cooling, and control systems to support a fourth ozone generator and power supply unit; and gas piping systems sized to convey	I	0	C	The existing Mills plant ozonation system is undersized for the expected ozone dosages required to reliably treat 220 mgd.The existing Mills plant ozone generation system includes three ozone generators, two liquid oxygen (LOX) tanks, and related equipment	2,000,000	647	0	16	Los Angeles	IV	2009

737	1910087	1910087-006	Metropolitian Dist. of So. Cal.	Henry J. Mills Water Treatment Plant Ozone System Capacity Upgrade	The project scope includes: addition of: a fourth 3,000 ppd ozone generator with power supply unit; a third LOX tank (34,000 gallon) with concrete foundation; a supplemental nitrogen generation system package; additional ambient ozone gas analyzers; power feeds, control system programming, and related accessories; Contactors 3 and 4; extension of influent and effluent conduits; extension of the ozone feed and off-gas piping systems; enlarged chemical feed systems; control system modifications; and sampling system extension. This project will increase the disinfection capacity of the ozonation process to match the 326-mgd capacity of the remainder of the plant at the higher 3 mg/L design ozone dose to meet all Federal and State disinfection requirements. Higher ozone dosages may increase bromate formation when bromide is present in the source water. Bromate is a regulated ozonation disinfection by-product. However, Metropolitan's bromate control method of	I	0	C	The Mills plant exclusively treats State Water Project (SWP) water. Due to its proximity to the DWR conveyance system, the plant receives East Branch SWP water via Lake Silverwood and Lake Perris. From 2003 to 2005, average total organic carbon (TOC) concentrations at the Mills plant inlet have increased nearly 30 percent, from 3.1 mg/L to 3.9 mg/L. In addition, maximum plant inlet TOC levels have increased over 50 percent, from 3.9 mg/L to 6.0 mg/L, over this same period. Increased SWP TOC levels appear to be due to changes in the statewide operation of the SWP system, including increased blending with agricultural sources during transport through the Northern California Delta areas and increased storm water runoff. Metropolitan now experiences increased variability in water quality, particularly in late winter and early spring. These variations are similar to those experienced by other SWP contractors in both Northern and Southern California who have limited raw water storage capacities. Because ozone reacts rapidly with TOC, increased TOC levels require a proportional increase in ozone dosage in order to comply with disinfection requirements. Reducing TOC levels prior to the ozone contactors using	30,829,000	647	0 16	Los Angeles	IV	2007
738	3510007	3510007-001	Hollister/Sunnyslope WTA	Lessalt Surface Water Treatment Plant Disinfection Byproducts Upgrade	The construction of the Lessalt Surface Water Treatment Plant retrofit will add chemical addition of alum coagulant, polymer, and oxidant to the influent side of the existing treatment plant. The oxidized and coagulated water will then flow in a newly constructed detention structure where it will be susequently treated by existing mcirofiltration filters. The Lessalt retrofit will replace the exisitng pumps on the influent side of the Lessalt Treatment Plant with variable speed pumps. The effluent side of the Lessalt Treatment Plant will have a new clearwell added to increase contact time and provide a new wet well for new variable speed pumps which will discharge into the existing Fairview and Ridgemark potable water pressure zones. Finally, the Lessalt Treatment Plant will add an emergency generator to supply emergency power to the treatment plant during power outages. The Lessalt Treatment Plant is located in the Hollister Urban Area and power outages can last up to 3 or 4 days due to disruptions of the power grid by several active faults in the Hollister area.The Lessalt retrofit will enhance the current intertie between the potable water system of Lessalt, the City of Hollister, and Sunyslope County Water District by increasing the water quality, water quantity, and reliablity of all three systems during periods time when there are source water quality problems or electrical disruptions.	I	0	C	Currently the Lessalt Surface Water Treatment Plant will not meet the upcoming disinfection byproduct rule which is slated to take effect in 2012. The renovation of the Lessalt Surface Water Treatment Plant will allow the Lessalt Potable Water System, the City of Hollister Potable Water System, and the Sunnyslope County Water District System to meet the upcoming disinfection byproduct rule. Additionally, Lessalt upgrade will increase the reliability of the Lessalt Treatment Plant to effectively operate at 3 million gallons per day. Currently the Lessalt Treatment Plant operates at approximately 1.5 mgd during average conditions but is shut down when source waters are impaired or when there are electrical outages. The use of treated water from the Lessalt surface water treatment plant will replace groundwater from wells which exceeds secondary drinking water standards for total dissolved solids in the potable water supplies of Lessalt, the City of Hollister, and Sunnyslope County Water DistrictThe construction of the Lessalt Treatment Plant upgrade will also improve the wastewater quality for the City of Hollister and Sunnyslope County Water District by supplying customers who discharge water to both wastewater sytems to discontinue using salt discharging water softeners. The discontinuation of the use of salt brine discharging water softeners will aid Sunnyslope County Water District in its attempt to	3,700,000	2	25 05	San Benito	II	2009

739	3910006	3910006-006	Stockton East Water District	Construction of Additional 4 Filters	The project will consis of the design and construction of four (4) new filters. The filters will be located at the district treatment plant adjacent to existing sedimentation basin.The filter project is part of a larger project that will consist of the 10 MG clearwell, 4 new filters, and 2 additional sludge lagons. Both the 10 MG clearwell and the additional 4 filters are being constructed to meet regulatory requirements. Both projects are seeking funding under the Economic Recovery program.	I	0	C	Stockton East Water District wholesales treated water from its Dr. Joe Waidhofer Water Treatment Plant to City of Stockton, California Water Service Company and San Joaquin County. Population served in the Stockton urban is over 300,000.The Dr. Joe Waidhofer Water Treatment Plant currently has 8 dual media filters constructed of 10-inches of sand, 12-inches of gravel, and 36-inches granular activated carbon. When one or more filters is taken out of service for backwash or repair at flow rates of 60 MGD or greater filtration rates exceed 6gpm/sq foot. This project would construct four additional filters to ensure the regulatory limits of 6 gpm/sq foot are maintained. Also, this would provide additional contact time for organics removal.	7,882,300	4	50	10	San Joaquin	III	2009
740	4600012	4600012-001	Alleghany County W.D.	Treatment Plant Improvments	Make improvements to treatment facility to ensure continued reliable water supply.	I	0	C	System not meeting CAP turbidity performance goal of 0.1 NTU. Electronic system for treatment plant needs to be replaced. New turbidimeter, new system pump at treatment plant and need new portable test equipment. Replace membranes.	55,000	55	80	02	Sierra	I	2007
741	4100503	4100503-004	BUTANO CANYON MUTUAL	Reconfigure treatment system to solve Trihalomethane issue & replace storage tanks.	Our fitration plant will be reviewed by an experienced engineer to then be reconstructed to eliminate our Trihalomethane problem. This is our main focus, however, we feel the storage tanks are highly subject to failure and therefore, we want to include them in this project.In addition to any equipment changes that need to be made to solve our TTHM problem, the two existing storage tanks will have to be taken apart and removed from the area. New foundations must be constructed for the two new tanks which will then be built on site and tied to the foundations.This will involve shipping the old tanks out of our canyon and shipping new ones in after the foundation work is completed. This will involve extraordinary circumstances as the road into our canyon can not accommodate large trucks.This project will involve replacing two 60.000 gallon tanks with two 55,000 gallon tanks and some incidental pipe changes to accommodate the new tank specifications. The cost of this project will include engineering, permits, tanks, shipping for old & new tanks, foundations, testing of new tanks, labor, installation, planning, contractor fees and some administrative costs. It may also include the rental of miscellaneous equipment and/or temporary tanks during the installation.	I	0	C	We constantly exceed the MCL for Trihalomethanes. This has required our Mutual Water Company to send out public notification every quarter upon receiving the test results.Our two 60,000 gallon water tanks are old and were used when they were installed many years ago. We have had them inspected and they show signs of metal rust and fatigue resuting in leaks.It is our desire to solve our Trihalomethane problem as soon as possible and eliminate the constant fear of a major tank failure.We are a small, private water company and do not have the means to raise the needed amount of money in a timely manner, while maintaining our emergency reserves and funds for the daily operation and maintenance of our water system.	325,000	92	276	17	San Mateo	II	2009

742	5510030	5510030-002	TUD - Monte Grande Water System	Monte Grande WTP (Willow Springs WTP) Expansion and UV Installation	The Monte Grande water treatment plant is made up of one up-flow clarification units. The plant capacity is .5MGD. The addition of a second unit was planned for in the plant design and would require minimal work for plant expansion. The District has reviewed several options which included replacement of the up-flow clarification unit with membrane filters, the addition of membrane filters, the addition of ozone, source water protection, GAC and various combinations all of these options. The length of the PG&E and district ditch systems from the South Fork of the Stanislaus River to the treatment plant is over 15 miles and passes through many dozens of private properties, with septic systems, as well as public and private timber lands. The probability of protecting the water quality without piping the entire system is extremely low. A project that would include piping the ditches would be cost prohibitive and an extreme CEQA challenge. The cost for new or additional membrane filter and ozone equipment is greater than UV equipment and up-flow clarification unit. The most economical and expedient way to address the increased disinfection requirements of LT2 will be the installation of UV units. The most economical and expedient way to address the deteriorating Willow Spring treatment plant is to replace it with a second unit at Monte Grande. There is adequate space and power on the treatment plant site	I	0	C	The Monte Grande water treatment plant serves approximately 538 customers in the Monte Grande, Soulsbyville and Curtis Creek areas of Tuolumne County. The treatment plant source water originates in the South Fork of the Stanislaus River and is conveyed to the treatment plant though PG&E's and Tuolumne Utilities District ditch systems. The District has recently started testing for giardia and cryptosporidium in its ditches. Giardia has been found in all of the District's ditch water and cryptosporidium has been detected in the source water for the Monte Grande water treatment plant. In five months of sampling the level and frequency of the cryptosporidium detection indicates that the Monte Grande treatment plant will be in bin four for compliance with EPA LT2. Test indicate levels as high as 38 ocysts per sample. The same ditch that is the source water for the Monte Grande plant is the source water for the Willow Springs plant which also has reduce treatment capacity due to equipment failures. The Willow Springs plant has been given DPH permission, in the past, to exceed rated filter capacity in order to meet customer demand. The Willow Springs plant would be retired by the expansion of the Monte Grande treatment plant thus removing the need for future requests to overdrive the filters or funds to make plant improvements to meet LT2.	1,805,000	73	550 11	Tuolumne	III	2009
743	3810001	3810001-073	San Francisco Regional Water System	Surface water treatment plant improvements	Design and construct ozone facilities for the Hetch Hetchy supply.	I	0	C	HH supply may not meet the new DB Rules for Crypto inactivation.	1,205,000	200	600 04	San Francisco	II	1998
744	3810001	3810001-173	San Francisco Regional Water System	Tesla Advanced Disinfection and Chemical Treatment Facility	SFPUC's unfiltered Hetch Hetchy (HH) water supply is currently pH-adjusted using lime for corrosion control and disinfected using sodium hypochlorite to provide at least 3-log Giardia and 4-log virus inactivation. The sodium hypochlorite disinfection occurs at the Tesla Portal site. In addition to these disinfection requirements, the LT2ESWTR requires unfiltered supplies to achieve at least 2-logs of Cryptosporidium inactivation. Additionally, the combined disinfection requirements for Giardia, viruses, and Cryptosporidium must be obtained using two different disinfectants and each disinfectant, by itself, must completely meet at least one of the disinfection requirements. The SFPUC completed a Conceptual Engineering Report (CER) that recommended installing ultraviolet (UV) disinfection for the HH water supply. Additionally, a Chemical Systems CER and a pH Alternative Analysis Report recommended installing carbon dioxide for pH adjustment. The proposed project calls for construction of a new 315-MGD treatment facility utilizing UV disinfection and a new chemical feed facility (sodium hypochlorite, carbon dioxide, and hydrofluosilicic acid) at the existing Tesla Portal site. The project will also include final design and construction of connections to existing pipelines upstream and downstream of the proposed UV treatment facility and a new operations building. A separate building/enclosure will house chemical storage	I	0	C	Although the San Francisco Regional Water System has about 600 retail customers, it is a wholesale water system that serves a total of 2.4 million customers in the counties of Alameda, San Mateo, Santa Clara, and San Francisco.Under the Long Term 2 Enhanced Surface Water Treatment Rule (LT2ESWTR), the SFPUC must construct new advanced disinfection facilities for its unfiltered Hetch Hetchy supply in order to inactivate Cryptosporidium. Compliance with the LT2ESWTR Cryptosporidium inactivation is required by March 31, 2012. The SFPUC will also be improving the reliability of chemical disinfection (sodium hypochlorite), corrosion control, and fluoridation facilities. The advanced and chemical feed disinfection facilities are currently ranked I and K, respecitvely, on the 2008 updated SRF Project Priority List.The SFPUC is requesting a grant of $20 million for this project.	20,000,000	200	600 04	San Francisco	II	2009

745	2110005	2110005-006	Bolinas Community PUD	Planning & Feasibility Study: Upgrade BCPUD Water Distribution System	The planning and feasiblity study will consist of a comprehensive engineering analysis of the BCPUD's water distribution system to identify, plan and prioritize system-wide improvement projects. This analysis will include, but not be limited to, a scrutiny of the district's numerous dead-ends and evaluation of possible inter-ties, among other things, to facilitate the district's implementation of a comprehensive flushing program to reduce present chlorine disinfection byproduct exceedences below the federal and state MCLs. The analysis also will include the development of a prioritized schedule for pipeline and fire hydrant replacement (with specific projects planned and described) with the goal of significantly reducing the system's chronic leaks and unaccounted-for water losses. The study will include all necessary environmental documentation for the identified system improvements.	I	0	C	The BCPUD water distribution system is a gravity-fed, piecemeal system assembled over the last 80 years. The present district was formed in 1967 via the consolidation of two formerly-existing utility districts that each served different sections of the community. The distribution system has two pressure zonea, one serving the Mesa area and other serving the downtown and Gospel Flats areas; there are four pressure regulators, each of which is in need of replacement. There are approximately 3,500 linear feet of distribution piping under paved roads and approximately 16,000 linear feet of piping under unpaved roads. The system consists of a mixture of AC, steel and PVC piping of different dimensions; as a result of the age and condition of these pipes, the district regularly experiences significant leaks and has an annual unaccounted-for water loss of more than 10%. Similarly, many of the approximately 80 fire hydrants on the system are nearly 50 years old, are leaking, and are in need of replacement. The distribution system has numerous dead-ends due to the fact that a large portion of the district is located on an ocean-bluff mesa which is eroding at a rate of 1-2 feet per year. Because of the numerous dead-ends on the system and the district's chronic water shortages, the district does not have a regular flushing program; we believe these conditions are contributing to the district's on-going	300,000	587	1,200	18	Marin	II	2007
746	0510005	0510005-004	C.C.W.D., West Point	West Point WTP Filter Compliance Project	Project will add 0.5 million gallons per day of redundant treatment capacity. The treatment process will use a packaged system purchased from a vendor. The District's bid package contains water quality performance requirements and details for connecting to the existing treatment plant. It will be up to the vendor to recommend specific treatment processes and equipment necessary to meet the performance specification, as well as meeting DPH approvals. The Project does not expand capacity nor requires additional land. All construction will be minor and onsite. The project qualifies for a NEPA exclusion and CEQA exemption. The bid package is in draft form and awaiting notification of fund availability for finalization and bid advertising. The District expects a 30-day bid period. Construction would start one month after bid opening.West Point's distribution system requires extensive leak repair and other efforts that use most of the available budget. Grant funding of this filter redundancy project is the only viable funding source at this time to complete the project. CCWD is seeking funding to assist this recognized low-income community with a significant Native American Indian population meet its water system's Health & Safety and Fire Protection needs. Increasing the community's ability to provide a high quality water supply while meeting adopted fire flow standards will increase the potential	I	0	C	The existing WTP consists of a 1.0 mgd Microfloc contact filtration process. The current backup filter is a pressure treated system that does not produce compliant drinking water. When plant filters go down or are offline for maintenance, water exceeds MCLs and District must issue boil water notices. The California DPH issues an out of compliance notice in each annual inspection report due to no backup filter for treatment.	650,000	556	1,400	10	Calaveras	III	2009

In addition, there are a number of filtration monitoring and control improvements to improve reliability, security improvements to bring the facilities into compliance with the Vulnerability Assesment Mitigation Plan, and emergency power improvements for treatment reliability.	500,000	1,577	3,554 01	Trinity	I	2009
750	2810004	2810004-001	St. Helena, City of	Aeration of Tank1 & Tank 2	Install a Pax Mixer @ Tank #1 and Tank #2. This will:Get rid of Thermal Stratification and dead spots within the tanks.Maintain a free Cl2 residual in all of the tank volume of waterImprove DBP results for TTHM & HAA5Save labor, It won't require manipulation to improve water quality.It will increase CL2 in the system.The units themselves are $29,800/unit. The Mixers can be installed by Aqua Tech for $2,850/tank and $2,850 for training. The City of St. Helena can install the conduits and mount the electrical boxes needed for installation	I	0	C	Tank #1 is located @ our Surface Water treatment plant north of St.Helena. It is a 1.4 MG storage reservoir and is used provide storage for the water distribution system and to obtain contact time for chlorine residual. It 1985 it was converted to a top fill. A consultant working on our sanitary survey said that aeration could improve our HAA5 testing results. In 2006, USEPA promulgated the Stage 2 Disinfection By Products Regulation (DBPR). Up to that time the Cities Surface Water Treatment Plant has been able to barely comply with the Stage 1 Disinfection By Products regulations requiring testing of 4 sample sites in the distribution system. Compliance was based on a running average of all the sites and was performed quarterly. The new Stage 2 DBPR regulation compliance is based on a four-quarter running annual average concentration @ each sampling location rather that a system wide running annual average. Also we had to add two sites to the four that were high in HAA5s and high in TTHM. Trending reveals increasing HAA5 and TTHM concentrations. Applying our TTHM and HAA5 data for the last 6.5 years to the DBPR Stage 2 regulations we would be out of compliance @ 5 out of six sites for HAA5s. Tank #2 is a 2.7 MG steel storage reservoir installed in 1993. Do to its size and the fact that it has a combined inlet and outlet makes it difficult to maintain a high enough Free Cl2 residual in the tank. We have	71,000	2,448	6,006 03	Napa	II	2011

751	2810004	2810004-002	St. Helena, City of	Louis Stralla WTP Granular Activated Carbon (GAC) Adsorption Process	The project would replace existing filter media with Granular Activated Carbon.18 “of anthracite coal would be replaced in the two conventional filters @ the Louis Stralla Water Treatment Plant with GAC.Existing filter surface washers would be replaced with an air scour system to ensure adequate cleaning of the GAC.USEPA describes GAC adsorption as the best available technology for DBP control.It is estimated that installing GAC in the filters would provide an additional 20% of TOC removal.	I	0	C	In 2006, USEPA promulgated the Stage 2 Disinfection By Products Regulation (DBPR). Up to that time the Cities Surface Water Treatment Plant has been able to barely comply with the Stage 1 Disinfection By Products regulations requiring testing of 4 sample sites in the distribution system. Compliance was based on a running average of all the sites and was performed quarterly. The new Stage 2 DBPR regulation compliance is based on a four-quarter running annual average concentration @ each sampling location rather that a system wide running annual average. Also we had to add two sites to the four that were high in HAA5s and high in TTHM. Trending reveals increasing HAA5 and TTHM concentrations. Applying our TTHM and HAA5 data for the last 6.5 years to the DBPR Stage 2 regulations we would be out of compliance @ 5 out of six sites for HAA5s.In June 2008 the City had a study performed by West Yost Associates to investigate alternative disinfection byproduct (DBP) control strategies and provide preliminary design criteria, cost estimates, and an implementation plan. As a result of this investigation, WYA recommended that the City retrofit a granular activated carbon (GAC) adsorption process into the Louis Stralla Water Treatment Plant filters rather than installing GAC adsorbers down stream of the filters. The GAC adsorption process will reduce the levels of DBPs in the water supply and help the City to	907,780	2,448	6,006	03	Napa	II	2011
752	1510053	1510053-004	ANTELOPE VALLEY E KERN WTR AGY	AVEK Rosamond Water Treatment Plant DBP Control Project	Modifications to the AVEK's Rosamond Water treatment plant will allow the system to remain in compliance when LRA TTHM regulations come into effect. Ozone disinfection combined with deep bed biologically active GAC filters are expected to help lower current levels of TOC and TTHM levels as much as 20%. In times of more difficult water quality, the GAC in the filters can be changed out frequently to provide better absorbtion of TOC. Filters will be modified with sample taps to allow staff to monitor GAC absorbtion rates and thus the need/frequency to change out the GAC media. Additional chemicals that will be added as part of this change are cautstic soda (for Ph control), calcium thiosulfate (for ozone quenching) and a liquid oxygen system (provide oxygen for onsite generation of ozone). Also included are the tanks and pumps needed for the new chemicals. Structures that are part of this project include a checmical feed building, ozone generator building and an ozone contactor. Disinfection residual will be provided by either free chlorine or chloramines. This project is expected to benefit a population of approx 60,000 people.	I	0	C	AVEK's Surface Water Treatment Plant in Rosamond has had violations of the current TTHM MCL (system averaging) requiring violation notification of AVEK retail purveyors. The water source for the plant is the State Water Project which has high TOC levels especially in times of drought. This combined with current free chlorine disinfection and long residence times in the distribution system will make modifications to the treatment plant necessary in order to be in compliance with upcoming LRA (Local running Average)MCL's for TTHMs.	12,562,600	14	11,548	19	Kern	III	2009

757	3610018	3610018-003	Cucamonga Valley Water District	LWMWTP Surface Water Treatment Facilities Upgrades	The upgrades include construction a 24 inch CML&C raw water main connecting the existing Day & East Canyon surface water main to the LMWTP. The proposed alignment runs approximately 3,150 feet from Etiwanda Avenue to Wilson Avenue to LMWTP and would allow high quality surface water from Day and East Canyon to be blended and treated with MWD water at LMWTPThe upgrades will also include the construction of a UV system to be used to meet primary disinfection requirements of 0.5-log to 2.0-log inactivation of Giardia. The upgrades will also include the construction of two 8 MG finished water reservoirs. Additional required upgrades include basin covers, GAC feed pump station and contactors, and a treated water pump station. The total cost of the required improvements to meet the Stage 2 disinfectants/Disinfection By-Product future rule is $33.5 million.	I	0	C	The Cucamonga Valley Water District (District) will be required to meet the future regulation of Stage 2 disinfectants/Disinfection By-Product (Stage 2 D/DBP) Rule. To continue to be in compliance with current pending and future water quality regulations, the District has planned upgrades to existing District treatment facilities. The District owns and operates three water treatment plants: Lloyd W Michael (LMWTP), Royer-Nesbit (RNWTP) and Arthur H Bridge (ABWTP). LMWTP can treat up to 60 million gallons per day (mgd) and utilizes surface water from the State Water Project (SWP) imported by Metropolitan Water District of Southern California (MWD). RNWTP can treat up to 11.5 mgd and utilizes a mixture of SWP water and flows from local canyons. ABWTP operates solely on high quality surface water which does not include the same operating issues associated with inclusion of SWP water.Based on recommendation provided in the District's "Surface Water Treatment Facilities Master Plan" and to adequately meet the timeframes required to meet the current pending regulations, it is proposed to design build the required upgrades to the LMWTP.	33,500,000	46,667	185,534	13	San Bernardino	V	2009

771	5510007	5510007-003	DEL ORO WATER COMPANY - STRAWBERRY	Strawberry District - Pipeline Replacement Project	The proposed project would entail construction of approximately 20,000 lineal feet of pipeline, which will meet all current and up to date CDPH standards of today.	J	10	C	The existing water distribution piping in the Strawberry District service area is extremely deteriorated. The pipeline was installed many years ago and is in drastic need of replacement as evidenced by multiple leaking points, extensive corrosion, and a unprotected, shallow buried depth.	1,500,000	373	330	11	Tuolumne	III	2009
772	1910153	1910153-003	SOUTH MONTEBELLO IRRIGATION DIST.	Replacement of Wells No. 1 & 2 with New Well No. 8	District wants to destroy two wells that may be influencing our Well 3 and contributing to an Arsenic problem that required us to notified our customers that we exceeded MCL (13ppm- MCL 10ppm) and to adopt a blending plan with our Well 5.We are currently installing a packer in Well 3 to increase our travel time in that well to comply with the CDPH 6 month travel time requirement. District would also like to drill a new well (8) next to our tanks and away from the settling basins (and the influence of recycle water). This would be a new modern well designed to mitigate Arsenic. The well (8) would also meet the six month travel requirement. The district intents ultimately to retired our old wells and replacement with new, modern well out of the settling basin area and this would be a first step toward that. We need the new well to provide redundancy and improve our reliability to fill our tanks with water.This project has been approved by our Board. A CEQUA exemption has been requested, and plans drawn up by our engineers. The new wells will go on land already own by the district. All we need to begin is funding.	J	10	C	Currently, South Montebello Irrigation District is requesting funds to construct a new well to improve water quality and meet federal requirements for Arsenic. Also, California Department of Public Health is requesting the district to submit a long term plan to restore Wells 3 and 5 to provide at least 6 month travel time before the recharged water in the Rio Hondo Spreading ground reaches the wells. In May 2008, on a routine check, the District collected a sample from well 3 that exceeded the revised federal Maximum Contaminant Level for Arsenic and issued a public notification. The district voluntarily blended the water pumped from well 3 with the ground water pumped from well 5. In October 2008, CDPH issued the district a Permit Amendment for Arsenic blending and 4-log virus inactivation treatment at Well 3. This permit allows blending water produced by Well #3 with water produced by Well 5 to reduce the Arsenic level in the water served to the customers. These two wells are the primary source of water supply to our storage thanks. Well 3 is currently down for inspection and service. Inspections findings indicate the well is in need of repairs and new equipment. Well 5 is the main pumping source to the district storage tanks since Well 3 is down. The district is in need of a redundant Well to cover any unexpected emergencies and ultimately to replace wells in the settling basin. This new well will feature better	2,150,000	2,364	7,880	22	Los Angeles	IV	2009

773	1600240	1600240-001	RUBALCAVA WATER SYSTEM	Rubalcava Water System Pipeline	Replace service line from well to commercial and residential users, approx. 350 feet using piping of an approved material. This includes excavation of a trench of sufficient depth to bury the new pipeline, with appropriate connections to the existing users' water intake lines and the wellhead. If possible, install also anti-siphon valve(s) to prevent backflow of any waters to the well tank.	J	10	N	Replace old, leaking 350 foot galvanized iron pipe from wellhead to several users including a residential dwelling house, a restaurant/bar and retail truck parts company. Wellhead has tested positive for coliform bacteria in the past, perhaps from backflow of contaminated water. Violations by Kings County Environmental Health Department have been corrected, so far, by addition of chlorine bleach to water supply. However, this seems to be at best a temporary resolution to the problem.	18,000	5	25	12	Kings	III	2007

777	2100508	2100508-002	MUIR BEACH COMMUNITY	Muir Beach CSD Sunset Way water line replacement	The project will replace approximately 2800 linear feet of existing 4" PVC that serves as the main water distribution line along Sunset Way in Muir Beach.Our initial choice is to use 6" HDPE, as we have used that successfully in other parts of the system that have been upgraded. Estimated replacement costs are $100 per linear foot.The project would entail coordination with roadwork to be done on Sunset Way, as we need to bury the new water line to a depth greater than 30". The project will also entail re-connecting the residential connections to the new line, and installing new shut-off valves at strategic locations.	J	0	C	Current Water Distribution Line along Sunset Way was installed in the 1970s and consists of 4" PVC. At most locations the line is buried to depths of less than 2 feet and in some cases less then 1 foot, and is clearly visible by the side of the road in a ditch also intended for storm drainage.The service line experiences numerous leaks, and with the additional factor there are numerous septic systems in the area, we are very concerned about possible contamination from stagnant water or septic runoff should a backflow condition occur.The projects goal would be to replace the existing line with 6" HDPE and bury the line down to depths of greater than 30".	400,000	148	350	18	Marin	II	2009
778	3110031	3110031-003	Ward Well Water Company	Ward Well School/Residential Well Consolidation	If funding is available, the adjacent mutual water company, Ward Well Water Co., would add these five parcels to their system. Ward Well would run a 6" or 8" main to area and connect the school and residences. This would also result in local fire hydrants.According to Ward Well water Co., the project would consist of running 1,800 feed of main, school and residential hook-ups, fire hydrants and survey, design and permitting. Additional monitoring equipment would be required.	J	0	C	Project would consolidate state small water system that has substandard well source.	425,000	224	375	02	Placer	I	2009
779	4710002	4710002-005	City of Dunsmuir	Dunsmuir Water System Improvement Project-Bush Street Main Replacement	Project components include design and construction. The 1994 Master Water Plan and 2010 draft Preliminary Engineering Report have identified the following problem areaBush Street Water Main $165,000	J	0	C	The City's 1994 Master Water Plan (MWP) investigated supply, storage, distribution, and internal pumping facilities, and recommended immediate, near-term, and long-term improvements. City completed all of the recommended immediate improvements, but none of the near-term improvements. These improvements are now ten years beyond the time in which implementation was originally recommended. As such, many deficiencies, including inadequate system pressures and fire flows, currently pose health and safety risks.The Bush Street water main is located in the same trench, and in some cases below the existing sewer main. When the water main is depressurized during leak repairs, significant public health risks exist.	165,000	1,285	1,923	01	Siskiyou	I	2012

780	0300037	0300037-001	LAKE AMADOR RECREATION AREA	Water quality protection project	Pipe treated water from the Amador Water Agency's Mokelumne River source to this water system. AWA has applied for funding for a project to bring a quality supply of water to the area and wholesale it to existing PWSs.	J	0	C	Source water is from an extremely impaired source strongly influenced by a waste water discharge	1,000,000	73	2,000	10	Amador	III	2000
781	3310036	3310036-004	Western MWD - Murrieta Division	Construct New Well	Design replacement well in new location. Construct new well.	J	0	C	Well located in close proximity to large concentration of septic tanks - increasing nitrate levels.	100,000	2,446	6,305	20	Riverside	V	2004
782	5510001	5510001-007	TUD - Sonora/Jamestown Water System	Sonora Water Quality Improvement Program	TUD proposes to replace one thousand (1000) water service laterals ranging in pipe size from 3/4 inch to 6 inch. The service lines would be replaced from the District main to the customer's property line. The District will then implement a private water service line replacement program to encourage property owners to replace, at their expense, the water service line from the District's meter to the residence or business. Blow offs and hydrants will be added to the TUD system at intervals and distrances to allow for adeqaute system flushing.	J	0	C	Water delivered in the business core of the City of Sonora and surrounding residential areas is constantly plagued with terrible taste, odor and color casued by rusty pipes, high iron and manganese and breakthrough of iron and manganese films. There are over 230 dead ends in the Sonora system with very few blow offs or fire hydrants to allow for adequate flushing of the system. The level of disinfection byproducts in the Sonora system is increasing to levels near violation due to the high degree of sediment and organics and the lack of flushing capability. Customer complaints of colored, smelly or dirty water caused by 100 year old service lines average between 150 and 200 per year. Service line failure is occuring on a regular basis, causing widespread service outages and potential backflow conditions from leaky water service lines in the same trench as sewer service laterals.	1,500,000	4,342	10,294	11	Tuolumne	III	2007
783	0410011	0410011-004	Del Oro Water Co.-Paradise Pines	Del Oro Water Company - Paradise Pines District - Replacement Pipeline Project	The existing mainline pipe will be abandoned and approximately 5,000 feet of 8" pipe will be installed as a replacement in conformance to all applicable standards and within public right-of-way.	J	0	C	The existing mainline piping that serves the Paradise Pines District has shown a marked deterioratoin over the last several years due to the increasing age of the mainline. The system has experienced several catastrophic cracking failures along portions of the pipe which has caused substantial flooding. The existing mainline pipe does not conform to AWWA standards, and is not NSF 61 rated. Since the pipe was installed many years before the region had developed, residential homes have been built above of the piping and a large sewage leechfield exists over a long section of the pipe.	750,000	4,752	11,405	21	Butte	I	2009

790	1206002	1206002-002	Palomino Estates M.W.C.	Water Quality Monitoring Equipment Project	The project will install a Surface Water Treatment Plant Monitoring and Recording System in accordance with CDHS Drinking Water Department requirements. The system will include the following:a) Influent turbidity monitoring and recordingb) Effluent turbidity monitoring and recordingc) Effluent chlorine residual monitoring and recordingd) Effluent pH residual monitoring and recordinge) Effulent temperature residual monitoring and recordingf) Filter effluent flow monitoring and recordingg) High quality industrial grade equipment and materialsi) Minimize waste volume and maintenancePERFORMANCEA surface water treatment plant monitoring and recording system shall be provided to monitor and record the raw water turbidity, treated water turbidity, pH, temperature, and free chlorine residual and record the parameters for the assimilation into state reports. In addition the system will be capable of storing at least 5 years of raw data and reports.The new system will enable the water company to meet the CDPH monitoring and reporting standards.	K	25	C	The Palomino Estates Water Company currently has no automatic monitoring equipment. Chlorine levels and turbidity are monitored manually on a daily basis. The water system operates disinfection facilities but lacks reliability features, alarms, constant chlorine residual and turbidity analyzers. These deficiencies result in non-compliance with drinking water standards.	47,800	19	64	01	Humboldt	I	2009
791	5200504	5200504-004	City of Tehama	City of Tehama Water System Monitoring and Control	We have had our system analyzed to see what equipment would need to be installed to allow off site monitoring and control. Equipment would be added to allow offsite monitoring of: water level, pump flow, system pressure, power, chlorine residual, communication betwwen the two wells, HOA switch position, generator including battery voltage, fault, and transfer switch position. Equipment to be installed at the two sites would be: 30' poles with antennas, cables, conduit, control panels, door sensors, chlorine sheds with concrete pads, 120V receptacles for chlorine pumps, ventilation fans for chlorine shed, pressure transducers, well level transducers, 4-20mV output for existing flow meters, Stenner Chlorine Pumps and Hach Chlorine Analyzer. This equipment would allow our current operator or an off site operator to continually monitor our wells and water. This would provide a labor savings by reducing or eliminating man-hour trips to the well sites for inspection and routine maintenance visits. It would allow water quality security by monitoring the water system and alarms on any change in operator-assigned conditions. It will allow chlorine monitoring in real time with adjustments to be made by internet. The chlorine system would automatically shut down in event of catastrophic chlorine levels. All equipment connected to the system can be operated remotely, i.e. pumps, valves, injection, tank levels, and	K	25	C	With limited staff and funds, we need to have the ability for more constant surveillance over our water system. Currently, it is too labor intensive and expensive for our small system to monitor our two wells on a daily basis. Our little city floods on a regular basis. When flooding occurs, we are not able to access the wells withour wading through waist high water which is sometimes quite swift and a real safety issue. We need to be able to monitor and make chlorine adjustments without physical presence. There have been times when one of our wells has shut down without our knowing about it until checking the well site physically. We need to be able to monitor both well sites without having to physically be present at the sites. It is important to be able to monitor the power coming to the well sites. PG&E power has fluctuated at our pump stations, with the spikes causing damage and causing the pumps and controls to go down. We have been told that it has probably shortened the life of our equipment. As we had no historical record of the power input, we could not bill the utility for repairs. Our water operator is 71 years old with no one else in line. We need to be able to install equipment that would allow the system to be monitored from anywhere with an internet connection so that we could have someone from another nearby water system oversee our system if and when necessary. We have MOU's with two nearby small	78,200	192	435	21	Tehama	I	2009

798	1810001	1810001-001	City of Susanville	Bagwell Springs Chlorine System Upgrade	To install a power line to Bagwell Springs so the high pressure gas chlorination system can be replaced by a gas chlorination system operated under vaccum. Installing power is required to run a vaccum pump due to the pipeline not having sufficient pressure to produce a vaccum to run a vaccum feed system. The power supply will also allow the installation of scada, leak detection equipment and monitoring systems on site.	K	15	C	To upgrade the Bagwell Springs pressurized chlorination system to a gas chlorination system operated under vacuum and install safety detection equipment on site. Annual DHS inspection report deficiency item number 2 dated December 5, 2006	75,000	3,599	9,137	02	Lassen	I	2007
799	1010027	1010027-002	REEDLEY, CITY OF	Domestic Water Well Chlorine Residual Analyzers	This project will purchase and install a Chlorine Residual Analyzer at each of the City's 8 domestic water wells and two new 1.5 million gallon water towers and install a Supervisory Control and Data Acquisition (SCADA) system to monitor and control the disifection of the City's water distribution system. The SCADA system will be able to monitor the wells at all times and provide the City Staff with alarms if and when the residual chlorine in the system is outside acceptable parameters. The SCADA system will also provide City staff the ability to react to such fluctuations in the residual chlorine in the system and adjust the injection rate remotely from one central location. These improvements to the City's water system will proivide for better monitoring and control of the chlorine injected into the system, producing a much more consistent level of disinfection and reducing costs to the City for chlorine. This project will provide for a much more efficient control of the City's water distribution system and a better quality product being delivered to the residences, schools, businesses and industries that utilize City water.	K	15	C	Currently the City has no Chlorine Residual Analyzers for any of the City's wells. The City, in accordance with State requirements, the City tests each well on a weekly basis. This is insufficient control of the water system disinfection for a delivery system that produces and delivers 1.959 billion gallons of water per year with peak flows of 266 million gallons per month (in September) to a minimum flow of 94 million gallons in (January).	845,000	6,619	25,584	11	Fresno	III	2009
800	5101007	5101007-001	Country Village North MHP	Country Village North MHP - Well replacement	Two approaches are possible:1. Deepen the existing well from about 80 ft and provide casing to a different aquifer (est. to be at 120 ft) or,2. Drill a new well aprox 120 ft deep, in close proximity to the existing one.The costs would be associated with the drilling, testing and reconnecting the 7 1/2 HP submersible pump to the pressure tank.	K	10	C	The current well is about 80 ft deep. Since the early 1990's, usually once a year, a water test comes back showing total coliform present. Follow up test come back as absent. As a precaution I Chlorinate the system. I would drill another well to a deeper aquifer and negate the reason for Chlorination. Based on other wells in this area I estimate the depth would be at the 120 level .	50,000	18	34	21	Sutter	I	2009

801	1200518	1200518-001	Riverside CSD	Riverside CSD Reliabiity Project	Green Non CEQA projects:Continue replacement of meters (75 still need to be replaced)Install 4 main line meters to help with leak detection Purchase Leak Detection Monitoring Equipment Remove and Replace Existing Generator and Gas Tank with Propane Standby Three Phase generator. This includes new pad for propane tank and a propane tank. Purchase safety equipment so that operators can enter confined spaces without risk to person. This includes items such as 4 gas detection meter and calibration tools, tripod lifeliine systems, full body harness, respiratorsblower and hose , gas portable to be used at remote site etc.System update . Remove obsolete Lookout program (SCADA) and replace with new Clear Scada and Telepace telemetry upgrades. Upgrade server to be able to accept these upgrades and allow for two users . Allow for Internet Explorer interface to page operator when low levels or power outage occurs. Allow for use with Emergency Notification Plan in the event of a State Water Emergency. Relocate chlorination device from inside source well room to a lean too addition outside main pump house. Presently we are exposing SCADA wiring to chemical fumes which is disintegrating system and will eventually corrupt electronics. Move all corrosive and flammable storage from pump house to lean too building attached to pump house. This requires new construction.Purchase corrosive and	K	10	C	Riverside CSD problem is reliability. Lack of reliability exists at many levels. Software, Potential contamination of system due to lack of back flow device instillation(s) outdated meters, lack of safety equipment to allow operator(s) access for repair(s) in confined spaces, high manganese levels with our back up well. (#6) and lack of leak detection equipment to find problems. Potential for erosion of SCADA system due to fumes from location of clorniator system. And finally a obsolete WWII surplus generator that at best has seen it's last days that needs to be replaced with one that is below the Haz Mat County Requirements for storage and one that will provide on demand power to run our source wells and equipment when power is off, which in Humboldt County happens frequently. One half of our requested amount would be considered NON CEQA - GREEN PROJECTS, The other half 95,000.00 is the cost to install a Green Sand Manganese Filtration system and purchase the land to put the system on. The CEQA impact of this would be minimal and could be completed, in our opinion within the time perimeters of the awards.Our current emergency paging software (Lookout) is obsolete. Support has been outsourced to China via e mail only. Not an acceptable situation as e mail response is is not guaranteed in a timely manner. Frequently it is our customers who tell us there is no water. Due to low water levels or pressure levels we	242,000	98	293	01	Humboldt	I	2009
802	3610009	3610009-004	BIGHORN - DESERT VIEW WATER AGENCY	Chlorination Facilities Reliability Project	Upgrade chlorination system components including dispensing equipment, monitoring and recording devices as well as climate and security control apparatus for increased reliability.	K	10	C	The disinfection facilities at the agency are deficient in the following ways: No SCADA to monitor residuals, intrusions, or runaway conditions, all chlorination equipment 100% manually operated with once a day, limited supervision, handheld monitoring equipment upgrades warranted, facility enclosures are primitive providing less than adequate storage temperatures (temp. variation enclosures >115 F to 20 F), security to chlorination equipment, staff continuing education on Preventative Maintenance. In addition, three production wells are not equipped with discharge to waste valves and piping which also decreases efficiency of the chlorination system and therefore posses risk to system contamination.	100,000	1,903	5,000	13	San Bernardino	V	2009
803	1910079	1910079-006	LYNWOOD-CITY, WATER DEPT.	Emergency Potable Chlorination System	Project :Purchase a trailer mounted emergency chlorination system for as needed chlorination of sections of the water system.	K	10	C	Existing Condition:The City of Lynwood Water System has presently six operating water wells, a two million gallon capacity concrete subterranean storage reservoir with a booster pump station and one MWD water supply connection. Each of the well sources and the booster pump station have used gas chlorine for disinfection of the water supplies pumped. The chlorination systems have all been recently been changed over to use liquid chlorine. The State Public Health Services Department has advised the City operators, the Utility Services Division, that the water system was of a size 10,000 plus connections in a City of 65,000 persons, that the Division should have an emergency chlorination trailer that could be put into service in an emergency for localized chlorination of sections of the water system as needed to comply with the requirements of the Health Department. No public notification is required.	90,750	9,035	73,212	22	Los Angeles	IV	2009

804	1900007	1900007-004	CALIFORNIA CONSERVATION CAMP # 14	Provide new chlorination system and secured structure to protect system	Install new chlorination system and secured building to protect the system.	K	10	P	A Boil Water Order was issued on October 8, 2008 due to positive testing for both total coliform and fecal coliform. The chlorination system on the site should be replaced with a modern system. Well is in close proximity to the San Francisquito Creek and to the septic tank and leach lines.	150,000	1	95	16	Los Angeles	IV	2009
805	1900901	1900901-003	FIRE SUPPRESSION CAMP 19	Add chlorination system and secured structure	Design and install a chlorination system to be housed in a concrete, secured shed. 807	5000277	5000277-001	VALLEY HOME SCHOOL PIONEER	Disinfection enhancement	We isolated the north well from the potable water conveyance system by shutting it off and disconnecting it from the water storage tank. We were required to trench in a new 2 1/2" water line last May. This temporarily solved the problem, but we will have to reconfigure our piping schematics, put in more back-flow prevention devices, and possibly a new separate storage tank for the north well, so as to create enough pressure to be able to adequately water the school grounds while not contaminating the school site's potable water system.	K	5	P	During the past year we were found to be in violation of the California Domestic Water Quality Monitoring Regulations by testing positive for coliform bacteria. We currently have two wells in close proximity to one another which feed into one storage tank which, in turn, serves the entire school site its potable water. We were ordered to shut these wells down and use bottled water only until the source of the contamination was found. With the help of an outside service vendor the north well seemed to be the source of the continual contamination problem. We also had to have our food service individually wrap each lunch serving for the students and staff as well as bringing in hot water for cleaning after each meal service until the contamination was completely cleared from the system. Title 22, California Code of Regulations 64426.0 & 64426.1	10,000	1	26	10	Stanislaus	III	2007
808	1502317	1502317-001	KERN CO P&R-GREENHORN MT. PARK WATE	Disinfection enhancement	REPLACE 2,000' OF PIPELINE. DRILL A NEW WELL	K	5	N	NEEDS RELIABLE DISINFECTION EQUIPTMENT. 811	2701278	2701278-005	RANCHO CHAPARRAL MWC	Distribution Line Replacement/ System Under Influence of Surface Water	The project is to replace two miles of supply and distribution lines. The supply line is 2" in diameter and one mile long having an elevation gain of 900 feet. The replacement will be schedule 40 steel and withstand 500 lbs of pressure at the well head. The four returning distribution lines of approximately an addtional mile will be 2" diameter and will be of sufficient size to meet miminal requirements of household water systems.	K	0	C	Rancho Chaparral Mutual Water Company is in vioation of the surface treatment rule, CCR, Title 22, Sec. 64652. The lack of a filtration/treatment plant along with aged distribution lines are responsible for this violation. The fires in Big Sur have contributed to increased contamination of Big Sur River source water revealing as much as a probable 256 count of e-coli. The system is currenty has a letter of commitment for Propositiion 50 funds (project number P50-2701278-081) to build a treament plant and replace rusting buried water tanks. The grant does not include replacement of approximate two miles of 40 year old rusting and leaking supply and distribution lines. The system is now injecting chlorine for disinfection and in so doing has uncovered difficulty in maintaining a consistent residual chlorine level due to the large amount of rust in the piping. The overall success of treatment is also threatened by the increasing holes in the lines that can allow contamination to occur when water pressure is lost during power outtages which plague Big Sur in winter months. In addition, although we are not classified as a "Disadvantaged Community" a closer look shows much difficulty in raising monies for this project due to the fact that eight of the sixteen members have incomes below the medium household income.	295,000	17	48 05	Monterey	II	2009
812	1900599	1900599-001	VALHALLA WATER ASSOCIATION	Pumphouse Upgrade with Automatic Disinfection & Monitoring	This project will upgrade the top of the well casing so that it rises 18"above the well-head slab, and upgrade the well-head seal to form an impenetrable barrier to water that might otherwise seap from the well-head slab into the well casing.The Pump house will be expanded to include an additional 30 square feet of floor space to accommodate a 30-gallon tank and injection-pump assembly for direct injection of sodium hypochlorite solution into the water stream flowing from the well pump to the distribution storage tanks. The assembly will include a continuous chlorine analyzer and control module to moderate the injection pump for achievement of a specific residual chlorine level.	K	0	C	Since August of 2009, the primary well has tested positive for coliforms on a consistent basis. The system was placed in a DO NOT DRINK status in December of 2009. In April of 2010, the water tested positive for fecal coliforms as well as high Nitrate (as N).The coliforms are most probably caused by aquifer contamination. The source of fecal coliforms was traced to a defective well-head seal which allowed rinse water to seap into the well. The source of the high Nitrate (as N), measured over 2100 ppm, is believed to be from additional contamination of the aquifer during the heavy rains of January and February 2010. These nitrate levels have significantly decreased as of August 2010.The well has never been set up for routine disinfection, and this has been a concern for several years, even before these latest water test results which violate the Safe Drinking Water Act at several points.	40,000	17	48 16	Los Angeles	IV	2011
813	3900558	3900558-001	RANCHO SAN JOAQUIN WATER SYS	Disinfection reliability	DRILL NEW WELL. INTERCONNECT WELL 1 WITH WELL 2 PRESSURE TANK AND INSTALL AUXILIARY POWER. 814	4900630	4900630-003	Austin Creek Mutual (Springhill)	4-Log Virus Inactivation System for Back Up Well	Installation of a 4-log virus inactivation system. Installation of 60 feet of 10" PVC pipe doubled back on itself in a serpentine fashion between the well and the pump house to provide adequate contact time for the chlorine and water. The contrator will lay the pipe on compacted base and bury it to avoid trenching the area. For automatic monitoring of chlorine residual, the contractor will install an automatic chlorine residual analyzer and related devices to shut off the well and summon the water operator if the residual drops too low or rises too high. The automatic residual analyzer will require a dedicated phone line.	K	0	C	Current well 01(state ID # 4900630-001) was drilled in 1959. Back Up well 02(state ID # 4900630-004) was drilled in June 2008. The Back Up well was drilled in preparation for the time when the current well will no longer be functional. The California Department of Public Health has advised Austin Creek Mutual Water Company-Springhill that we must install a 4-log virus inactivation system before we can use the Back Up well. The reasons for the extra monitoring are: 1. The Back Up well is only 30 feet deep with a 10 feet sanitary seal. California Well Standards specify a minimum 50 feet annular seal.2. Raw well bacteriological samples show Total Coliform results ranging from <1.0 to 26.5 MPN and E. coli from <1 to 1 MPN.3. The Microscopic Particulate Analysis showed low levels of plant pollen and rotifers.The Back Up well is Inactive and the Permit Application process for the Back Up well is incomplete. We are not authorized to use the Back Up well until the 4-log virus inactivation system has been installed and approved.	10,000	61	150	18	Sonoma	II	2011

819	5610005	5610005-002	MEINERS OAKS CWD	SWTP Monitoring and SCADA Alarm system	The project will include building a new 10 ft by 15 ft building on a concrete pad adjacent to the SWTP. The flooded SCADA equipment will be rehabilitated to include monitoring the alarms for the system; alarms for high and low chlorine levels and turbidity notification interface; tank level and low pressure alarm to provide early warning of system pumping or distribution failure. The TU and Chlorine monitoring and recording equipment will be upgraded to unclude chart recorder and data logger with software, and secured in the new building.	K	0	C	The monitoring station and SCADA equipment alarm system is currently located near the SWTP in a temporary large freight shipping container. The equipment is inoperable due to flooding of the container. The system needs a permanent secure building to house a rehabilitated SCADA system, Turbidity and Chlorine monitoring and recording equipment.	150,000	1,283	4,000	06	Ventura	IV	2007
820	5010009	5010009-001	Keyes Community Services Dist.	Disinfection Upgrade	REPLACE WITH ON SITE CHLORINE GENERATORS. OTHER = DESIGN AND CONSTRUCTION.	K	0	C	REPLACE HYPOCHLORITE FEED PUMPS PURCHASED FOR OCCASIONAL, NOT FULL TIME, USE.	80,000	1,472	4,575	10	Stanislaus	III	2006

821	4910027	4910027-004	Sonoma State University	Domestic Water Chlorination System	Removal of the existing T2 Chlorinator (approx. 10 years in age) from the potable water control building located within the Corporation Yard including HAZMAT disposal. Install 50 feet of new 1" CPVC piping and fittings for new system requirements, upgrade electrical power supply from 110VAC to 220VAC, install new sensors to existing Allen-Bradley monitoring system which will allow monitoring of water condition including chorlination and total dissolved solids and alarm reporting to Police and Plant Operations with automatic shutdown in the event of chlorination system failure.	K	0	C	The Unviersity relies on self operated, owned and maintained well water for the campus. The current chlorination system is no longer supported by the manufacturer and replacement parts are not available. If the system was to fail, the University would shut down and the on-campus residents would have to be relocated. Violations would be not providing proper water disinfection and most likely violation of California Code of Regulations Title 22 Sections 66-4421-64426.5.	100,000	1,100	6,000	18	Sonoma	II	2008
822	4910027	4910027-005	Sonoma State University	Ultraviolet Purification Water Treatment System	The campus is proposing to install a Barrier SUN Series System, SUN8E-HO Type 304. The project includes pouring of concrete slab at Well No. 2A which will , installation of 8' chain link fence approximately 20' x 30', install electrical 208VAC 3-phase power. Intercept existing pipe from the well, install new UV light system, install monitoring and alarm system, install water piping to the existing system and lab testing, etc. This system would provide the necessary sanitizing of the water s well as the redudency and auto shutdown to prevent system contamination in the event the UV system failed.	K	0	C	The existing well water from Wells No. 2A is consistently positive for total coliform since development. Due to the contamination, the water supply cannot be used for potable water which places the campus at risk if one of the other wells should become contaminated or otherwise fails. The system would treat the water before entering the existing domestic water system. The Office of Drinking water has verbally approved this approach assuking the coliform does not clear. The well shaft has been sanitized multiple times and heavily flushed to attempt to clear without success. Non compliance in this area violates California Code of regulations Title 22 Section 64421-64426.5.	110,000	1,100	6,000	18	Sonoma	II	2008

825	1010023	1010023-003	ORANGE COVE CITY OF	Orange Cove SWTP Expansion and Storage Improvements	As discussed in the Problem Description section of this DPH Pre-Application The three primary issues to be addressed per this request are: Issue 1:1. The existing SWTP does not have sufficient redundancy capacity to reliably provide potable water in case of filtration equipment failure and maintenance and also meet current population growth demands. Issue 2:2. The SWTP disinfection facilities do not meet current safety standards and equipment throughout the plant shows clear signs of aging. Issue 3:3. Problem with leakage of the 140 acre feet SWTP off canal storage ponds creates a danger of water shortage during times of Friant Canal Authority canal maintenance and dewatering. The Canal Authority is the primary supplier of potable water to the community. The City does not have any back up well capacity. The City has been directed by the CA Dept. of Public Health (DPH) to address how the City will meet its growing demands for potable water. The Kennedy Jenks Facilities Concept Study (May 2007) provides the following recommendations to address the Issues #1 and #2 above. A copy of the Facilities Concept Study (May 2007) is on record with the Fresno office of DPH. RECOMMENDATIONS:1. Installation of 2,100 gpm additional filtration capacity in the location of demolished sludge beds.2. Installation of intake pumping and chemical storage and feed capacity for an additional 2,100 gpm filtration capacity.3. Install two	K	0	C	The City of Orange Cove (OC) is ranked among the 5 poorest communities in California. Per the 2000 Census, City MHI is $22,357, 44% of the population lives below the poverty level; with a 25% unemployment rate. OC is an extraordinarily poor community. The OC Surface Water Treatment Plant (SWTP) has a current capacity of 2,100 gpm or 3,000,000 gpd. It was installed in 1974 and completed in 1996. The City has experienced rapid growth and now reflects a 10,000 population. Thus, current water demand often surpasses the available treatment capacity. The OC SWTP requires additional redundant treatment capacity, to address the City's increasing demands. Should elements of the current treatment process fall out of service, due to maintenance or failure, the City's water supply is threatened. In addition, outdated SWTP chemical storage and feed equipment has the potential to create a safety hazard; and filtration and pumping facilities require significant maintenance. The existing gas chlorine system does not include provisions for leaks or chemical spill containment. Modification of the SWTP facilities is necessary in order to supply reliable potable water to the community. The primary required modifications deal with the capacity of filtration system. Currently, two different conventional treatment trains provide a maximum of 2,100 gpm of treated water, which is no longer sufficient to meet growing	12,500,000	1,503	8,500	11	Fresno	III	2009

Remove (1) existing and install (2) new caustic soda storage tanks, pumps, and piping.6. Remove existing polymer feed equipment and install new polymer solution mixing, storage, and feed systems.7. Construct containment for all new storage tanks.8. Miscellaneous structural, valve,	K	0	C	CCWD operates two water treatment plants, the Nunes WTP, completed in 1982 and expanded in 1994 and the Denniston WTP, completed in 1972. Both plants need significant updates to chemical storage, feed and control systems in order to ensure safety, compliance and reliability. The need for improvements is underscored by three incidents of water quality violations in recent years: a chlorination requirements violation at Nunes in 2005 and turbidity (2006) and chlorination violations (2008) at Denniston. The scope of the plant improvements plan is based on a 2006 Camp Dresser & McKee study which included regulatory compliance evaluation and plant operations assessment: 1.) Need to replace chlorine gas with liquid hypochlorite for disinfection in order to comply with California Accidental Release Program and San Mateo County Environmental Health Services Division requirements.2.)Need to replace chemical storage and feed systems to meet health, safety, and environmental requirements, improve plant reliability.3.) Need to configure Denniston WTP for automated shutdown and automated filter-to-waste in order to ensure water entering the distribution system meets standards at all times. Lack of such control resulted in water quality violations in 2006 and 2008.4.) Need to upgrade process monitoring and control systems at both plants for improved reliability.	3,200,000	6,893	16,900	17	San Mateo	II	2009

834	1910067	1910067-036	LOS ANGELES-CITY, DEPT. OF WATER & POW	LAAFP - UV Project	The LAAFP Disinfection Contact Tank is a rectangular 9.5 million-gallon partially buried concrete tank designed to provide the required contact time for disinfection of the LAAFP flows using free chlorine. The tank will be an approximate 300 ft. by 150 ft. with sufficient baffling to create a 5 pass configuration. Approximately 800 ft, of 144-inch diameter reinforced concrete pipe will connect the tank to the LAAFP outlet line and the distribution system. Chlorine injection points will be located both upstream and downstream of the tank.The contact tank will provide the necessary time to achieve disinfection compliance for nearly all of the possible flow scenarios through LAAFP using free chlorine prior to the injection of ammonia to form the chloramines. In an extreme case, such as the filter plant operation at maximum capacity with cold water, then an operational change will be required in addition to the contact tank.	K	0	C	Currently, the disinfection requirement is typically achieved at the Los Angeles Aqueduct Filtration Plant with ozone treatment. When the ozone system is out of service, chlorine is used to meet the requirement. The Department of Water and Power is planning to convert to a chloramine residual disinfectant to reduce disinfection byproducts and comply with the Stage 2 Disinfectant/ Disinfection Byproducts Rule. Following the chloramine conversion, when the ozone system is out of service there would be times when the contact time requirements will no longer be achievable prior to the water reaching the first customer.	50,589,181	686,422	4,071,873	15	Los Angeles	IV	2009

841	1010035	1010035-003	DEL REY COMMUNITY SERV DIST	New Municipal Well No.8	The project would be constructed in two phases:Phase 1: Drilling of a 6-inch-diamater test well to a depth of approximately 700 feet in northwest Del Rey by the casing hammer method of drilling. The test well would provide water quality and quantity information to be used for the design of the production well.Phase 2: This phase would include the drilling and equipping of the production well. The production well would be constructed to produce a minimum of 1,500 gallons per minute. The 16-inch-diamater production well would be drilled to approximately 500 feet deep and sealed with gravel pack and annular cement. The well would be equiped with a vertical turbine pump and motor, discharge piping, chlorination and electrical equipment within a secured enclosure (building), a hydropneumatic tank, an emergency standby generator, and other related site devellopment improvements. A 10-inch-diameter pipeline would be constructed for approximately 1,500 feet to connect the new well to the distribution system.	L	25	C	The Del Rey Community Services District (District) currently operates a water system that is supplied by three active groundwater wells (Well 4, 6, & 7) and two standby wells (Well 3 & 5). However, only Wells 6 and 7 are reliable drinking water sources since Well 4 can only be used intermittently due to recurrent bacteriologic contamination events and due its close vicinity to a previously contaminated site. Wells 3 & 5 produce water with DBCP and Uranium above maximum contaminant levels. Past water quality sampling results for Well 4 showed positive for total coliform for two consecutive testing cycles on April 07 and June 07. The well has since been maintained to prevent this bacteriologic contamination but is still prone to such conditions as the well is not adequately equipped to follow appropriate flushing procedures. Also, District is afraid to use this Well 4 on a regular basis due to concerns of drawing down the groundwater levels in this area near an abandoned lead battery recycling site in southeast Del Rey. The site has been mitigated by the owner as required by the RWQCB but there are still concerns with regards to possible contaminants. The three active wells are the District's only water sources to meet the community's drinking water supply, fire flow and emergency needs. Only Well 7 is equipped with a backup generator to supply the community in case of power outages (very common in summer	1,140,000	402	1,100	11	Fresno	III	2009

851	1700695	1700695-001	High Valley Ranch	High Valley Ranch Well Replacement and treatment plant expansion	Development of a second water source well at 250-500 feet will provide high quality aquifer water with adequate quanity for drinking and eliminate iron and coli contamination. Instalation of 4,000 feet of new lines will replace oudated and inadequate distribution lines, stop line breakage, leaks and contamination from outside sources. A package water treatment unit will enable us to provide safe drinking water, moniter quality and meet the requirements of the Safe Water Drinking Act. Instalation of a 150,000 gallon storage tank and replacement of exististing tank will reduce the risk of contamination. A flow meter will moniter the water supply. Developing a secondary aquifer source well at greater depth will increace water quality and availability. The planned instalation of wind produced turbines will ensure financial solvency for the district and be ecologically beneficial. The water district will be no longer dependent on bottled water, will meet the fire safe water storage requirements and be able to meet DHS regulations.Our project is ready to go June of 2009, greatly needed and includes the following:Installation of Improved monitoring equipmentInstallation of water treatment packageReplacement of distribution lines, totaling 4,000 feetDevelopment of a new water source(well) at depth of 250-500 feet to tap into clean aquifer strataRevitalization of Spillway ariation system to	L	25	N	DHS non-compliance with safe water drinking standards on existing well with surface coli contamination. Water is supplied in volcanic geographical area with high iron content at existing depth, frequent coli contamination on gravity flow system. Non-profit non community water system has inadequate water storage capacity, and deterorating source piping and didtribution lines. A secondary aquifer source should be developed to improve water quality and quanity.Water storage tanks are old and small at 10,000 gallons and should be replaced with 150,000 gallon tank to meet safety requirements and provide adequate clean water. Currently 20 hook-ups require new lines and filtration system replacement. Our treatment facility is outdated and we require a package water treatment facility to meet the mandates of the Safe Water Drinking Act. There is no water available from nearby utilities. We also wish to install wind turbines to lower electrical consumption of pumps. Caqpital resources are limited. Lake County is a rural low income county. In past years there have been no County resources for this project.Lake water lab reports dated 6/00/08- 1/00/09 list frequent cliform bacteria in both raw an TX present. Method MF 9222ABC . Current compliane for the California Code of Regulations are at risk. Bottled water is currently being used for drinking.. Code violation - Bacteriological water sampling failure, high iron content	400,000	10	50	03	Lake	II	2009
852	1500289	1500289-002	ATHAL MUTUAL WATER SYSTEM	Athal Water Supply Project	- Update of Planning and Feasibility study of Treatment and Consolidation options.- District & Community meetings to review Project, financing, support and steps for consolidation.- Project CEQA/NEPA- Design of Project to meet East Niles CSD requirements- Annexation of project area- Project bids- Project construction to upgrade Athal storage, well & distribution system and build a 9/10 mile transmission line to connect to East Niles CSD water system at Doney Street & Weedpatch Highway	L	20	C	Athal's new well has levels of 1,2,3-Trichloropropane in the water supply.This chemical has no MCL but is under consideration for establishment of a Safe Drinking Water Standard & MCL. This community is low-income (2000 US Census Tract 62.01, Block Group 1 with a MHI of $27,465) and needs grant funding to affordably correct their drinking water problems.	1,500,000	62	150	19	Kern	III	2012

854	5400957	5400957-004	WEST GOSHEN MUTUAL WATER CO.	Water Quality & Reliability Improvement Project	The project would initially be a planning/feasibility study. West Goshen has hired engineers to perform cursory studies of their capacity and adequacy of facilities, but they have not been able to afford in-depth analysis of the best solution for their challenges. Consolidation could be an option and it would be analyzed in the course of the feasibility study. Possible alternatives other than consolidation include well rehabilitation and/or drilling a new well, along with an upgrade to the distribution system.	L	20	C	West Goshen is located in northern Tulare County, an area that is well-known for contamination of its groundwater aquifers by nitrates. West Goshen's water has long been in excess of half the MCL for nitrate, and recently its backup well exceeded the MCL for nitrate with 50 parts per million. Their primary well is still below the MCL, at 36ppm, but this number has been climbing. There have also been a number of bacteriological violations for total coliform.It is hoped that one or both wells could be rehabilitated to select for the best water available; however, both wells are aging and the primary well has some collapse in its casing. Additionally, capacity in the system is insufficient for fire flow in the existing community and the board of directors has been forced to institute a moratorium on new connections.	750,000	69	200	12	Tulare	III	2012
855	5500125	5500125-005	MOTHER LODE MOBILE ESTATES	Mother Lode Mobile Estates TUD Public Water Connection Project	The project is to supply public water via TUD to the Mobile Home community eliminating the dependency on the current single souce well and improve both wather quality and flow. By implementing this project, we firmly believe that the complaints from our tenants would dramitically reduce and there would not be a need for additional filtration systems at individual mobile sites. It would eliminate the secondary water quality standard concerns with the existing water source in relation to Iron and Manganese, as the TUD supply is treated and disinfected prior to distribution. In summary, because of the size of the population served and other system requirements, the TUD water supply is subject to more rigorous testing and treatment requirements, has a larger reserve in the event of droughts, and a more readily available source. The project entails establishing a connection from TUD to the parks existing water system; re-plumb approximately 2000 lineal feet of transite pipe converting it to PVC and install individual taps at each unit within the park.	L	20	C	We are an 89 space Mobile Home community, of which 74 spaces draw their water from a single source well. The water is contained in a 2000 gal pressure tank and distributed out to the tenatns. As documented in our 2011 Consumer Confidence Report, we were found in violation of secondary drinking water standards for Iron and Manganese. In order to secure a waiver for future monitoring for these constituents, we performed a survey of the residents asking if they were willing to pay for iron and manganese reduction/sequestration treatment or connection to public water by Tuolumne Utilities District (TUD) or whether they prefer to avoid the cost of treatment and live with the current water quality situations. Provided that at least 64% of our residents are at a MHI of =< $31,800, the cost to move to public water or even reduction treatment was not something the tenants could absorb; therefore, they voted to live with the current water quality. Although many of the park renants have installed filters at their individual units to reduce the effects of Iron and Manganese, there continues to be complaints from a few tenants on the smell and color of the water. In addition to the water quality issues, in the event of an emergency, we do not have a secondary hook up to public water. This leaves the park and its tenants vulnerable to water outages and possible contamination during emergency hook-ups, as well as, a substandard	559,462	85	225	11	Tuolumne	III	2012
856	1510004	1510004-001	Casa Loma Water Co, Inc.	Replace high PCE source	Construct new well or connect to California Water Service-Bakersfield	L	20	C	PCE exceeds MCL in one of two system wells. Well is needed to meet demand. Public notification conducted per Compliance Order.	500,000	215	600	12	Kern	III	2002
857	3600270	3600270-001	Golden State Water-Mor Del Norte		Construct treatment facilities	L	20	C	Uranium approaching MCL	150,000	174	870	13	San Bernardino	V	1998

858	1010042	1010042-012	MALAGA COUNTY WATER DISTRICT	Well #8 Construction	The project consists of design and construction of a new well to avoid contaminants and connection to the water distribution system.	L	20	C	Water quality from Well No. 5 exceeds the maximum contaminant level (MCL) for DBCP as defined in Section 64445.1(c)(5)(B) of Title 22, California Code of Regulations. The MCL is 0.2 and the well produces water in concentrations that exceed 0.3 microgm/l. This well has been placed on "standby" status pursuant to direction from the Department of Public Health dated June 19, 2000. The Malaga County Water District is reliant groundwater as the water supply source. Two of the District's wells have been placed on "inactive" status due to contamination which severely restricts the District's ability to reliably provide water to its residential, commercial, and industrial customers. The Malaga County Water District has experienced bacteriological problems with Well No. 1. Well No. 1 is presently out of service. Well No. 4 has been enhanced with GAC treatment facilities; however, the use of this well is limited as the electroconductivity of the source water is high after treatment and leads to violations of the Waste Discharge Requirements at the Wastewater Treatment Plant. Presently Malaga County Water District is reliant upon two water supply wells. One of the supply wells has had mechanical failures in the past and a fire in the electrical cabinet. The Malaga County Water District is therefore susceptible to water shortages without a replacement well.	1,240,000	472	900	11	Fresno	III	2009
859	1510011	1510011-004	Buttonwillow CWD	Buttonwillow Well #1 Replacement	The rural, low-income, farmworker community of Buttonwillow (Median Household Income of $28,370) must replace a community well that is contaminated with Iron, Manganese, TDS and Conductivity above the State and Federal Maximum Contaminant Level (MCL) Consolidation is not possible due to the 8 or 10 mile distance to the nearest large water supplier. The most cost effective solution is to drill a new +/- 400 foot deep well with 18 inch casing, a pump, electrical system and connection to the water system. The contaminated well will then be destroyed. The District will need to obtain a new well site for the well.	L	20	C	The Buttonwillow County Water Districts' well #1 has been taken out of service due to high levels of Total Dissolved Solids (TDS) of 1,100 ppm vs the MCL of 500-1,000-1,500 ppm, Turbidity of 5.0 NTU vs 4.0 NTU, Sulfate of 310 ppm vs an MCL of 250-500-600 ppm, Color of 20 vs an MCL of 15, an Iron level of 0.51 vs an MCL of 0.3, a Manganese level of 0.23 ppm vs an MCL of 0.05 ppm and Electrical Conductivity (EC) of 1,600 umho/cm vs the MCL of 900-1,600-2,200 umho/cm. This well needs to be abandoned to prevent contamination of other District wells. A replacement well needs to be built.	700,000	444	1,266	12	Kern	III	2007
860	1610001	1610001-008	Armona Community Services Dist	Well 2 Backup Water Supply	The project would consist of installing a transmission main between the existing Well #2 and the proposed Well #3. The water from Well #2 would be conveyed to the Well #3 treatment plant for treatment. Water from Well #2 would serve as a backup water supply in the event that Well #3 goes out of service. The project would also include a second pipeline from Well #3 to Well #2 to fill the existing storage tank to maintain use of the tank and generator as a backup water supply.	L	20	C	All of the District's water sources exceed the 10 ppb Arsenic Standard. We do not have a source that meets the current Standard. The District is in the process of implementing a project to replace Well #2 with a new well (Well #3). However, no backup water supply is available for the District's water system. This project will provide backup water supply.	1,750,000	1,179	3,239	12	Kings	III	2009

861	1510019	1510019-009	Shafter, City of	Arsenic Treatment System at Well #11	An expedited pilot study analyzing the available and accepted Arsenic removal technologies will be conducted. The system deemed the most cost-efficient and practical will be designed and developed at the well site. The well is located at an existing City park site so there is sufficient space to construct any of the accepted removal systems. Given the increased hydraulic demands for pumping water through new vessels and discharge piping for any of the systems, an upgraded pump and motor will be needed to maintain adequate flows and pressures. A new SCADA-equipped control cabinet is also necessary to efficiently manage and monitor the well's performance. The City has staff engineers and planners to expedite the design and permit process. The construction schedule is being pushed back to the Fall of 2009 because it is generally less risky to take a well offline for maintenance and improvements during the low demand periods.	L	20	C	City Well #11 (Source PS Code 28S/25E-16N02 M) has seen its Arsenic levels sharply increase over the past five years. The levels have reached as high as 10 parts per billion which is the latest maximum contaminant level adopted by the State. The cost of constructing Arsenic removal systems would require a severe rate increase for residents already living in a region with double-digit employment and a rapidly declining economy.	2,250,000	3,863	15,609	12	Kern	III	2009
862	1510019	1510019-010	Shafter, City of	TCP Granulated Activated Carbon Treatment Systems	The City conducted a pilot study at one of its wells to confirm that granulated activated carbon (GAC) can readily treat for TCP. Upon this confirmation, the City awarded a construction project to have its first full-scale GAC system operational by the summer of 2009 at City Well #14. The cost of this first GAC system is expected to reach $600,000. This system consists of two ten-foot diameter GAC vessels plus over 200 feet of new above-ground discharge piping and numerous valves for proper flow control. The well will ultimately pump water through the vessels and into an existing above-ground storage tank.There are six additional well sites that will likely be required to have similar GAC systems in place once the MCL is adopted by the State.	L	20	C	Shafter first started detecting a contaminant referred to as 1,2,3-Trichloropropane ("TCP") in its water supply in the Mid-1990s. It's currently unregulated but the State Public Health Department has adopted an Action Level (AL) of 5 parts per trillion (ppt). All of our seven active groundwater wells generally have levels that exceed this amount but are not 100 times higher which would lead to the State asking to have a water source taken offline. The State has reported that a Maximum Contaminant Level (MCL) is imminent and that it could be as low as the current AL. The City is working towards Citywide treatment for TCP but the water system's capital improvement and operations reserves can not fund the necessary infrastructure without very severe rate increases. The City's customer base has a median income of less than $30,000 and is within an area of double-digit unemployment with a rapidly declining economy.	5,000,000	3,863	15,609	12	Kern	III	2009
863	1510019	1510019-007	Shafter, City of	Well 16 Construction and TCP Treatment Project	The City has already awarded the construction of a granulated activated carbon (GAC) treatment system at one of its well sites. The existing submersible well motor and pump at Well 6 is not hydraulically equipped to handle the discharge pressure required to pump water through a similar GAC system. Due to this hydraulic issue and the overall age of the well, the City is proposing to drill a new well at the same site to a depth that will produce the lowest levels of TCP which could be as low as 1,110 feet. A new well house, hydropneumatic tank and new discharge piping will also be required to connect the well to the GAC vessels and, ultimately, to the distribution system. A new multi-stage pump and variable frequency drive motor assembly is also a component of this project. Well 6 would be properly destroyed. The new well would be assigned a designation of "Well 16".	L	20	C	The City's existing Well No. 6 (Source P/S Code No. 28S/25E-10R03M) was constructed in the Mid-1950s and is the oldest active well in the system. It routinely has levels of 1,2,3-Trichloropropane ("TCP") that exceed the Action Level (AL) for this contaminant. However, it hasn't reached levels that are 100 times higher than the AL which would leave the State Public Health Department to recommend taking the source offline. The State has notified the City that a Maximum Contaminant Level is imminent and it could be as low as the AL. The City would like to work towards Citywide treatment for TCP but the likely cost of up to $1,000,000 per well to actually do this is realistically cost prohibitive for our customer base that has a median income of less than $30,000 and is in region that is suffering from double-digit unemployment and a rapidly declining economy.	2,700,000	3,863	15,609	12	Kern	III	2009

864	5410010	5410010-013	Porterville, City of	Replacement Wells	Well #1 - The City has already drilled , installed casing and ran water quality and water quantity tests. The well site has been acquired. Remaining work includes the installation of pumps, electrical panel, SCADA monitoring to the City's main computer panel and miscellaneous piping from the well head to the City's water grid.Well #2 - Existing Ag well drilled to 700 ft. Well owner is interested in selling the well to the city. Water quality and water quantity tests have been performed. The well has excellent quality water and produces approximately 1,300 gallons/minute. The City has submitted "as built" plans and water tests to DHS for review and approval to convert the Ag well to a municipal domestic well. DHS has informed the City that the well is a good qualit ywell but must be sealed to approximately 50 - 100'. If the city acquires the well, the pumps will be replaced, electrical panel upgraded and the new ell will be connected to the city's SCADA monitoring system.Well #3 - The City has acquired a well site and is preparing plans & specifications to drill and install casing. If funding is realized, the City will move ahead with the all phases of construction.	L	20	C	The City has approximately 3 to 4 water wells with nitrate levels in excess of 45 mg/l. This project will replace the nitrated wells.The problem did not require public notification because the nitrated well water was blended with the City's overall water production but more importantly, the City's monitoring protocol identified the "bad" wells early on. The City's approximately 30 excellent producing wells was sufficient to satisfy the City's water needs with the exception of 2 months out of the year. During the months of July and August, the City experiences lower pressures than normal. The nitrated wells have been been turned off and will not be used again. The City is surrounded by residential lots located in the County and these residential lots are served by small private water companies. The City is aware that many of these water companies have wells that exceed the MCL for nitrates and perhaps other hamful constituents. Unfortunately, the City is not in a position to allow connection of these private water companies to the City's water system until the areas are annexed and the water company assist in funding a portion of a new well.Many of the private water companies have asked the City to purchase or accept their water system so that they can receive City water. City policy requires that a portional cost of a new well be borne by the private water company, that full water connection fees be paid and	2,500,000	14,562	51,467	12	Tulare	III	2009
865	5410010	5410010-010	Porterville, City of	Well #10 treatment PCE near mcl	To equip the well with wellhead treatment facilities, either GAC or airstripping.	L	20	C	Well 10 produces water containing PCE that exceeds the MCL of 5 ppb.	650,000	14,562	51,467	12	Tulare	III	2004

867	3400101	3400101-006	HOOD WATER MAINTENCE DIST	Hood System Improvement - Construction of a Groundwater Treatment Plant, and a Storage Tank/Pump Sta	The proposed Hood System Improvement project includes two elements: (a) Install a skid-mounted manganese removal plant for the removal of manganese to less than 10 ug/l. Feed water will be from Well No. 20. The designed treatment capacity will be of 400 gpm. (b) Construct a 50,000 gallon storage tank with 1000 gpm in booster capacity. The propsoed project will help the town to meet the minimum fire flow requirement, and will have the capability of delivering about 1350 gpm which is a vast improvement over the existing 725 gpm.	L	15	C	Groundwater is the sole drinking water source for the residents located in the town of Hood. The two drinking water supply wells (Wells No. 19 and 20) have been found to contain manganese at levels ranging from 230 to 310 ug/l. A treatment plant for the removal of manganese is needed for the compliance of the state Secondary MCL requirementof 50 ug/l.In addition, the total water production rate from these two wells is 750 gpm and is below its current fire flow requirement of 1500 gpm. To meet the local fire flow requirements, construction of storage tank and pump station is needed.	840,000	30	100	09	Sacramento	I	2009

869	4900688	4900688-001	Journey's End Mobile Home Park	Well intertie and manganese treatment plan	There appears to be two alternatives for domestic water, continue with operation of the existing wells or connect to City water. Fire protection improvements could only be provided by the City.The domestic water alternative that retains the existing wells requires the installation of 2-inch water mains in most of the driveways in the park. A few extra loops in the water main layout are shown and recommended to improve system reliability and flexibility. The installation of meters for each space would be neccessary.The domestic water alternative that connects to City water requires the installation of a 3-inch water service line from the City water main in Mendocino Avenue and 2-inch mains that would distribute water to every space. No water main loops are shown but could be added to improve system reliability and flexibility. The installation of meters is recommended.Options that are a combination of both alternatives are possible, as well.For long term stability, intertying with the City water system is recommended.	L	15	C	Water from both park wells contains manganese at levels above the secondary limits set by DHS Secondary Drinking Water Standards. The park recently installed water treatment systems that have shown to reduce the manganese to acceptable levels; unfortunately, manganese that previously settled in the distribution system continues to be a water quality problem. When first inspected in 2003, Exceedance of a Chemical MCL was distributed, no longer in effect, and though manganese levels are currently below unacceptable levels, it takes considerable effort and cost to keep them that way. An additional problem is that distribution system pipelines that are currently in use include above ground pipes, underground pipes, some pipes from the original system, some pipes that remain from the water softening distribution system and some pipeline additions installed to interconnect the two well distribution systems that were originally separate systems. As a result, there is no certainty to which valves in the distribution system are effective in isolating specific areas of the park. Another significant complication is that underground gas and sewer pipelines are located in close proximity to underground water pipelines and most of these are located along the fence lines at the back end of spaces where access is very limited. Also, water pipelines and conduits for electrical lines are located above ground on fences at	1,522,962	161	180	18	Sonoma	II	2009
870	0707613	0707613-001	WILLOW MOBILE HOME PARK	M-28 Required Compliance and RO System Improvements	1. New Containerized RO Water Treatment PlantA new containerized RO Water Treatment Plant (WTP) will be constructed to replace the existing building and treatment facilities. This will essentially provide a new plant, using the existing filters.2. Seismic Restraints/Pipe SupportsThe RO skid is not seismically restrained and some plant piping is not adequately supported and seismically restrained. In the event of an earthquake, significant damage may occur, resulting in an extended plant outage. Anchor clips will be added to secure the RO skids, lateral bracing added to the pipe supports, and flexible couplings between unit processes and additional pipe supports installed. 3. Reservoir StabilizationThe existing foundation for the 20,000-gallon reservoir may be inadequate to resist overturning in the event of an earthquake. Needed improvements include grout stabilization of the soil under the tank slab to increase soil resistance, concrete anchors to provide additional over-turning resistance to the slab, and additional anchor clips on the tank to prevent existing bolt pullout.4. Backup Distribution PumpFailure of the single existing booster pump will result in loss of water supply and basic fire protection to the residents. A backup pump and motor will be added.5. Blending/Acid Elimination (RO Bypass Line)The RO system bypass line for stabilizing RO permeate with well water was not installed as part of the original	L	15	C	The District's Reverse Osmosis (RO) water treatment facility has deteriorated over the years and no longer meets OSHA standards. Reliability of the system has also decreased over time. This has resulted in call outs during the night and a high level of attention to maintain operation of the system. The system is operated through a contract with Diablo Water District (DWD). Notice has been given by DWD that they will terminate the maintenance agreement unless improvements to the system (especially the structure housing the unit) are made in a timely manner. They have cited safety issues and an increase in the time their staff must spend keeping the system running. A 1995 study by the engineering firm CDM was updated in 2006 and again in 2008 identifying improvements necessary to improve reliability and safety. These include replacing the structure housing the RO unit; installing seismic restraints; anchoring the 20,000 gallon reservoir; sealing the abandoned well; installing emergency power, telemetry, and other monitoring instrumentation. These improvements will drastically improve safety and reliability for both the plant operators and the water customers. Diablo Water District will terminate its maintenance agreement unless these extensive improvements are made. No other qualified operator has been identified.There is limited capacity in this small water district for rate	1,101,000	120	350	04	Contra Costa	II	2008
871	5110007	5110007-003	Sutter Community S.D.	well replacement	A new well will be drilled 50 feet from the existing well, therefore we can use the existing well house and Tesco equipment, pump, etc. This well replacement is being done due to arsenic levels slightly higher than EPA standard. The existing well was not drilled correctly and will be destroyed. This is the most cost effective solution, we have looked into Arsenic removal treatment which is very costly to install and for yearly operations and maintenance.	L	15	C	Due to EPA Arsenic regulations our Well #2 has been on stand-by by DPH for over one year. Sutter CSD needs to drill a new well to continue adequate water supply to the community.	300,000	1,025	2,885	21	Sutter	I	2009

873	1010001	1010001-004	BAKMAN WATER COMPANY	DBCP Well #13 & #8	We would like to install two Model 10 Adsorption Systems. One system will be on Well #13 and the other will be on Well #8. The system consists of two ten feet diameter, ASME pressure vessels that contain 20,000 pounds of virgin GAC each. Each location will require Pressure Switches, bladder tanks and chlorine buildings for safe storage of the chlorine tanks. To comply with current regulations we will need to install chlorine analyzers' and chart recorders. With blackouts in our area we loose four wells due to the fact that they are on the same PG&E grid. If we are able to bring these two well back on line we will be able to use these wells during the brownouts. In just this last year we have had three power outages in the Clovis and Balch area taking down two wells with GAC on them for more than the 6 hours, thereby requiring the testing for Nitrate before being able to bring the well back online. We our median House Hold Income at $33,985 and so many foreclosures in our district we are unable to proceed on these much needed wells as our rate payers can not shoulder any rate increases.	L	15	C	We have two wells that exceed the DBCP 0.2 ug/L MCL. Well # 13 test reflect a 0.67 ug/L and Well # 8 reflect a 0.90 ug/L.	750,000	1,910	8,865	11	Fresno	III	2008
874	1010001	1010001-003	BAKMAN WATER COMPANY	Nitrate Well #6	We would like to blend Well # 6 with Well #15. Well #6 is locted off of Olive on Minnewawa and Well # 15 is located on Olive approx. 500 yards from each other. We would intall a pipeline to connect the two wells. Installation of a pulse output transmitter with digital indicator and 8" water meter. Included are 8" 150 PSI Welding Saddle Meter 1000 PGM Indicator/100 gallon totalizer, TR06-1-S pulse outpurt transmitter 10 PPS @ 100 GPM, IN62 digital indicator- totalizer 100 GPM indicator/100 gallon totalizer, enclosure, lock out relay, lot wiring material, lot plumbing material.	L	15	C	We would like to blend Well # 6 with Well #15 to reduce the level of Nitrate. The last testing of Well # 6 was 83 mg/L, the MCL for this chemical is 45 mg/L.	80,000	1,910	8,865	11	Fresno	III	2008
875	4010011	4010011-009	MORRO BAY WATER DEPARTMENT	Chorro Valley Nitrate Treatment	The City of Morro Bay has been looking into obtaining ion exchange nitrate treatment trains to treat the Chorro Valley well water. These treatment trains will allow the City to ensure safe drinking water during periods of reduced deliveries in State Water Project, as well as during shutdown of State Water Project.The City would purchase the ion exchange nitrate treatment trains and install and operate them from the location of the current well #16. The treatment trains will treat the water from the ground water wells and reduce nitrate levels to below the MCL. The project will consist of preparing the site, purchasing and installing the treatment equipment, extending a sewer line to the well site, and installation of associated apparatuses.	L	15	C	The City of Morro Bay operates 6 groundwater wells in the Chorro Valley as the historic source of water. The water from the wells has high nitrate levels that exceeded the MCLs. The Department of Public Health has ordered us to inactivate these wells impacting our ability to provide adequate water supply. This impact is especially acute during periods when the State Water project has reduced deliveries. In the future the City will receive lower water deliveries from State Water and will have no choice but to use the Chorro Valley well water. In preparing for this rapidly approaching eventuality the City intends to provide ion exchange nitrate treatment.	500,000	5,425	10,270	06	San Luis Obispo	IV	2009

876	1910161	1910161-003	PARK WC - LYNWOOD	Well 9D Arsenic and Manganese Treatment Plant	Park Water Company (PWC) proposes to install a wellhead coagulation/filtration treatment plant on their Well 9D to reduce existing levels of Arsenic and Manganese to meet State maximum contaminant levels (mcl). The plant will be designed to treat a maximum flow of 1,250gpm. Through extensive pilot testing on the water produced from this well and the existing site constraints, the treatment plant is designed to be a 3-cell horizontally mounted sand filter over a subterranean backwash tank. The Arsenic and Manganese will be oxidized through the addition of Chlorine, and Ferric Chloride will act as the coagulant. A pump will be installed to remove the filter backwash effluent, and the effluent will be disposed through a force main sewer to a local sewer connection. The treatment plant will also require the addition of a control panel and link to our existing SCADA system.	L	15	C	Park Water Company (PWC) drilled Well 9D in 1999/2000. At the time, the water quality met the maximum contaminant levels (mcl). However, with the new mcl for Arsenic at 10ug/L and the mcl for Manganese at 50ug/L, our well does not meet the standards. Quarterly water quality monitoring from Well 9D shows a range of Arsenic from 9.7 to 11ug/L with an average of 10.5ug/L. For Manganese, the range is 46.3 to 57ug/L with an average of 52.3ug/L. Because of these water quality concerns, Well 9D is on standby status and is not used as a water supply source. PWC is utilizing their purchase water connection CenB-25 to meet average day demand and Well 4B to meet peak water demand.PWC drilled Well 4B in 1952 and it produces about 720 gpm. The maximum production from Well 9D is 1,250 gpm. The average day demand for this water system is 1,285 gpm, and the maximum day demand is estimated at 2,571 gpm. The maximum available flow from CenB-25 is 5,625 gpm. The groundwater wells are PWC's CDPH designated emergency alternate sources of supply. In the case of CenB-25 being unavailable, we would utilize our wells to meet customer demands. With Well 9D being on standby, we are unable to meet average day demands for this water system solely through the use of Well 4B. With a treatment plant installed at Well 9D and an outage at CenB-25, we could fully utilize our wells and	2,164,000	4,392	17,124	22	Los Angeles	IV	2009
877	3610008	3610008-009	BIG BEAR CITY CSD	Equip well #3B , and Abandon Well #3	Project Description: Equip well #3B with a verticle turbine pump that will produce approximately 1,050 gallons per minute and connect to the existing fluoride blending reservoir. Install a standby generator, and construct a well building. Destroy well #3 building and permanantly abandon the well. The District anticipates this project will increase water production by 650 to 750 Gallons Per Minute and reduce the threat of TCE in the water system.	L	15	C	Well #3 has been contaminated with TCE @ 20.0 ug/L (State MCl is 5.0 ug/L). Well #3 pumps directly into a fluoride blending reservoir.Well #3 is 50 years old, does not have a sanitary seal that meets current standards.Well #3 currently yields 300-400 GPM. The District currently has Well #3 locked out of service pending approval af a VOC blending plan with the CDPH. Even with approval of the blending plan Well #3 will only be used on a limited basis. Well #3B was drilled in 2000 to replace Well #3 and yielded 1,050 GPM at the time it was drilled. Due to elevated fluoride levels 7.5 mg/L (state MCL 2.0 mg/L) and our lack of low fluoride sources to blend with at the time well #3B was not equipped for production. Additional low fluoride producing wells have recently been added to the blending system to allow Well #3B to be blended down to below the State MCL for fluoride.	275,000	6,356	25,000	13	San Bernardino	V	2009

The loss of Well 2B due to radiological contamination along with Well 1 due to excessive nitrates has created a potential fire, safety, and health problem. Reconstruction of the well will allow the district to better manage the water system and provide for additional redundency in the water system help the distribution system meet capacity requirements in peak water usage periods.	L	10	C	The purpose of this application is to acquire funding to replace a well that Denair CSD had to abandon due to excessive radiological contamination. The old well was identified as Well 2B.	750,000	1,294	3,225	10	Stanislaus	III	2009

890	1510053	1510053-003	ANTELOPE VALLEY E KERN WTR AGY		INSTALL AMMONIA FEED SYSTEMS AT ONE WATER TREATMENT PLANT	L	10	C	CONTROL FUTURE THM'S WHILE ACHIEVING REQUIRED CT	187,500	14	11,548	19	Kern	III	1998
891	2410005	2410005-003	LOS BANOS-CITY	Well #15 Arsenic Mitigation	The project will begin with a study that will help identify the best treatment system needed to get Well #15 back in service. The options that will be reviewed will include Well Head Treatment or blending with the existing water system. Upon the results of this study, staff will have plans developed to incorporate the recommendation. The final step would be to construct the needed treatment mechanism and have Well #15 put back in service.	L	10	C	Well #15 has been on stand-by for several years due to arsenic levels that are above the MCL of 10 PPB.	1,100,000	12,277	27,635	11	Merced	III	2009
892	1510029	1510029-005	Vaughn WC INC	Noriega Storage Tank and Booster Pumping Plant	The two water well sites are existing, operational facilities that exceed the MCL for arsenic. However the operation and maintenance costs as well as the waste handling make well head arsenic treatment an undesirable alternative. The project will involve the construction of a new water supply well in an area that a well not requiring treatment is believed to be attainable. A 1,000,000 gallon welded steel storage tank and booster pumping plant will be constructed to provide peaking source capacity that will replace the capacity lost from the two wells. The well will fill the storage tank in off-peak hours for electricity and the booster pumping plant will operate during peak hour periods to take advantage of time of use pumping. A well site, 160-ft by 160-ft, has already been obtained. The well will be connected to fill a 1,000,000 gallon welded steel storage tank. A booster pumping plant will convey water from the storage tank to the distribution system and be automatically controlled based on system pressure.	L	10	C	Vaughn Water Company serves the Rosedale Community in Kern County, California. The system relies solely upon groundwater for its water supply. Two existing water supply wells in the system have arsenic above 10 ppb and thus exceed the chemical MCL. These two wells account for a total supply of 2,000 gpm. This is 10-15% of the total system supply. The system cannot meet peak system demands without this capacity. The operating and maintenance costs associated with arsenic treatment are also cost prohibitive as determined from pilot tests and demonstration tests utilizing ion exchange, adsorption, and coagulation-filtration. In addition, there were times during the testing of the treatment system when the contaminant still exceeded the chemical MCL due to breakthrough. These wells will be shut-in and made inactive as a result of arsenic concentrations exceeding the MCL. During peak hour system demands the water system has experienced pressures in the high 20's and received numerous customer complaints. With the two wells described above off-line, system pressures will be even lower and are expected to drop below 20 psig and be out of compliance with State regulations.	2,300,000	8,931	28,100	12	Kern	III	2009
893	3610036	3610036-025	City of Chino Hills	Installation/Operation of Arsenic Removal Equipment at Chino Hills Well#15	The City of Chino Hills requests $1 million in Safe Drinking Water State Revolving funds to purchase and install a 1,200 gallon per minute (GPM) Arsenic Removal System to bring potable water from existing Well #15 online by complying with Title 22, Chapter 15 requirements. The City plans to purchase, install, and operate a Coagulation-Filtration (CF) Treatment System that will treat 1,200 GPM with a minimum of sludge waste product. Plans call for a single horizontal vessel with five separate filtration cells. Coagulation filtration is an environmentally-friendly approach that produces no brine waste, eliminates the need for media regeneration or replacement, and offers both a low equipment cost and a low operating expense. Backwash water and sludge filtrates will be recycled to plant headwords. The estimated efficiency of the system proposed (as measured by water out/water in) in most cases is 99.998 percent. The waste product is a sludge consisting mainly of iron and arsenic. The proposed coagulation filtration treatment system will be fully automated. A Programmable Logic Controller (PLC) will monitor and control the operation of the system, which will employ analog and digital instrumentation and valves to determine the proper operating sequence, indicate failures, display current process variables, and notify operators of critical alarms. Coagulation filtration requires no media or	L	10	C	This project will address high levels of arsenic in a groundwater well owned and operated by the City of Chino Hills. The City of Chino Hills Water Division provides water services to approximately 23,000 customers who include residential, non-residential, government and reclaimed water accounts. The Water Division derives its water from five sources, which is a blend of purchased water and the City's own groundwater wells. Collectively, the five sources provide the City with a current capacity of 41 million gallons per day (MGD). Overall, the utility manages over 250 miles of water mains. Currently, Well #15 does not comply with Title 22, Chapter 15, Section 64431 regulations, which sets the State's acceptable Maximum Contamination Level (MCL) of arsenic allowed in potable water at 10 parts per billion. Well #15 is producing water with arsenic levels averaging 72 parts per billion. According to the California Department of Public Health (CDPH), ingestion of arsenic can pose a risk of cancer and other health issues such as vascular effects or skin effects. California recently revised the arsenic MCL to 0.010 mg/L, effective November 28, 2008. The same criteria have been in effect at the federal level since January 2006.Well #15 is currently "shut down" and not being utilized as part of the City's potable water system. The well can produce upwards of 1.7 million gallons per day	1,000,000	18,927	55,000	13	San Bernardino	V	2009

894	1510031	1510031-003	Bakersfield, City of	Well 1 through 5 Arsenic Treatment Project	This project will include the installation of filter vessels, media, piping, monitoring equipment and other facilities for treatment at each of the well sites.	L	10	C	This project will provide treatment at each of the wells for arsenic and 1,2,3 trichloropropone. Each of these wells are approaching or exceed the 10 ppb average arsenic level as required USEPA and CA DHS drinking water regulations.	3,250,000	32,703	132,736	12	Kern	III	2009
895	1510031	1510031-002	Bakersfield, City of	3 Million Gallon Water Storage Facility	This project will constuct a 3 Million Gallon reinforced concrete tank and booster pump facility. The project will be tied-in to existing infrastructure to maintain system production requirements.	L	10	C	This project will blend groundwater wells in order to meet the 10ppb average arsenic level in accordance to USEPA water quality standards. It will also incraese water supply capacity due to drop in groundwater levels.	3,150,000	32,703	132,736	12	Kern	III	2009

901	2610001	2610001-004	MAMMOTH CWD	MCWD Groundwater Treatment Plants: Corrosion Control and Arsenic Compliance	In order to achieve compliance with the Arsenic and Lead and Copper MCL rules, Mammoth Community Water District (MCWD) proposes to make modifications to the treatment processes of Groundwater Treament Plants #1 and #2, and the Lake Mary Surface Water Treatment Plant. Initial design proposals and cost estimates have been developed to achieve compliance with the Lead and Copper Rule per the recent Corrosion Control Study. MCWD proposes to add an aeration system to adjust the ph of the plant effluent in order to stabilize the distribution system to achieve compliance with Lead and Copper Rule MCLs. The Department of Public Health has initially approved this treatment alternative as recommended in the Corrosion Control Study.Additionally, MCWD has retained the services of HDR engineering to evaluate the Best Available Treatment options for arsenic removal to achieve compliance with SDWA arsenic MCLs. HDR has already completed evaluation of the Treatment Plants' existing water quality and is currently developing proposals for treatment alternatives. Preliminary design of selected arsenic removal is expected by April 2009. To achieve the most cost-effective and timely implementation, MCWD will incorporate both the ph control and arsenic removal improvements into a single design and construction contract.With ER funding, this project can be "shovel-ready" by November, 2009.	L	5	C	Mammoth Community Water District (MCWD) Groundwater Treatment Plants #1 and #2 are experiencing treatment failures resulting in arsenic levels as high as 13 ppb. In the past, Treatment Plants #1 and #2 have remained in compliance with the maximum contaminant level (MCL) of 10 ppb with quarterly averaging of test results. However, the California Department of Public Health (CDPH) has now required MCWD arsenic maximum contaminant levels to be below 10 ppb at all times. CDPH is also requiring MCWD to begin Teir II public notification of the exceedence of the arsenic MCL. Additionally, MCWD customers have seen a continued exceedence of the Safe Drinking Water Act (SDWA) Lead and Copper rule. CDPH has mandated that MCWD implement the results and recomendations of a recent Corrosion Control Study to achieve SDWA compliance for the Lead and Copper Rule. MCWD has already given Teir II public notification to District customers regarding non-compliance with the Lead and Copper Rule.	5,600,000	3,666	8,214	13	Mono	V	2009

902	2710001	2710001-002	Alco Water Service	Construction of Water Blending Facility	To reduce Arsenic, blending is a prefered mitigation strategy, being a "zero treatment option", as per the EPA's Arsenic Mitigation Strategies. Alco currently has 5 active wells that are below the State and Federal MCL of 10 ppb. In order to blend the waters from these 5 active wells with the higher-arsenic concentration waters of the 3 standby wells, Alco will be constructing a blending facility that has a capacity to adequately blend all 8 sources. After the blending facility, the water that will be provided to Alco's customers will meet State and Federal standards for Arsenic.	L	5	C	Alco currently has 3 wells that, due solely to Arsenic levels exceeding the 10 ppb MCL (State and Federal), have been designated as standby groundwater sources. Specifically, before being designated as standby sources, the Boronda Well's (source code 2710001-012) most recent Arsenic level was 21 ppb, the Las Casitas Well's (source code 2710001-011) most recent Arsenic level was 22 ppb, and the Nogal Well's (source code 2710001-013) most recent Arsenic level was 17 ppb. These sources have a combined production capacity of 6,399 gpm. The building of this project will allow Alco to blend these sources with other sources that are below the Arsenic MCL so that the combined total flow after blending will be less than the Arsenic MCL of 10 ppb.	4,500,000	8,624	27,901	05	Monterey	II	2009
903	3700912	3700912-001	YMCA CAMP MARSTON/RAINTREE	Camp Marston Storage/Water Main Improvements	Qualified professionals have indicated the need to sandblast the inside of 60k tank, radiograph metal thickness, and install NSF approved spray liner on entire tank. Install appropriate filtration system, booster pumps, plumbing, and backwash settling pond to ensure iron and manganese removal to acceptable levels. To correct dead end issues, install 1650 ft. of 6 in. water main with two more fire hydrants to allow for proper flushing of system as well as fire protection completion of water main loop.	L	5	P	Current 60k water storage tank is degrading rapidly with extensive rust eating at several seams. Water in this area is extremely aggresive and we continually exceed the recommended levels for Iron and Manganese from all three wells. Last reading taken was 17,000 ugl. on iron and 110 ugl. manganese. Turbity was 138 ntu. Extensive dead ends in system contribute to possible exceedence of mcl's of various pathogens.	300,000	27	310	14	San Diego	V	2009
904	4310027	4310027-002	Santa Clara Valley Water District	Stage II DDBP compliance	Solution to the problem requires the construction of a settled water ozone system using LOX as feed gas and sulfuric acid and hydrogen peroxide for bromate control, with fine bubble diffusion ozone contactors followed by GAC filtration. 911	4200804	4200804-002	WALKING M RANCHES ASSN.	Walking M Water System - Improve Drinking Water Quality	The well committee specified the following requirements: Select one of three possible well sites recommended in an existing geological report. After permitting by the County of Santa Barbara, drill the well at the site selected using a local well drilling and pump company. The well head shall be fitted with a lockable fitting which permits water sampling. Other County requirements for a well of this size shall be complied with. Connect the well to the existing water storage and treatment installation with 6 inch PVC piping. The well depth is projected to be between 800 and 1000 feet deep with a projected maximum output of 120 GPM. Approximately 4225 feet of 6 inch PVC piping with a shutoff valve and two check valves is required for connection to the storage tank. The well site area of approximately 100 x 150 feet shall be fenced to prevent intrusion by cattle or other farm animals. An all weather access shall be provided. After proof of satisfactory operation of the new well, the well being replaced shall be secured to prevent tampering, entry of foreign material or vertical migration of any contaminants. Local contractors and suppliers are immediately available for all subcontracted work and supplies. An association member with previous experience managing a well installation for the association will manage this project.	L	0	C	The Walking M Water Association has been distributing water to its association members since 1967. One of two wells now in operation was recently tested and shown to be exceeding Primary Drinking Water Standards for Turbidity and Secondary Drinking Water Standards for Color and Iron; further, the cost to treat sulfides from this well has become excessive. A study by a qualified consultant in 2008 projected that a cost of $230,000 would be required to provide a water treatment facility for this well which could solve all treatment issues. The operating costs were not provided but are considered extensive. When water from this well is blended in our 125,000 gallon storage tank with water from a second well under supervision of our Water Master, the water distributed to association members does not exceed Drinking Water Standards. Because of blending requirements, we were able to use this well for only 16% of our water needs during 2008. Summer usage during June through August requires that both wells be available. It is our desire to be able to use each well for 50% of our water needs and be fully compliant with Drinking Water Standards.If it were necessary to take the second well offline to conduct preventive or corrective maintenance, distributed water could then exceed some Drinking Water Standards. Because of the high cost to change water treatment methods as proposed	183,000	17	54 06	Santa Barbara	IV	2009
912	2701959	2701959-002	TIERRA VISTA MWC	Arsenic Filtration and System Rehabilitation	Tierra Vista Mutual Water Co. proposes to refurbish the 3 steel storage tanks with Eco friendly liners. This would eliminating the need to replace the existing tanks and reduce the environmental impact of their removal. Replace 3,000 feet of deteriorating 2" supply line.Install equipment to remove Arsenic using a process known as co-precipitation and filtration. Liquid ferric chloride and liquid sodium hypochlorite (chlorine) are injected into the water and the Arsenic is oxidized and adsorbed on the precipitated iron hydroxides. The precipitated hydroxides including the arsenic are removed from the water through a pressure filter containing a catalyzing filter medium sand coated with manganese dioxide. The filter is periodically backwashed to remove the precipitated solids and this sludge is accumulated in disposable cartridges which are stored for disposal in accordance with county and state regulations.Grade, install proper drainage and lay down a layer of base rock to eliminate the continual erosion of the tank site access road.	L	0	C	Tierra Vista Mutual Water Co. is a small incorporated water system with 17 connections. The system relies on one groundwater well for production. At present the system has no disinfection or filtration. Raw water is pumped to storage and then distributed. The system is 26 years old and has not been properly maintained. The following is proposed:Recent raw water monitoring indicates that Arsenic exceeds the MCL of 10ug/l at about 14 ug/l. Our local regulator is the Monterey County Health Department. They have indicated that all systems exceeding the Arsenic MCL must reduce this contaminant to less than 10ug/l.The Road access to the 2-15,000 gallon storage tank site needs to be refurbished and the ongoing erosion controlled.The three storage tanks need to be replaced or refurbished and the 3,000 foot distribution line from the well to the storage tanks needs to be replaced.	275,000	19	57 05	Monterey	II	2009
913	0510004	0510004-001	C.C.W.D. Sheep Ranch	Sheep Ranch treatment plant	Replace mixed media filtration with membrane filter. Modify disinfection to use ozone or UV as primary disinfectant. 919	4400502	4400502-007	TROUT GULCH MWC	Well # 1 (Norman Hill) Manganese Filtration Plant	Contract for engineering services to determine best-value facility for re-charge slurry removal and disposal. Design manganese removal facility and re-charge slurry handling system.Procure and install manganese removal system and re-charge slurry handling system. A quotation has been obtained for a Manganese Filtration Plant at $80,000. However, this quotation assumed that slurry disposal would be done via a local sewer connection.All funded projects may be combined into one or two larger projects to facilitate administration, oversight and review.	L	0	C	This well was drilled in 1934 on a dedicated parcel of the Forest Glen subdivision. It was sole water source for Mar Vista Water Company (MVWC) for at least 40 years until Meadow Ranch subdivision, with its own well, was added to the company in 1987. Although a cross-connection has been installed, each well normally supplies only its portion of the system. Trout Gulch Mutual Water Company (TGW), a customer-owned corporation, purchased the assets of MVWC on July 1st, 2008. The Norman Hill well has been in continuous service and production capacity is believed to be adequate to meet entire system needs, but this has not been tested for periods longer than a few days. The Meadow Ranch well has been a sand producer, has severe well casing perforation occlusion and its production capacity has dropped from 150 gpm in its early years to 41 gpm now. Forced conservation is required to keep consumption within available Meadow Ranch well production this year. The Meadow Ranch well can scarcely supply its own part of the system, about 1/3 of the connections, so it is not a useful replacement or even back-up for the Norman Hill well.Norman Hill well manganese level was 17 times MCL in 2007. The most recent test result from April 18, 2008 of 0.95 is 19 times the MCL. The PUC/California State DEH/Santa Cruz County DEH have ordered MVWC to take corrective measures. See: PUC Water Division	90,000	171	584 05	Santa Cruz	II	2008
920	5400824	5400824-001	SULTANA C.S.D.	Sultana CSD Safe Drinking Water Project	The proposed project is to acquire land, drill a test well and then drill a production well with storage facilities that would be tied into the community's water system.	L	0	C	The Sultana Community Services District serves the small Tulare County community of Sultana with drinking water. The District currently has two operable water wells. One of these wells, Well #2, exceeds the Maximum Contaminant Level (MCL) for DBCP. The most recent test on this well indicated a DBCP level of 0.56 ppb, over twice the MCL of 0.20 for DBCP.	1,000,000	180	650 12	Tulare	III	2007

923	1010042	1010042-008	MALAGA COUNTY WATER DISTRICT	Replacement Well for Well No. 3	The project consists of acquiring a new well site, drilling a test well, design and construction of new well, connection to the water distribution system, and abandonment of Well No. 3.	L	0	C	Water quality from Well No. 3 exceeds the maximum contaminant level (MCL) for DBCP as defined in Section 64445.1 (c)(5)(B) of Title 22, California Code of Regulations. The MCL is 0.2 and the well produces water in concentrations that exceed 0.3 microgm/l. This well has been placed on "standby" status pursuent to direction from the Department of Health Services dated June 19, 2000. In addition, the well has concentrations of nitrate that exceed 50 mg/l. The MCL for nitrate is 45 mg/l as defined in Section 64431 (a) of Title 22, California Code of Regulations. Malaga County Water District is completely reliant upon groundwater as the water supply source. Well No. 3 generates 1,500 gpm and the site includes a standby generator. The removal of this well from active status has severely restricted the District's ability to reliably provide water to its residential, commercial, and industrial customers. The Malaga County Water District has experienced bacteriological problems with Well No. 1. Well No. 1 is presently out of service. Well No. 4 has been enhanced with GAC treatment facilities, however, the use of this well is limited as the electroconductivity of the source	1,740,000	472	900	11	Fresno	III	2007
924	1010042	1010042-009	MALAGA COUNTY WATER DISTRICT	Replacement Well for Well No. 5	The project consists of acquiring a new well site, drilling a test well, design and construction of a new well, connection to the water distribution system, and abandonment of Well No. 5.	L	0	C	Water quality from Well No. 5 exceeds the maximum contaminant level for DBCP as defined in Section 64445.1 (c)(5)(B) of Title 22, California Code of Regulations. The MCL is 0.2 microgm/l (ppb) and the well produces water in concentrations of 0.62 microgm/l. The well has been placed on "Standby" status pursuent to the direction from the Department of Health Services dated June 19, 2000. The Malaga County Water District is completely reliant upon groundwater as the water supply source. Two of the District's wells have been placed on "inactive" status due to contamination which severely restricts the District's ability to reliably provided water to its residential, commercial, and industrial customers. The Malaga County Water District has experienced bacteriological problems with Well No. 1. Well No. 1 is presently out of service. Well No. 4 has been enhanced with GAC treatment facilities, however, the use of this well is limited as the electroconductivity of the source water is high after treatment and leads to violations of the Waste Discharge Requirements at the Wastewater Treatment Plant. Additional information will be forwarded to the Dept. of Public Health. Presently Malaga County Water District is reliant upon two water supply wells. One of the supply wells has had	1,740,000	472	900	11	Fresno	III	2007

926	4410015	4410015-001	Lompico County Water District	Water Storage Tanks Replacement and Site Improvements. Water Lateral Replacements. 8" Interconnect	1. Water Storage Tank Replacements: All of the tank site would obtain an engineered soils report and design plans. In addition, each site would require demolition and site grading. Temporary storage tanks would be required for the Lewis #1 Tank replacement. Lewis #1 is also a larger site including the Lewis WTP, which would involve addition demolition and site grading. Concrete ring foundations would be constructed per engineered plan provided by the Tank Subcontractor. Tanks would also be constructed also by engineered plans up to seismic codes. Piping connecting to the tanks would be replaced. Flexible piping connections would be installed to the tank. Lewis #1 and #2 would be replaced with welded steel tanks and coated. Welded steel tanks are well documented to be the longest lasting water storage tank but require sufficient space to construct, which the Lewis Tanks have. The next best tank for restricted areas is a fiberglass coated bolted steel tank and this type of tank is selected for the remaining 4-60,000 gallon tanks. 2. Service Lateral Replacement: The service lateral replacement would not require any engineering, however all of the services would have to be located which would need to be drawn on a map and supplied to qualified bidding contractors. The piping from each would be replaced with copper piping per standard specifications.3. System Interconnect Pipeline: The System Interconnect Pipeline would be 8" in	L	0	C	1. Water Storage Tank Replacements: Lompico County Water District, LCWD, has six (6) water storage tanks and they are all made out of redwood, which is no longer a standard in the industry due to a low useful life span. Two of the tanks, called Lewis #1 & #2, are 100,000 gallon tanks and represent 50% of the storage to the community. These two tanks are leaking profusely, creating an emergency situation to replace these tanks as soon as possible. Two of the other tanks, called Kaski #1 & #2, are 60,000 gallon each. These tanks have begun to leak and also should be replaced very soon. The final tanks, Madrone #1 & #2 are also 60,000 gallon. These tanks were replaced in 1989 and will probably last another 10 years without leaks.2. Service Lateral Replacement: LCWD has 500 -3/4" connections and all of the lateral piping for these services were installed with polybutylene piping which is now a defunct pipe material due to extensive failures. Many of these service laterals fail without warning, and also often during weekends or nights. Not only is a large amount of water wasted, (+/- 2000 gallon per leak), but the employees for the District have to usually work overtime to fix them which involves replacing the entire lateral with copper piping. To date, 167 of these laterals have already been replaced, leaving 333 remaining to replace.3. System Interconnect Pipeline: A system interconnect pipeline between LCWD and San	4,121,750	501	1,500	05	Santa Cruz	II	2011

L	0	C	Filter life has expired, this project rebuilds 6' x 12' rapid sand filter, for meeting iron and manganese compliance levelsCurrently water source is off line, due to filter and ozone issues. Do not have quote for rebuild of 03 generator, may apply separetly.	20,960	708	2,500	03	Lake	II	2009
928	1710012	1710012-006	Cobb Area County Water District	CAWD WELL 3 OZONE REHAB	Without Well#3 on line we have no redundancy in the system. WEll 3 and Well 1 work together and are the primary wells for the entire water system. Well 3 cannot meet the standard for iron and manganese without oxidation and filtration, the combined ozone and filter rehab projects provide us with adequate water to maintain both water and fire service.Our system remains vunerable until the situation can be remedied.	L	0	C	Project is in direct conjunction with CAWD Well 3 Filter Rehab application. Ozone generator does not function must have new Ozone Reaction Chambers, Compressors, etc. We cannot meet the standards for Iron and Manganese, and have had to take this source off-line. Well 3 works in tandum with another source, and serves as a compliment and a backup to our primary well.	10,000	708	2,500	03	Lake	II	2009
929	4410018	4410018-002	Central Water District	Cox Well Field Iron/Manganese Treatment Facility	This project is divided into two phases. The first phase includes hiring a consulting engineer to assist the CWD with the evaluation and design of an iron and manganese treatment plant that addresses the concerns of the District. The second phase of the project is to conduct a pilot plant study to help assure that several parameters are met. These parameters include the removal of iron, manganese and hardness from the Cox Well Fields utilizing the most cost effective and efficient technology. Additionally, the Central Water District will work to minimize project capital costs as well as operational and maintenance overhead.The District will construct a treatment plant which will have the capacity to treat up to .35 mgd and could be modified to meet projected transfer of drinking water supplies from the Aromas Red Sands Aquifer to the Cox Well Field. (Due to Chromium 6 levels present in the Aromas Red Sands Aquifer.)The treatment plant design will incorporate alternative energy sources, such as solar power, to help minimize the Carbon Footprint.	L	0	C	The Cox Well Field has high levels of Iron and Manganese. The District currently blends drinking water from the Cox Well Field with water from the District's primary source, the Aromas Red Sands Aquifer. The District is aware of the fact that elevated levels of Chomium 6 exist in the Aromas Red Sands Aquifer and so is being proactive in planning for the use of the Cox Well Field as its primary source of drinking water. The project will take a comprehensive apporach to planning for long term solutions that help ensure a clean and safe source of drinking water. The project planning will include a planning and feasibility study for a water treatment facility to be located within the Central Water District at the Cox Well Field. The treatment plant will function to treat a drinking water supply that currently cannot be fully utilized due to a high concentration of both iron and manganese.	2,000,000	808	2,700	05	Santa Cruz	II	2011

939	4910016	4910016-003	Cotati, City of	Well 1A and 3 Sand Filter Replacement	Work will consist of replacing the green sand mixed media at two municipal wells (Well 1A and Well 3), and repacing the backwash control valves and actuators. Construction activity start date is shown as October 2009 to reduce the impact of having these wells out of service during peak summer demand periods.The project is intended to address periodic break-throughs of Fe and Mn in the finish water in violation of secondary MCLs, increase the reliability of the backwash controls, and reduce water waste through leaky backwash control valves. The sand filter system has been in service over 20 years.	L	0	C	The City of Cotati has 3 municipal groundwater wells. Two wells (Well 1A and Well 3) have elevated levels of iron (FE) and manganese (Mn) in the raw water, in addition to hydrogen sulfide (H2S). The City uses a green sand-mixed media filter to remove the Fe, Mn, and H2S, in addition to pre-chlorine/potassium permanganate oxidation step. The green sand-mixed media filters have been in service for over 20 years and are well past the expected service life. As a result, the City has periodic violations of secondary MCLs for Fe and Mn in the finish water.In addition, the sand filter backwash control valving is equally old and is experiencing periodic failures. There is also chronic leaking of the backwash control valving into the sanitary sewer. These issue can't be addressed without taking the unit out of service, and the City wishes to coordinate this work to reduce down-time.	150,000	2,560	7,532	18	Sonoma	II	2009

942	4210020	4210020-008	Santa Ynez River Water Cons. Dist. ID#1	Nitrate Well Treatment	Santa Ynez Water Conservation District, Improvement District No 1's (ID#1) project is the reactivation of existing Well #3 with nitrate removal treatment as determined through best engineering planning and practices.	L	0	C	Santa Ynez Water Conservation District, Improvement District No. 1 (ID#1) serves a population of 8,298. It also provides water to the City of Solvang with a population of 5,322 and serves water on a stand-by basis to Rancho Marcelino Mutual Water Company, which uses the water provided to blend with its one well for the purpose of Nitrate MCL reduction. ID#1's source water problem is Nitrate contamination in Well # 3, which exceeds Nitrate MCL. This well is critical to the water delivery capability in pressure Zone 2, which has the highest demand for domestic water and is needed to compensate for production losses in well #1 due to its nearly 60-year age. The decrease in production is further complicated by the uncertainty of the scheduled water deliveries from the State Water Project, and loss of several GWUDI (Ground Water Under the Direct Influence) wells due to floods and river shifting. As ID#1 will need to continue to meet the water demand and provide water to the City of Solvang, because of the State Water Project delivery amounts, ID#1 will need to backfill that supply with water from its groundwater basin. Additionally, Well #3 provides for necessary pressure to ID#1's pressure Zone 2 area, which, within specific locations do not meet fire flow standards. Well #3 is a high yield, reliable, Zone 2 well, capable of pumping 800 gpm, and reactivating it would	1,200,000	2,327	8,298	06	Santa Barbara	IV	2007
943	1010001	1010001-002	BAKMAN WATER COMPANY	Wells 10 & 13 DBCP Treatment	Install GAC treatment systems on Wells 10 and 13.	L	0	C	Wells 10 and 13 are contaminated with DBCP.	573,430	1,910	8,865	11	Fresno	III	2004

944	1010025	1010025-003	PARLIER, CITY OF	Integrated Well Storage and Distribution System	The City is adding an additional well and a storage tank to meet peak demands and fire flow. The problem comes when some wells must be shut down because of elevated DBCP levels. The DBCP levels range from .22 - .41. The current State Maximum Contaminant Level (MCL) for DBCP, set by DHS, is 0.2 µg/L. The city finds it more economical to to have storage versus drilling another well. The City also has no way of knowing if a well is having problems until complaints are received. A SCADA system will allow the City to better monitor and manage which wells are in service and how the storage tank can best be utilized to avoid distribution pressure problems, especially during power outages, peak demands or fire flow conditions. The SCADA software can be tailored to provide decision making routines based upon collected data from all of the well sites. The SCADA can notify City staff as soon as a problem is detected at a well site. This will avoid distribution pressure problems and maximize use of available wells and future storage. The City staff will be able to make control inputs from a central location and avoid the time lag associated with having to drive to each well site. The SCADA can also provide security for the well site by incorporating intruder alarms. The	L	0	C	The City currently has sufficient water supply and distribution when all wells are online. The problem comes when some wells must be shut down because of elevated DBCP levels. The DBCP levels range from .22 - .41. The current State Maximum Contaminant Level (MCL) for DBCP, set by DHS, is 0.2 µg/L To correct this problem, the City is adding an additional well and a future storage tank. The City also has no way of knowing if a well is having problems until complaints are received. A SCADA system will allow the City to better monitor and manage which wells are in service and how the storage tank can best be utilized to avoid distribution pressure problems, especially during power outages, peak demands or fire flow conditions. The loss of additional wells to DBCP contamination and the need for storage to meet peak demands and fire flow necessitates storage tank. Drilling another well is more expensive than storage and it is becoming more difficult to find good water in the area. The City has received a violation for bacteria contamination. The city is required to do continuous chlorination.	1,200,000	2,229	12,058	11	Fresno	III	2007
945	4010004	4010004-005	GROVER BEACH WATER DEPARTMENT	Nitrate compliance	Replace unit with new Chemscan UV-3100 and process analyzer	L	0	C	Nitrate removal treatment plant needs upgrades to comply with the nitrate MCL.	30,000	5,203	13,248	06	San Luis Obispo	IV	2006
946	1510012	1510012-005P	Lamont Public Utility Dist	Plainview Well Rehabilitation Project	Plainview well # 3 was taken off line and abandoned due to high nitrates.The proposed project is to first perform a groundwater study of this site to gather the necessary information for redrilling to a different aquifer, within the location of the existing well site, where nitrates are not present.Upon receiving results of the groundwater study, the second step will be to drill a new well at the suggested depth to bypass nitrates and begin producing water from a viable groundwater source.The following steps will require a new motor, pump, connection to existing system and existing on site storage tank.	L	0	C	The Plainview Rehabilitation project will address the excessively high nitrate problem at this site.The drinking water standard exceeded the MCL for nitrates.	10,000	3,603	13,296	12	Kern	III	2008
947	1510019	1510019-005	Shafter, City of	Arsenic Treatment at Well 15	The City has started to conduct pilot studies of the three accepted Arsenic treatment options which are adsorption, ion exchange and coagulation and filtration. The option that presents the most cost-effective solution will be chosen and we would immediately commence the design and construction of that full-scale treatment system. Because any of the treatment options considered will hydraulically impact the existing well's ability to produce a desirable amount of flow with the addition of new vessels and discharge piping, the pump will need more impeller bowls added to its multi-stage assembly. A new motor equipped with a variable frequency drive will also be needed because of the additions to the pump and to efficiently adjust the flows to the actual needs of the system. A hydropneumatic tank is also needed to regulate the water pressure exiting the well.The City's sewer collection pipeline system is in the immediate vicinity to discharge wastewater from any media or process used to treat for Arsenic.	L	0	C	The City of Shafter constructed a groundwater well in 2004 per State drinking water standards adjacent to its inactive wastewater plant. The City has been intending to tie the well into its distribution system once the wastewater plant was properly abandoned and the site could be used for redevelopment purposes to promote job growth. The City has designated the well as "Well 15". The plant is now abandoned but it has been revealed that the well's Arsenic levels exceed the State's new maximum contaminant level of 10 parts per billion (ppb). Currently, the levels are at approximately 16 ppb. Having access to this well is critical to the City's ability to market the neighboring area for economic development and job growth but the typical price of constructing an Arsenic treatment exceeds what our water capital improvement and operational reserves can fund.	2,250,000	3,863	15,609	12	Kern	III	2009

949	3510003	3510003-007	Sunnyslope County Water Dist	Lessalt Surface Water Treatment Plant Disinfection By-Product Compliance Upgrade, System Intertie, &	The construction of the Lessalt Surface Water Treatment Plant retrofit will consist of two phases. In the first phase, alum coagulant (PACL), and polymer will be added to the influent side of the existing treatment plant to reduce total organic carbon, lower chlorine demand, and reduce disinfected byproducts. The coagulated water will then flow in a retrofitted detention chamber where it will be subsequently treated by existing microfiltration filters. Following microfiltration, the filtered water will enter a new clearwell and be pumped into the Fairview and Ridgemark Potable Water Pressure Zones via two new 4000 foot long pipelines for additional contact time. At the Fairview Potable Tanks the tanks will be reconfigured for additional contact time, turnover circulation, and chlorine residual monitoring and rechlorination. Phase one will also have a pilot study to determine the effect of proposed nanofiltration following existing microfiltration on disinfected by products, especially brominated species.In the second phase, after the nanofiltration pilot study, additional treatment will be added to reduce disinfection by-products. At this time, it is assumed that nanofiltration will be effective in reducing disinfection by-products to compliance levels. Preoxidation will also be added, and existing non oxidant tolerant membranes will be replace by oxidant tolerant membranes. Additionally, the	L	0	C	Currently the Lessalt Surface Water Treatment Plant will not meet the upcoming disinfection byproduct rule for potable water which is slated to take effect in 2012. The renovation of the Lessalt Surface Water Treatment Plant will allow the Lessalt Potable Water System, the City of Hollister Potable Water System and the Sunnyslope County Water District System to meet the disinfection byproduct rule in 2012. Additionally, the Lessalt upgrade will increase the reliability of the Lessalt Treatment Plant to effectively operate at 3 million gallons per day, and supply potable water to the Ridgemark Potable Water Pressure Zone with soft treated surface water. Once the Ridgemark Potable Water Pressure Zone receives soft treated surface water, water customers in the Ridgemark Potable Water Pressure Zone will discontinue using salt based water softeners which customers currently use to reduce hardness. The discontinuation of the used of salt based water softeners will allow the Ridgemark Wastewater Treatment Plant to comply with its primary discharge requirements for total dissolved solids, sodium and chloride which it is currently in violation of. The improved water and treated wastewater quality will also produce recycled irrigation water of sufficient quality to replace imported raw water from the Sacramento Delta which is currently used for irrigation.Currently the Lessalt Treatment Plant	17,129,300	5,241	16,713	05	San Benito	II	2009
950	1910130	1910130-002	QUARTZ HILL WATER DIST.	Well 6A Arsenic Mitigation	Quartz Hill Water District is planning on partially abandoning Well 6a. The planned start date for this project is fall of 2007. According to Los Angeles County Water Works District 40, the aforementioned process takes approximately two weeks to complete. The partial abandonment process is done by removing the shaft and bowls within the well. Then a compactor is lowered to the strata where the high levels of arsenic have been detected. A fine grout will then be pumped into the area where the arsenic heavy water is present which effectively seals off the portion of the well where the contaminants reside. The compactor is then removed and the shaft and bowls are replaced, and pumping can resume.	L	0	C	Do to the EPA lowering the MCL for Arsenic on the 23rd day of January 2006 Quartz Hill Water District has had to suspend use of Well 6a due to high levels of arsenic being detected in the water. Several alternative blending plans have been implemented in hopes of mitigating the arsenic problem, but none have been found to be successful. For this reason Quartz Hill Water District is planning on partial abandonment of well 6a (one of nine active wells). Since the arsenic problem with in this region is very localized (primarily one strata), the planed course of action is to “micro grout” the region of the well were the levels of arsenic are much higher. It is currently believed that the elimination of this strata will not affect greatly affect the production of this well. In January of 2007 Department of Health Services notified Quartz Hill Water District that they had received a Tier II violation. Due to this violation, we have suspended use of Well 6a.	65,000	5,490	17,050	16	Los Angeles	IV	2008
951	1910245	1910245-006	SANTA FE SPRINGS - CITY, WATER DEPT.	Standby well - arsenic compliance	Destroy existing well and construct a new replacement well with arsenic treatment facility	L	0	C	Water well 02 had Arsenic level @ 14 ug/L. Size of the well can not accommodate any treatment facility	2,000,000	5,209	17,438	22	Los Angeles	IV	2004

952	3410016	3410016-002	Orange Vale Water Company	OVWC Well No. 2 Replacement Project	The project will provide up to 2,000 AFY of reliable water supply for the OVWC and will play an important role in the Regional Water Authority's and San Juan Water District's dry year plans by creating the possibility of forgoing portions of its surface water supplies, and allow both agencies to meet the terms of the Water Forum Agreement. It may be cost effective to rehabilitate the existing well but even with rehabilitation the production rate would be significantly decreased. This project would replace Well No. 2 on the same site with a new well equipped with an electric motor and pump, disinfection equipment, and space for a backup generator for emergency power. The project would also include a complete CEQA review, permitting, and the destruction of Well No. 2 according to California Well Standards. The intended capacity of the well is 1,200 to 1,800 gpm. Prior to the destruction of Well No. 2, extensive pumping and analytical testing program would be conducted to confirm the absence of perchlorate and other contaminants. Concurrent with this work a CEQA review will be conducted; however, it is anticipated that a Notice of Exemption will be adequate due to the replacement nature of the project. Upon successful completion of this program, the dismantling and destruction of existing Well No. 2 would begin. Following the destruction of Well No. 2 and completion of the permitting processes, the	L	0	C	The Orange Vale Water Company (OVWC) is located in northeast Sacramento County, encompasses approximately 4.8 square miles and serves approximately 17,500 customers. OVWC now receives 100% of their supply from surface water supplies through its parent wholesale agency, San Juan Water District (SJWD). Two existing groundwater supply wells have been used for emergency and dry year supply (Well No. 1 and Well No. 2); however, these wells have deteriorated over time which has resulted in the production of an unacceptable amount of sand, significantly reduced specific capacity of the wells, and Well No. 1 has now been impacted by perchlorate. In 2007, through Proposition 50 grant funding and in coordination with the Regional Water Authority and San Juan Water District, OVWC was awarded $400,000 in grant funds for the installation of a conjunctive use replacement well (Well No. 3) with a total cost of $1.4 M. The new Well No. 3 is located in the OVWC Corporation yard within approximately 300 feet of the existing Well No. 1. Well No. 3 was completed in June 2008 with a tested yield of approximately 2000 gpm but has recently been impacted by perchlorate (June 2008). With all three wells no longer reliable OVWC has lost a combined 4,500 gallons per minute supply - even for emergency use. This makes OVWC vulnerable to lack of water supplies as well as providing conjunctive use	850,000	5,327	17,500	09	Sacramento	I	2008
953	3010017	3010017-002	Laguna Beach County WD	City of Garden Grove/Laguna Beach County Water District Nitrate Removal Facility	The City of Garden Grove (City) is seeking grant funds in the amount of $4,000,000, to fund the City and Laguna Beach County Water District's (District) Nitrate Removal Project. This project is located in Northern Garden Grove, between Chapman Avenue and Lampson Avenue, near Euclid Street. This project is scheduled to begin in September 2009 and will be completed in February 2010. The Nitrate Removal Facility will require the following equipment and activities: installation of an Anionic Ion Exchange Facility, ion exchange vessels, valves and gauges, resin, brine system, nitrate analyzer, control system, rinse tank, waste tank, bag filter, booster pumps, concrete work, yard piping, mobilization/demobilization, electrical, instrumentation and brine bump station.The project will be publicly bid and constructed through performance specifications. A discharge permit will be obtained. The Site Specific Work Plans will describe procedures and methods for completing the Nitrate Removal Facility under health and safety requirements.A licensed contractor will then be selected to perform services within the Site Specific Work Plan, under acceptable labor compliance practices. Prior to implementation, all affected regulatory agencies will be notified in a timely manner. The proposed Nitrate Removal Facility activities will fulfill State of California Treatment Facility Standards and Orange County Water District requirements for	L	0	C	The City of Garden Grove (City) and Laguna Beach County Water District (District) are coordinating a project that will provide additional water supply as well as protect the Orange County Groundwater Basin through a Nitrate Removal Project. In June 2005, City of Garden Grove had to shut down a groundwater well in response to surveys indicating an ever-increasing concentration of nitrate that exceeds state and federal drinking water standards, in an area historically used for agricultural purposes. Under these circumstances, there is a potential threat for contamination in deep aquifers will affect the potable water supply needs of northern and central Orange County, which consists of nearly 2.3 million residents. This project was a recommendation in a recent feasibility study conducted by Carollo Engineers and sponsored by the Municipal Water District of Orange County (MWDOC).The City relies heavily on groundwater sources from the OCWD. Approximately 69% of potable water supply is pumped from groundwater to support a population of over 172,000. In contrast, the District currently relies on 100% imported water supplies to support a population of over 24,000 and owns groundwater-pumping rights that are currently not fully utilized. Therefore, the District seeking to partner with the City to enable them to exercise their groundwater pumping rights after the Nitrate Removal Project is completed. 960	2410001	2410001-002	ATWATER, CITY OF	Well #22 Construction Project	Well #22 Construction Project is currently in the design phase and CEQA has been completed. The only obstacle to construction is funding. A new well will be constructed and approximately 1,000 feet of 12 inch pipe will connect the new well to the current system. This project would consist of construction of a new municipal well, pumping equipment, electrical and controls, an emergency generator and site work. A test well was completed and analyzed to 700 feet and contract documents with specifications have been prepared and ready for a bid call when funding is secured. Well #22 will have a capacity of 1,500 gpm which would go a long way in covering the 1,570 gpm deficit the Atwater system is currently experiencing.	L	0	C	The City of Atwater is located in Merced County in Central California. The climate is dry and mild in the winter and hot in the summer. Rainfall occurs between November and April, and rarely during the summer. High temperatures and low humidity in the summer months lend to a generally much higher water usage. The City's water users consist mostly of residential, commercial, and industrial with some agricultural customers. The City's water supply is entirely from groundwater wells with an average annual consumption of 2,869 MG and a daily average demand of 5,650 gpm. The City of Atwater's existing water system consists of ten groundwater wells serving a current population of 27,369 based on 2009 estimates from the California Department of Finance and it is anticipated the population will increase to 38,800 by buildout. A nearby federal prison is connected to Atwater's system but has its own well. As of December 2009, nine of the ten wells are active and per a discussion with a representative from California Department of Public Health recently, Atwater is on the brink of not meeting capacity. Our largest well, Well #15, is inactive due to elevated nitrate levels (over 60 ppm) that exceed the California Department of Health Services standards. As a result, Well #13 was recently on standby due to elevated levels of ethylene dibromide but is currently active and supplies water to the system on an as-	650,000	6,721	28,100	11	Merced	III	2011

967	1910070	1910070-012	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Arsenic Treatment in Well 4-36	This project is for the removal of arsenic from the groundwater pumped from Well No. 4-36 to ensure compliance with the new arsenic standard. To accomplish this goal, the District proposes using one of the commercially available ion exchange systems for arsenic treatment. Ion exchange is designated as Best Available Technology by the US EPA for the removal of arsenic from drinking water sources and some ion exchange treatment systems have already been permitted by the California Department of Public Health and are in operation in the State. Also, a typical ion exchange treatment process is simple, robust, compact, easy to automate, and can be operated on demand. The treatment goal is to remove the arsenic in the effluent (treated) water to less than 4 ppb, meeting the arsenic standard of 10 ppb. The proposed packaged wellhead arsenic removal system includes a treatment module, pre-filter assembly, salt/saturator tank, brine processing unit, and brine wastewater storage tank(s). Details of each component that is sized to treat the flow rate from Well No. 4-36 at 900 GPM are as follows. The treatment module (i.e., ion exchange system) uses multiple columns of ion exchange resin operating in parallel to remove the arsenic from the well water. The columns	L	0	C	Arsenic is the primary contaminant to be addressed by the project. Arsenic in drinking water has been shown to impact human health and is considered one of the prominent environmental causes of cancer in the world. The Safe Drinking Water Act Amendment of 1996 required the United States Environmental Protection Agency (USEPA) to finalize a new drinking water standard for arsenic. In January 2001, the USEPA adopted a new arsenic standard of 10 parts per billion (ppb). The new standard became effective in January 2006. The Los Angeles County Waterworks District No. 40, Antelope Valley, Regions 4 & 34, Lancaster (Regions), serves approximately 145,000 people through over 47,000 service connections in the Lancaster and Palmdale areas of the Antelope Valley. During 2006, approximately 20 percent of the water supply in the Regions was groundwater. The groundwater is extracted from 33 wells drilled into the aquifers in the Lancaster Subunit of the Antelope Valley Groundwater Basin impacted by arsenic which is naturally present in rocks and minerals. The District collected six arsenic samples between April	820,000	46,878	144,215	16	Los Angeles	IV	2007
968	1910070	1910070-024	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Arsenic Treatment in Well 4-43	This project is for the removal of arsenic from the groundwater pumped from Well No. 4-43 to ensure compliance with the new arsenic standard. To accomplish this goal, the District proposes using one of the commercially available ion exchange systems for arsenic treatment. Ion exchange is designated as Best Available Technology by the US EPA for the removal of arsenic from drinking water sources and some ion exchange treatment systems have already been permitted by the California Department of Public Health and are in operation in the State. 979	3610041	3610041-024	SAN GABRIEL VALLEY WC - FONTANA	Plant F26 Perchlorate Treatment Facility	Plant F26 occupies an approximately 0.50-acre lot on Micallef Street between Sierra and Mango. The proposed project will consist of grading and site work to provide a well-draining site with appropriate Stormwater treatment facilities and the construction of four (4) new ion exchange reactor vessels with related piping to remove perchlorate from the groundwater prior to construction. Additional electronic controls will be installed to provide both local and remote indication and control of the new facilities.	L	0	C	Well F26A is a critical production well in the north east portion of the Fontana Water Company service area that produces approximately 2,000 gpm. The well has been impacted by perchlorate with an historic high of 6.0 ppb. The Department of Public Health has established a drinking water maximum contaminant level for perchlorate of 6.0 ppb. It is necessary to construct an ion exchange system to remove this pollutant from the groundwater from this well prior to consumption.	1,500,000	42,871	153,647	13	San Bernardino	V	2008

980	3610041	3610041-025	SAN GABRIEL VALLEY WC - FONTANA	Plant F23 Perchlorate Treatment Facility	Plant F23 occupies an approximately 1-acre lot on Boyle Avenue between Citrus and Catawba Avenues about one block south of the I-10 Freeway in the City of Fontana. The plant is located in the south central portion of the Fontana Water Company service area and provides a critical source of supply to the south end of the system. The proposed project will provide new facilities to remove the pollutant perchlorate. The project consists of regrading to provide a well-draining site with appropriate Stormwater treatment facilities. New asphalt pavement will provide site access by maintenance vehicles and parking. Construction of four new ion exchange reactor vessels with related piping and controls to remove perchlorate from the groundwater prior to consumption. Additional electronic controls will be installed to provide both local and remote indication and control of the new facilities.	L	0	C	Well F23A is a critical production well that produces 2,500 gpm in the south portion of the Fontana Water Company service area. The well has been impacted by perchlorate with an historic high of 6.0 ppb. The Department of Public Health has established a drinking water maximum contaminant level for perchlorate of 6.0 ppb. This project is partially funded by the Department of Defense through the ESTCP program and funding allocated towards this project is currently $653,000. Matching funds are available if Prop 50 funding is available for this project.	856,100	42,871	153,647	13	San Bernardino	V	2008

982	3410001	3410001-028	Sacramento Suburban Water District	Replacement Well for Well #19	One of the options for this well would be on-site treatment of the Tetrachloroethylene (PCE). Treatment of groundwater containing PCE typically is performed with traditional pump-and-treat technology using air stripping or activated carbon filtration. It is estimated that the cost of a 1,000 gpm granular activated treatment system for this well would be in the range of $700,000 to $1,000,000 (not including design, permitting or construction management). This also does not include the cost of acquiring additional property. This well was drilled in 1951 and currently has a capacity of 950 gpm. Becasue of it's age and the fact that the site is tight with very little potential for acquiring additional property for treatment equipment, the preferred option to the District would be to drill a replacement well. The replacement well would have a mimimum capacity of 1,500 gpm. The District already owns a well site within 1/2 mile of the Balmoral/Yorktown Well (#19) that could be used for the construction of a replacement well. There is an existing monitoring well on the proposed site of the replacement production well and this monitoring well could be used to monitor water quality and groundwater depth. When this monitoring well was constructed water quality samples were collected and the water met all current federal and state drinking water standards. Since the District already owns the	L	0	C	The Balmoral/Yorktown Well (#19) (PS Code #3410001-014) has a current pumping capacity of 950 gpm. On June 11, 2009, staff collected samples in accordance with Title 22 in the District's South Service Area (SSA). The results from Well #19 showed a detection of Tetrachloroethylene (PCE) at a concentration of 5.9 ug/l which is above the Maximum Contaminant Level (MCL). The MCL for PCE is 5 ug/L. Well #19 was immediately placed off-line upon notification by the laboratory of the test results. PCE is a colorless organic liquid with a mild, chloroform-like odor. Its greatest use is in the textile industry, and as a component of aerosol dry-cleaning products. The California Department of Public Health (CDPH) requires that a confirmation sample be collected when PCE is detected, with the average value compared to the MCL. On June 24, 2009, a confirmation sample was taken and the concentration of PCE was found to be 10.0 ug/l. Therefore, the average concentration of the two samples was 8 ug/l. The MCL is not violated until after the monthly (up to 6 months) sampling average exceeds the MCL. Staff is currently compiling information necessary to determine if monthly PCE monitoring can be conducted. In order to conduct monthly monitoring the well would have to pump to waste for approximately 1 hour prior to each sample collection. General waste discharge requirements set forth in the District's National	2,000,000	44,744	177,000	09	Sacramento	I	2009

990	3600070	3600070-002	Center Water Co	Consolidation of western Lucerne Valley water systems with Center Water Company.	Sources of water in the Lucerne Valley area are individual systems (parcel-by-parcel, well-by-well) operated by property owners and small mutual water companies, some of which currently cannot meet service requirements and will not likely be able to accommodate new hookups. There are numerous independent small water systems within the area that are overseen by the County of San Bernardino. Some wells in the higher groundwater levels upgradient of the Helendale Fault have shown evidence of somewhat higher Nitrate levels, although not to levels exceeding standards. Nitrate levels from tested wells west of the Fault averaged approximately 5 mg/l. Samples for Nitrates were taken at the Lucerne Valley Elementary School in April of 2005 and levels were observed to be 12 mg/l at this location. Higher Nitrate levels could be detected where wells and septic tank systems are in proximity to each other. Improvements to consolidate up to six water systems in the Lucerne Valley area were studied and evaluated in the Lucerne Valley Water & Sewer Preliminary Study, completed in 2006 by Nolte Associates. The project was conceived to take place in two phases. This project constitutes Phase 2 of a bigger water system consolidation effort among the Lucerne Vista Water	M	45	C	Source of water in Lucerne Valley are individual wells of property owners & small mutual water companies, some of which currently cannot meet service requirements & may be unable to accommodate new connections. 997	2010014	2010014-003	HILLVIEW WATER CO-GOLDSIDE-HIL	Goldside-2010014 Interconnect with Oakhurst - Source and Treatment	The primary solution to the water quality and quantity problems would be to interconnect and consolidate with the Oakhurst Sierra Lakes Water System. The 16,500' of 12" pipeline to intertie would allow blending for a higher quality water and provide a continuous reserve for emergencies and routine maintenance of the Goldside water system. Drilling two new wells on existing water lots and installing iron and manganese removal on the south side of the Goldside system and blending will eliminate all water quality problems in the Goldside area. This would also make it feasible for interties or consolidation to help several small Madera County maintenance districts neighboring the Goldside water system. This economy of scale would benefit the water quality and limit the skyrocketing costs for water in this area. It would also improve fire flow. Security is an ever present priority which could be done with 1,200' of 6' privacy fencing with razor wire around all wells and equipment sites, coupled with SCADA to maintain and further secure the system.	M	45	C	The Goldside water system is located over the "Fresno River" underground flow of water. Salt water is the inevitable result if wells are drilled below a certain level. Once this happens, the well is no longer usable because of the high cost of treating the water and disposing of the salt waste. Additionally, the water in the area is high in iron and manganese, which can cause problems for consumers. The existing wells have been fairly consistent over the years, but there has been some diminishing output recently due to low precipitation years. The inability to closely monitor well levels and other important indicators will cause service and maintenance response problems as the system ages, greatly reducing the longevity of the existing wells. Additionally the system does not have adequate security.	3,849,780	314	927	11	Madera	III	2009
998	1510041	1510041-006	North of the River MWD	Water Transmission Intertie/Redundancy Project	There is now under construction a second 27 inch line that is about one mile in length. This proposed project would connect to the end of that new main, and increase the sizes of some of OMWC's water mains such that a redundant water transmission pathway would exist completely independent of the current transmission main, and connecting into NORMWD's system. The design is already complete.	M	45	C	The community of Oildale is served by two water agencies, North of the River (2000 customers) and Oildale Mutual Water Co.(7000 customers). They receieve their water supply from a treatment plant 3 miles away., through one 27 inch pipeline. If that line were to rupture, service could be interupted for days.	1,800,000	2,025	7,500	12	Kern	III	2009
999	5500152	5500152-004	CURTIS CREEK ELEMENTARY SCHOOL	Curtis Creek School District Water Connection to Tuolumne Utilities District	Tuolumne Utilities District (TUD) has water available within a reasonable accessible distance of the school site. It is estimated that a minimum of a 12 inch line run approximately a half mile will be needed to meet the needs of the fire hydrants as well as the school. The school is required to provide its own link to the main line. Through the Office of Public Hardship Program the lines on campus have been replaced. Unless the water source is also replaced, this solution is only temporary. TUD has established the fee for the District to connect to TUD water at the rate of $431.00 per student, which is $215,500.00 as our current student count is right around 500. The District cannot afford to pay that fee and is seeking funding to make this connection and bring the service to the school location. It is imperative that this work be done as soon as possible to protect the long term health and safety of the school's students and staff and to insure the future of the school.	M	45	P	Curtis Creek School relies on well water for all of its watering needs. The well is a very old one having been drilled in 1957. The well services nearly 600 students and staff during the school year. It also is used to irrigate approximately 5.5 acres of lawn areas which includes two large ball fields. Water is pressurized in a metal tank and the water quality is declining. In the recent past we have had bacterial contamination of the water system which required work to be done to the well casing and resulted in the closure of the school. At the beginning of the current school year we had a failure of the well which resulted in the closure of the school for one day due to the inability of the well to meet the water demands of the school. Sediment was pumped into the schools water supply. The public was notified via a CONNECT ED message of school closure for one day. The following day a do not drink order was in effect. Bottled water was provided to students and staff. Efforts have been made to improve water quality and reliability but they are only temporary fixes as the declining well is currently unable to meet our needs. We are losing our ball fields due to inadequate supply and due to the age of the well we are on borrowed time. Water pressure is inadequate to regularly flush the pipes and keep deposits from collecting. Steps have been taken to improve water quality by replacing all of the metal pipes and corroded lines with new piping. In	500,000	1	595	11	Tuolumne	III	2012

1011	5500041	5500041-002	ALPINE ACRES MUTUAL WATER CO	Alpine Acres Water Supply/Intertie Project	This intertie project will connect Alpine Acres MWC's existing facilities to TUD's Crystal Falls system. The intertie will require approximately 1,400 l.f. of 8-inch line to be laid along with appropriate valves, master meters, road repairs, engineering, inspections etc.	M	35	C	Alpine Acres MWC seeks to consolidate its operations with Tuolumne Utilities District to improve the reliability of water supply and delivery operations. The Company currently relies on two wells to serve its customers. This groundwater supply fails to meet secondary standards for Manganese and/or Iron content. The system includes no treatment facilities. Currently, untreated water is served to all customers. Further, the ground water supply has been unpredictable leading to service interruptions. This intertie project will convert the system's supply to more reliable treated surface water.Alpine Acres MWC's small size presents operational challenges. Maintenance of the delivery systems using primarily volunteer labor from the company's membership has led to service interruptions. Consolidation with TUD will provide access to TUD's maintenance staff and will reduce duration of future service interruptions.Note that the Company is currently unable to determine the median household income for its service area. Because many customers are retired and because many of the residences served are quite modest, we believe that many customers do have household incomes below $46,731. We request DWP's assistance in determining the median household income of our service area.	282,857	61	100	11	Tuolumne	III	2009

1014	0910007	0910007-006	Lukins Brothers Water Company	Lukins Brothers Water Company Distribution System Upgrades	Lukins Brothers Water Company (LBWC) was formed in 1946 by Melvin Lukins to serve seasonal and annual residents in the Lukins Brothers real estate subdivision. In 1953, Lukins was granted a Certificate of Public Convience and Necessity. The system's 20 customers were served by two wells through two-inch and four-inch mains. The system now includes approximately 400 feet of two-inch main, 48,000 feet of four-inch main, 7,600 feet of 6-inch main, and 1,300 feet of 8-inch main. The mains and wells are almost fully depreciated, and are near the end of their normal service life. Some parts of the system cannot carry enough water for adequate flow because the mains are too small, and many of the mains and wells are between 50 - 60 years old. On June 24, 2007, the Angora fire, ignited by an illegal campfire burned 3,100 acres of land and destroyed 254 homes in and around the City of South Lake Tahoe. Shortly after this catastrophic event, emergency assessments were conducted and the magnitude of the inadequate water flow was brought to the forefront of concern by residents and local agencies. The City of South Lake Tahoe, local fire agencies, customers, and Lukins all want the Lukins system to be improved. The enormity of the improvements are far above the financial ability of the Lukins Brothers Water Company. The Public Utilities Commission of the State of California agrees with the imminent need for	M	35	C	Lukins Brothers Water System (LBWC) serves approximately 650 acres, with 942 connections. The system is comprised of approximately 54,000 feet of water main of which about 45,000 feet are 4-inch diameter steel pipe. Five wells origianlly supported the system's water supply but two wells are abandoned due to the presence of Synthetic Organic Chemicals (SOC's) and two others are of questionable value because they showed small traces of Perchloroethylene (PCE's) in the most recent sampling. In addition, the current distribution system cannot meet local and State fire flow requirements of a least 1,000 gallons per minute (gpm) for residential and 1,500 gpm for commercial. The ISO rating of fire protection for part of the Lukins service area is 9/10, the lowest rating for fire safety. This becomes increasingly dangerous, as evidanced from the 2007 Angora Fire event in South Lake Tahoe where more than 250 homes were destroyed. Had the fire spread less that a mile from where it was contained; it would have encroached in the LBWC area, in which the current system would not have been able to handle the needed water flow requirments. This could have lead to a much larger catastrophe losing many more homes and businesses to the fire. Currently the 4-inch diameter mains only flow at rates as slow as 100 gpm, far below the fire flow requirements of 1,500 gpm. To meet standards, all 4-inch diatmenter mains will need	24,000,000	905	250	09	El Dorado	I	2009

1015	5510027	5510027-001	TUD-Cuesta Center-Lambert Lakes	Curtis Creek School	Tuolumne Utilities District (TUD) is installing water within a reasonable accessible distance of the school site. This has previously not been an option for the district. The school is required to provide its own link to the main line. Through the Office of Public School Construction Critical Hardship Program the lines on campus have been replaced. Unless the water source is also replaced, this solution will only be temporary. The TUD has established the fee for the district to connect to TUD water at the equivalent of 32.9 residential units, which is $160,000.00. The district cannot afford to pay that fee and is seeking funding from the Department of Health Services Division of Drinking Water and Environmental Management to make this connection and protect the long term health of the school's students and staff.	M	35	C	Curtis Creek Elementary School is located in rural area of Sonora, California. The campus houses nearly 500 students and staff during the school year. The current water source is a well. Water is stored in a metal tank and the water quality is declining. Efforts have been made to improve water quality but they are temporary fixes. Water pressure is inadequate to regularly flush the pipes and keep deposits from collecting. Steps have been taken to improve water quality by replacing all the metal pipes and corroded lines with new piping. In addition, the well does not provide the pressure required to serve the five fire hydrants recommended by the Tuolumne County Fire Protection District.	160,000	200	491	11	Tuolumne	III	2007
1016	1710019	1710019-001	Lake County CSA 6 - Finley		Construct 100,000 gal storage tank and evaluate consolidation with Kelseyville and Soda Bay systems.	M	35	C	During high demands, source becomes taxed. No long term storage exists.	500,000	207	590	03	Lake	II	1998
1017	1710019	1710019-002	Lake County CSA 6 - Finley		Conduct capacity analysis and develop master plan, study possibility of consolidation with Soda Bay water system.	M	35	C	System needs a capacity analysis and master plan to comply with Lake County General Plan. Current deficiencies include storage source reliability. 1018	5510019	5510019-002	TUD - Mono Village Water System	Mono Village System Improvements	This project involves the construction of a new six inch pipeline, 2050 feet in length, 750 lineal feet of ten inch pipeline and new valves. The existing surface water treatment plant will remain in service. The project includes the elimination of the existing contaminated well. The construction of this new pipeline from the existing WTP to the storage tanks will further address the backwashing needs of the WTP.	M	35	C	The Mono Village water system was acquired by the Tuolumne Utilities District (TUD) in January of 2004 at the request of the Mono Village Mutual Water Company. It was determined by the Mono Village Mutual Water Company that it would be best that the TUD take over the ageing water system to meet the needs of the existing customers. The system is comprised of four wells and a limited capacity surface water treatment system. The WTP can not meet the summer demands of the system and the wells are run all year round to meet the consumptive demands and for operational efficiency. One of the wells in the systems that supplies 19.5 % of the total well capacity has tested positive for Uranium above the State standards. In addition, all the other existing wells exceed the secondary standards for manganese and iron. The current manganese and iron treatment unit is plumbed in such a manner that all water, including the treated water from the surface WTP, must be re-treated and it requires that untreated well water be used for backwashing of the WTP.	374,080	275	649	11	Tuolumne	III	2007
1019	1805007	1805007-006	Herlong Utilities Incorporated	Herlong Trailer Park Connection	Connect the Trailer Park to the Herlong Public Utility District's system. After completion of construction of the district's new storage tank, the district will have the capacity to provide service to the park. The district would construct a 6"inter tie to the parks system.	M	35	C	The Herlong Trailer park currently operates its own water well along with sewer collection and a septic system. There is concern about adequate separation between the drinking water supply and the septic. It is unknown to what standard the well was drilled and developed; and is undertermined if there is an adequate sanitary seal.	286,250	1	1,200	02	Lassen	I	2009

1020	2010008	2010008-001	Madera County M.D. #10A - Madera Rancho	Consolidation with MD-95	Create an intertie with MD-95, Ranchos West water system, directly to the west. The project would entail installation of approximately 4,020 feet of 8-inch C-900 PVC water main. Additional appurtenances, pavement construction, etc may be required.	M	35	C	MD-95 is a small water system adjacent to MD-10. Their system currently has three well (South, East and North Wells). The South Well is the primary source of water, producing approximately 125 gpm. The East Well produces a small contribution at 10 gpm. The North well is contaminated and therefore provides no contribution to the water supply. The system serves thirty-one one-acre lots, with a water demand factor of 1.9 gpm, placing the calculated water demand at 59 gpm. The Maximum Daily Demand peaking factor is 2.4, placing the MDD at 142 gpm. Similarly, the Peak Hourly Demand peaking factor is 3.2, placing the PHD at 189 gpm. The current well system cannot meet the MDD and PHD, causing a potential low pressure issue. Additionally, all three wells have a sanding problem and only the South well is currently producing sufficient water.	322,000	922	2,255	11	Madera	III	2009
1021	4510002	4510002-007	Mountain Gate C.S.D.	regional water intake phase 1 shasta lake	this project is phase 1 of a regonal water supply provideing all the water to mtn gate and intertie with 2 other agencys. construction of an intake structure at beaver island shasta lake to replace the obsolete old one. install intake pipes into the pit river arm of the lake replace the high voltage power line under the lake to the island .construct 2250 ft 24 in. raw water transmission main to boosterstation site and tap off into mtn gate booster diversion .this would conclude phase 1	M	35	C	current intake structure at shasta lake is in failure .intake structure is 20ft out of water .emergency float pumps have been in constant use sence july of 2008.the district will not be able to supply necessary maximum day demand as it rises through the summer.public health and safety are at risk due to unreliable system requiring constant monitoring and maintainance. the district will be unable to maintain required fire reserves in the upcoming summer months.	264,300	664	2,500	02	Shasta	I	2009
1022	1710007	1710007-002	Kelseyville Co Waterworks District 3		Conduct capacity analysis and develop master plan, study possibility of consolidation with Soda Bay water system.	M	35	C	System needs a capacity analysis and master plan to comply with Lake County General Plan. Current deficiencies include supply and storage inadequacies. 1027	5400639	5400639-001	TRAVER SCHOOL	Traver School to Traver City Water System	The school site is approximately 1/2 mile from the "city" well(s) that we hope to hook up to. It may be necessary to assist too with part of the cost of a new well for the town in order to have the water capacity that would be required when the school goes online. I would expect that a 6 in. line (minimum) would be necessary to carry the flow that is needed. That would be for about 1/2 mile. The existing school pump is about 400 feet back from the street side of the property ie the line would have to be laid through an area of existing water pipes, sewer lines and underground electrical lines. Once on the street right of way we would expect a relatively clear track in front of the school to a point where it would go under the street and to the West for about 1/4 mile. We would work with California Water Services to meet all local, state and federal requirements in relation to bringing good clean water to the school site. At the same time we would evaluate our old well more thoroughly in anticipation of making it available for back up purposes or possibly to use for irrigation purposes as long as it is functional for that.Traver School was founded in 1883. We expect that the school/town will be here for many years to come. We are right on Hwy 99 about 5 miles South of Kingsburg, Ca. We look forward to working with you on this project.	M	35	P	The Traver Joint Elementary School District is a Kindergarten through 8th grade, one school district in Northern Tulare County. It currently has one well that is 50 plus years old. It is an open bottom well with water at about 50 feet and a maximum depth of just over 100 feet. Currently we are drawing water from 80 feet. In the past we have had some problem with fecal coliform but currently are clear. We have also recently had to deal with excessive sand being pulled up into the system. The one pump system serves both irrigation of 15 acres of playground as well as classroom, cafeteria and restroom and misc needs. The water system serves a school population of about 250 students and about 30 staff. (and in many instances nearly the whole community of 500 plus at special occassions) The population served is very low income. The adjoining "town" called Traver is an unincorporated area of Tulare County. The town (pop. 700 +) is served by a water system owned by California Water Services (Coalinga Ca.) We are very concerned that should the water system fail for any reason the school would be unable to operate. California Water Services has expressed it's willingness to work with us to tie into their system. We would hope to do so and to incorporate the school well as a backup to the wells that they operate. We have had a good working relationship with the California Water Services company. They assisted with a source of water	350,000	8	300	12	Tulare	III	2009

1030	4110028	4110028-001	Pillar Ridge MHP (Former El Granada MHP)	Consolidation of Pillar Ridge with Montara Water and Sanitary District	This project will support consolidation of the Pillar Ridge disadvantaged community water system with the MWSD public water system. Since there is an existing operational permanent connection between the two water systems, only minor improvements are required for this consolidation, as follows:1. Pillar Ridge Water Treatment Plant improvements to consolidate the controls and add the facilities to the MWSD's Supervisory Control and Data Acquisition System (SCADA). Other minor repairs and maintenance issues for the facilities are also included.2. Meter replacement: existing 228 meters will be replaced with new radio-read meters per the MWSD's standards.3. The 228 additional water accounts from Pillar Ridge community will be consolidated into the MWSD's billing and record keeping system.All these activities are expected to be exempt from CEQA. Categorical Exemption will be filed by MWSD as Lead Agency. All design and procurement documents and construction bid award and management will be carried out by MWSD,	M	30	C	Pillar Ridge Mobile Home Park (Pillar Ridge) is a small mobile home community located in Moss Beach, California, in the Montara Water and Sanitary District's (MWSD) service area. Pillar Ridges currently operates its own water system consisting of 3 groundwater wells, a storage tank, a water treatment plant, and raw water transmission lines, and a distribution system network. The system serves 228 mobile home residences in the community. In addition, MWSD currently provides water to Pillar Ridge through a permanent metered connection on as-needed basis. The Pillar Ridge community is designated a low- to extremely-low-income disadvantaged community. Pillar Ridge community has been experiencing difficulties with maintaining and operating its various water facilities, including the wells and the water treatment plant, securing certified operators, and carrying the high cost of maintenance and operations of the water system. In 2006, Pillar Ridge through its owner, Millennium Housing, has approached MWSD willing to consolidate its water system with the MWSD water system and transfer the ownership to the District. MWSD, although willing to consolidate and assist Pillar Ridge, had no ability to do so due to lack of funds to accommodate 228 new metered connections into its water system.This project will consolidate the entire Pillar Ridge water system into the MWSD water system and	450,000	228	1,000	17	San Mateo	II	2009

1031	1510019	1510019-006	Shafter, City of	Bishop Acres Mutual Water System Consolidation	In order to extend Shafter's water system to the Bishop Acres well site, a 12-inch supply line would have to be bored across a Burlington Northern and Santa Fe Railway (BNSF) line and a County of Kern road from the nearest City water line location. The City intends to assume ownership and responsibility of the existing Bishop Acres well but the pump will probably need to be lowered with possibly more impeller stages with an upgraded motor to properly meet the desired discharge pressure. The existing service connection meters should be replaced with City standard automatic meter reading technology to efficiently use staff for meter reads in this remote location. All Bishop Acres pipelines and appurtenances will also be deeded to the City for future operations.BNSF permitting of the water line bore work under their rail lines is expected to be the construction schedule critical path.	M	30	C	The community of Bishop Acres is located in an unincorporated area of Kern County near the intersection of Seventh Standard Road and Santa Fe Way. An existing mutual water system (System I.D. No. 1500434) is in place to serve approximately 27 service connections with one well. Although the well complies with drinking water standards, the system is not properly funded to cover all of its operational expenses and it's not properly equipped with a back-up water source if the only well is taken out of service due to power outages or well maintenance work.Representatives from Bishop Acres Mutual Water and the State Department of Public Health have approached City of Shafter officials about consolidating with the City's distribution system which is less than one-half mile away from the Bishop Acres well site.	500,000	3,863	15,609	12	Kern	III	2009

1044	4700503	4700503-002	Callahan Water District		Construct new storage tank and install new water mains.	M	25	C	Two inground storage tanks are old and deteriorated with marginal storage capacity. Deteriorated and undersized water mains.	650,000	29	70 01	Siskiyou	I	2002
1045	2010013	2010013-002	HILLVIEW WATER CO-COARSEGOLD	New well to augment single well	The proposed project consists of the construction of a new well.	M	25	C	The existing water system has only one hardrock well. An additional well is needed to supplement the existing well.	200,000	24	72 11	Madera	III	2008
1046	2010013	2010013-003	HILLVIEW WATER CO-COARSEGOLD	Coarsegold 2010013 Infrastructure-Fireflow and Security	Install approximately 230 feet of 6 foot high privacy fencing with coiled razor wire top, producing three lockable enclosed areas for the well sites, chlorination equipment and the storage tanks. Drill an additional well on an existing approved well lot and refurbish two 20,000 gallon water storage tanks so that both can be in service for fire flow and for maintenance. Install a SCADA system compatible with current systems so that the well sites, tanks, levels and treatment can be monitored electronically 24-7.	M	25	C	The Coarsegold area is growing due to a new casino in close proximity and the well source, chlorination and the storage tanks are unprotected at this time. The remote location exaggerates the risks from vandalism, terrorism and risks to water consumers due to treatment equipment failure. The one tank and one well do not allow adequate redundancy for maintenance and safety in event of a failed well, equipment failure or vandalism. The systems is located 12 miles from maintenance facilities, exaggerating all servicing and response times for problems. Additionally, it would be the closest source of water for firefighting in the area, but only one storage tank would not recover quickly enough for fighting a brush fire or supplemental water for a fire at or around the casino.	246,500	24	72 11	Madera	III	2009

1048	5403113	5403113-001	SOUTH FORK ESTATES MUTUAL WATER CO	SFE MWC Adddition of new well and upgrade of existing well	Existing well repairs= remove existing casing, set 10" casing; ream existing hole to 10"; 10" seal to 50'; set 8-5/8" casing; Tulare County permit; downhole perforation of casing; Total estimate for project= $86,881.00 and then add 10hp grundfos submersible pump; 620' 4/4 subcable; 10hp pump panel plus labor to pull sub, reinstall, electrical, and shop total = $15,012.00 added to the above for total of $101,893.00.New well: drill pilot hole, drilling 10" and 8"casing 710'; annulare surface seal to 50'; Tulare County permit; total = $29,456.00 Additonal costs to upgrade electrical panel, drop new pump, tie in to existing system took total estimate up to approximatly $100,000.	M	25	C	Our Problem: Due to several factors that have contributed to decreasing our well production, we desparately need to properly repair our well and drill another to supply our water needs.South Fork Estates Mutual Water Company is a small rural community water system that currently serves 33 connections and over 100 people. The existing water system has two wells; one deeper than the other. Over the past several years, we have seen decreasing output from both wells in addition to repeated pump failures in the higher producing well. The deep well, the higher producing one, has repeately required significant down time. Both wells are required to supply the residental water needs during the summer/fall months of the year. Over the past three years, the deep well went off line during the winter and spring months, when the other more shallow well had the capacity to supply the residential needs. This has resulted in several public notifications to limit water usage. Should the deep well fail during the summer months when the other well capacity is below the mimumin water needs of the households, the system will run out of water within 2 days despite severe conservation attempts. The deep well has consumed over $48,000 in the last two years and now requires another projected $100,000 to repair it. In light of the current drought in our area, the projected repairs may not be sufficient to cover the water needs of our	201,893	19	76 12	Tulare	III	2009
1049	1500336	1500336-003	BURLANDO HEIGHTS MUTUAL WATER CO.		Replace approximately 1500 feet of the distribution system water line.	M	25	C	Deteriorating distribution system water lines.	81,693	42	85 19	Kern	III	2000

1051	1500209	1500209-002	ALTA SIERRA MUTUAL WATER CO.	Main Water Line Replacement	Replace the existing 3,300' of 2" galvanized line with 8" C900 plastic water line, including inline block valves and necessary fittings to connection to the existing housing distribution system. As part of the upgrade we would like to include dry barrel fire hydrants at 500' intervals (this portion of the project may have to be funded by the landowners.)	M	25	C	The water distribution main line consist of 3,300' of 2" galvanized threaded line that was installed during the 1930's & 40's. The primary problem is that the metal makeup of the old galvanized pipe contains lead. The Water Company is currently required by the CDPH to test semi-annually for Lead. We have not been able to meet the minimum threshold level for Lead in serveral years despite our efforts to replace portions of the line and improve the system. A secondary problem is the line is undersized and does not adequately serve the community.	350,000	215	100 19	Kern	III	2009
1052	3301276	3301276-001	FULLER MUTUAL WATER COMPANY	Consolidation with Coachella Valley Water District	The goal is to connect with Coacheella Valley Water system and remove the well to provide an adequate and reliable water product to the community members. Discussions have already been started with CVWD and both parties agree with the concept, but details still need to be worked out.	M	25	C	The system is over 40 years old and the well pump and motor are being held together on a "band-aid" basis. The storage tank is also old and leaking. The entire system has no shut off valves to the individual homes causing countless service problems. The communnity consists mostly of low income families unable to pay for the repair costs. The well also have sand issues of which the homeowners are complaining even after flushing the lines.	175,000	35	100 20	Riverside	V	2009

1061	1200671	1200671-006	Benbow W.C.	Zone 2 Emergency Power Supply	Install a 15 kW, LPG fueled, standby generator system with automatic transfer switch and genset exercise control system in a weatherproof enclosure	M	25	C	Existing Pressure Zone 2 Pump System does not have an emergency source of power	35,000	101	150 01	Humboldt	I	2009

1062	1500341	1500341-002	SIERRA BELLA MUTUAL WATER COMPANY	Addition of new 50K Storage Tank on existing Tank Location	Sierra Bella will locate, purchase and install a 50K gallon tank in its exiting tank location to supplement the existing two 100,000 gallon tanks that currently are in operation. Existing plumbing in the existing valve house has been previously plumbed to accomodate an additional tank. Some source pipes from the pump house (300 ft) will probably have to be replaced to accomplish this project.The tank will be installed on the existing tank site in close approximation to the other 2 tanks. Additional of this new tank will also facilitate regular inspection, cleaning, and repairs for this and the other tanks.	M	25	C	During summer usage periods (July through October) Sierra Bella experiences high usage of water by customers who are visiting their cabins. During these periods, and especially during years of significant drought, Sierra Bella is exposed to periods of significant water depletion in its existing storage tanks, sometimes delivering to customers "Water Shortage Notices" and restrictions on personal use. The addition of this tank will add 25% storage capacity to the system and can easily be added to the existing valving system that has already been plumbed for this addition. The site is adequate to handle the additional tank. Sierra Bella believes that no CEQA of EIS are required to put this tank on the existing tank site. Sierra believes that is item falls under Category E, water system outages. No customer notices are currently in effect.	75,000	125	165	19	Kern	III	2009
1063	1500341	1500341-004	SIERRA BELLA MUTUAL WATER COMPANY	System Emergency Generator Capability	Sierra Bella will add sufficient emergency generator capability to operate the system is some limited capacity during an emergency. This will require additions to the existing Pumphouse to house the generators, control and interface systems to the existing electrical panels.	M	25	C	Sierra Bella has no emergency electricity generating capability for its pumping system. Water is delivered to the storage tanks from a central blend tank by 2 pumps that rely on Southern California Edison. No backup system exists to provide power to these pumps. During any significant disaster situation (earthquake, forest fire etc) where power is lost, Sierra Bella can only provide the existing tank capacilty to customers. This falls under Catagory E, water outages.	15,000	125	165	19	Kern	III	2009
1064	1500341	1500341-003	SIERRA BELLA MUTUAL WATER COMPANY	New System Circulation Interconnects	This project would require Sierra Bella to provide 2 new system circulation interconnects between several sections of the existing distribution system. Two additional sections of plumbing with appropriate pipes and shutoff valves are anticipated. In addition to providing for better circulation within the system it will allow for more customers to maintain service during periods of repairs and other system shutoffs.	M	25	C	Several sections of the distribution system are somewhat isolated and adequate circulation of water in the distribution system can be limited during warmer periods of the year. This requires additional system flushing and residual chlorine testing in these isolated areas to assure quality of the water. Although Sierra Bella has had no problems to date, this issue requires regular attention through its Site Sampling Plan to assure quality water. No public notification has been required. The probably fall in the Catagory O, not covered in other catagories.	20,000	125	165	19	Kern	III	2009

1065	2210901	2210901-003	MPWD-Coulterville CSA 1	Coulterville Service Area Well and Storage Tank	This project requires drilling a backup well and constucting storage to increase the capacity serving Coulterville, Ca. The request includes funding for planning, engineering, materials, equipment and construction. Materials and equipment inclu well, pipe, storage tank, pipe, floats, scada, flowter, me,	M	25	C	The water system infrastructure in Coulterville is thirtyseven years old and, exept for pump failure - most recently July 19, 2007 - is generally considered not to have reached its maximum service life. The problem in Coulterville is with the lack of backup and storage capacity. Coulterville is located in the rural foothills of the Sierra mountains and every year during fire season the well is drafted from by Cal Fire, Mariposa County Fire, the Roads division of Public Works and other, non-authorized, users. The residence have been left without water a number of times throughout the years because of fire needs. Current water rates in Coulterville are deficient and do not provide enough revenue to maintain operational status quo, and certainly do not provide for any kind of reaerve. A recent rate study conducted by Public Works administrative staff showed a rate increase of 110% was necessary just to maintain operational costs, and it does not provide the revenue needed for infrastructure repairs, replacements and additions. Unfortunately, Coulterville is an economically depressed community and the proposed rate increase was deemed too big a burden to be implemented and was subsequently voted down. in addition, Coulterville does not receive any tax revenue.	410,000	98	165	11	Mariposa	III	2007
1066	1700516	1700516-001	Lake County CSA 16 - Paradise Valley		Conduct capacity analysis and develop master plan, study possibility of consolidation with Kono Tayee water system.	M	25	C	System needs a capacity analysis and master plan to comply with Lake County General Plan. Current deficiencies include water supply and quality. The distribution system should be evaluated.	100,000	72	180	03	Lake	II	1998
1067	1500393	1500393-004	RAINBIRD VALLEY MUTUAL WATER COMPAN	Rainbird Valley Water Distribution System Repairs	Replace ten 6 inch and/or 8 inch gate valves on distribution system.	M	25	C	Gate valves on water distribution lines are frozen and need to be replaced. Entire system must be shut down if major repairs are needed. Loss of water supply & pressure.	50,000	80	188	19	Kern	III	2007
1068	1000267	1000267-001	KINGS CANYON MOBILE HOME PARK		CONSTRUCT A NEW WELL AND REPLACE PIPELINES.	M	25	C	NEED A NEW WELL AND REPLACEMENT OF PIPELINES.	150,000	60	200	23	Fresno	III	1998
1069	0800526	0800526-002	Redwood Park C.S.D.		Replace the water tank(s).	M	25	C	150,000-gallon redwood water storage tanks are about 50 yrs. old; one cannot be used; the second tank has rot.	200,000	39	200	01	Del Norte	I	1999
1070	2500911	2500911-002	I'SOT Well #3 & #15		Installation of an elevated storage tank and an enlarged pumping station to provide the reliability required by the Waterworks Standards.	M	25	C	Water system has low pressure and does not fulfill Section 64566 (system pressure) of the Waterworks Standards.	250,000	43	215	01	Modoc	I	1998
1071	5400934	5400934-003	PONDEROSA CSD	Ponderosa Water Project-Repair Existing Tank and Refurbish Wells	The District proposes to have the interior of the 60,000 gallon storage tank cleaned and coated to eliminate leaks in the tank. In addition the inline flow meter and control valve would be installed at the tank outlet. This will allow volume records of water delivery to the system to be recorded and emergency control in the case of a major leak. Major leaks in the past have drained the 60,000 gallon tank so rapidly that the manual valve was unable to be closed. The district would also refurbish the existing four hardrock wells. The wells were drilled in the 1960's and have never been refurbished. Productivity is expected to increase 10-15% as a result of refurbishing.Please note that Ponderosa community has grown to 140 connections and a ppulation of 360.	M	25	C	The goal is to increase water capacity to supply current and peak demand. The district has had to restrict water usage in past years and has a three (3) stage water conservation policy with fines for violations. To increase water production, the district seeks to conserve water resources by repairing the leaky storage facility and refurbishng the four wells.In addition, over the last five years the District has experienced an increase in the cost to repair leaks in the aging storage tank and an increase in the cost of electricity to pump water.Improved well productivity as a result of refurbishing, and system leak reductions will reduce the amount of groundwater needed to be pumped and increase production volume of the sources.	94,286	116	232	12	Tulare	III	2009

1072	2010012	2010012-002	HILLVIEW WATER CO-RAYMOND	Raymond 2010012 Redrill #2 to Public Standards-Security and SCADA	If Raymond Well #2 is re drilled to public standards, it could be drilled deeper at the same time and likely improve the quantity of water as well as making the well consistently safe. This would also eliminate the shut offs for chlorination and the wasted water used for flushing at critical consumption periods.1100 feet of security fencing with top coiled razor wire and installation of wireless cellular SCADA would secure the wells and facilities as well as allow 24-7 monitoring of low production wells, improve response times and mean substantial savings on service calls. A round trip to the Raymond system from the main office is over and hour. With SCADA the service personnel can be alerted and diagnose problems before leaving the main office in Oakhurst.	M	25	C	Well #2 in Raymond is not built to public standards and as a result occasionally tests positive for total coliform. Chlorination and flushing always produces a clean retest, but water is so scarce in the area that even the few gallons per minute the well has yielded for years is critical in the warmer months.The Raymond area system does not have any security fencing or SCADA. Service personnel come all the way from Oakhurst (20 miles) for all monitoring, maintenance and service calls. The Raymond community would be better served if the water system could be monitored remotely for production, chlorination, public safety and security.	179,000	80	243 11	Madera	III	2009
1073	1700546	1700546-004	Clearwater Mutual Water Company	Clearwater Mutual Water Co. - Storage/Distribution	Clearwater Mutual Water Company is a small community water system that has 90 active service connections serving a maximum population of 100 persons. Most residences are retired living on a fixed income. The community is considered disadvantaged due to the median income being approximately less than $30,000 per year. The census tract is "Census Tract 9." The system has two storage tanks which one is used as a clearwell and the other is for our main storage. The storage tank is a 35,000 gallon redwood tank that is in fair condition but is starting to have problems. By the time we get funded for the project, it will probably be in poor condition. The Department of Health Services recommended the tank be replaced with a 100,000-gallon bolted steel tank to increase storage . The construction of this tank would allow the system to be in compliance.	M	25	C	The 35,000 gallon redwood storage for the Clearwater Mutual Water Co. should be replaced in accordance to water permit No. 02-03-98P17005. The storage tank has been in place since 1965. There are several patched holes around the tank, and some leaks on the sides. There is 18 ft. capacity, but can only be filled to 15 ft. due to its condition. If this storage tank were to fail, Clearwater would not be able to supply water to its customers. This would cause Clearwater Mutual Water Co. to be in violation.	140,000	93	250 03	Lake	II	2007
1074	4700513	4700513-002	Hornbrook C.S.D.	Provide New Reservoir (#3) To Service Eastside (95%) Of Water District	This project entails a 250,000 gallon reservoir situated on the eastside of the District. The reservoir will be connected by two 10-inch lines to existing system in First Street. It will also have an all weather access road, chlorinator, and check valves to circulate the water from the existing system, through a chlorinator into the tank and then looped back down to the existing system. There is a concern that the water on the eastside of the District is not being chlorinated properly because it is too far from initial chlorination. Further analysis of the system, after additional loops are installed, may reveal that only one line is needed up to the tank and no chlorinator would be necessary. This additional reservoir will provide critical backup in the event that the two existing reservoirs fail and/or distribution is curtailed due to main water lines coming from west of the I-5 freeway being disrupted, which would leave 95% of the District (and the elementary school) without potable water, or means for fire suppression.	M	25	C	This project entails a 250,000 gallon reservoir situated on the eastside of the District. The reservoir will be connected by two 10-inch lines to existing system in First Street. It will also have an all weather access road, chlorinator, and check valves to circulate the water from the existing system, through a chlorinator into the tank and then looped back down to the existing system. Further analysis of the system, after additional loops are installed, may reveal that only one line is needed up to the tank and no chlorinator would be necessary. This additional reservoir will provide critical backup in the event that the two existing reservoirs fail and/or distribution is curtailed due to main water lines coming from west of the I-5 freeway being disrupted, which would leave 95% of the District (and the elementary school) without potable water, or means for fire suppression.	1,750,000	141	280 01	Siskiyou	I	2009
1075	4700513	4700513-001	Hornbrook C.S.D.		Eliminate deadends by looping. Where looping not possible, provide flushing valves at end of deadend.	M	25	C	System has 11 deadends in distribution supply main lines.	550,000	141	280 01	Siskiyou	I	1998

1076	2500503	2500503-002	California Pines C.S.D.	Second 10 inch Main From Storage Tanks	The District has one 10" main line to service our community. When there is a problem within our system we must shut off the whole community to work on it. By doing this not only do we cause problems for our customers, but this puts a damper on any fire protection and causes risks that we are uncomfortable with. If we were able to place a second 10" main and loop our system we would be able to address these problems. This would also solve a possible compliance problem with DWP.We need 1.5 miles of a second 10" line to give us the capability to do the above. Not only would this solve our problems with the above but we would be able to offer water services to a larger area in this District. This would replace any wells that would need to be drilled in Unit 1a.Our area is a proverty stricken area and it is hard to come up with the funds needed to do these projects. We would appreciate any consideration you can give us.	M	25	C	California Pines CSD needs to be able to work on our water system without shutting down the whole community. At this point in time we do not have a way to do this. We also must be ready and able to expand the drinking water availabilty in other areas around this District.The project would include putting into play a second 10" main from our storage tanks. This would enable us to shut down parts of the system and not effect the whole area. One unit here also needs pipe laid for the delivery of water rather than have property owner drill their own wells. We are a very poverty stricken area and try our best to keep our costs down and a reserve. We are unable at this time able to fund this project.	800,000	130	300	01	Modoc	I	2009

1085	1200701	1200701-001	Orick C.S.D.	Orick C.S.D System upgrades for engery efficiency	Our project goals are as follows: 1.) Install new energy efficient well pumps with integrated pump panel to closely monitor tank levels which will allow OCSD to reduce over flow and unnecessary pumping. Having the technology to closely monitor tank levels will increase OCSD's efficiency by eliminating unnecessary pumping. The existing pumps and panel are over 30 years old. The pump panel had continual problems during lightning storms and parts to repair our pump panel are no longer available. 2.) Repair broken distribution valve and improperly maintained valve covers.3.) Install Generator connect panel. Orick is located at the 'end of the line' in a remote location. The community is often left for a week at a time without power. Installing a generator connect panel will allow OCSD to maintain tank levels during power outages.4.) Install permanent, auto start generator to power well pumps, fire hall and community center; all buildings are run and maintained by the OCSD. In times of power outages we currently look to the county sheriffs' office to help supply us with a generator to power our water pumps. Having a dedicated, onsite generator would allow OCSD to power the fire hall and community center which is designated as our local emergency shelter. Orick is in a rural area, and in the event of a major windstorm, earthquake, flood and or tsunami, we would easily be isolated from the county services. In a major event, the OCSD would	M	25	C	Currently, the Orick Community Services District (OCSD) is in compliance with all state standards regarding water quality. The proposed project is geared toward upgrading our aging water system to become more energy efficient and reduce operating costs to better serve the community. Orick is a disadvantaged community in a rural area. OCSD has a need for the project as there is one known broken distribution valve and other valve lids were covered by a highway overlay. OCSD well pumps are approaching 30+ years in age; although the pumps are still fully functional, they are far from energy efficient. The water system automated pump panel is old and has been out of service for many years due to poor design and now is out dated with repair parts no longer available.	250,000	139	400 01	Humboldt	I	2009
1086	5410007	5410007-004	LSID - Tonyville	Tonyville Water Pipeline Deadend Elimination Project	The proposed project includes the installation of new 6-inch by 1,650 feet long water service piping that will eliminate the dead end piping, increase operation flexibility, system operating pressure. Further, the proposed project will install sectionalizing valves on the proposed 6-inch pipe line and along the existing 10-inch water main.The project is entirely located in the County road right of way. It is anticipated that the project will be CEQA exempt.	M	25	C	The community of Tonyville's existing water distribution system consists of a 10 inch delivery pipeline that branches into one 4-inch and three 6 inch service pipelines. Each service pipeline has a dead end. During the pipeline installation, there were very few sectionalizing valves installed in the distribution system. Due to the lack of sectionalizing valves, the District is unable to isolate portions of the water system to repair pipeline and service lateral leaks. This requires the draining of the entire or at least the majority of the water system to repair a leak. This can result in all of the residents being without water until the leak is repaired and the distribution system recharged. With the large water demands and small diameter pipelines, the residents experience low pressures.	400,000	50	400 12	Tulare	III	2009

1087	0800532	0800532-006	Big Rock C.S.D.	Hiouchi SCADA System	The Big Rock CSD issued a Phase One RFP to install a SCADA system in Hiouchi. The goal for Phase One was to arrive at a system concept. The goals for Phase Two are to engineer and install the chosen system. The only response to the Phase One RFP was presented by Von Hoogenstyn and Associates (VHA) of Cloverdale. The Board of Directors/Trustees accepted VHA's proposed SCADA-system concept and already paid a fee of $2,500. Von Hoogenstyn and Associates also provided a bid for Phase Two. Since then, a second contractor indicated its desire to make a Phase Two proposal. That presentation is scheduled for a public hearing on March 19, 2009. Contractor selection decisions for all Phase Two considerations will be made in that meeting.The VHA bid includes the following tasks.Task 1. Pre-design visit.Visit site, meet with district personnel. Document existing panel wiring, and measure for new panel installation. Create a conduit and wire plan. Design antenna mount and feed line run. Design field wire paths and sensor piping. FCC license site survey. Develop list of electrician tasks.Task 2. Hardware and software acquisition.District order control panels from Control Systems West and ship to Von Hoogenstyn and Associates, Cloverdale. Von Hoogenstyn to order CMI software, pressure transmitters, antennas, feed line and miscellaneous parts. Submit license application with FCC and coordination fees.Task 3. System programming	M	25	C	The Big Rock CSD installed the community's water distribution system in 1971 to satisfy Hiouchi's residential, commercial, and fire suppression needs. The township elects a Board of Directors/Trustees to manage the Big Rock CSD's responsibilities, which include water collection from under the Smith River, drinking water distribution, and drinking water storage. This water system is nearing the end of its life cycle. The Big Rock CSD must comply with safe drinking water standards that recently have become significantly more demanding, the relatively new Homeland Security Act along with unanticipated/unfunded mandates, a water-allocation limit imposed by the California Water Resources Control Board that must be adjusted upward in the near future to accommodate consumer growth, and a geographic jurisdiction that has quadrupled in size. Since 2001, Hiouchi has been beset with nearby wildfires on an unprecedented scale. Wildfires regularly occur on three of the jurisdiction's sides that not only present serious recurring threats, but also place extraordinary demands on the Big Rock CSD's water distribution system when federal, state, and local fire protection agencies head for Hiouchi to draw water from any one of its 15 fire hydrants. For instance, the "Signal Hill Fire" recently cost the Special District 130,000 gallons of potable water in three weeks, and the "Blue Two Fire" absorbed another 150,000 gallons	68,183	113	400 01	Del Norte	I	2009
1088	1200729	1200729-002	Orleans C.S.D.	New 100,000 Gallon Storage Tank	A new 100,000-gal bolted steel storage tank will be installed adjacent to the existing 100,000-gal redwood tank. The C.S.D. already has an easement for use of the property for construction of a second storage tank.	M	25	C	The existing 100,000 gallon storage tank is leaking excessively due to shrinkage of the redwood staves. Additional storage is required in order to have storage while fixing the existing tank and to maintain adequate reserve capacity for fire flows and peak community demands, as the existing storage capacity cannot meet demand plus rural fire flow requirements.	215,000	139	430 01	Humboldt	I	2009

1094	5410037	5410037-001	LSID-Page Moore System	Page-Moore Water Pipeline Replacement Project	The proposed project includes installing about 8,200 lineal feet of new 6-inch diameter pipline in the county road right-of-way limits. The pipeline will be installed with sectionalizing valves. It is estimated that 173 new services will be installed to the existing house with a service box and shutoff valve and connect to the existing water meter.	M	25	C	The existing water distribution system is old and in many locations consists of undersized pipelines. The pipeline sizes range from 4 to 6-inches and the material is primarily steel. Due to the materials utilized, the District has experienced numerous leaks on the water services. During the time of installation, there were few sectionalizing valves installed in the distribution system. Due to the lack of valves, the District is unable to isolate portions of the system to repair pipeline leaks. This requires the draining of large sections of the system to repair a leak. This can result in many of the residents being without water until the leak is repaired and the distribution system recharged. Further, this community is unsewered and relies on individual septic tank and leach field systems. Therefore, the combination of old leaky water pipelines and unsewered residential units present a high risk for contamination of the water supply.With the large water demands and small diameter pipelines, the residents also experience low pressures.	1,800,000	235	550 12	Tulare	III	2009

M	25	C	The PZ currently has only one source of supply comprised of Well 26 with pump, providing no redundancy and inadequate system reliability.	149,000	222	567 20	Riverside	V	1998
1096	3310078	3310078-002	West Palm Springs Village		Design and construct 11,000' of new watermain to meet the WWS and increase system reliability by interconnecting the PZ source of supply sites and storage site with new watermains.	M	25	C	The existing bare steel watermains and appurtenances are old, deteriorated and unreliable, with limited remaining useful life, including frequent leaks, repairs, outages, valves work, etc. (refer to attached documentation)	530,000	222	567 20	Riverside	V	1998
1097	1200707	1200707-002	Miranda C.S.D.	Miranda CSD Source and Secondary Water Mainline Replacement Project	The water system for the District was constructed in the 1960's, shortly after the District was established. The system is 50 years old and is reaching the end of its design life. This has been made abundantly clear by four major leaks in the central portion of the system in the last five months. A separate application has been submitted for replacement of mainlines in the central portion of town as these are the lines with the most recent breaks and which are of greatest urgency for replacing. However, there are two other mainlines that service the system that are also almost 50-years old and are in need of replacement. One pipeline is the mainline from the intake gallery on the Eel River, and the second pipeline is the mainline that services the western portion of town. Failure of the mainline from the intake gallery would prevent the refilling of the storage tank. Failure of the mainline to the western portion of town means half of the community would be without portable water and fire protection.For Phase II, the District intends to replace mainlines from the intake gallery to the mainline leading to the water storage tank. The replacement of the mainline from the intake gallery will entail the replacement of the existing 6-inch AC pipe with 6-inch PVC piping. This will include 1,350 feet of 6-inch diameter PVC pipe. This piping is located in the roadway of the Avenue of the Giants and approximately 450-square yards of pavement will need	M	25	C	The Miranda Community Services District is located in south-central Humboldt County, covering an area of approximately 280 acres, and serves an estimated 400 people. The District is the only public water supplier in the Miranda area, and was established in 1964 to supply the residents with potable water for domestic, irrigation, sanitation, commercial, fire protection and recreational uses. The District currently has 129 residential and 17 commercial connections. Miranda is located in a High Fire Hazard rating area, and in addition to providing fire protection for the town, the Miranda Fire Department has a mutual aid agreement with the California Department of Forestry and Fire Protection (CDF) and provides water to assist the CDF with fire suppression services for the Public Resource Lands surrounding Miranda. The District also provides water to South Fork High School, which serves more than 350 students and staff which come from a geographically mountainous area half the size of Rhode Island. The water system for the District was constructed in the 1960's. The system is 50 years old and is reaching the end of its design life. This has been made abundantly clear by four major leaks in the central portion of the system in the last five months. The leaks were all in the heart of the system, in the mainlines from main storage tank down to town. Each of these leaks required the District to shut down the entire system, and the entire	310,000	143	600 01	Humboldt	I	2009

1098	1200707	1200707-003	Miranda C.S.D.	Miranda CSD Water Distribution Loop System Installation Project	The water system for the District was constructed in the 1960's, shortly after the District was established. The system is 50 years old and is reaching the end of its design life. This has been made abundantly clear by four major leaks in the central portion of the system in the last five months. Each of these leaks required the District to shut down the entire system, and the entire town, including South Fork High School, was without potable water for several hours and in the worst case for over a day. The District provides water to South Fork High School, which serves more than 350 students and staff which come from a geographically mountainous area half the size of Rhode Island. No water means that school must be dismissed, and the financially strapped Southern Humboldt School District incurs additional costs that it can ill afford. For Phase III, the District intends to install a mainline around the northwest corner of South Fork High School that will create a loop system to allow water distribution to the school all the western portion of town if the system needs to be shut down else where. This piping will be located within the right-of-way of the Avenue of the Giants along the southern side of the High School and will cross east underneath Highway 101 to tie into the existing mainline along a portion of the High School perimeter. This portion of the project will entail installing 1,450-feet of 4-inch PVC piping. Approximately 130-square	M	25	C	The Miranda Community Services District is located in south-central Humboldt County. It covers an area of approximately 280 acres and serves an estimated 400 people. The District is the only public water supplier in the Miranda area, and was established in 1964 in order to supply the residents with potable water for domestic, irrigation, sanitation, commercial, fire protection and recreational uses. The District currently has 129 residential and 17 commercial connections. Miranda is located in a High Fire Hazard rating area, and in addition to providing fire protection for the town, the Miranda Fire Department has a mutual aid agreement with the California Department of Forestry and Fire Protection (CDF) and provides water to assist the CDF with fire suppression services for the Public Resource Lands surrounding Miranda. 1099	1200707	1200707-001	Miranda C.S.D.	Miranda CSD Emergency Water Main Replacements Project	The District intends to replace the mainlines from the water storage tank down into the distribution system for the town as Phase I of the entire project. This is the backbone of the system and is the section most need of replacement based on recent leak history. This project will entail the replacement of the existing AC pipe with PVC waterline. This will include 600 feet of 8-inch diameter PVC pipe, and 1,800-feet of 6-inch PVC pipe. A portion of this piping is located in the roadway and approximately 100-square yards of pavement will need to be saw cut, demolished and disposed of and the roadway repaved after completion. Additional work will include clearing and grubbing thick vegetation along portions of the piping alignment outside of the roadway, and the associated sediment and erosion control measures needed for this are. There are also two 8-inch and six 6-inch gate valves and one 6-inch pressure regulating valve that will also need to be replaced along with their valve boxes. Two separate pre-applications will be submitted for Phases II and III of this project. Phase II is the replacement of two other mainlines that service the system that are also almost 50-years old and are in need of replacement. Phase III is the installation of redundancy loops in the water system to facilitate continued water service to portions of the town when there is a leak in the system and needs to be shut down elsewhere.	M	25	C	The Miranda Community Services District is located in south-central Humboldt County, 50 miles Southeast of the City of Eureka and 15 miles north of Garberville. It covers an area of approximately 280 acres and serves an estimated population of 400. The District is the only public water supplier in the Miranda area, and was established in 1964 in order to supply the residents of Miranda with potable water for domestic, irrigation, sanitation, commercial, fire protection and recreational uses. The District currently has 129 residential and 17 commercial connections. Miranda is rated with a High Fire Hazard rating, and in addition to providing fire protection for the town, the Miranda Fire Department has a mutual aid agreement with the California Department of Forestry and Fire Protection (CDF) and provides water to assist the CDF with fire suppression services for the Public and Natural Resource Lands surrounding Miranda. The District also provides water to South Fork High School, which serves more than 350 students and staff which come from a geographically mountainous area about half the size of Rhode Island, covering approximately 773 square miles. The water system for the District was constructed in the 1960's, shortly after the District was established. The system is going on 50 years old and is reaching the end of its design life. This has been made abundantly clear by four major leaks in the central portion of the system in the	280,000	143	600 01	Humboldt	I	2009

1103	4710001	4710001-003	City of Dorris	Dorris Water Tank	Construction of 750,000 to 1,000,000 gallon tank. Construction to include all pipes, gates and valves to connect to the existing system.	M	25	C	The City has only one water tank, which at a capacity of 750,000 gallons is less than ½ of the peak day demands. Without a second storage tank available, the tank cannot be taken out of service for coating or other repairs, and it is now 26 years old, with the original coating.	950,000	481	887	01	Siskiyou	I	2007
1104	4710001	4710001-004	City of Dorris	Dorris Water Line Reconstruction	Reconstruction of approximately 11,000 feet of water distribution main line infrastructure along the City streets, alleys, Hwy 97 and under Union Pacific Railroad tracks. This will include 6", 8" and 10" water main line along with service connections, gate valves and hydrants.	M	25	C	Approximately 50% of the City's water distribution system consists of steel pipeline more than 50 years old, including many lines dating from the 1940's and earlier. Those lines are failing at an increasing rate, exposing the distribution system to possible contamination by groundwater intrusion, as well as becoming a maintenance hardship. One of our oldest lines is beneath Union Pacific Railroad Tracks to supply water to our molding mill. This line is critical to replace along with our lines that are parallel to Highway 97.The City has had to notify affected residents and businesses of the shutoff of water services and a boil water order due to a possibility of contamination.	990,000	481	887	01	Siskiyou	I	2009
1105	4710001	4710001-005	City of Dorris	Dorris Chlorinator-Well Project	The City will drill a well at sufficient depth of an estimated 1500 feet to provide a safe, quality water supply. A pump will be installed with sufficient capacity for the City's current and projected use along with the main water and valve pipeline system to connect the City's water infrastructure together.We will construct a chlorine generating system to treat 1500 to 2000 gallons per minute. A well house station of approximately 20' X 25' will be constructed to house the system along with the storage of salt for the hypochlorite system.	M	25	C	The City is currently served by one good well, which must be pumped in excess of 21 hours per day to meet the peak day demands. The existing back-up well is of a limited capacity and now does not meet the EPA standards for potable water due to arsenic level and infiltration of sand into the distribution system. It is cost prohibitive to have arsenic and sand removal on this well.With the capacity that the City is running their only well, we are not able to meet our Housing Element projected need for this disadvantaged community as our City Engineer advised the City they are at the maximum functioning capacity.With only one well on-line, we can not schedule maintenance of our pump nor do we have any backup for eventual failure of this well and main pipeline. The City's chlorinating system is beyond its maximum capacity and the City has had to shutdown their water system until it is repaired. It is not capable of treating the volume of water that is required by our system.The system failed three times in the last year and we received a notice of violation due to the failure. Water customers were given the boil water order due to this failure.	600,000	481	887	01	Siskiyou	I	2009
1106	1310009	1310009-002	Winterhaven WD	Storage tank renovation, water main replacements, & hydrant replacement	There are a # of items that would increase system reliability, reduce service outages and enhance fire fighting capabilities as follows:1. Storage Tank Inspection and Rehabilitation.2. Isolation (Gate) Valves.3. ACP Replacement with PCV.4. PVC Tees with thrust block.5. PVC Cross with thrust block.6. Street cut and pavement replacement.7. Hydrant Replacement.8. Compressor (fore pressure tank), pressure switch, valve.	M	25	C	The system presently has asbestos pipe throughout the plant and distribution system. The valves throughout the town cannot be excercised as they are frozen. In an emergent situation, the entire town's water is forced to be shut down as the valves cannot be isolated.The compressor located at the water plant is outdated as it was installed in 1974. There have been problems on a regular and recurring basis keeping the air level control working properly on our hydro pheumatic tank.	513,110	170	892	14	Imperial	V	2009

1107	1710009	1710009-002	Upper Lake County Water District	Sabini St and Rice St	Completion of this project would eliminate two "dead-ends", and replace more than 1500 feet of AC pipe. Increasing line size will increase capacity for delivering fire flows, increasing fire safety.The project will result in water conservation in two ways, and energy conservation in two ways, providing better fire protection to both a residential neighborhood and a business district, and protect district personnel from possible asbestos exposure.	M	25	C	Sabini St. is an undersized asbestos-cement line that "dead-ends". Rice St. is also an undersized asbestos cement line that "dead-ends". Both lines are over 40 years old and must be flushed frequently, wasting water and energy. Both lines are undersized, decreasing fire flows and fire safety. Rice St has already had to be repaired several times. Repairs to AC pipe can expose personnel to asbestos fibers.	430,681	327	989	03	Lake	II	2009
1108	1710009	1710009-001	Upper Lake County Water District	Old Lucerne Rd to Hillcrest tank site	This project consists of two parts.Part 1 - Eliminates an old, undersized, and dead-end asbestos-cement pipe with a large diameter flexible pipe. Potential leaking from the aged a.c. pipe will be prevented and the goal of water conservation will be advanced. Extension of the line to the tank site will provide a complete diameter transmission system between the community and the storage tanks. Acquisition of easements for this extension will also be required. With this line in place, fire flows will be increased from approximately 500 GPM to an estimated 2500 GPM, specifically in the area of the three public schools. Pressure drops will be reduced, pumping will be more efficient and less electricity will be used.Part 2 - Two of the districts smallest tanks will be replaced with a tank more than twice as large as the two combined thus, providing enough storage to allow the district to utilize off peak pumping for increased energy efficiency. The increased storage will also allow for future commercial development which would benefit the local economy.	M	25	C	This project is intended to address and resolve fire safety concerns including pressure and storage issues within the community including the area of the three public schools, the historic business district, and future development.	1,366,022	327	989	03	Lake	II	2009
1109	1210017	1210017-003	Manila Community Services Dist.	Manila Community Services District 2009 Pre-Application	In order to meet the state's mandated compliance and prepare for expected growth of the community, the district proposes to build an additional 100,000 gallon storage tank of concrete construction with addional piping from the booster pump station and the existing redwood storage tank. The additional piping scheme is needed to isolate each storage tank from the other to allow for repairs and routine maintenance on indivdual tanks without interruption in service.	M	25	C	Our current storage capacity is 100,000 gallons, but according to Department of Health Services's (DHS) 2005 annual report, by Ronnean Lund December 8th, 2005, we are well below DHS's recommended standards for water storage capacity. According to Craig Bunas, of DHS, our storage capacity should be 130,000 gallons. 130,000 gallons would meet the current demand, but the proposed Humboldt County General Plan projects growth of approximately 150 more living units, above and beyond the 68 applications for proposed development, we currently have on file. These expected increases will in effect double our storage requirement.	250,000	343	1,000	01	Humboldt	I	2009
1110	1710018	1710018-003	Lake County CSA 2 - Spring Valley		Conduct capacity analysis and develop master plan.	M	25	C	System needs a capacity analysis and master plan to comply with Lake County General Plan. Current deficiencies include filtration and storage. The distribution system should also be evaluated.	100,000	420	1,018	03	Lake	II	1998
1111	4710010	4710010-001	City of Tulelake		Replace old pumps and electrical equipment. Replace chlorination facilities with more reliable and effective equipment.	M	25	C	Have had occasional outages due to old pumps and electrical equipment. Hydrogen sulfide in water is inadequately treated by existing chlorination facilities causing occasional taste and odor complaints.	200,000	484	1,058	01	Siskiyou	I	1998

1112	0510005	0510005-005	C.C.W.D., West Point	West Point Pipeline Replacement	CCWD is seeking funding to leverage an existing federal grant award to assist this recognized low-income community with a significant Native American Indian population meet its water system's Health & Safety and Fire Protection needs. Increasing the community's ability to provide a high quality water supply while meeting adopted fire flow standards will increase the potential for growth and business development.The project will replace most of the distribution system in the West Point service area. Pipeline diameters range from 6-12 inches for a total of 21,100 LF of pipeline replaced. Project will replace main valves and fire hydrants, split dual service lines, and replace water meters where appropriate. The existing redwood Bummerville Storage Tank will be replaced with a 100,000 gallon steel tank. A 3,000 gpm fire flow pumping system will be installed at the Bummerville Tank site.The planning for this project began in 2006, with results indicating a construction cost of over four million dollars. The project was given a low priority due to the high cost and burden on the water customers. With the prospect of state and Federal loans, the project design was started. A grant of $1,000,000 and a loan of $3,290,000 was awarded from the USDA. However, in the current state of the economy, the system does not have sufficient funds to incur the loan debt and the project was put on hold again. The District	M	25	C	Existing water system is failing due to deterioration. Water leakage from the pipelines and Bummerville storage tank is estimated to be up to 30 percent of total system demand. District is concerned that the system currently exhibits water quality issues and insufficient fire flows and pressure . The community's only school is located in this area and the District is concerned proper fire flows cannot be maintained for the school. The community is an economically disadvantaged community and would suffer economic hardship if burdened with the full cost of water system replacement. In addition, the community is unable to develop additional commercial land uses in the downtown area due to insufficient fire flow protection.	2,000,000	556	1,400	10	Calaveras	III	2009
1113	1610009	1610009-006	Kettleman City CSD	Water Storage Tank Rehabilitation	The Water Storage Tank Rehabilitation project will include the complete sandblasting of the interior and exterior of the tanks. The Commercial Tank Facility (CTF) would be retrofitted with the current safety appurtenances and cathodic protection system. The CTF hydropuematic tank, booster pump station and electrical controls and equipment would be replaced to the current standards. The CTF chlorination station would be installed to meet the current health and safety standards. An emergency diesel generator will be installed to provide emergency power as required.The above modifications and replacement will improve the operation and maintenance of the water storage tank facilities.	M	25	C	The Kettleman City Community Services District has three (3) water storage facilities in the system. The residential tank was installed in 1986 with a capacity of 400,000 gallons and the commercial tanks were installed in 1969 with a capacity of 165,000 gallons each for a total nonimal water storage capacity of 330,000 gallons. The interior and exterior coatings of the water storage tanks have expired and needs replaced. The commerical tanks were constructed without the current safety design standards and need to be modified. The existing cathodic protection system is inoperable needs to be replaced. The commerical tank facility installed in 1969 included a hydropnuematic tank, booster pump station, chlorination system and electrical equipment and needs to be upgraded to meet current design code requirements.The existing KCCSD booster pump system in the Commercial Area has no emergency backup power supply. In the past, KCCSD has experienced power supply problems with Pacific Gas & Electric because they are at the end of the power grid system and outages are frequent. The Commercial Area businesses, based upon recent outages, have been without power for a period of six (6) to ten (10) hours three (3) to four (4) times per year. Commercial businesses have had to close down during these outages because of no water supply and fire protection. We have included an emergency diesel generator to	1,700,000	356	1,499	12	Kings	III	2009

1116	1610007	1610007-004	Home Garden CSD	Well and Water Meters for Treatment Plant Expansion	New Well and LandTwo of the District's wells are within the proximity of 100 feet of each other. As a result, they do not operate efficiently. Therefore, the District needs to separate these wells and establish a distant solar power well site. This would entail the District purchasing land, drilling a well and installing a pump. In addition, the District needs to establish new lines from the new well back to the current Arsenic removal treatment facility. This entails excavation to install the pipe line. The existing facility currently complies with federal and state water standards. Booster PumpsThe District needs to replace the booster pumps on three of its existing wells, due to age, general usage, and lift strain. This entails extracting the booster pumps out of the well and replacing old booster pumps with new booster pumps, and reinstalling booster pumps and assemble pumps on well. As a result of the continuing draught these pumps become a vital component of service delivery. In the spirit of conservation, the District would convert electric pump grid power to solar electric pump power. This entails purchasing land and establishing a solar energy field. Residential Water MetersThe installation of water meters would permit the District to more efficiently regulate and conserve water, and maintain the water at an acceptable level. The installation would require the excavation of each residents' home (450 residents) and install water	M	25	C	In Spring 2007, the Home Garden Community Services District began an Arsenic Removal Project. The Project's facility provides water to approximately 1800 residents in the grass root community of Home Garden, Kings County, Hanford. The State of California has designated Kings County as an extreme draught region. During 2007-2008, precipitation in the Hanford area was only 83% of the normal to date. Dry years impact the water supply for the District. In the last two years, ground level waters have dropped approximately 60 feet. The lowered water levels indicate groundwater pumping exceeds the recharge and the resulting increased lift adds to the District’s operation and maintenance costs. Landscape watering accounts for greater than 50% of the water demand during the summer months and without restrictions this use can occur during the maximum hour demand period of the day. This, coupled with the anticipated growth in the District, would continue to place a strain on the water usage.To continue to meet the water demands of the overall community and business and residential expansion, the multi-year California draught, and the need to consume water, it is necessary that the District install a new well. The District would need to acquire additional land upon which it would install the well; in addition, install three new booster pumps on the existing wells, install residential water meters and have adequate work space	3,997,000	450	1,750	12	Kings	III	2009
1117	2210001	2210001-008	MARIPOSA PUBLIC UTILITY DIST	Mariposa PUD Water Tank Rehabilitation and Additional Storage	To bring the existing tank into compliance with AWWA d-100 and seismic requirements would be cost prohibitive. The inspecting engineer reccomends a second tank be constructed in the distribution pressure zone to act as a back up in the event the existing tank becomes compromised. The existing tank should be rehabilitated to at least meet current safety requirements and arrest further structural damage including the following;.Tank interior to be abrasive blast cleaned to SSPC-SP 10 and coated with an NSFapproved epoxy system. . Installation of one entryway 180 degrees from the eexisting entryway to meet Cal/OSHA requirements for confined space . Installation of anti-fall bars on the interior and exterior ladders (safety climbs). . Install expansion joints on the two discharge nozzles.The new tank will be constructed either at the WTF next to the existing tank or at an alternative site within the distribution system. A minnimum 500,000 gallon capacity steel structure lis proposed.	M	25	C	In February of 2007 the Mariposa Public Utility District (MPUD) contracted with Los Osos Engineering to clean and provide recommendations for maintenance of an existing 1,000,000 gallon steel water storage tank near the MPUD water treatment facility (WTF). The result of the inspection was that the tank is in need of major repairs. The interior shell wall, floor, center column and roof surfaces all exhibited checked and cracked coatings with large areas of steel surface corrosion.This water tank is the primary storage for the entire distribution system within the service area. It is also the only option for the provision of disinfectant contact time for the treated surface water sources.The tank inspector conducted "pit depth" measurements and found areas of metal loss 2-3 mm, almost half of the steel tank wall thickness. The engineer estimated that penetration of these more serious corroded sections could occur eight years from the date of inspection.The tank ladders inside and out do not meet current OSHA employee safety requirments. The tank sits on a gravel bedding with no foundation or stablizing structre. The nozzle outlets to the distribution system are not designed in complince with the construction standards for the seismic area. The Engineers report is available at the MPUD administrative office.	1,200,000	671	2,000	11	Mariposa	III	2009
1118	1810002	1810002-001	Westwood C.S.D.		Construct additional 500,000 gallon storage tank. Install generator unit, new pump/tank control system and water meters.	M	25	C	Winter power outages cause water shortages. Pump/level controls need replacing.	500,000	910	2,000	02	Lassen	I	1998

1119	3310047	3310047-011	Cabazon Water District	New Production Well for the Southeast Pressure Zone	The project proposed is to drill and equip a new well pumping plant in the Southeast Pressure Zone consisting of a well, well pumping plant, electrical switchgear and instrumentation, discharge and blow-off piping, masonry block control building, emergency standby generator, and required site work. It is anticipated that the new well would be capable of producing 1,000 gallons per minute, similar to the District's other two well pumping plants.	M	25	C	The District has a total of approximately 1,050 service connections. Of these, nearly 500 are located in its lowest pressure zone (the 1713 or Southeast Pressure Zone). The Southeast Pressure Zone's single 0.5 MG water storage reservoir was once supplied by Well #3, which was also a low producing well (250 gallons per minute at its best) and is currently inoperable (it literally will not turn on). The well also has no chlorination facilities, flow meter, building to house electrical equipment, or security. The District has determined that it would make more sense and be more cost effective to drill a new production well rather than perform the necessary repair and corrective work to make Well #3 operable. Currently, all of the water that is supplied to the Southeast Pressure Zone is from the District's two highest pressure zones, the 2156 and 2021 Pressure Zones. All of the water that is supplied to the Southeast Pressure Zone must travel through a pressure reducing station located at the corner of Almond Street and Esperanza Avenue. From a planning and practical standpoint, it is not desirable to rely so heavily on pressure reducing stations, nor is it desirable to move such a large quantity of water between zones. Since the Southeast Pressure Zone consists of nearly one half of the District's current service connections, it would be much more efficient to provide the zone with its own production well, as was the case in the past.	1,100,000	875	2,229	20	Riverside	V	2009
1120	3310047	3310047-010	Cabazon Water District	Replacement Interconnection with Morongo Indian Reservation to Provide Emergency Water Supply	Morongo has recently expressed an interest in reactivating this emergency interconnection. Since most of the existing facilities are not usable, the District plans to remove all of the existing facilities and replace them with new, functioning facilities that are properly designed and specified. The new interconnection will primarily consist of the same facilities, except that the masonry block vault will be replaced with a precast concrete vault, the existing meters will be replaced with compound meters, the concrete slab will be replace with aggregate base, and the above ground piping will include pipe supports. The project will involve demolition of the existing interconnection, and construciton of the following:Chain Link Fence and Gate Enclosure8" Piping and Fittings4" Piping and FittingsPrecast Concrete VaultFour 4" Gate ValvesTwo 8" Gate ValvesTwo 4" Compound MetersOne Double Check Detector Backflow AssemblyPipe SupportsAggregate Base	M	25	C	Cabazon Water District used to have a standby water service agreement with Casino Morongo to provide emergency backup water to the old casino if the need arose. Since the new casino was constructed, the metering station has been inactive and is no longer operational (verified on January 25, 2007 by District). The old metering station (located on Morongo property along the easterly boundary of Section 8, Township 3 South, Range 2 East, or the westerly side of Millard Canyon Road).The old metering station is not salvageable. The piping was never coated and is deteriorating rapidly. The gate valves are leaking. The double check detector backflow assembly is not functional or repairable. The masonry block vault is not in accordance with OSHA standards. In order to re-establish an emergency supply in this area, the District needs to replace the existing metering station and waterline inter-connection.	125,000	875	2,229	20	Riverside	V	2009

1121	3310047	3310047-008	Cabazon Water District	Replacement Pipelines in Southeast (1713) Pressure Zone	The project proposed is to replace all of the old, undersized pipelines that serve the existing homes within the Southeast Pressure Zone in the areas that are essentially built out. In the areas that are not built out, new developers will be required to either construct new, adequately-sized pipelines or to extend existing adequately-sized pipelines. The existing pipelines will be replaced with 8" diameter PVC pipelines that will meet current District standards and will also ensure that fire flow will be able to be provided for nearly one half of the residents of Cabazon.In addition to replacing the existing pipelines, the District intends to replace the existing service connections with new service connections. The service connections will be installed in accordance with the District's current standards, consisting of a service saddle, corporation stop, service line, angle meter stop, curb stop, meter and meter box. In the area where existing streets are paved, the proposed project will also include trench paving repair and paving overlay, all in accordance with Riverside County standards. The total linear footage of 8" PVC replacement pipelines is approximately 23,900 lineal feet, as follows:- 880 feet on Peach Street between Esperanza Avenue and Ida Avenue- 870 feet on Plum Street between Esperanza Avenue and Ida Avenue- 420 feet on Ida Avenue between Peach Street and Helen Avenue- 890 feet on Sunrise Avenue between Adele	M	25	C	The District has approximately 1050 service connections. Of these, nearly 500 are located in its lowest pressure zone (the 1713 or Southeast Pressure Zone). The Southeast Pressure Zone is one of the oldest portions of the District's system. The District acquired the system from a private water system approximately 10 years ago. The system is ageing and undersized, with pipelines ranging from 1" diameter to a maximum 6" diameter.Most of the pipelines in the Southeast Pressure Zone are well past their service life, and are of insufficient diameter to provide adequate fire protection service for the area. It is not uncommon for the District to record maximum available flow in the Southeast Pressure Zone of 300 GPM. The County of Riverside generally requires a minimum of 1000 GPM. Additionally, existing pipelines are unable to handle even minor pressure increases without developing leaks. Due to the lack of shutoff valves, many residences are left without water until the leaks are fixed.	5,300,000	875	2,229	20	Riverside	V	2009
1122	3310047	3310047-009	Cabazon Water District	Security System for Water Supply Facilities	As part of the security upgrades, the District plans to install weather-resistant video cameras, tilt & pan capabilities, motion detector based on the change of pixels with thermal imaging to determine whether the movement is an animal, vehicle, person, etc. This capability will reduce false alarms due to debris being blown by high winds common in the Pass (Cabazon) area. Once an intrusion is detected, an alert will be sent to an off-site alarm monitoring facility. Alarm monitoring personnel will immediately view the "real-time" images.Additionally, the District plans to install a Supervisory Control and Data Acquisition (SCADA) system. SCADA is a common process automation system which is used to gather data from sensors and instruments located at water facilities to transmit and display this data at a central site for either control or monitoring purposes. The collected data will be viewed on one or more SCADA Host computers located at the central or master site.It is imperative that District water operators, specially during non-business hours, weekends, and holidays to be able to monitor water levels at the three (3) tanks and wells operated by the District. In the event when the water level exceeds a preset threshold, SCADA will activate the system pumps to move water to the tanks with low water levels. Other common analog signals that SCADA systems monitor and control are levels, temperatures, pressures, flow	M	25	C	The community's water distribution and treatment system has been the target of vandalism, particularly during the past two (2) years. District management and security personnel have been working closely with the Riverside Sheriff's Department, Cabazon Station, in investigating these criminal acts against water facilities, property, and personnel. Patrol Deputies and District security team members patrol District water lines and facilities. The Sheriff Posse and the District deploy a mounted patrol periodically.Numerous criminal incidents have gone undetected until after the fact, and often no evidence has been left for law enforcement to determine the perpetrators. Incidents have included damage to the District's Jensen water treatment and reservoir facility, and theft of District owned vehicles. With limited District funds and the Sheriffs Department's minimal manpower due to their budget constraints, it is essential to district operations to repair, improve, and upgrade security measures and equipment.	225,000	875	2,229	20	Riverside	V	2009

1123	3310047	3310047-007	Cabazon Water District	Construction of New Interconnection to Provide Emergency Service to Pressure Zones 2156 and 2021	Cabazon Water District's Well No. 2 serves the district's highest pressure zone, Zone 2156. The district currently lacks a backup supply if Well No 2 fails. the Manager of Morongo Indian Reservation's Water Department recently informed the District that the Tribe has two parrallel 16" pipelines that could service the 2156 pressure zone in the event that Well No 2 fails. The pipelines have pressures of approximatley 100 psi and 20 psi. In order to connect to the Tribe's pipelines, the District will need to construct a new interconnection within the District's existing reservoir No. 2 site. The construction would require the following:Chain Link Fence and Gate Enclosure8" Piping and Fittings4" Piping and FittingsPrecast Concrete VaultFour 4" Gate ValvesFive 8" Gate ValvesTwo 4" Compound MetersOne Double Check Detector Backflow AssemblyPipe SupportsAggregate BaseConstruction for this project could begin in the near term.	M	25	C	The District currently lacks a backup water supply or distribution system tobe used in the event of an emergency. If an emergency were to happen, water service could fail to portions of the District, with potentially devastating impacts. To provide for an emergency supply for the District's highest pressure zones, specifically those served by District Well No. 2, the District is planning to construct an interconnection with two existing water lines owned and operated by the nearby Morongo Indian Tribe. This interconnection will proivde District ratepayers with access to a backup water supply in the event of a failure associated with Well No. 2 and its supply lines.	300,000	875	2,229	20	Riverside	V	2009
1124	5410038	5410038-006	Terra Bella Irrigation District - TBT	Electronic Water Meter Reading Project	The project includes installing 700 5/8-inch x 3/4-inch water meters with data transmitting capabilities and a laptop to receive water consumption data for billing and water system management purposes. Further, it is estimated that 350 meter boxes, lids and meter stops will be removed and replaced with new meter boxes, lids and water stops. The installation of these meter reading and transmitting devices will significantly reduce the amount of District staff time devoted to meter reading and will free up staff time for other needed operation and maintenance activities.	M	25	C	The Terra Bella Irrigation District (District) furnishes potable water to residential users located in the District's service area. As the District's treatment, production and distribution system ages, there is more demand on the District's personnel to perform operation and maintenance activities. The periodic reading of the meters reduces the amount of time District staff has to devote to operation and maintenance duties.	550,000	714	2,340	12	Tulare	III	2009
1125	5410038	5410038-004	Terra Bella Irrigation District - TBT	Vandalia Intertie	A pipeline that interties the Terra Bella Irrigation District (TBID) and the Vandalia Irrigation District (VID) is needed to provide TBID with water during canal water supply interruptions. The proposed Project consists of the installation of an intertie pipeline between the VID distribution system and the TBID's Pump Station 3. The TBID has existing chlorination facilities at Pump Station 3. This intertie will allow TBID to receive water from VID during periods when the Friant-Kern Canal is out of service. The TBID can return water to VID during the fall months of the year, if necessary. This will assist VID during dry years. The Project provides a dependable water supply during canal outages or periods of poor quality water in the Friant-Kern Canal. In addition, this intertie will provide TBID with a backup water supply that is developed from local sources. The proposed Project will consist of the design and construction of the interconnecting pipeline. The districts will also need to develop the terms and conditions for the operation and maintenance of the pipeline. The design component of the Project will consist of surveying, California Environmental Quality Act (CEQA) procedures, right-of-way acquisition and the detailed design of the improvements. The design of the	M	25	C	The Terra Bella Irrigation District (TBID) primarily receives its domestic and agricultural water supply through the Friant-Kern Canal of the Central Valley Project. The source of this supply is from the San Joaquin River Watershed. This surface water supply represents 96 percent of the TBID's total supply with the remainder coming from groundwater wells. The surface water supply from the Friant-Kern Canal is typically of excellent quality. During the year, however, the water quality can be degraded due to surface inflows into the canal. The canal is also dewatered every two to three years during the winter months for maintenance activities. In addition, the canal is subject to unscheduled outages that would disrupt the water supply. These situations result in the TBID having insufficient water supply available. The Vandalia Irrigation District (VID) lies northeast of TBID. VID has a well field that is recharged naturally and artificially with water retained from the Tule River. These water supplies are of excellent quality. The major irrigation demands within VID occur during the summer and fall months. During the winter, VID has additional capacity available within their system. TBID relies primarily on surface water for its domestic and agricultural water supply. Interruptions to its	650,000	714	2,340	12	Tulare	III	2007

1126	0310021	0310021-006	Amador County Service Area #3/Unit 6	Lake Camanche Groundwater Management Plan & Supply Study	The project proposed is to develop a local groundwater management plan for the Lake Camanche area in Amador County. By analyzing this groundwater basin's sustainability and volume, it could lead to a conjunctive use recharge area being identified and used in conjunction with San Joaquin County as part of the Intergrated Regional Conjunctive Use Project (IRCUP). THe project consists of three parts: 1) a phased paper collection and field data collection and analysis program to fill gaps in the conceptual groundwater model; 2) a public outreach program to identify key stakeholders to be involved in the Plan development process and relevant issues and concerns to be addressed by the plan, and to form the basis for a regional forum for long-term implementation of the Plan; and 3) Preparation of the IRGWMP itself.	M	25	C	The Ca Department of Public Health has imposed restrictions on the Lake Camanche Water System which places a moritorium on any new connection until a grounwater managment plan/water supply study has been completed. CDPH ahs required that we verify the sustainability of the groundwater supply before any new connection are allowed.	250,000	723	2,386	10	Amador	III	2009
1127	1710001	1710001-011	Clearlake Oaks County Water District	Rehabilitate Distribution System	Funds from this project would be used to replace a redwood storage tank with a 465,000 gallon reservoir and booster station with telemetry and back-up propane generator. Another tank would be replaced with a 100,000 gallon reservoir and booster station with a propane back-up generator. A third booster station with telemetry and a propane back-up generator would be installed.4,500 feet of PVC main would replace existing asbestos mains in the Caltrans right-of-way.	M	25	C	Major storage components (redwood tanks) are deteriorating and will potentially fail causing a loss of system storage, pressure and massive property damage. Current redwood tank design limits the ability to circulate and improve water quality to reduce disinfection by-products. Existing storage does not meet current waterworks standards.Asbestos mains are failing due to age and ground movement, causing potentially catastrophic highway failure. Booster stations have no back-up power causing low pressure problems, potentially allowing backsiphonage and contamination. Project funds would be used to replace 4,500 feet of asbestos main.	2,100,000	1,667	2,458	03	Lake	II	2009
1128	1710001	1710001-009	Clearlake Oaks County Water District	Clearlake Oaks 2007 Infrastructure Improvements-Storage Tank	Install a 465,000 gallon reservoir and booster station with telemerty and back-up propane generator. Install a 100,000 gallon reservoir and booster station with a propane back-up generator. Install a new booster station with telemetry and a propane back-up generator.	M	25	C	Major storage components,(redwood tanks) are deteriorating and will fail causing massive property damage, redwood tanks limit the ability to cycle water to reduce disinfection by-products. Existing storage does not meet current waterworks standards.	863,500	1,667	2,458	03	Lake	II	2007

1129	1210015	1210015-003	Willow Creek C.S.D.	Hodgson Tank & VFD Pump Replacement	The scope of work of the Hodgson Tank & Pump Replacement will consist of the following:A. Install a 10,000 gallon poly tank to provide customers with water during the demolition and construction period.B. Install new pump and level control mechanisms.C. Demolish and remove old tank & foundation. Remove old pumps.D. Install cement foundation for the installation of the new tank.E. Install valve and drain system.F. Install new 150,000 gallon welded steel tank with OSHA safety ladders, rails, etc.G. Replace two existing 20 horsepower motors and pumps. The replacement motors will be heavy duty, vertical, low energy use muti stage units.H. Install variable frequency drive unit on each motor for additional energy conservation.I. Install a six foot chainlink fence with security wire on top surrounding the entire tank site perimeter.	M	25	C	We have water facilitiy storage tanks and pump stations that are in serious deterioration due to their age. The tank and pump station that we would like to address in this cycle of funding is within the Hodgson pressure zone.The District would like to replace the 41 year old redwood storage tank and install two new energy efficient variable frequency drive motors and pumps. The Hodgson tank is a 100,000 gallon redwood tank that has deteriorated over the years. The seals and most of the lower and upper staves are victim of dry rot. The condition of the tank is at the end of its life cycle.Despite annual maintenance and repairs, the District has allocated more than $ 22,000 dollars the last eight years in maintenance. The tank can leak up to 30,000 gallons per day before temporary repairs slow down leaks with stop gap measures.Pumping costs add thousands of dollars to our operation each year due to the failed redwood tank. The replacement of the tank with a steel welded epoxy coated tank would extend service many decades for our community.Energy costs are a high priority for the District. The replacement ot the two pumps and motors would achieve that goal. The pumps would be multi-stage with heavy duty motors that are variable frequency driven. The replacement would improve management of energy use at this site.Security is a high prioroty with this project. We propose to install a security fence. This part of the	349,000	889	2,500	01	Humboldt	I	2009

1133	4810021	4810021-003	City of Vallejo-Lakes System		replace old pipes in the area with 4,750 lineal feet of 6" PVC pipe including the installation of four new hydrants.	M	25	C	Water under risk of microbial contamination due to old and corroded cast iron pipes.	321,000	842	2,800	04	Solano	II	1998
1134	4810021	4810021-002	City of Vallejo-Lakes System		To consolidate with that of the Green Valley Water System.	M	25	C	Water system does not meet requirements of SWTR.	3,600,000	842	2,800	04	Solano	II	1998
1135	4710009	4710009-001	City of Weed	City of Weed Water System Health and Reliability Improvements	1. Replace existing Bel Air storage tank with new 0.625 MG steel tank2. Add new well to meet demands and overall system reliability3. Approximately 1000' of 10" water line for looping water system for health and saftey4. New 0.75 MG steel water tank needed storage for new comerical and new housing	M	25	C	CDPH in their letter of March 12, 2008 to the City of Weed regarding proposed water system improvements stated "This office fully supports all of the proposed work since it would increase the reliability of the City's water system." Regarding the Bel Air Tank the letter states "that a structural evaluation performed by your engineer has determined that the corrosion is serious enough to endanger the structural integrity of the tank roof and possibly the floor. We agree that this tank should be replaced as soon as possible." On the water lines the letter reads "The water mains to be replaced are generally old, undersized steel pipes. The replacement of these water mains will help ensure uninterrupted service to the affected customers, increase the reliability of the distribution system, and conform to the California Waterworks Standards." For the water well the letter informed the City "An additional well source within the community would help meet future demands and greatly increase the overall system reliabilty." A water tank is also needed for for system storage and reliability.	2,079,900	1,042	2,963	01	Siskiyou	I	2009

1136	2010007	2010007-010	HILLVIEW WC-OAKHURST/SIERRA LAKES	Oakhurst 2010007 Source - Storage - Fireflow and Infrastructure	This project would replace 15,000 feet of 12" mains with 14" HDPE pipe. The new mains would be installed outside of the fog lines on Highway 41 and 49 to eliminate the need to excavate existing road bed. A new source well would be drilled on an existing well lot (Pine Ridge Way) to provide more continuous water supply and an existing 437,000 gallon storage tank that has deteriorated beyond the point of repair or refurbishing would be removed and replaced with a 600,000 gallon storage tank for additional distributed system storage and fire flow reserves. Approximately 1900' of 6' high privacy fencing with razor wire and lockable swing gates would complete the security needs for the remaining vulnerable water delivery facilities.	M	25	C	Aging 12" mains in Oakhurst threaten safe consistent service due to failure and limit the systems ability to deliver required fire flow. Because of the varying terrain and elevations, in this high fire danger area, extreme pressure fluctuations can occur in the lower part of the water delivery system when there is high or irregular flow. There is also a lack of storage to provide reserves for fire flow. In emergency or drought conditions current ground water sources would not be able to recharged the existing storage tanks in a timely way. Drought conditions and higher consumption in warmer months serve to magnify all the existing problems of the aging inadequate infrastructure. In addition to the aging infrastructure problems, there are about half of our well or storage sites that do not have security fencing to discourage vandalism, theft or terrorism.	4,655,100	1,007	3,006	11	Madera	III	2009
1137	3310018	3310018-001	Home Gardens County WD		A water treatment plant with biological denitrification, filtration and disinfection, plus stroage tank for blending, detention and equalization.	M	25	C	NO3 contamination of the local groundwater has caused shut down of the District's most productive wells, and requires purchase of water from City of Riverside at high costs and there is no guarantee of supply.	1,000,000	811	3,044	20	Riverside	V	1998
1138	2410007	2410007-003	PLANADA CSD	Replace Failing Water Lines, Phase 1	The existing thin walled PVC pipe will be replaced with AWWA C900 rubber gasketed PVC Class 150 pipe. Undersized pipelines (i.e., 2" & 3") will be replaced with 6" pipe. Fire hydrants will be added to provide for proper flushing. Existing water services will be reconnected to the new water lines	M	25	C	Much of the existing water system consists of water lines that are pressure rated PVC, probably per ASTM 2241. This is a thin walled PVC pipe that is normally used for agricultural or landscape purposes. This pipe has aged to the point where it has become brittle. When hit with a shovel it can split and leak. Maintenance personnel have a difficult time doing repairs due to the fragile nature of the pipe. There is a real concern about contamination from leaking pipes. Also, there are portions of the piping system that are 2" and 3" in diameter, and in these areas the water pressure can fall below 20 psi. In addition, some areas of the system do not have sufficient flushing points, so fire hydrants will be added. This is the first phase of a three phased project.	1,300,000	1,335	4,000	11	Merced	III	2009
1139	1710006	1710006-002	Konocti County Water District		Construct new 0.5 MG storage tank.	M	25	C	Aged water storage tanks.	625,000	1,744	4,986	03	Lake	II	1998
1140	0310003	0310003-014	AWA Sutter Creek	Broad Street Water Improvement Project	The project includes the installation of 1,105 feet of 10 inch water main along Broad street in Sutter Creek. The addition of this water main will avoid high velocities and low pressures in the pipe system which is anticipated to occur once the City begins service during the peak demand periods.	M	25	C	The Water Agency has been working with the City of Plymouth for approximately five years to get a treated water main to the City from the Amador Water System (Tanner WTP) to provide a reliable water supply. The City has been under a water moritorium for approximately ten years. A pipeline construction project has just begun which uses a combination of new and existing water mains. The Water Agency determined that once the service is established for the City, on of the existing mains will begin experiencing high velocities (greater than 7 Ft/s) and low pressures at higher demand periods. In order to maintain presuures and adequate flows to both the City and the existing customers in the Sutter Creek area, 1105 feet of 10 inch water main needs to be installed along Broad street in Sutter Creek.	305,570	1,654	5,458	10	Amador	III	2009

1141	0310003	0310003-013	AWA Sutter Creek	Leak Detection Water Conservation Project	The purpose of the study will be to quantify disparity between water production and retail deliveries, known as unnacounted for water. Recommnedations from the study will identify opportunities for water conservation improvements. The water audit will delineate production and retail discrepancies, help identify programmatic improvements to water conservation. Surveys would identify specific actions of systme improvments that can be made to promote water conservation to large landscape and commercial accounts and quantifying potential water losses. Infrastructure improvement study of the entire distribution system, which includes reporting and monitoring to ensure that the project moves forward as planned.	M	25	C	The Amador Water Agency's unaccounted for water is estimated between 800 and 1,000 AFY, and at least 95% of this lost water is derived from the Mokelumne River. The source of the losses are attributed to raw water ditch delivery system, pipeline and storage tank leaks, unauthorized water uses, and unmetered users. Parts of the system are antiquated and aging faster than can be maintained, such as 7 wooden tanks that leak 1-5 gallons per minute on average. An extensive water audit and leak detection study would establish a water balance and identify oppurtunities for water conservation.	150,000	1,654	5,458	10	Amador	III	2009
1142	0410004	0410004-002	City of Gridley	Water Main Replacement Project	The City of Gridley will install approximately 3,300 feet of 6-inch and 8-inch diameter distribution system piping in Peach Street from Idaho Street to Oregon Street; in Nevada Street from Peach Street to Oak Street; in Oak Street from California Street to Maine Street; in Maine Street from Oak Street to Spruce Street; in the north-south alley between Indiana Street and Vermont Street from Bridgeford Street to Vermont Street; and include all fittings, fire hydrants, valves and other appurtenant equipment required to connect to the existing distribution system and homes.	M	25	C	Portions of the City's water distribution system were installed in the early 1900's. Areas within the City have old galvanized iron pipe and dead end water mains. The old galvanized iron pipe is undersized and does not meet water system flow or pressure requirements. Replacement of old water mains and services, and providing looped water mains will improve water distribution pressure and fire hydrants flows.	493,000	2,058	6,403	21	Butte	I	2009
1143	4710011	4710011-001	City of Yreka		Construct 1.5 MG storage tank for north end of town.	M	25	C	Experiencing low pressures at north end of town during high summer demands.	1,000,000	2,876	7,290	01	Siskiyou	I	1998
1144	1010044	1010044-002	Huron, City of		PROVIDE A SECOND SOURCE OF SURFACE WATER BY CONNECTING TO LATERAL 22R WHICH IS ABOUT 5,000 FEET AWAY FROM THE PLANT SITE.	M	25	C	RAW WATER FROM THE CALIFORNIA AQUEDUCT IS DELIVERED VIA LATERAL 23R WHICH CAN BE PERIODICALLY SHUT DOWN FOR MAINTENANCE FOR 2 TO 4 DAYS.	155,000	860	7,306	23	Fresno	III	1998
1145	5110001	5110001-018	City of Live Oak	City of Live Oak SCADA System and Controls Upgrade Water Main Replacement Project	The City's SCADA system will be upgraded in order to improve water delivery to residents and improve the coordination of the storage tank and booster pump station with the other wells on the City water system. The project will include installation of a new central radio at the storage tank site to improve system-wide communication, two new SCADA computers, a new fill valve and control appurtenances at the storage tank to allow Wells 3, 4 and 5 to fill the storage tank during periods of low demand, installing a variable speed drive and appurtenant controls at Well 4, and installing new control panels and motor controls at Wells 1A, 2A and 5 to allow the SCADA computers to control all 5 wells simultaneously.	M	25	C	In 2003, a 1.4 MG water storage tank was constructed at the City's Memorial Park. The tank is filled by two City wells on the same site (Wells 1A and 2A). Discharge from the tank is through a booster pump station capable of pumping 4200 GPM. The remainder of the City's supply is from three individual wells. Two of the wells are connected to the City's existing SCADA system but the existing system does not allow the wells and the storage tank to operate efficiently together on the distribution system. This results in hard on-off operation of Well 4 and inefficient low-demand operation of Well 3. Neither of these wells can currently be used during periods of low demand to fill the storage tank.	400,000	2,186	7,475	21	Sutter	I	2009
1146	1510041	1510041-008	North of the River MWD	Disinfection By-Products Reduction Project	This project would install Solarbee tank mixing devices, along with associated electronics, and chlorination equipment. The tanks being fully mixed will allow for a uniform chlorine level, reducing the amount of chlorine added, and provide a better quality water.	M	25	C	Poor mixing within the two 750 elevation and two 900 elevation reserviors has at times produced high TTHM readings.	200,000	2,025	7,500	12	Kern	III	2009

1147	1510041	1510041-004	North of the River MWD	North Highland Park Turn-out Project	This Project would create another Turn-out, connected to the Oildale Mutual water system; thereby reducing the water velocities upstream.	M	25	C	The North Highland Park portion of the District is served by one turn-out. The District has received complaints about fine silt within the water. This area was once served water from wells. We believe that the source of the silt. Our investigation has shown that silts trapped within the pipe collars are being stirred up during times of high use due to the significant velocities of the ditribution water. The District performs a unidirectional flushing twice a year, and has repeatedly flushed this problem area to no avail.	150,000	2,025	7,500	12	Kern	III	2009
1148	5410020	5410020-003	Woodlake, City of		INSTALLATION OF 500,000 GAL RESERVOIR. OTHER - DESIGN AND CONSTRUCTION	M	25	C	NEW WELL AND RESERVOIR CAPACITY TO MEET DEMAND	450,000	1,784	7,524	12	Tulare	III	1998
1149	5410020	5410020-002	Woodlake, City of		ENGINEERING TO LOOP THE SYSTEM. OTHER - DESIGN AND CONSTRUCTION	M	25	C	DEAD ENDS IN DISTRIBUTION PIPES RESULTING IN POSITIVE BACTERIOLOGICAL SAMPLING	75,000	1,784	7,524	12	Tulare	III	1998
1150	5410020	5410020-004	Woodlake, City of	Water System Improvements and water meters	VARIOUS SYSTEM IMPROVEMENTS PER "WATER MASTER PLAN". OTHER - DESIGN AND CONSTRUCT. Install water meters on all unmetered services	M	25	C	LOW WATER PRESSURE AND INADEQUATE FIRE FLOWS IN SOME AREAS OF SYSTEM	1,600,000	1,784	7,524	12	Tulare	III	2007
1151	5410020	5410020-008	Woodlake, City of	Woodlake Water Supply Project	The proposed project is the drilling of a new water well (preceeded by the drilling of a test well) that meets Title 22 requirements with a capacity of approximately 700 gpm. The new well would be drilled on land already owned by the City in an area where other good quality wells have been drilled in the past.	M	25	C	The City has lost two wells due to contamination. Well #6 is out of service due to high nitrates and Well #1 is no longer active due to recurring bacteriological problems. These wells reportedly produced about 620 to 400 gpm respectively. Reactivating these two wells is not considered a viable option. The drier climate has lowered the ground water in the area. Due to this, there is an insufficient supply of water for maximum day demand and fire protection. The existing water supply source capacity is 450 gpm deficient in meeting system needs.	1,030,000	1,784	7,524	12	Tulare	III	2009
1152	5410020	5410020-001	Woodlake, City of		CONSTRUCTION OF ADDITIONAL WELL WITH STANDBY POWER. OTHER - DESIGN AND CONSTRUCTION	M	25	C	CAN NOT SUPPLY PEAK DAY AND PEAK MONTH DEMANDS	300,000	1,784	7,524	12	Tulare	III	1998
1153	5410020	5410020-006	Woodlake, City of		Construct additional water tank to meet needs and provide adequate fire flow.	M	25	C	Capacity issue due to size of elevated water tank being too small.	1,500,000	1,784	7,524	12	Tulare	III	2004
1154	1710002	1710002-001	Golden State Water Co.-Clearlake System		Replace with 1,000 ft of 8 inch PVC in Lakeshore Dr.	M	25	C	Existing 2 inch steel pipe has deteriorated beyond it's economical life. The existing main has had numerous leaks, requiring shutdown for repair.	90,000	2,238	7,544	03	Lake	II	1998

1155	2310004	2310004-002	Willits, City of	Main Street Water Main Replacement Project, Phase II	The City proposes to replace approximately 2,200 linear feet of compromised water main and associated connections along Highway 101, which travels through the heart of Willits and serves as our Main Street. The proposed project would replace the existing undersized failing line with a 12" Ductile Iron Pipe Class 350 water main. This project would also replace 3 fire hydrants, 14 water meters with boxes, 7 tie-ins, 13 valves and miscellaneous fittings. The project will also require a bridge crossing and water meter relocation. Due to traffic restrictions on Highway 101, some construction will occur at night. Pending funding, the City expects to begin the project in July of 2009.	M	25	C	water main servicing the northern most section of town has deteriorated to a condition of questionable reliability and is in dire need of replacement. This section of main is not only undersized for the area it services, but it is also putting additional demand on the City's dwindling water supply due to leakage. It is anticipated that by replacing this line the City will save an estimated 84 million gallons of water per year. Along with a reduction of leakage and improved reliability, this project would serve to bolster fire fighting capabilities to both the school district and industrial properties along the Highway 101 corridor. This project will qualify for an exemption under CEQA because it proposes to replace an existing line. Recent replacement of the connecting section of this main line has proven that the amount of water produced at the water treatment plant and introduced into the system will be greatly reduced as a result. This, in turn, promotes increased contact times for disinfection, more accurate accounting of water loss (UAF), and a reduction of overall expenses now dedicated to water production and failing infrastructure. This project would reduce production, reduce unaccounted for water (UAF), promote conservation, and will assist us with our efforts to increase our source capacity as mandated by CDPHS.	2,260,226	2,168	8,062	03	Mendocino	II	2009
1156	0310012	0310012-009	AWA Buckhorn Plant	CAWP Emergency and Fire Storage Project	The Project includes the installation of a bolted or welded steel tank on a centrally located parcel already owned by the Water Agency and zoned for a water storage tank. The project also includes an emergency generator at the Mace Meadows Pump Station which is utilized to pump water to three of the system water tanks. The balance of the system tanks can be fed by gravity from the proposed 2.0 million gallon treated water stoage tank. The project also includes monitoring and control devices wich communicate to the Buckhorn water treatment plant. This project will enhancve the commercial and residential fire protection and emergency storage for mor than 10 communities in CAWP water system which are located in rural Amador County.	M	25	C	The Water Agency owns and operates the Central Amador Water Project which serves communities along Highway 88, a steep and heavily wooded area of Amador County. The existing system of storage tanks and distribution water mains are not adequately sized to provide fire protection and provide for emergency water supply in case of outages in much of the area. Many of the existing undersized storage tanks are more than 40 years old. The placement of a treated water storage tank in a centrally located area will greatly enhance the ability to fight fires even during power outages. Water flows by gravity to most areas; however an emergency generator will be added for a pump station that serves a portion of the system.	2,500,000	2,558	8,508	10	Amador	III	2009

1157	3610025	3610025-006	JOSHUA BASIN CWD	Pipeline Replacement Project	The project consists of constructing approximately 15,000 linear feet of 8-inch PVC or ductile iron water pipeline to replace existing 4-inch deteriorating pipelines. The location of these pipeline replacements are spread out over the various pressure zones of the District. For cost effectiveness, the District has packaged these replacements together to provide for increased contractor interest and competitiveness. The pipeline construction will also include various appurtenances, including valves, air-vac valves, blow offs and fire hydrants.	M	25	C	A large portion of the District's water system is comprised of an aging and relatively small diameter distribution system network, with distributed groundwater wells for water supply. The system is arranged in pressure zones with booster stations and reservoirs moving the water from the lower zones into the upper zones. The distributed nature of the groundwater wells results in smaller pipeline diameters for conveyance of water from source to consumer. The water system was coalesced from several smaller localized private water systems, eventually connecting in a regional distribution system. As a result, large portions of the system were originally constructed of 4- and 6-inch welded steel pipeline materials. As the District's service population has grown over many years, these smaller diameter pipelines have become overtaxed, particularly in the area of providing required fire flow protection. Additionally, the small diameter pipelines have begun to deteriorate, resulting in numerous system breaks and outages. The District has developed a small diameter pipeline replacement project to systematically replace these pipelines. Replacement of these pipelines results in consumer health protection by reduction of breaks and elimination of potential contamination, increases system reliability and safety, and provides the ability of the District to meet current fire flow requirements for	1,500,000	4,370	9,000	13	San Bernardino	V	2009
1158	0410008	0410008-003	Thermalito Water & Sewer District		Replace old steel mainline. Design and construct new 2.5 MG storage tank.	M	25	C	Critical need of steel main line replacement. The district also requires an additional 2.5 MG enclosed reservoir and appurtenances.	4,000,000	2,779	9,513	21	Butte	I	1998
1159	4510006	4510006-001	City of Shasta Lake	Intake Piping in Shasta Dam	Project implementation would result in a third intake pipe being placed in Shasta Dam to allow withdrawal of water at the elevation 850 piping gallery. This would create an additional mechanism (opportunity) for increasing the volume of warmer surface water being withdrawn, thereby decreasing the draw on the deeper cold water pool. The new piping would connect to the existing elevation 850 piping gallery at four locations, and then extend out the existing ventilation/drainage shaft and connect to the existing 16-inch raw water main on the face of the dam. The preliminary layout for the proposed piping is very similar to the piping previously installed at the elevation 750 and 950 piping gallery levels, except that a flow meter and temperature sensor will be incorporated at the new piping in order to monitor the temperature of water being withdrawn at the 850 level. The data from these instruments will be sent to the raw water pump station at the City's water teatment plant by a radio telemetry system. This additional piping will allow the City's transferred water to be withdrawn above the cold water pool in all but the most extreme drought conditions. The proposed piping could also be extended in the future to four additional withdrawal points to allow for withdrawal of additional transferred water and/or the existing City and USBR allocations from the Elevation 850 piping gallery.The estimated cost of this	M	25	C	The City of Shasta Lake has reached a critical turning point in the maturation of its water system. The City cannot accomodate the inevitable growth of the future or protect against a water shortage during drought periods without being able to access additional quantities of water during periods of high demand.Transfer surface water, beyond the Central Valley Project (CVP) allocation from Shasta Lake, is the sole source of supplemental municipal and industrial water for the City. The City's present supply system consists of an intake piping system from inside Shasta Dam, a raw water pump station at the base of the dam, a treatment plant , and a 16-20 inch treated water transmission main to the City. All water transfers are subject to prior approval from the US Bureau of Reclamation (USBR). The City is allocated and withdraws water through two intakes from inside Shasta Dam at the 750 and 960 foot levels. When the level of Shasta Lake drops below approximately elevation 970, all of the water withdrawn must be taken from the 750 foot level, reducing the amount of water available in the cold water pool for the Salmon fishery downstream of Shasta Dam. The city experiences hot, dry summers with little or no precipitation occurring from November to April. Supplementing the City's surface water supply with groundwater is not a viable option because the City lies outside the Redding	615,000	3,609	10,293	02	Shasta	I	2009
1160	1010025	1010025-002	PARLIER, CITY OF	New Well	Construct a test well and a new production well.	M	25	C	Need additional water supply to maintain adequate pressures for domestic and fire flows.	601,000	2,229	12,058	11	Fresno	III	2002

1161	1510022	1510022-004	West Kern CWD	WKWDPA04 -- Installation of 1 MG Welded Steel Storage Tank, Station G	The scope of the project includes the earth work, piping and the installation of a new one million gallon tank at Station G. Underground piping consists of inlet, outlet and overflow piping. Earthwork inclueds over excavation and comapction of the tank pad area and installation of a concrete tank ring with seismic anchors. Upon completion of construction the new tank would tested and painting and coating of all steel surfaces would follow. The tank sould also be fitted with a new cathodic protection system which would be activated approxiamtly one year after completion of painting and coating.	M	25	C	During peak demand periods at Pump Station G, the pumps located at Pump Station B (up gradiant) are required to run due to lack of storage at Station G. When Station B is pumping under this scenario it requires additional electric powered pumps during peak energy demand periods. If additional storage could be added at Station G, Station B could pump the additional one million gallons of water at night during off peak periods using existing natural gas engines. The power savings during the summer demand periods would equal a substantial portion of the project cost.	1,272,700	7,589	16,630	12	Kern	III	2009
1162	1510022	1510022-003	West Kern CWD	WKWDPA02--South Taft Water System Replacements/Improvements	The proposed scope of work includes the installation of approximately one mile of 12" transmission mainline and five miles of 8" distribution line, appurtenance and thirty three fire hydrants. The new facilities will be replacing the existing undersized and deteriorated infrastructure and re located to the street front within public rights of way. The project scope shall also include new service lines and meters.	M	25	C	South Taft is comprised of approximately 40 blocks of low income residential housing. The existing water system infrastructure originally installed in the mid 1920's, is primarily composed of 2.5, 3.5 and 4.5 inch steel water lines typicaly located in alley ways. In addition to the above pipelines, there is also a small amount of 6 inch transite waterline. Due to age, material type, internal condition and effective pipe diameters, the current water quality, fire flow and fire protection are currently inadequate within the South Taft Area and do not meet current water works standards.	4,311,515	7,589	16,630	12	Kern	III	2009
1163	1510022	1510022-005	West Kern CWD	WKWDPA03 -- Re Coating Tank#8, Pump Station A	The subject tank was originally constructed in 1926 of rivited steel plates and wooden roof. The cathodic protection system as well as an agressive inspection and coating program has enabled this tank to remain in service to date. The tank currently serves as one of three, primary storage reserviors at the District's Pump Station A. The proposed scope of work for this project includes the complete interior and exterior re coating of the 920,000 gal water storage tank whose dimensions are 115' x 15'. Recoating of the tank is necessary due to extensive coating failures and exposure of bare metal as was noted in a recent dive and video inspection conducted 01/27/09. Preservation of this crucial storage tank is critical to the Districts storage requirement needs and ability to operate.	M	25	C	The problem is promarily an issue of protecting the steel plates from further corrosion. The secondary issue is water quality. Station A is the destination for all water pumped from the well field, which has very small amounts of sand, which settles out on steel surfaces over time. Steel surfaces that are protected with coating are unaffected. Steel surfaces which are not protected will corrode rapidly, collect sand deposits and provide a more suitable environment for bacteria.	240,120	7,589	16,630	12	Kern	III	2009
1164	1210001	1210001-004	City of Arcata	Downtown Steel Water Line Replacement Project	There is approximately 11,000 linear feet of water distribution main lines that need replacement at several locations in Arcata's downtown "core". These aged mains are made of various materials, including asbestos concrete. Arcata has experienced catastrophic failures of water mains in the recent past, and only expects this to continue without replacement. The scope of work would include excavation and replacement of these water mains, along with all necessary valves, laterals, and other ancillary equipment to provide safe, reliable service to customers.	M	25	C	Arcata's downtown water distribution system is quite aged in some locations, and seriously deteriorated along portions of the mains. Replacement of lines at key locations will renew the life of the downtown water system that is so important to Arcata's well being.	1,550,000	5,278	16,651	01	Humboldt	I	2009
1165	1210001	1210001-005	City of Arcata	New Panorama Water Storage Tank and Pump Station	The project scope involves the construction of a 600 square foot valving and treatment building, approximately 800 linear feet, and a hot tie-in with the Water District's 33" water transmission line. The City of Arcata has right-of-way for this project.	M	25	C	The City of Arcata purchases 60-70% of its water from the Humboldt Bay Municipal Water District, and currently has a single tie-in point to access this water. In the interest of redundancy and safety, a second tie-in point is desired so as to have a back-up water supply in the event of a natural or other emergency.	50,000	5,278	16,651	01	Humboldt	I	2009

1166	1210001	1210001-003	City of Arcata	Tank 4 to Zone 1 Mainline Replacement	The scope of work for this project is the replacement of a mainline consisting of 6" and 8" diameter sections with a 12" line. The length of pipe is approximately 1700 linear feet. The project includes all excavation and backfill, pipe replacement, and appurtenances.	M	25	C	The current configuration of this portion of Arcata's water system is inadequately sized to transfer water to Water Storage Tank #4 during off-peak periods. The resulting problem is inadequate storage at certain times, along with inefficient pumping.	200,000	5,278	16,651	01	Humboldt	I	2009
1167	1610002	1610002-012	Avenal, City of	Water Tank No. 4 Replacement	The Tank No. 4 replacement at the Tank Site No. 3 would be connected to both the 12" and 18"/14" transmissions pipelines and continue to serve the City's distribution system as well as the Prison. The construction of an additional water storage tank at Tank Site No. 3 will allow the City to provide annual maintenance, cleaning and inspection on one of the storage tanks during off peak periods while maintaining water service and fire protection from the other tank.The construction of an additional water storage tank at Tank Site No. 3, equivalent in size to the existing Tank No. 3, will allow the City to provide annual maintenance, cleaning and inspection on one tank during off peak periods while maintaining water service and fire protection from the other tank. The storage capacity will improve future water supply operations and provide the city with a better ability to have a supply of water available to meet shortages caused by transmission pipeline failures. The second tank will also allow the same type of maintenance opportunity on the single water storage tank, at Tank Site No. 6, which serves the California State Prison.The Water Tank No. 4 Replacement Facilities project includes the welded steel tank and appurtenances, interior and exterior coating, cathodic protection, earthwork, grading, reinforced concrete, oiled sand, inlet and outlet manifolds, chainlink fencing and gates, guard post installations,	M	25	C	Water Storage Tank No. 4, a 750,000 gallon welded steel tank, installed in the early 1950's has exceeded its anticipated life expectancy. Tank No. 4 is approximately sixty-five (65) feet in diameter, thirty feet in height, and is supported by a crushed rock foundation. The tank does not meet current seismic design standards, or the operational and maintenance requirements of the American Water Works Association Standards (D-100), and the Department of Public Health. No bypass exists around the tank for emergency or operational and maintenance needs. Furthermore, the City is located near Coalinga, California, an area which has experienced recent seismic activity.In the early 1990s's a major leak developed at the outlet connection to the City's distribution system causing both Tank No. 4 and Tank No. 3 (upstream) to drain. This leak also created major erosion to the adjacent hillside and endangered the foundation of Tank No. 4. With all leaks at tanks or in pipelines, the pumps at the treatment plants continue to supply water "on demand" until the leaks are discovered and isolated. Due to the deteriorating condition of the tank, a possibility of failure exists. Since there is no bypass around the tank, a total failure would cause a major water outage to the City, leaving it without water, fire protection and operational sanitation facilities for approximately five to eight days.In August 2007, a tank inspection was performed	4,000,000	1,892	16,737	12	Kings	III	2009
1168	1610002	1610002-010	Avenal, City of	Water Distribution Upgrades	The water distribution upgrades project will include a temporary bypass / pressure reducing piping around the existing Tank No. 4 until completion of the project. The existing steel Tank No. 4, miscellaneous appurtenances, gravel foundation, chain link fencing, inlet and outlet manifold manifolds, pressure reducing enclosure, electrical poles and equipment will be removed from the site. The site will be graded and a drainage system installed. The proposed Tank No. 4 pressure reducing station w/ bypass piping will be installed in a below ground concrete vault. The pressure reducing station will include a meter station to monitor and record flow rates into the water system. Chainlink fencing, walk and vehicle gates will be installed near the completion of the project. The existing PG&E electrical service may need to be relocated for the SCADA controls and area lighting. The existing graded surface shall be recompacted and 6" of compacted aggregate base installed within the chainlink fence enclosure. The existing access roadway shall be improved with an all weather surface.The distribution system pressure reducing and meter (PR&M) station will be located below ground and connected to the 14" steel pipeline with butterfly valves. There will be 8" connection into the pressure reducing station. 8" Class 200 and Class 150 PVC piping will connect the PR&M Station to the distribution system.	M	25	C	Water Storage Tank No. 4, a 750,000 gallon welded steel tank, installed in the early 1950's has exceeded its anticipated life expectancy. Tank No. 4 is approximately sixty-five (65) feet in diameter, thirty (30) feet in height, and is supported by a crushed rock foundation. The tank does not meet current seismic design standards, or the operational and maintenance requirements of the American Water Works Association Standards (D-100), and the Department of Public Health. No bypass exists around the tank for emergency or operational and maintenance needs. Furthermore, the City is located near Coalinga, California, an area which has experienced recent seismic activity.In the early 1990's a major leak developed at the outlet connection to the City's distribution system causing both Tank No. 4 and Tank No. 3 (upstream) to drain. This leak also created major erosion to the adjacent hillside and endangered the foundation of Tank No. 4. With all leaks at tanks or in pipelines, the pumps at the treatment plants continue to supply water "on demand" until the leaks are discovered and isolated. Due to the deteriorating condition of the tank, a possibility of failure exists. Since there is no bypass around the tank, a total failure would cause a major water outage to the City, leaving it without water, fire protection and operational sanitation facilities for approximately five to eight days.In August 2007, a tank inspection was performed	1,700,000	1,892	16,737	12	Kings	III	2009

1169	1610002	1610002-011	Avenal, City of	Groundwater Deepwell	The proposed groundwater deepwell would be located on the westside of the Water Treatment Plant No. 2 near the entrance gate. The groundwater well would be designed for 1,200 to 1,600 gpm depending on the groundwater test hole information. We are assuming the groundwater test would be drilled to a depth of 1,250 feet. The past water quality information would require aquifer zone testing be performed on the test hole. Based upon past experience a 16" diameter casing would be installed for the proposed groundwater deepwell. The groundwater deepwell will include a vertical turbine pumping unit, well manifold, 12" Class 150 PVC piping to the clearwell. clearwell inlet manifold, electrical controls and equipment and a new electrical service meter.	M	25	C	The City of Avenal receives its water supply directly from the San Luis Canal, a federally owned portion of the California Aqueduct, through water treatment facilities located adjacent to the Aqueduct and near the Avenal Cut Off Road. This water provides for the City's domestic, municipal and industrial needs as well as the needs of the California Department of Corrections Prison.The City presently has a contract with the U.S. Bureau of Reclamation (USBR) for delivery of 3,500 acre feet per year (AFY). This amount, however, is subject to shortages. In 2007, the City experienced a 25% reduction in contract water due to lack of adequate rainfall in the state. This reduction forced the City to buy a minimum of 250-300 acre feet (AF) of water from outside sources at a higher cost. In the dry years of 1977, 1991, 1992 and currently 2009 the water supply was subject to a 50% reduction which left the City with only 1,750 AF from this source. The City was able to obtain additional waters over the 1,750 AF allocation due to carryover from previous years, hardship water and other waters purchased from third parties. The current 40 year contract between the City and USBR is in effect through December 31, 2008. At this time, the City and the USBR are in negotiations for a new interim renewal contract.The City is proposing to install a groundwater deepwell at the existing water treatment plant for additional water supply during drought and	1,060,000	1,892	16,737	12	Kings	III	2009
1170	1610002	1610002-008	Avenal, City of	12" Transmission Pipeline Replacement	The 12" Transmission Pipeline Replacement project will include 12" Class 200 and Class 150 PVC pipelines, ductile iron fittings and concrete thrust blocks. The proposed pipeline alignment will cross existing county, state and interstate highways that will be required to be bored and jacked. We have included road, highway and interstate crossings in the project costs. The 12" Transmission Pipeline Replacement project will include 12" Class 300 and Class 150 sectionalizing valves, air release & vaccum valves and blowoff valve installations.	M	25	C	The 12" diameter transmission pipeline, installed in 1972, is approximately eight (8) miles in overall length. The majority of the pipeline travels through hilly terrain, operating under a maximum pressure of 250 psi, with total lift requirements exceeding 1,000 feet. The cement lined and coated steel pipe has welded joints with a maximum spacing of forty feet. All of the leaks on the 12" pipeline, major and minor have been reported at the field joints. Over the past 10 to 15 years, joint failures have increased at an alarming rate. In 2006, available records showed a minimum of nine major failures in the pipeline. In 2007, City staff has reported breaks in the 12" pipeline are occurring at a frequency closer to 1 ½ to 2 breaks per month. With over 1,050 joints, a huge potential exists for many more future leaks and breaks in the transmission system. Due to the remote regions of the pipeline alignment, it is not uncommon for leaks to go unnoticed for a few days to several weeks. Undetected leaks can lead to ground failure at the site. In one instance, it was once necessary to rescue a cow from a cave-in caused by a break in a joint. Cave-ins pose a safety threat not only to pastoral and wild animals, but also to repair crews. In March of 1995, the 12" diameter transmission pipeline had an undetected leak for a long enough period of time to cause ground failure that ultimately disrupted both the 12" pipeline and the adjacent 18" prison	6,000,000	1,892	16,737	12	Kings	III	2009

1171	1210009	1210009-003	Humboldt C.S.D.	Ridgewood Tank and Water System Improvements	Humboldt Community Services District – Ridgewood Water Tank and Water System Improvement Project.In January 2007, the District contracted with an engineering consultant to determine the required improvements necessary to provide adequate maximum daily demand and fire protection to serve the existing Ridgewood/Cutten service area. The results of the study indicated the following:1. Upsize the existing District Yard water booster pump station pumps from 400 gpm to 1250 gpm and replace undersized yard piping ($45,000).2. Replace or supplement approximately 1650 LF of undersized 6-inch and 8-inch distribution main with 12-inch PVC transmission main ($195,000) within the County roadway. 3. Supplement the existing 0.5 MG steel water tank with an additional 1.0 MG welded steel tank (1.5 MG total) of storage ($500,000). The proposed tank will be placed next to an existing 0.5 MG tank on leased property that does not have any property rights issues or environmental contraints.The District has completed design of these improvements and specifications and is in the process of completing the permitting. The project qualifies for a CEQA exemption consisting of a Negative Declaration, with the District as Lead Agency. The only other permitting required is Department of Public Health review and approval of the Improvement Plans and a County Encroachment Permit to be obtained by the	M	25	C	The Humboldt Community Services District Ridgewood Tank and Water System Improvement Project.Currently, the existing Ridgewood / Cutten water system is not capable of maintaining maximum daily demand. This situation results in "Low Pressure" problems and customer complaints and requires 24-hr (excess) pumping during PG&E on-peak pumping periods. The existing storage tank does not provide adequate fire protection storage per State standards.The Project will provide additional water storage, transmission and pumping capability to provide maximum daily demand and fire protection in conformance with State of California Safe Drinking Water Act, Title 22, Chapter 16, Article 2 (Regulations and Standards for Quantity of Water Supply). The project will also reduce energy consumption, especially during the critical "On-Peak" energy demand periods.	740,000	7,266	19,000	01	Humboldt	I	2009
1172	3310016	3310016-008	Hemet, City of	Echo Hills Water Tank and Line Improvement Project	Installation of a 2 million gallon above ground reservoir tank and approximately 5,000 linear feet of 24-inch transmission main line.	M	25	C	The City's current water storage capacity does not meet California Waterworks standards for a system of its size. Storge capacity needed has been determined by CDPH to be approximately 6 million gallons. Currently, the City's reservoirs are only able to provide a maximum of 5 million gallons.	3,000,000	8,667	20,047	20	Riverside	V	2009
1173	3310016	3310016-009	Hemet, City of	City of Hemet Well No. 17	Installation of new well.	M	25	C	The City's current source productions are not sufficient to meet the maximum daily demand of 7.7 million gallons. CDPH has strongly recommended that the City consider the addition of new water sources to allow for more reliability in the event that higher capacity wells fail and/or the City is unable to rely on its connections with neighboring water agencies.	750,000	8,667	20,047	20	Riverside	V	2009

1186	1210013	1210013-005	Humboldt Bay MWD	HBMWD Fieldbrook Booster Pump Station at Korblex	This project would include construction of a booster pump station, which would include 2 pumps with variable speed drives, capable of producing between 400 and 850 gpm. The pumps would discharge to the existing 16 inch pipeline and would be housed in a small building that would also include a generator to provide standby power. The electrical controls would be tied into the District's existing SCADA system.The pump station would be located on the District's property referred to as Korbex, where they have and existing water treatment plant and storage facilities.	M	25	C	The purpose of this project is to correct low water pressure issues in portions of the Humboldt Bay Municipal Water District's distribution system, particular where it feeds into the Fieldbrook CSD. A study was completed in 2003 that identified the size and other aspects of the project. The preferred location for this booster station is on the District's Korblex site and would provide improved pressure to customers of both HBMWD, Fieldbrook, Glendale and possibly portions of the McKinleyville CSD. In addition, it would reduce pumping costs for the City of Blue Lake, as their system is located downstream on the same transmission line.Residences off of Glendale Road, in the Glendale Heights area have also contacted Fieldbrook CSD with complaints of low water pressures. Water pressures are susceptible to being lowered below the State standard of 20 psi when water is being pumped either at the Lymann Road pump station or the Blue Lake pump station, and especially if both stations are running at the same time. During any fire flow conditions, water pressure would not meet the State standard.In addition to the low pressure occurrences in the Fieldbrook system, the HBMWD serves residence off of West End Road, Warren Creek Road and Lindley Road and this project would also improve pressure to these users. The Lindley Road extension off of West End Road has also experienced occurrences of low	600,000	224	80,000	01	Humboldt	I	2009

1199	5800824	5800824-001	COUNTRY VILLAGE MOBILE HM PRK	2nd Water Source	This project would include the construction and development of a new production well. The pump, panel and pipelines would also be installed after completion of the new well.	M	20	C	This community PWS currently has only one source of water - a groundwater well. Due to the current drought conditions in California, the need for another water source may be imminent.	250,000	10	30	21	Yuba	I	2008
1200	5301102	5301102-002	Trinity Knolls Mutual Water Company	Trinity Knolls MWC Supply Well Installation	The water system would like to install one or two additional groundwater supply wells to increase their source capacity and prevent summer outages.The project would include engineering and permitting, drilling, well construction, aquifer testing, pump and motor installation, main installation and tie-in to existing system, electrical work, instrumentation and controls, chlorination equipment, construction of a pump house, and required initial source water testing.	M	20	C	Trinity Knolls MWC supplies their 61 connections (one includes a very large campground) with groundwater from six wells. In wet years, the combined maximum capacity of these wells is 100,000 gallons per day (gpd). In recent dry years, maximum capacity has been 75,000 gpd. Note, the wells run dry and cannot sustain these pumping rates continuously.Trinity Knolls MWC's maximum day demand is approximately 100,000 gallons per day. In the summer, Trinity Knolls MWC is unable to keep up with demands. This problem is heightened by increased needs from the campground in the summer and a declining water table. Lower regional groundwater elevations in the summer are the result of both seasonal variations as well as the current state-wide drought.The water system currently charges a flat rate for their services. Consequently, despite conservation notices issued by the water system, customers have not reduced their usage.	80,000	60	36	01	Trinity	I	2009

1203	1900801	1900801-005	COLORADO MUTUAL	Upgrade storage capacity and Support Programs	It will be necessary to subdivide and purchase a porton of adjacent land to accomodate the larger tank.We propose to purchase a 90,000 gal tank which will have a charge for erection by a contracting company.The new tank will need monitoring devices, pipeline and valves (from the well and then to the pressure tank and distribution system. There will be approx 200 feet of 6" pipe and at least four 6' valves involved in the upgrade.The entire electrical system will have to be replaced/rehabilatated to provide for the additional needs. In addition, it will be necessary to purchase a new compressor to support the hydroneumatic tank.We will hire a company to perform hydrological studies at the proposed tank installation, and grading compacting and land fill.We propose to construct a concrete ring for placement of the tank and the necessary gravil fill.Also, in our estimate is an approx. cost for Engineering of the upgraded system.	M	20	C	This water system has inadequate storage to provide fire protection and drinking water to shareholders. There is less than 14,000 gal of storage, which does not provide the regulation for fire flow, necessary to provide protection.This system has periods of low pressure and inadequate supply due to lack of storage.	448,200	12	50 16	Los Angeles	IV	2009
1204	1900801	1900801-004	COLORADO MUTUAL	Loop system and install required fired hydrants	Currently, the mains in this system are 4". We propose to replace these lines with 6" C-900 lines. We also propose to loop the system to alleviate dead ends and make maintenance accessible to all areas in the distribution system. We propose to install 10 fire hydrants. It will be necessary to install 13 new service meters, including all necessary corp stops, service lines, etc. Most of the current service lines are 50 + years.The main thrust of this project is to provide adequate fire protection.	M	20	C	This system does not have adequate fire protection. It is proposed that we install 10 fire hydrants with necessary valves.It is also in this proposal to loop the system as it is now operating in a treesystem creating dead-ends, with current lines running through adjacent properties making maintenance inexcessible.	385,000	12	50 16	Los Angeles	IV	2009
1205	5200013	5200013-002	WOMACK SUBDIVISION M.W.C.	Womack feeder pipe replacement project	our plan is to replace the entire distribution line system from our collective tanks to each of the 16 homes. Then place valves in front of each house, and then replace the supply line going to the side of the house.	M	20	C	our distribution lines are breaking at an alarming rate. It is diminishing our funds so fast that it is breaking our bank account fast. we have to keep raising our rates to try and keep ahead of repair expenses.	50,000	16	51 21	Tehama	I	2009
1206	5500092	5500092-001	PONDEROSA MOBILE HOME PARK		CONSTRUCT AN ADDITIONAL WELL.	M	20	C	SYSTEM'S SOURCE CAPACITY COULD BE IMPROVED.	60,000	59	54 11	Tuolumne	III	1998
1207	3500552	3500552-001	Venture Estates MWC		Construct a pipeline to connect to Sunnyslope water system.	M	20	C	System is aging and has high TDS - 1300 ppm, and high Na - 500ppm.	60,000	18	60 05	San Benito	II	1998
1208	4300526	4300526-002	Oakmont Water System	Oakmont Water upgrades for consolidation	All of the exisitng 2600 LF of mains will need to be replaced with 6 inch DIP. All of the exisitng 26 service connections (5/8th) will be replaced along with the main replacement. The exisiting 22,000 redwood water storage tank will need to be replaced with a 30,000 gallon bolted steel tank. Further studies are needed to determine if a new concrete foundation pad is required for this tank. Additional upgrades to Oakmont's water system may be required after further investigation by SJWC staff.	M	20	C	Oakmont Water is currently served by a "wholesale" connection to San Jose Water Co (SJWC) (paying retail water rates). Oakmont has requested SJWC acquire Oakmont (consolidation) but they require our system be upgraded to PUC standards. This will require the replacement of 2600 LF of main with 6" DIP and the replacement of the existing 22,000 gal redwood storage tank with a bolted steel storage tank of 30,000 gal (min) capacity. The existing Oakmont water system serves 26 households and so does not have the resources to effectively operate and maintain a water system to current standards. Water quality, system reliability and fire protection would all be improved with the proposed consolidation. While consolidation could occur easily (the plumbing is already connected) SJWC refuses to accept Oakmont's system without these proposed upgrades for consolidation.	420,000	24	63 17	Santa Clara	II	2007

1209	1400072	1400072-004	North Lone Pine Water District	Project Title: North Lone Pine Mutual Water Company Main and Lateral Replacement	Install new mains, laterals and fire hydrants	M	20	C	Our mains and laterals were installed in the 1940's with used military surplus pipes. Some of the mains were replaced in 1972 with welded steel pipe, the life expectancy of which is 35 years. We are regularly experiencing lateral breaks. Our local plumbers will not work on the system any more as the pipes are so rotted. Each repair can result in several feet of pipe being replaced to find a solid piece to attach to. Our fire hydrants and standpipes are not functional. The Fire Chief will not hook up to the hydrants as he feels that this will collapse our mains.	350,000	32	70 13	Inyo	V	2009
1210	5800823	5800823-001	COUNTRY AIR MOBILE HOME PARK		Upgrade current system to ensure adequate safe supply.	M	20	C	Aging wells, valves and distribution lines.	10,000	36	70 21	Yuba	I	1998
1211	3700937	3700937-001	LAZY H MUTUAL WATER COMPANY		Replace 11250' mains and laterals with 8" and 4" C900 pipe, upgrade service connections.	M	20	C	Substandard old water distribution system with 1 1/2" - 6" tuberculated mains, allowing low flow capacities - inadaquate fire protection.	213,500	37	70 14	San Diego	V	1998

1214	4500023	4500023-005	HAT CREEK HIGHLANDS MUTUAL WATER CO		Replace storage tank to provide the reliability required by the Waterworks Standards.	M	20	C	Aging storage tank not fulfilling Section 64560(a)(6) (minimize effects of structural failure) of the Waterworks Standards.	65,000	39	75 02	Shasta	I	1998
1215	5400647	5400647-001	YOKOHL MUTUAL WATER CO.	Water Main Line / Meters Replacement	Replace approximately 3000 feet (+/-) of 4" main water line by utilizing the new trenchless method using polyethylene pipe. This method uses the path of the existing water line and would only utilize trenching at the service connections. Currently, there are no isolation valve in place and when the water is turned off for repairs, the entire system is down for all connections. Install isolation valves in four (4) different locations within this loop. Install water meters at all 32 service connections. Provide computer program to read meters, water usage statistics and billing.	M	20	C	Our water system was established in 1972 which provides service for 32 connections. The water main line consists of 4" tranzite pipe in a "loop" system. This tranzite pipe has an asbestos lining and has been linked to different cancer causes. Over the past two years, there have been two different major escavations to repair main line breakage indicating that this system is deteriorating and starting to fail. The last breakage gave the appearance that the ground is shifting and settling in differnt locations throughout the loop and only indicates more future problems and expenses. For a disadvantaged community, this has been very costly. Currently there are no water meters in place and all residents pay a monthly flat rate fee for there service. There are several residences within this community that abuse and waste our water and obviously the cost for that abuse is passed on to all the rest of the community it serves. In today's time, it is essential for all to conserve our most precious resourse. If water meters were in place, those abusers would pay for the water they use above their monthly flat rate and would ultimately be a detourant for all. There have been no improvements or upgrades since 1972 and this 35 year old water system is in dire need for replacemet or refirbishing.	200,000	32	75 12	Tulare	III	2007
1216	4700638	4700638-001	Oak Valley Acres P.O.A.		Purchase and install a new booster pump and recondition the existing pump and use it for a backup. If that is not feasible, construct a second well.	M	20	C	Bishop Acres MWC has only a single well as a source and therefore lacks required system reliability.	500,000	28	81 19	Kern	III	2008
1218	0400028	0400028-002	BIG BEND MOBILEHOME PARK	Increase Storage Capacity	Install new storage tanks with increased capacity to 35,000 gallons.	M	20	C	Water system only has 10,000 gallons of storage capacity. Per the engineering report of 10/4/2007, title 22 section 64564, indicates the MDD is 35,000 gallons daily and a such should have storage capacity equal to the amount.	42,000	35	85 21	Butte	I	2009

1219	0400028	0400028-001	BIG BEND MOBILEHOME PARK	Backup electric system	Install a propane (or other alternative fuel) generator to power the water system in the event of electrical outages.	M	20	C	Water system is powered by a well pump and booster pump, during an electrical outage the water system will not operate. Outages have extended in excess of 3 days forcing tenants to obtain water by some other means. When water is restored an immediate boil order notice is issued from the loss of pressure.	28,000	35	85	21	Butte	I	2009
1220	4300741	4300741-001	Mireval Improvement Association	Mireval Association Water Improvement Project 2010	We will work with San Jose Water to design a system that will replace the 5000 feet of failing pipe. We have had preliminary meetings with San Jose Water to establish rough costs and required pipe materials. San Jose Water requires 6 inch ductile iron or blue bell pipe.	M	20	C	Mireval Improvement Association consists of 16 homes connected by 55 year old galvanized iron piping. There are more than 5,000 feet of deteriorated-leaking pipes that supply these homes. This includes 2,800 feet of 3 inch galvanized water main that is in desperate need of replacement. The system is in near complete failure. We will replace the existing system with materials complying with San Jose Waters specifications. Once this has taken place, San Jose Water will take the system over and all homes will be part of the local public water system. Ensuring safe, high quality water for all users.	420,000	15	90	17	Santa Clara	II	2011
1221	4900514	4900514-001	Rancho Del Paradiso-Cal Water Svc (PUC)		(Install approve filtration system,) NOW replace existing 5,000 gal tank with 10,500 gal concrete tank and new transmission lines.	M	20	C	System WAS in non-compliance with swtr, NOW needs ONLY storage and fix inadequate sized mains.	158,500	59	90	18	Sonoma	II	1998
1222	5500353	5500353-002	SIERRA VILLAGE MOBILE HOME PARK		Install storage and water lines.	M	20	C	Need more storage and system reliability.	75,000	16	90	11	Tuolumne	III	1999
1223	0400016	0400016-003	BERRY CREEK COMMUNITY SER DIST	Replacement for well number four	The project will consist of drilling a new well, to replace well number four. Install pump, pipe lines and electric, to incorporate the new well to our system.	M	20	C	The water system was designed with four wells and a 90,000 gallon holding tank. Well number four has never worked as it was drilled in the wrong location. Well number 3 can only be operated a half capacity for approximately one week, and then it has to rest for a few days, or plugs up with sand.With only two fully operational wells, we will not be able to meet the peak demand this summer.	20,000	36	99	21	Butte	I	2009
1224	0500068	0500068-001	DUNROVIN MOBILE HOME VILLAGE		INSTALL GENERATOR AND SMALL BACK-UP PUMP	M	20	C	LACK OF BACK-UP POWER AND A BACK-UP PUMP	20,000	42	99	10	Calaveras	III	1998
1225	4300504	4300504-001	Arrowhead Cooperative Company		Run new 10-inch mains from SJWC to all streets. Abandon existing system. The study and design has already been done by SJWC.	M	20	C	Replace mains and consolidate.	1,642,632	38	100	17	Santa Clara	II	1998
1226	0400013	0400013-004	MERRY MOUNTAIN MUTUAL	New Well, Pump and, Tank	new well, pump, and tank	M	20	C	lack of adequate source and storage capacity	300,000	77	100	21	Butte	I	2002
1227	2000557	2000557-001	MD#43 MIAMI CREEK KNOLLS		CONSTRUCT A NEW DISTRIBUTION SYSTEM AND A 50,000 GALLON STORAGE TANK.	M	20	C	THE WATER SYSTEM WAS INSTALLED IN THE EARLY 60'S AND IS VERY UNRELIABLE. IT CONSISTS OF 4 VERY LOW PRODUCTION WELLS AND A DETERIORATED DISTRIBUTION SYSTEM. THE SYSTEM MUST BE CHLORINATED TO MEET THE TCR.	250,000	37	100	11	Madera	III	1998
1228	2701789	2701789-001	HOLLY HILLS MWC		New pumping station, new well, and increase storage.	M	20	C	Insufficient water pressure, insufficient storage, and insufficient pumping volume.	150,000	27	108	05	Monterey	II	1998
1229	3900543	3900543-001	MAURLAND MANOR WATER SYSTEM		INSTALL PRESSURE TANK, REPLACE LINES WITH LARGER PIPES AND CONSOLIDATE WITH SYWSTEM 3901348. OTHER = DESIGN AND CONSTRUCTION	M	20	C	SINGLE WELL SYSTEM WITH PRESSURE PROBLEMS.	400,000	28	110	10	San Joaquin	III	2006
1230	1700549	1700549-001	Corinthian Bay Mutual Water Company	generator power back up for electrical outages at the well	Purchase and installation of a propane powered generator to supply emergency electrical power for use as required with the existing system to properly maintain adequate system pressure during loses of public electrical power. Will include required base for the generator and all electrical safety bypass switches required to interact with existing system.	M	20	C	Lose of electrical power prevents pump motors from maintaining adequate system pressure through the holding/chlorination tank which could allow a back flow and contamination into the main source lines.	45,000	74	125	03	Lake	II	2009
1231	1200592	1200592-001	Big Lagoon CSD		Purchase water system; overhaul electrical system; and add a generator to ensure continuous water delivery.	M	20	C	Interruptions in water delivery during power outages which occur frequently in winter months and may be 3 to 5 days duration. No emergency power supply and no gravity tank.	100,000	35	140	01	Humboldt	I	2006

Replace storage tank,distribution system and boost pumps to meet fire flow requirements.	M	20	C	Water System does not meet fire flow and storage requirements. System has no back up generator for possible power outage. System is in critical fire zone and cannot provide adequate fire protection.	1,800,000	35	150	11	Madera	III	2007
1236	1700516	1700516-003	Lake County CSA 16 - Paradise Valley	Water Distribution Piping Project	The project includes construction trenching and 1,200 lineal feet of 4" C900 PVC plastic pipe to connecting Well #3 to the Paradise Valley Water System, as well as restoration of construction area.	M	20	C	The project is designed to provide the pipe and connection of additional water supply (well) to the Paradise Valley Water System. The water system provides drinking water for the customers within County Service Areas # 16.The system is currently under a County imposed urgency ordinance and connection moratorium. Connection of Well #3 to the system is critically needed to address the current situation.HEALTH BENEFITS include additional available drinking water and fire flow.ECONOMIC BENEFITS include construction (engineering, materials and labor).REGULATORY BENEFITS include compliance with DPH goals and recommendations.	50,000	72	180	03	Lake	II	2009
1237	1400036	1400036-002	Keeler CSD		Construct new 150k tank	M	20	C	Inadequate storage capacity	125,000	88	180	13	Inyo	V	1998
1238	1400036	1400036-004	Keeler CSD		Replace mainline	M	20	C	Old substandard mainline	125,000	88	180	13	Inyo	V	1998
1239	1700516	1700516-004	Lake County CSA 16 - Paradise Valley	50,000 Gallon Storage Tank	The 50,000 gallon storage tank will include a seismically engineered concrete foundation, one 50,000 gallon capacity anchored bolted steel storage tank, and the associated piping and controls to connect to the Paradise Valley water system. The facility will be protected with a security fence.	M	20	C	This project will provide additional needed storage for customer drinking water needs and fire flow.HEALTH BENEFITS include additional available drinking water and fire protection.ECONOMIC BENEFITS include construction (engineering, tank, materials and labor).REGULATORY BENEFITS include compliance with DPH storage requirements.	250,000	72	180	03	Lake	II	2009
1240	1700501	1700501-001	Adams Springs Water District		System rebuild.	M	20	C	Outdated system with many nonworking valves, fire hydrants, service lines.	500,000	71	200	03	Lake	II	1998
1241	5400504	5400504-001	A & A MHP		Drill new Well	M	20	C	Needs back-up storage tank and well	150,000	60	200	12	Tulare	III	1998
1242	1000359	1000359-001	FCSA #32/CANTUA CREEK		INSTALL AN ADDITIONAL STORAGE TANK TO INCREASE STORAGE CAPACITY FOR SYSTEM RELIABILITY.	M	20	C	SURFACE WATER IS PROVIDED FROM THE WESTLANDS WATER DISTRICT. DURING THE LAST 12 MONTHS, WESTLANDS' WATER LINES HAVE BROKEN TWICE LEAVING THE COMMUNITY WITHOUT WATER.	200,000	35	230	23	Fresno	III	1998
1243	1700546	1700546-006	Clearwater Mutual Water Company	Instrumentation/SCADA	A SCADA system will installed to monitor and record signal output from all monitoring equipment and alert system operator in the event of a system failure. A continuous turbidity and pH meters will be installed. Coagulant flow alarm, clearwell tank flow meter and low level tank sensor and alarm to be installed. Chart recorders for chlorine, pH and turbidity will be installed. This project is eligible because the system is required by its water supply permit. The system is a small public water system that is considered disadvantaged due to the median income being approximately less than $32,000 per year. The census tract is "Census Tract 9." If this project is granted, it would allow the system to be incompliance with its water supply permit and the Enhanced Surface Water Treatment Rule.	M	20	C	Alarms and monitoring is required for the Clearwater MWC in accordance with provisions in the water supply permit. The system does not have turbidity, pH, tank flow meter and tank level monitoring and recording. There are no alarms for these systems and no coagulant alarm. The system is in violation of the Enhanced Surface Water Treatment Rule. The project is intended to address the above deficiencies and bring the system into compliance with its water supply permit and the Enhanced Surface Water Treatment Rule.	32,000	93	250	03	Lake	II	2009
1244	5500193	5500193-001	TAMARRON MOBILE HOME PARK		REPLACE PUMPS AND PIPING. OTHER - DESIGN AND CONSTRUCTION	M	20	C	LOW WATER PRESSURE, BROKEN LINES AND ONE TIME CONTAMINATION AND PUMP PROBLEMS	75,000	85	273	11	Tuolumne	III	1998
1245	3200188	3200188-002	Greenhorn Creek Services District	Greenhorn CSD Distribution System	Replace undersized water mains, increase capacity of booster stations, construct additional storage tanks.	M	20	C	Undersized water mains and insufficient storage and pumping facilities to provide fire flow.	1,135,430	90	280	02	Plumas	I	2006

1246	0400014	0400014-001	LAKE MADRONE WATER DISTRICT	Lake Madrone Water District Storage Facility Improvement	The purpose of this project is to replace Three (3) leaking and deficient redwood community water storage tanks with new steel tanks and retro fit the associated plumbing as required to complete the upgrade. This will correct the deficiency, enhance the water quality, safety and reliability of the community drinking water system.• Site FoundationsThe sites for each of the existing redwood tanks are very close to “turn key” in their current condition. Only minor improvements to the grading of the site would apply due to a slightly larger footprint of the new tanks. • Electrical The electrical upgrades required will include replacing old wiring and upgrading circuit panels to meet current state and county safety regulations.• PlumbingThe plumbing upgrades required will include replacement of old PVC and steel piping as well as fittings, installing increased capacity pumps and replacing valves with more reliable modern types.• PermitsPermitting for this improvement is easily obtained. Anticipated permit times to begin construction are within 30 days. The permitting requirements will be at a minimum due to the readiness of the existing system and sites. • Regulatory Testing and AcceptanceOnce the retro fits are completed the necessary water quality testing requirements will be completed. Recently completed retro fits to wells within this community have the same or similar testing	M	20	C	Department of Public Health, Division of Environmental Health, County of Butte, State of California recorded a System Deficiency in 1998, describing the following water system defect: "Redwood holding tanks are starting to leak. Moderate bowing between bands noted as well. Repair as necessary. Explore replacement of older redwood tanks."There were inspections in 2001 and again in 2005 where the defects continued to be observed.The oldest tank is more than 25 years old. Over the past 10 years the leaking and bowing have increased. Replacing the old redwood tanks with steel tanks is the recommendation of our Certified Water System Operator.Due to the fact that in recent years we have lost our portion of property tax revenue from the County and since we are a Special District, the limits placed upon us by Proposition 218 have made rate increases that much more difficult, we have put off replacing these tanks making the possibility of a major failure more likely.	63,800	115	297 21	Butte	I	2009
1247	2500503	2500503-001	California Pines C.S.D.		Drill a new well to provide the reliability required by the Waterworks Standards. Recoat the interior of the water tank.	M	20	C	Existing wells have insufficient output to fulfill Section 64562 (quantity of supply) of the Waterworks Standards. Water tank needs new inside coating.	50,000	130	300 01	Modoc	I	1998
1248	3301775	3301775-001	HIGH VALLEYS WATER DISTRICT		For the past 3 yrs. We have replaced approx. 1 mile a year of the bade pipe with ductile iron. This is approx. all that the budjet will allow. Although replacing pipe in the worst areas has helped, to save cost we replace all the pipe in house.	M	20	C	The tank transmission pipeline is improperly installed and has had major leak problems. From main tank we have miles of pipe in the same condition.	3,000,000	168	300 20	Riverside	V	1998
1249	0410018	0410018-002	Del Oro Water Co.-Stirling Bluffs	Stirling Bluffs - Storage Tank Project	The scope of work for this project would include the installation of one 500,000 gallon welded or bolted steel storage tank, ringwall tank foundation, and inlet/outlet piping to the distribution mainline.	M	20	C	The Stirling City water service area does not currently meet the emergency and operational storage requirements as detailed in the California Waterworks Standards. The existing water system does not have sufficient storage available to meet one maximum day demand event in the event of a water outage emergency.	500,000	162	313 21	Butte	I	2009
1250	1700554	1700554-005	Lake County CSA 13 - Kono Tayee	Pumps and Controls for CSA #13	The project will include the replacement and upgrade of the pumping network and controls at all three tank sites, including pumps, level and operational controls, and communications.	M	20	C	The Kono Tayee Water System provides drinking water for County Service Area #13. A system of wells and distribution piping serves the community. The water system experienced a tank failure last year and the tank replacement is being constructed at the Tank 2 (midlevel) location.The Tank 2 site includes the tank, pumps and controls. In conjunction with piping upgrades (separate application), additional pumps and controls are required to bring the community water system into operational stability.	200,000	136	333 03	Lake	II	2009
1251	1700554	1700554-004	Lake County CSA 13 - Kono Tayee	Water Distribution (pipe) Upgrades for CSA #13	Piping replacement and upgrades to the Tank 2 site in conjunction with the District constructed water storage tank project.	M	20	C	Undersized distribution piping and non-looped portions of the distribution system. HEALTH BENEFITS include improved supply and quality of drinking water and fire flow.ECONOMIC BENEFITS include construction (materials and labor).REGULATORY BENEFITS include compliance with DPH requirements.	90,000	136	333 03	Lake	II	2009

1252	1700554	1700554-006	Lake County CSA 13 - Kono Tayee	Replacement Water Storage Tanks - Tank Site 1	This project is a water storage tank replacement project. (2 co-located tanks)The project will involve the construction of two seismically engineered concrete tank foundations, two 50,000 gallon capacity anchored bolted steel tanks, and associated piping and controls.Disinfection, filling and coordinated crossover from existing tanks will take place along with dismantling and removing of the existing redwood tanks. Security fencing will complete the project.	M	20	C	The Kono Tayee water system serves customers within the County Service Area #13. The system experienced a tank failure last year (redwood tank at the Tank #2 Site) and is observing tank decay and leakage at two additional redwood storage tanks located above the community (Tank 1 site). This project is to replace the existing redwood storage tanks with two new bolted steel storage tanks.This need was recognized and funding for tank replacement was dilligently sought and denied last year through DWR's Water Use Efficiency Program. The District is once again seeking funding for this much needed project. HEALTH BENEFITS include additional storage of drinking water and fire flow.ECONOMIC BENEFITS include construction (engineering, tank, materials and labor).REGULATORY BENEFITS include compliance with DPH regulations.	500,000	136	333 03	Lake	II	2009
1253	1700574	1700574-002	Lake County CSA 18 - Starview	50,000 Gallon Storage Tank	The project will include a seismically engineered concrete foundation, an anchored 50,000 gallon capacity bolted steel tank, and the necessary pipe and controls to supply stored water to the Starview water system.	M	20	C	This project is for the construction of a 50,000 gallon storage tank to serve the customers served by the Starview Water System. The tank will provide the additional storage needed to supply customer demand and fire flow.HEALTH BENEFITS include additional water availability of drinking water and fire flow through increased storage.ECONOMIC BENEFITS include construction (engineering, tank, materials and labor).REGULATORY BENEFIT includes continued compliance with DPH requirements.	250,000	140	338 03	Lake	II	2009
1254	1700574	1700574-003	Lake County CSA 18 - Starview	Water Distribution System Upgrades	This is a simple pipe upgrade project replacing smaller diameter pipe with 6" and 8" lines. The project will concentrate in areas that have a history of leaks.	M	20	C	The Starview Water System provides drinking water for the customers in County Service Area #18. The Distribution System Upgrades for the water system will provide 500 feet of needed upgrades within the system, including main distribution piping.HEALTH BENEFITS includes improved and reliable supply of drinking water and fire flow.ECONOMIC BENEFITS include construction (engineering, material and construction labor).REGULATORY BENEFITS include continued compliance with DPH requirements.	80,000	140	338 03	Lake	II	2009

1255	1200553	1200553-010	Weott C.S.D.	Replace sub-standard distribution lines.	There is approximately 9,500 feet of 4 inch mainline needed to be installed parallel to the existing (to be abandoned) 2" lines, hooked up to existing metered laterals and install a total of 8-4" hydrants at the ends and proper intervals to facilitate adequate flushing of system. "Resilient" 4" gate valves will be installed at all connections, hydrants and proper intervals. There are 7 separate locations for these installations. The longest replacement is almost a mile and the shortest is 300 feet. Some of these lines to be replaced have abandoned laterals with known/ unknown locations which will be eliminated in the process. Only one 400 foot section will require the removal and replacement of asphalt in the roadway, the rest of the roads are graded base/rock surfaces.	M	20	C	This application is for improvements/upgrades to the oldest part of our distribution sytem which was not replaced for financial reasons when we installed a new water system (in 1989) for 80% of WCSD's service area. They installed C 900 lines with new parts throughout. The lines that didn't get replaced in the outlying areas are either 2 inch boiler pipe or 2" poly(most of which is partially exposed). with almost no structural integrity. These old lines have low flow, low pressure and need leak repairs on them often. There are many rusted sections that are always wet. Several times since I became the operator here I have had to go past my high end filtration parameters (compromising our treated water quality) to keep up with the loss from a bad leak until it was found and/or repaired.WCSD has recently completed the metering of all the residences and we now have an approximation of our substantial losses in the distribution system . In November 2008 we produced 1,232,358 gallons, while the metered consumption was 489,985 gallons. Over half of our produced water is leaking out through our old distribution lines. There are almost 2 miles of these 70 year old 2" lines that have no adequate way of being flushed, are hard to keep a Cl residual in them and are a constant problem, as leaks appear almost weekly. We fix the ones that we find, but there are many more that are ongoing. In Oct. 2007 we had a Coliform Presence	2,000,000	150	364 01	Humboldt	I	2009
1256	1700544	1700544-005	Lake County CSA 7 - Bonanza Springs	Bonanza Water System Distribution System Upgrades	400 ft of 6" and 8" inch pipe will be installed to replace undersized portions of water main in the vacinity of Loch Lomond Road.	M	20	C	This project will include the replacement of 400 ft. of undersized water main. The preliminary engineering report recommends a pipe upgrade will improve distribution and fire flow to the customers of Bonanza Springs.HEALTH BENEFITS include better distribution and flow resulting in improved availability for drinking water and fire flow.ECONOMIC BENEFITS include construction (engineering, materials and loabor).REGULATORY BENEFITS include compliance with DPH permit requirements, and increased flow for fire protection.	75,000	151	375 03	Lake	II	2009
1257	1700544	1700544-004	Lake County CSA 7 - Bonanza Springs	100,000 Gallon Water Storage Tank	The project will include the construction of a seismically engineered foundation, an anchored 100,000 gallon bolted steel tank, pipes and controls to connect to the Bonanza Springs water system.	M	20	C	This project will provide an additional 100,000 gallon storage tank for the water system serving County Service Area #7. The water storage tank will provide additional availability of drinking water and fire flow for the Bonanza water System customers.HEALTH BENEFITS include additional storage and availability of drinking water and water for fire supression.ECONOMIC BENEFITS include construction (engineering, tank, materials and labor).REGULATORY BENEFITS include compliance with DPH permit requirements.	400,000	151	375 03	Lake	II	2009
1258	3700938	3700938-002	YUIMA MUNICIPAL WATER DISTRICT IDA		Replace 10,840' of main lines with CML/C or C900 PVC pipe.	M	20	C	Various pipe segments are very old and troublesome with many repairs per mile. Some will not support fire flows.	314,300	241	400 14	San Diego	V	1998
1259	2310013	2310013-006	Point Arena Water Works	Water Mains	Upgrade a 60 year old 540 foot section of the existing 6" main line to a 12" main line. This upgrade will increase the Fire flow protection of the City of Point Arena as well as secure the integrity of the infrastructure of the distribution pipes in that part of the water system.	M	20	C	Installation of approximately 540 feet of 12" main line on Mill Street, Point Arena to replace a deteriorated section of 6" main line, which is over 60 years old.	75,900	210	465 03	Mendocino	II	2009

1261	5400903	5400903-005	TRACT 92 C S D	Tract 92 CSD Water Distribution Replacement Project	Water Distribution Replacement Project Project Description: The proposed project will include the replacement of the existing water distribution system including water mains and service connections. It is estimated that approximately 15,000 linear feet of water main and 95 service connections will need to be replaced. In addition one dead end line would be looped back into the system to equalize pressure and eliminate stagnant water.	M	20	C	Water Distribution Replacement Project Problem Description: Tract 92 Community Service District provides water to the unincorporated area known as Union Addition. This unincorporated community consists of approximately 135 households and one church and is located Southeast of the City of Visalia. This economically disadvantaged community is a mix of retired people, farm workers, and low-income families. The community's water system was established in the early 1960's. The water distribution system was installed over 40 years ago. It consists primarily of asbestos/cement water mains and galvanized water services. Leaks have been an issue primarily around the water valves. In one incident for example one leaking valve flooded an open trench that was open during construction. There is a concern of cross contamination in this un-sewered community due to the presence of on site septic tank sewage disposal systems. Other distribution issues include undersized mains, service connections that are filling with deposits of rust and a dead end line.	1,000,000	91	500 12	Tulare	III	2007
1262	4500195	4500195-003	STARLITE PINES MUTUAL WATER CO INC		Repair complete reservoir to provide the reliability required by the Waterworks Standards.	M	20	C	Reservoir aged and repairs are required every year. System not fulfilling Section 64560(a)(6) (minimize the effects of structural failure) of the Waterworks Standards.	10,000	170	510 02	Shasta	I	1998
1263	1909006	1909006-002	WEST VALLEY COUNTY WATER DISTRICT	Replacement Well	We propose 3 possible alternatives for construction of a new water source that meets the Arsenic MCL and provides reliable water to meet system demand. The project will be based on the most cost effective solution.All project alternatives are based on the abandonment of Well 1 and purchase of property for an additional water source site.1) Drill a new well including appurtenances, provide standard and backup power sources-generator- construct a pump house and install security fencing for the perimeter; or2) Construct a well, and an arsenic treatment facility for the new well, including storage tanks, monitoring equipment, and security fencing around the perimeter; or3) Drill a new well and install pipelines and storage tanks to blend water from both wells to reduce the arsenic concentration to below the MCL. Length of pipeline unknown until property is purchased.	M	20	C	This system has two wells. Well 3 is active and yields adequate water to supply current demand. Well 1 is inactive and unavailable due to Arsenic MCL exceedance. Well 1 is also more than 40 years old and does not provide adequate water to meet demands.This is a sole source system and the only active well does not have an emergency interconnection or alternative power supply. If well 3 fails or loses power, the system will not have enough drinking water. We need an additional source of water that meets the Arsenic MCL, and a backup power supply generator.	650,000	274	530 22	Los Angeles	IV	2009
1264	1909006	1909006-003	WEST VALLEY COUNTY WATER DISTRICT	Backup Well power source	We propose to install a generator capable of providing backup power for our existing sole operating well. One ~ 200 kW Diesel generator, including switchgear and accessories on site at well #3. Security fencing is currently in place.	M	20	C	This is a sole source water system and the only active well does not have an emergency interconnection or alternative power supply. If well 3 fails or loses power, the system does not have drinking water.	60,000	274	530 22	Los Angeles	IV	2009

1265	1710019	1710019-003	Lake County CSA 6 - Finley	Finley Water Distribution System Upgrade	This project will include approximatly 2,200 lineal feet of 8" C900 PVC pipe replacement within the Lands End development along Clear Lake. The project will include the replacement of water mains within the development and installing additional pipe to loop the dead legs of the system.	M	20	C	The Finley water system serves customers within County Service Area #6. Portions of the existing distribution system (Lands End area) are in need of replacement (upsizing) and dead ends (also Lands End area) require looping.HEALTH BENEFITS include a better flow of drinking water through the distribution system.ECONOMIC BENEFITS include construction (engineering, materials and labor).REGULATORY BENEFIT includes improved water quality, increased reliability and fire flows.	350,000	207	590 03	Lake	II	2009
1266	5510033	5510033-001	TUD-Scenic View/Scenic Brook	consolidation w Apple Valley and Phoenix Lake Park	EXTEND THE HEIGHT OF THE SHORT TANK. ALSO CONSOLIDATE THIS SYSTEM WITH THE APPLE VALLEY AND PHOENIX LAKE PARK SYSTEMS.	M	20	C	THE HEIGHT OF ONE OF THE TWO STORAGE TANKS NEEDS TO BE RAISED TO PROVIDE ADEQUATE STORAGE CAPACITY TO MEET PEAK SYSTEM DEMANDS.	40,000	265	625 11	Tuolumne	III	1998
1267	5510033	5510033-005	TUD-Scenic View/Scenic Brook	replace water storage tank	CONSTRUCT A 200,000 GALLON STEEL STORAGE TANK.	M	20	C	THE CINDER BLOCK TREATED WATER STORAGE TANK IS ON THE VERGE OF COLLAPSE.	142,000	265	625 11	Tuolumne	III	1998
1268	5510033	5510033-008	TUD-Scenic View/Scenic Brook	Phoenix Water Treatment Plant	The District owns a parcel of land that is adequate for the construction of a surface water treatment plant that could meet the needs of existing customers, committed parcels and existing residents of the community. The proposed project would provide for the consolidation of three groundwater systems, one surface water system, one groundwater and surface water system into one large surface water system. The surface water source for the WTP is currently approved by the State for treatment.	M	20	C	The District owns and operates 14 water treatment plants (WTP) that serve 13,000 treated water customers. The majority of these WTPs are of limited treatment capacity and capability. There are an excessive number of water treatment plants for the number of customers primarily due to the fact that these once independent systems were acquired by TUD from private and mutually owned water companies and special districts which were financially or managerially unable continue system operation due to failing infrastructure and/or drinking water standards violations. Most of these customers are below the State MHI. There are several WTP's and well systems that need upgrading and replacement. One of well systems is experiencing reduced production and extended run times (Apple Valley), not meeting drinking water standards for uranium (Mono Village), exceeding secondary standards (Phoenix Lake Park) and the surface water treatment plants do not have the capacity to meet the L2 ESWTR and the needs of existing customers (Mono Village and Scenic View). In addition, the Mono Village system does not have the capacity to meet the needs of an existing senior citizen mobile home park, which is currently served by privately owned, deteriorating well water system that has requested support from the TUD in the past.	5,342,625	265	625 11	Tuolumne	III	2007

1273	3610023	3610023-002	GREEN VALLEY MWC	gvl ac main replacement	Project is to replace existing 45 year old aspestos cement pipe distribution system with minimum standard of 6" inch or greater (as needed) of PVC C-900 pipe. Included in this project will be the replacement of metered service line replacement for domestic use, system isolation valves, hyrants, hydrant valves and all associated appurtances.	M	20	C	This project is for the purpose of water distribution system replacement. The project covers replacement of aspestos cement (a.c.) pipe that is approximatly 45 years old. Much of the distribution system is substandard in size 4" inch diameter and does not meet the minimum size of 6" inch diameter for distribution systems and fire flow requirements.	5,000,000	1,135	700 13	San Bernardino	V	2007
1274	0410009	0410009-001	Del Oro Water Co.-Magalia		Will be alleviated with the current construction of an intertie and new storage tank.	M	20	C	Water shortage. Degradation of water quality.	376,000	275	707 21	Butte	I	2006

1275	4510015	4510015-001	Del Oro Water Co.-Johnson Park	Source, storage, & distribution	New 12" and replace 6" & 8" water mains, new 50 MG tank, new 10 HP booster facility, replace well pumps, emergency generator	M	20	C	System does not meet CA Waterworks Standards for water pressure, line size, and line looping	3,900,000	316	760 02	Shasta	I	2003
1276	2400172	2400172-003	Sandy Mush Detention Center	Merced County Correctional Complex Arsenic Treatment Project	The project will provide an additional arsenic treatment vessel to assure un-interrupted reduction of arsenic concentrations in the drinking water to acceptable levels, in compliance with the Federal and/or State MCL, whichever is more stringent. Currently, there are two treatment vessels that are connected to the distribution system. However, the connection is accomplished through temporary piping only. Two looped 8 inch (8") water mains provide both domestic and fire suppression water to each facility. No irrigation water is associated with this system. A significant amount of reconfiguration to the existing water distribution system will be required to combine the water from all three wells into a single point of confluence for the most cost effective treatment system. The project locates the water treatment plant between the supply wells and the water storage tanks. Water will first be pumped from the supply wells into the water treatment plant, then from the water treatment plant into the storage tanks. This will require the water treatment plant be sized to provide peak hour domestic demands of 100 gpm and rely on storage to provide supply for fire flow demands. The temporary piping connecting the treatment plant must be removed and the new infrastructure will include permanent piping to connect the wells to the treatment plant and the treatment plant to the storage tanks. This	M	20	C	Arsenic levels in all three ground water wells that serve the County's juvenile justice and adult correctional facilities currently range from 15 ppb to 49 ppb. These levels exceed the Federal Maximum Contaminant Level (MCL) for arsenic, which was lowered from 50 ppb to 10 ppb (effective January 23, 2006). A similar, or more stringent, MCL is expected to be adopted by the State of California. No other source of water exists in this isolated vicinity. The ground water in this area of Merced County contains naturally high levels of arsenic. Potential long-term, non-cancerous health effects associated with arsenic ingestion include development defects, stillbirth, spontaneous abortion, heart attacks, strokes, diabetes mellitus, and high blood pressure. Potential cancerous effects include skin, bladder, lung, kidney, nasal passages, liver, and prostate cancers. A Notice of Violation of the Federal Arsenic Rule Exceedance was issued by the Merced County Division of Environmental Health on September 24, 2007 and remained in effect until April 11, 2008.	375,000	157	800 11	Merced	III	2009

1282	1210017	1210017-004	Manila Community Services Dist.	H2O Storage Tank Addition Sept. 2009	In order to meet the State's mandated compliance and prepare for expected growth of the community, the District proposes an additional 100,000 gallon storage tank of concrete construction with additional piping from the booster pump station and the existing redwood storage tank. The additional piping scheme is needed to isolate each storage tank from the other to allow for repairs and routine maintenance on indivdual tanks without interruption in service, as is the need now for repairs of our redwood tank and temporally not having any storage capacity at all.	M	20	C	Our current storage capacity is 100,000 gallons, but according to Department of Public Health's (DPH) 2005 annual report, by Ronnean Lund December 8th, 2005, we are well below DPH's recommended standards for water storage capacity. According to Craig Bunas, of DPH, our storage capacity should be 130,000 gallons. 130,000 gallons would meet the current demand, but the proposed Humboldt County General Plan projects growth of approximately 150 more living units, above and beyond the 68 applications for proposed development, we currently have on file. These expected increases will in effect double our storage requirement. Our current redwood tank is starting to develope some major leaks and will need to be taken out of service for replacement of rotten staves. Tank will be out of service for 1-2 weeks this fall, with no back-up storage capacity.	250,000	343	1,000 01	Humboldt	I	2009

1283	1710018	1710018-008	Lake County CSA 2 - Spring Valley	Spring Valley Water Treatment Facility Standby Emergency Generator	This project will include the construction of a concrete pad, the purchase and installation of a 175kW propane fired emergency generator, and necessary switchgear and wiring. It is intended to locate install the emergency generator within and as close to the existing treatment plant facilities as possible.	M	20	C	Spring Valley experiences periods of commercial line power interruptions. The water treatment facility only operates when power is avaiable. Power outtages have occured during peak demand periods, requiring the use of portable generators from outside the area. This project will provide emergency standby power through the installation of a 175 kW propane fired emergency generator installed at the water treatment facility.HEALTH BENEFIT includes uninterrupted water treatment, minimal air pollutants from propane combustion compared to diesel.ECONOMIC BENEFITS include construction (engineering, materials and labor)COMPLIANCE BENEFITS include uninterrupted treatment	125,000	420	1,018	03	Lake	II	2009
1284	1710018	1710018-007	Lake County CSA 2 - Spring Valley	100,000 Gallon Water Storage Tank	The project will include the construction of an seismically engineered concrete tank foundation, a 100,000 gallon bolted steel storage tank anchored to the foundation, piping and controls to connect to the existing distribution system.	M	20	C	This project is to provide needed additional 100,000 gallons of water storage for the Spring Valley Water System. The additional storage will provide for Peak Day Demand and fire flow, well into the future.HEALTH BENEFITS include and adequate supply of drinking water and fire flow.ECONOMIC BENEFIT includes construction (engineering, materials and labor)COMPLIANCE BENEFIT includes the ability to provide sufficient storage capacity.	450,000	420	1,018	03	Lake	II	2009

1289	1510011	1510011-003	Buttonwillow CWD	Buttonwillow Arsenic Mitigation Project	The District proposes to install 1,300 feet of 10 inch water line to supply water from the Districts' clean wells (#2 and #3) to blend with well #4's Arsenic contaminated water at wellsite #4. A blending station and a 0.5 MG storage tank will be installed to store the blended water at wellsite #4. The water will be blended during offpeak hours and stored in the new 0.5 MG bolted steel ground storage tank. Water will be supplied back into the distribution system during peak hours from a new booster pump station, through the new 10 inch main. Blending will allow the District to meet Safe Drinking Water Standards without the expensive operating costs of Arsenic treatment or the high construction costs of drilling a new well.	M	20	C	Water well number #4 is contaminated with Arsenic (11 to 14 PPB) in excess of State and Federal Safe Drinking Water Maximum Contaminant Level (MCL) of 10 PPB.	780,000	444	1,266	12	Kern	III	2007

1290	4710006	4710006-010	McCloud C.S.D.	Northwest Water Distribution System Replacement	Installation of a new water delivery system in the northwestern corner of the District's service area which includes approximately 12,410 linear feet of 6"-12" PVC pipe, two connections into the existing Phase 2 Bypass Pipeline system, three railroad crossings and 123 public water service lines. This installation will be performed within Siskiyou County road right-of-ways with minimal easement acquisitions necessary. This installation constitutes a new infrastructure footprint since the existing, antiquated system runs helter-skelter through private properties and under residential structures. This installation will require open trench construction.	M	20	C	The project is located in the northwestern section of the boundaries of the McCloud Community Services District. McCloud's company-owned mill town legacy includes deeded inheritance of approximately 12,410 linear feet of piping in this area of the water distribution system predominantly installed in the 1940s without benefit of design planning or engineering. The existing helter-skelter pipelines include mains running through now private properties since the company divested itself of ownership. Homes sit atop infrastructure. Valves are located on private properties and frequently lie under residential structures. Infrastructure was deeded to McCloud with minimal documentation to facilitate accurate location of water mains, service lines and appurtenances. Although MCSD employees have developed a map book based on the minimal documentation provided and additional field observations, it is difficult and sometimes impossible to accurately establish the location of lines or appurtenances. An inordinate amount of staff time must be spent performing open trench investigations of infrastructure prior to performing what should be minor repairs or replacements since unknown factors often cause significant, negative consequences. A 2006 engineering report identified multiple causes of concern in the distribution system including an estimated 65% water loss attributed to age, deterioration and high	4,200,000	641	1,300 01	Siskiyou	I	2009
1291	4710006	4710006-009	McCloud C.S.D.	Rehabilitation of Lower Elk Springhouse	Identified renovations necessary to protect this public water source include: Construct missing sections of the interior concrete retaining wall to keep the spring area intact. Uncover the spring inside the building by removing dirt over the existing French drain area. Cap the spring area with support beams and concrete/steel decking. Install 3 screened air vent/overflow pipes above the concrete cap. Replace the existing 10" WS inlet pipe from the Upper Elk spring with a new 16" WS fusion-bonded epoxy coated pipe and install rubber strips underneath the pipe to prevent damage on the pipe coating by pipe supports. Replace riveted steel surge tank with a WS fusion-bonded epoxy coated tank approximately 3.5' in diameter and 8' tall. Provide a sealed cover and install a new baffle wall inside the tank. Replace the 12" WS pipe that discharges from the surge tank to the concrete distribution box with a 16" pipe from the surge tank. Replace the existing 20-24" WS pipe from the distribution box to the Lower Elk Spring pipeline with a 24" WS fusion-bonded epoxy coated pipe. Install a 16" WS fusion-bonded epoxy coated overflow pipe from the distribution box and from the Lower Elk Spring to the drainage ditch located outside the springhouse. Replace the 12" drain from the Lower Elk Spring with a new 12" WS drain pipe and install a rubber check valve at the outlet into the drainage ditch. Remove the existing wheeled gate valve	M	20	C	McCloud's Lower Elk Springhouse has multiple deficiencies that require renovation to address the potential for water supply contamination to both the Upper and Lower Elk spring water supply. A 2006 engineering study determined that the springhouse has met its useful life. The antiquated structure, approximately 27' by 80' consists of a perimeter concrete foundation, wood siding, framed wooden support system and a metal roof. Water that overflows or leaks from the springhouse is collected by a culvert which leads to a ditch that flows to Mud Creek. The engineering study identified corrosion hot spots that have either failed and are leaking or that could fail at any time at the lower end of the Upper Elk Spring pipeline suspended inside the springhouse. The pipeline located between the surge tank and distribution box has experienced significant corrosion as well and has been identified as having reached its useful life, requiring replacement. An existing old riveted steel surge tank which controls pressure and flow before discharging the Upper Elk Spring water into the distribution box inside the springhouse is in poor condition. A wooden wall diffuser is located inside the tank; the tank exterior is coated with what appears to be a paint similar to that used on MCSD's old water storage tank. The paint on the old storage tank was tested and identified as lead-based paint that is	550,000	641	1,300 01	Siskiyou	I	2009

1292	1710022	1710022-005	Lake County CSA 20 - Soda Bay	Four (4) 50,000 Gallon Water Tanks	Construction of the 4 new tanks will include seismically engineered foundations, anchored 50,000 gallon bolted steel tanks, piping and controls to connect to the Soda Bay Water System. Security fencing will complete the construction.	M	20	C	The Soda Bay Water Treatment Facility treats surface water from Clear Lake to drinking water standards for customers within County Service Area #20. Drinking water is stored in a network of water tanks spread out over the service area. Tanks 1, 2, 3, and 4 are old redwood tanks that according to DPH inspections are in need or repair and/or replacement. This project is to replace all four failing tanks with four 50,000 gallon bolted steel tanks.HEALTH BENEFITS include new clean secure storage tanks.ECONOMIC BENEFITS include construction (engineering, components, and construction labor). Secondary economic benefits for the water system include less maintenance and less water loss through leakage.COMPLIANCE BENEFITS include compliance with DPH 7/9/08 recommendations.	1,000,000	596	1,342 03	Lake	II	2009
1293	1210002	1210002-003	City of Blue Lake	Blue Lake Water Distribution System Improvement Project	The City of Blue Lake's 1999 Water System Capital Improvement Plan identified a number of necessary water system improvements to ensure the long term viability of reliable community water service. Currently, the operating system is not properly functioning due to aging infrastructure. While some of the recommended improvements (water storage tank modifications) were completed, a number of vital water system needs have not been implemented due to local budgetary constraints. The necessary system modifications are the replacement of gate valves in the distribution network, modifications to the booster pump station and motor control center, an upgrade of the emergency backup disinfection system, and the looping of several parts of the distribution system. Along with these modification priorities, a building needs to be constructed to house the portable system backup generator.Replacing the 1973 obsolete electrical 200 amp motor control center will include the installation of a new 600 amp motor control center. The existing system has been upgraded with a third 30 Hp pump. However, all three pumps cannot be run at the same time without an upgraded motor control system. The current system has insufficient power for its current use. Repair/replacement of the two 36 year old pumps would provide for repair parts and pump operations would become interchangeable, increasing the	M	20	C	The City of Blue Lake receives treated potable water from the Humboldt Bay Municipal Water District. The City owns and operates the Booster Pump Station, which houses pumps, electrical controls, and an emergency chlorination system. The existing distribution system consists of 51,050 feet of pipeline ranging in size from 2"to 12" in diameter. Most of the pipe is asbestos cement installed in 1973. The distribution system also includes about 125 gate valves, and approximately 18,000 feet of ¾" to 1" diameter service lines. The system has needed major repairs due to aging infrastructure as identified in the City's 1999 Capital Improvements Plan, many of which have been deferred due to budget constraints. The repairs to the system include gate valve/ cluster replacement (200), energy efficient motor control center and booster pump replacement, chlorine system upgrades, and looping existing waterlines. These repairs and improvements will result in a more reliable operating water system.The aging gate valve system is 36 years old, and in need of replacement and repair. The ability to operate existing gate valves properly is unknown; and the system could be at risk of failing if a main line break occurred. It is not known whether the line could be isolated for repair. Attempting to close a valve to isolate a break may result in additional problems if that valve were to fail. The ten year Capital Improvement Plan	720,000	651	1,500 01	Humboldt	I	2009

1302	1710007	1710007-004	Kelseyville Co Waterworks District 3	200,000 Gallon Water Storage Tank	The project will include site acquisition, rights of way, the construction of a seismically engineered foundation, an anchored 200,000 gallon capacity bolted stell tank, and the necessary piping and controls to supply the Kelseyville system.	M	20	C	This project is the construction of a 200,000 gallon storage tank to serve the customers within the Kelseyville and County Waterworks District No. 3 water system. The tank will provide the additional storage needed to supply customer demand and fire flow.HEALTH BENEFITS include an additional supply of drinking water and fire flow.ECONOMIC BENEFITS include construction (engineering, tanl, materials and labor).REGULATORY BENEFITS include compliance with DPH storage recommendations.	500,000	950	2,550	03	Lake	II	2009

1303	1510046	1510046-003	Lost Hills Utility District	Arsenic Facility Improvements Project	Project Location:Site 1: Project will be located at the current Arsenic Removal Treatment Facility. Site is located at the northeast corner of Gun Club Road and McCombs Avenue in Kern County. The parcels associated with this site are APN 059-160-19 and APN 059-160-18. Site 2: The Chemical Treatment for corrosion prevention is to be located at the 2.5 MG storage tank site located on the northeast corner of Highway 46 and Brown Material Road. The parcel associated with this part of the project is APN 058-180-13.Site 3: The pipe to be replaced will cross Highway 46 near the intersection of Highway 46 and the on-ramp to Interstate 5. The parcel associated with this site is APN 069-171-02.Site 4: The pipe to be replaced will cross Highway 46 north of the Lost Hills Elementary School. The parcel associated with this site is APN 058-131-22.Site 5: The pipe to be replaced crosses Interstate 5 north of Highway 46. The parcels associated with this site are APN 058-330-04, 058-330-03, and 058-33-06.New ConstructionSite 1: Installation of two sludge beds with three bays each at the existing Arsenic Removal Facility. Site 2: A Chemical Addition facility will be constructed for the 2.5 MG water tank.Rehabilitation: Replacement of two sections of pipe are needed at Sites 3 and 4 to improve drinking water conditions. The original pipes are 8″ steel and are to be replaced by a method of jacking and boring using	M	20	C	More Sludge beds are needed at the existing Arsenic Treatment Facility to contain excess backwash produced by the treatment process. Currently the sludge beds available do no provide enough capacity limiting the effectiveness of the Arsenic Treatment Facility. Treatment for arsenic has improved drinking water conditions, but in the process has changed the chemistry of the water throughout the distribution system. This change has clients complaining of brown water. This brown water indicates that the piping in the distribution system is corroding. It has been investigated that the piping replacements at site 3 and site 4 are prime locations to remedy the brown water problems for clients complaining in those designated areas. Chemical addition for corrosion prevention at the existing storage tank would insure that clients receiving service from the tank would not experience the brown water effect. Residents within the Lost Hill Community District would benefit by ensuring quality drinking water.	474,308	360	2,772	12	Kern	III	2009
1304	1510046	1510046-005	Lost Hills Utility District	Water System Improvements	The proposed project will replace and upgrade existing water pipelines and will be constructed in existing designated streets, alleys and dedicated rights-of-way. No acquisition of lands will be required.Proposed New ConstructionThe water system consists of upgrading from the existing 2-inch mains to 4-inch mains. The initial estimate includes 17,800 linear feet of 4-inch pipe, 65 re-connections, 9-gate valves, and miscellaneous items to complete the project.Since the proposed improvements will replace and upgrade existing pipes, the existing users should not increase the existing water consumption. Therefore, the system capacity should remain the same.Proposed RehabilitationThe water system proposes to have approximately 10,000 linear feet of the existing 2-inch water line mains removed.Nature and Level of ServiceThe District provides water service to approximately 400 residential and 40 commercial connections. The water system project will enhance the District=s water system within its boundaries.Coordination with Other Service ProvidersThe District is the only water system in the area. The I-5 and Highway 46 commercial water connections are also serviced by the Districts water system. There may be a need to coordinate with Kern County for the drainage piping in the community.	M	20	C	The purpose of this proposed project is to replace and upgrade the existing old water pipelines in the Lost Hills community water distribution system. There are many 2-inch mains throughout the system, which do not meet current Kern County standards. The minimum diameter for a water main according to Kern County standards is 6-inches. Once these pipes are replaced, Lost Hills will have a system which meets current standards and should result in less maintenance problems in the water distribution system.	666,731	360	2,772	12	Kern	III	2009
1305	3610030	3610030-002	MARIANA RANCHOS CWD	Consolildation,Infrastructure Repair and Replacement	Project will connect three systems with the Mariana system remaining. Failing portions (approx 24 miles)of its distribution system will be replaced along with properly sized hydrants to meet fire flow and eliminate water loss. The storage tank will be replaced and connections made to adjacent water systems in worse condition. LAFCO has encouraged this effort for some time.	M	20	C	While the system has an ample water source it cannot meet fire flow with undersized and failing distribution lines and standpipes. Storage needs repairs to stop reoccuring tot coliform violations. Adjacent systems are smaller and have similar issues. Systems are encouraged by LAFCO to consolidate and discussions are underway on how to end up with one reliable singularly managed system.	2,000,000	650	3,019	13	San Bernardino	V	2011

1306	1210012	1210012-003	City of Rio Dell	Undersized Water Distribution Pipeline Replacement Project - Various Locations	The City of Rio Dell proposes to replace approximately 2,350 linear feet of 2-inch galvanized steel line with 6-inch PVC C-900 or HDPE pipeline. Waterlines on Ash Street, Birch Street, Monument Rd, Pacific Avenue and Elm Street are included in the project. The project also includes new hydrants, new valves, and new service laterals. The project will improve water pressure to residences served by these lines and reduce water losses thereby improving water use, energy efficiency, and water quality.	M	20	C	The water Coinciding with the California governor's goal of achieving a water use reduction of 20 percent per capita, the City of Rio Dell needs to upgrade approximately 2,350 linear feet of under-sized steel water distribution pipelines at several locations within the City limits. Inspection of the under-sized pipes, installed in the 1960's, revealed leakage and breakage at many locations. It is estimated that losses along these lines can be as high as 30 percent of the flow through these pipes. City residents served by the undersized and deteriorating pipelines, experience water outages during frequent required repairs and water quantity problems caused by insufficient water delivery capability necessary to supply current demand.Since the existing 2-inch steel pipelines were installed, the population of Rio Dell has grown significantly. Major portions of the existing water distribution system were designed to accommodate flows that would serve significantly less residents. The replacement of undersized water distribution pipelines is proposed to provide adequate water service to the residents on the west side of the City. The replacement of the undersized water mains is in support of the California Governor's Order No. S-06-08, which in part orders the Department of Public Health to mitigate impacts from delivery limitations. The project would also support Order No. S-06-08 as well as the California	425,000	1,134	3,174 01	Humboldt	I	2009
1307	1210012	1210012-005	City of Rio Dell	Waterline Replacement on Monument Road	The City of Rio Dell proposes to replace approximately 1,500 linear feet of 2-inch galvanized steel line with 6-inch PVC C-900 or HDPE pipeline located on Monument Road. The project also includes connections to the existing system, new valves, and new service laterals. The project will improve water pressure to residences served by these lines and reduce water losses thereby improving water use, energy efficiency, and water quality.	M	20	C	Coinciding with governor's goal of achieving a water use reduction of 20 percent per capita, the City of Rio Dell needs to upgrade approximately 1,500 linear feet of the under-sized water distribution pipeline that provides service to the residents living on Monument Road. Inspection of the existing under-sized steel distribution pipes, installed in 1960's, revealed leakage and breakage at many locations. It is estimated that losses along this line can be as high as 30 percent of the flow through this distribution pipeline. The City has repaired the steel pipeline six times this year. Residents served by the undersized and deteriorating pipeline experience water outages during frequent required repairs and water quantity problems caused by insufficient water delivery capability necessary to supply current demand.The replacement of the undersized water main is in support of the California Governor's Order No. S-06-08, which in part orders the Department of Public Health to mitigate impacts from delivery limitations. The project would also support Order No. S-06-08 as well as the California governor's stated goal of achieving a 20 percent reduction in per capita water use State wide by 2020, through reduction in water losses from the almost 50 year old pipeline.Replacement of the undersized pipeline will also improve water quality as there is a build up of iron and manganese in this pipe from the City's previous groundwater source, which was	255,000	1,134	3,174 01	Humboldt	I	2009

1308	1210012	1210012-004	City of Rio Dell	Service Line Replacements on Riverside Drive	The City of Rio Dell proposes to install 24 – 1-inch PVC C900 lateral service lines to residences on Riverside Drive in Rio Dell and tie the new waterline into the existing distribution system. Connecting water service laterals to residences also includes the installation of 24 meter boxes, corporation stops and service saddles.	M	20	C	The City of Rio Dell installed a new 8-inch and 6-inch water main distribution line on the West end of Riverside Drive to replace an existing deteriorated 4-inch steel waterline as part of a past waterline rehabilitation project, however, the City did not have the funds complete installation of the new service lines and tie the new line into the existing system. The 24 families living on the west end of Riverside Drive homes on this street are still served by a deteriorated, undersized waterline installed in the late 1960's and corroded service laterals. Pursuant to Title 17 of the California Code of Regulation and Section 116270-116293 (a) and (e) of the Health and Safety Code, every citizen of California has the right to pure and safe drinking water. Connecting the residents on Riverside Drive to the existing water distribution system will improve the water quality as there is a build up of iron and manganese in these pipes from the City's previous groundwater source, which was replaced in 2002. Iron and manganese re-dissolve and can contaminate the water and directly impact the consumers. Installing a new PVC distribution line will improve the quality of the water delivered to the consumers.	78,000	1,134	3,174	01	Humboldt	I	2009
1309	1610001	1610001-005	Armona Community Services Dist	Additional Water Storage Tank	Install new water storage tank at Well Site No. 2. 1310	0510003	0510003-003	Angels, City of	Angels, City of	Replace 3750 linear feet of 10" diameter steel main with 10" diameter C900 main.	M	20	C	Substandard 35 year old 10" diameter steel main serving City of Angel. Multiple leaks	298,375	1,773	3,441	10	Calaveras	III	1999
1311	1310003	1310003-003	GSWC, Calipatria	GSWC-Calipatria System-Secondary Feed to Niland	Project Scope includes approximately 5400 feet of 12 inch pipeline, including all trenching, backfill, paving, valves, and appurtenances. The estimated completion date for the plans is June 2009 and the estimated construction start date will be in September of 2009.	M	20	C	Currently, the Niland Water System is supplied by a single, 3mile long pipeline from Calipatria to Niland. A secondary feed is needed to provide redundancy in the system and an extra supply line in case of emergency failure of the existing supply line. The secondary line will be a direct water supply line to the southern portion of the Niland System.	644,741	873	4,040	14	Imperial	V	2009
1312	2410002	2410002-005	DOS PALOS-CITY	Water distribution replacement project	City of Dos PalosWater Distribution system replacement projectThe replacement of large section of distributionpipeline will significantly reduce the present issue of laekage and break withint he existing sytem. The new main pipelines will be sized to have capacity to meet the flow and pressure requirements of the the system and to provide the minimum needed for health standards. The project will invlove the removal and replacement of pipelines in the the older areas of the communities to upgrade those pipelines to current standards. The contractor will need to execavate the existing street, provide dewatering, bypass piping for the continued distribution of the water to customers, place new pipeline, bedding and repave the street.	M	20	C	City of Dos PlaosWater distribution replacement projectThe water distribution system for the community has been installed over several years and has several areas of leaks through out the system. The aging pipeline material and high groundwater contributes to the failures in the pipelines, along with poor bedding when the pipeline was installed some 50 years ago in the older areas of the community. The water service connections atthe main distribution pipelines have breakage due to the leaks and high groundwater that causes the traffic load to place pressure onto the connection. These breaks or leaks allow for the potential contamination fo the distribution system with the introduction of groundwater into the system at the break or leak point. The System operator needs to run high chlorine levels higher than normal due to thei high potential of leakage in the system.	10,560,000	2,566	4,417	11	Merced	III	2009

1315	3310048	3310048-001	Coachella VWD: I.D. NO. 8		Replace distribution pipelines to prevent contamination caused by leaks or breaks in the pipelines. In addition, extend and loop distribution pipelines to eliminate dead end lines per CA Water Works Standards, Chapter 16.	M	20	C	Old deteriorating water mains installed in the 1950's are routinely leaking and or breaking.	1,000,000	1,555	5,132	20	Riverside	V	2001
1316	1710004	1710004-003	Lakeport, City of		Provide additional water production facilities and upsize lines.	M	20	C	Diminishing water production capacity, low water pressures.	5,300,000	2,196	5,200	03	Lake	II	1998
1317	1710004	1710004-005	Lakeport, City of	Water Distribution System Rehabilitation and Replacements	Replace existing 6" main w/ 10" or parallel w/ 8" along Martin Street between Russell and Bevin's;Wet well improvements at treatment plant;Replace water system Profibus telemetry system;Replace existing 6" main with 10" or parellel with 8" along Hartley from Boggs to 20th;Replace or parallel existing 8" and 6" mains along Lakeport Blvd with either 8" or 10" mains from Bevins to Forbes;Parallel 6" with 8" along Brush Street and replace existing 4" and 6" mains along 2nd street with 10" main from Brush to Main Street;Parallel existing 8" mains along 11th street with 8" main from Alden to Brush;Replace existing 6" mains along 11th street with 10" main from Brush to Main street;Replace existing 4" main along 2nd Street with 10" main from Russel to Brush;Parallel and replace existing 4", 6", and 8" mains along Main Street with 8" and 10" mains from 2nd to 11th Street;Parallel existing 8" main along Main street with 8" main from 2nd street to Konocti Ave; andStorage tank interior recoating to prevent corrosion.	M	20	C	City water distribution system is in desperate need of rehabilitation and replacement. Existing water mains and appurtenances are as old as 80 years in some locations, made of pourous and decaying material. Potable water loss in the system is estimated to be over 15%, due to broken and deteriorating mains and laterals. Service lines are sized insufficiently for current and future demands. Water quality and delivery are at increased risk of further deterioration until improvements can be made.	2,550,000	2,196	5,200	03	Lake	II	2009
1318	1710004	1710004-004	Lakeport, City of	SCADA Control and Communication System Replacement	The SCADA and telemetry systems will be replaced with a modern and fully functional system. New hardware and software will be purchased and installed at the water plant and at locations within the water distribution system. Professional customization will also be performed, which will fit the new system with water plant and distribution operations and to meet operator needs.	M	20	C	The SCADA (Supervisory Control and Data Acquisation) is a large component in the operation of the surface water treatment plant. It is designed to automatically control water treatment and alarm notification functions. However, the system is antiquated and disfunctional. It is plagued with technical problems and prone to frequent malfunction.As a result, the water plant has become increasingly difficult to operate and burdens already overworked staff with additional responsibilities when processes, which are supposed to be automatic, fail or don't perform as expected.Additionally, the Profibus Telemetry System for the water system has become antiquated and unreliable. Third-party analysis of the problem, and review by the Department of Public Health, has suggested it be replaced with a radio telemetry system as soon as possible. The SCADA and Profibus Telemetry System are designed to work congruently. Therefore, the replacement of both with a unified control and communication system is the appropriate and preferred option for the City. However, current funding is unavailable to move the project forward.	500,000	2,196	5,200	03	Lake	II	2009

1320	4110010	4110010-047	Montara Water and Sanitary District	Consolidation of the Pillar Ridge Mobile Home Park Water System	This project will support consolidation of the Pillar Ridge disadvantaged community water system with the MWSD public water system. Since there is an existing operational permanent connection between the two water systems, only minor improvements are required for this consolidation, as follows:1. Pillar Ridge Water Treatment Plant improvements to consolidate the controls and add the facilities to the MWSD's Supervisory Control and Data Acquisition System (SCADA). Other minor repairs and maintenance issues for the facilities are also included.2. Meter replacement: existing 228 meters will be replaced with new radio-read meters per the MWSD's standards.3. The 228 additional water accounts from Pillar Ridge community will be consolidated into the MWSD's billing and record keeping system.All these activities are expected to be exempt from CEQA. Categorical Exemption will be filed by MWSD as Lead Agency. All design and procurement documents and construction bid award and management will be carried out by MWSD,	M	20	C	Pillar Ridge Mobile Home Park (Pillar Ridge) is a small mobile home community located in Moss Beach, California, in the Montara Water and Sanitary District's (MWSD) service area. Pillar Ridges currently operates its own water system consisting of 3 groundwater wells, a storage tank, a water treatment plant, and raw water transmission lines, and a distribution system network. The system serves 228 mobile home residences in the community. In addition, MWSD currently provides water to Pillar Ridge through a permanent metered connection. The Pillar Ridge community is designated a low- to extremely-low-income disadvantaged community. Pillar Ridge community has been experiencing difficulties with maintaining and operating its various water facilities, including the wells and the water treatment plant, securing certified operators, and carrying the high cost of maintenance and operations of the water system. In 2006, Pillar Ridge through its owner, Millennium Housing, has approached MWSD willing to consolidate its water system with the MWSD water system and transfer the ownership to the District. MWSD, although willing to consolidate and assist Pillar Ridge, had no ability to do so due to lack of funds to accommodate 228 new metered connections into its water system.This project will consolidate the entire Pillar Ridge water system into the MWSD water system and greatly contribute to improving water quality and	450,000	1,640	5,412	17	San Mateo	II	2009
1321	1910084	1910084-010	MAYWOOD MUTUAL WATER CO. #1	Water Tank Replacement	Tearing down the old water tank and rebuild a new tank will provide a secure source of clean water to our customers. The area is densely populated during the day time hours with 4 public schools serving over 8000 students, 2 shopping areas, 3 strip malls, 2 large markets, 1 large conversant hospital, 4 large churches and the central business area of the City of Maywood. CDPH has asked about updating the tanks. Our concern is to have adequate water in case of fire. Protection of all major structures has prevented us from taking this tank off line. Increasing the tank size will mean that we have to redesign and relocate our pumping station to accommodate the new water tank.	M	20	C	Here are some facts about our tank that needs repair and updating.a) Our 500,000 gallon tank (small tank) measures 36 feet diameter by 70 feet tall, built in 1965.b) All the anchors on the tank have been stretch or broken, due to past earthquakes. c) The tanks internal lining was done with tar as was the standards in 1965. d) Corrosion has been documented on the inside and outside of tank.e) This tank is inter-connected with a 2,000,000 gallon tank that's built next to it.f) The inter-connection from tank to tank is ductile iron pipe; Not flexible.g) Tank is located less than 50 feet from residential housing units.h) Engineering study suggested to tear down the water tank and rebuilt it because it is more cost efficient.i) Safety of the community.j) Be able to provide a minimum pressure of 20 psi in case of power loss.	2,500,000	1,161	5,500	16	Los Angeles	IV	2009
1322	1910084	1910084-005	MAYWOOD MUTUAL WATER CO. #1	dead end water main replacement	Install new 8 inch water main along Maywood Avenue on the west end of our water system; to eliminate the dead end areas. This project will improve circulation of the water supply and stop the constant need to be flushing the area to remove sedement in the water. Test have shown that manganese tends to build up every 4 to 6 weeks and this must be flush out. Approximately 4,000 feet is needed to connect this area to our system to create a loop and eleminate the dead ends. This project will help the save 100s of thousands of gallons of water by not having to flush the area so often and also imporve the quality of the water and build up of the secondary MCL for manganese. At the current time CDPH has issued a violation for secondary MCL for manganese. This project will be the must cost effect solution to this area and clean up the water that just sit there for a long time and accumulates sediement and discolors the water. This will help compliy with CDPH voilation order.	M	20	C	Install new 8 inch water main along Maywood Avenue on the west end of our water system; to eliminate the dead end areas. This project will improve circulation of the water supply and stop the constant need to be flushing the area to remove sedement in the water. 1324	1910084	1910084-011	MAYWOOD MUTUAL WATER CO. #1	Remove 4" inch water mains and upgrade system on Slauson	These pipes need replacement because of the location of the pipes and condition of the pipes. Cookies have been cut and they have heavy tubercle and manganese buildup within the pipes. Because of the size and location of these undersize pipes and fire protection that is needed in this area; replacement of the pipes will provide a safer, cleaner and more reliable water supply to our customers. If funding is available we will lay about 11,200 feet of pipeline on Slauson avenue. This will provide a outstanding fire flow protection to the city of Maywood and help the secondary problem of rusty water and poor pressure to our customers.This project will also afford us to upgrade our system with air relief valves since it is at the higher end of our system and safer for pedestrians when repairs are needed.	M	20	C	Slauson Avenue has old 4 inch cast iron pipes that were laid back in the 1920's and 30's these pipes run under the sidewalk of the major business district of the City of Maywood. These pipes have old lead chalking to prevent leakage are undersize and must be replaced with an 8” inch pipeline. These pipes need replacement because of the location of the pipes and condition of the pipes. Cookies have been cut and they have heavy tubercle and manganese buildup within these pipes. Because these pipes are undersize and provide poor water circulation and pressure and fire protection that is needed in this area; replacement of the pipes will provide a safer, cleaner and more reliable water supply to our customers.	2,000,000	1,161	5,500 16	Los Angeles	IV	2009
1325	2310006	2310006-005	Millview County Water District	N. State St. Pipeline Project	The project will replace approximately 4,800 feet of asbestos cement pipe with 16 inch C-900, replacement of the existing 3 and 4 inch warf type fire hydrants and service lines.	M	20	C	The Millview County Water District backbone main, routed along North State Street, Consists of pipelines that vary in diameter from 4 to 12 inchs. A large majority of the mainlines are of asbetos-cement construction. The inadequate size of the pipeline results in low pressures and flow for peak demands and fire flow events. This project is the first phase of solving the low pressure and flow rates by replacing approximately 4,800 feet of the undersized piping. This work is also necessitated at this time as the County is widening the existing roadway and requires all piping, etc. to be upgraded as a part of this effort. The plans and specifications for the pipeline are complete, and project bids are presently being obtained to construct the work. The work will commence in March/April and be completed by mid-summer of 2009	1,250,000	1,489	5,500 03	Mendocino	II	2009

1326	1910084	1910084-004	MAYWOOD MUTUAL WATER CO. #1	Updated plant and system electrical components	Maywood Mutual water Company is a small system with only 3 employees to work the system. We do maintenance and repairs when needed. We do not have no night shift to watch the water system after hours even doe we always have on call personnel for emergences.The updated plant and system electrical components is needed to put our remote location (well #3) on a SCADA system and generator.1.) A SCADA system will allow us to monitor the system for any problems that have occurred and to respond within minutes to correct the problem via computer. This system can save lives and property or avoid contamination problems or pressure problems before it can get out of hand.2.) A recent test of our electrical boosters we have (3) three 40HP motors have been documented to perform between 24% to 29% efficiency. This has cost the company thousands of dollars due to the performance of these motors. The motors do not move the water as they should and waste electricity. A more energy efficiency motors will reduce cost, save valuable energy. Boosters at the present time do not perform well during peak periods and 2 booster may need to be on when demand is high or we will lose pressure in the system. 3.) A generator is needed at our well #3 location to generate power when and if the power should go out. Our well #3 is now our principle well for production. This well has produce near	M	20	C	Maywood Mutual water Company is a small system with only 3 employees to work the system. We do maintenance and repairs when needed. We do not have no night shift to watch the water system after hours even doe we always have on call personnel for emergences.The updated plant and system electrical components is needed to put our remote location (well #3) on a SCADA system and generator.1.) A SCADA system will allow us to monitor the system for any problems that have occurred and to respond within minutes to correct the problem via computer. This system can save lives and property or avoid contamination problems before it can get out of hand.2.) 1327	1910084	1910084-008	MAYWOOD MUTUAL WATER CO. #1	Replacement of old and undersize gate valves	Replace all valves within our system to properly shut down any area that may need repairs without having to shut down several blocks to make these repairs. This will prevent any backflow problems that may occur and any low water pressure when hydrants or peak periods occur. These valve have been in use since the 1920's and 30's have seen their useful life.Many valves are undersize and connected to larger pipes restricting the water flow and effecting emergence fire hydrant with the water that is needed.Valves are missing in areas and need to be added to have a safe system of shutdowns due to emergence of any sort.These valves are also a source of corrosion and release of iron in our water supply that has effected the color and taste to our customers. Removal and replacement of these valves will help us comply with CDHS for secondary MCL problems we have in this area.	M	20	C	We have about 400 Valves that have been there since 1920's and 30's.Many of these valves do not shut down properly and many leak for weeks or months when they are exercised.We have found under size 4" inch valves connected to 6" inch pipeline giving us flow problems. Many intersection do not have valves or not enough to do a complete shut down within one block and we have to shut down and disinfect several block for any repairs.In case of fire very low pressure can occur and will produce backflow problems and possible contamination of the drinking water supply.New valves in our system will give us the tools to perform repairs in a safe and more efficient manner and help keep our system in compliance with CDPH.	1,500,000	1,161	5,500	16	Los Angeles	IV	2009
1328	1910084	1910084-007	MAYWOOD MUTUAL WATER CO. #1	Drill New Well #5	Hire a drilling company to find a clean source in the aquifer and engineer the well to meet the needs of the community.Drill well and put in operation on a rotating basis.If new well is iron and manganese free it will become are primary water well. If the well has manganese or iron or any other contaminates we can connect to a filtering system that can remove the containments before it is stored in our water tanks. Replacing these 60 and 70 year old wells will help the community and will be served with healthier and better drinking water and ensure that presure in our system will be always be meet.	M	20	C	Well #3 was drilled in 1943 and our well #4 was drilled in 1950 according to records in our office. Both wells are needed for redundancy and to supply water to our customers.These wells have past the useful life of a well and may fail soon. It is important to be prepared for such an event with a new well in place to supply water to our customers.It is only a matter of time when ant of these well will fail and there is not enough money to supply the community with outside water such as CBMWD or any of the neighboring water districts.Drilling a new well is a critical need for this community to avoid possable pressure problems if in the future.	1,250,000	1,161	5,500	16	Los Angeles	IV	2009

1340	1510045	1510045-009	GOLDEN HILLS CSD	Well Replacement Project	The project consists of the installation of a new 400 gpm production well to replace the Iriart Well. The proposed well would be located on land owned by the Tehachapi Cummings County Water District (TCCWD). Based on existing hydrogeologic information the estimated depth of the proposed well is 500-550 feet. The casing size would be 12 inches with 200 feet of well screen. The pump would most likely be a submersible type pump. Other project components would include continuous chlorination equipment, a small building to house the well and equipment, and 300 linear feet of 6-inch diameter pipeline to connect to the existing water system.The well would be interconnected for emergency use to the TCCWD water system and the City of Tehachapi. By providing this interconnection, if water service was disrupted for either system, the District could provide a backup water supply.	M	20	C	The Golden Hills Community Services District (District) is located in the Tehachapi Mountains in Kern County, 40 miles east of Bakersfield. The District has a Median Household Income (MHI) of $48,047 (which is 3 percent higher than the Disadvantaged Community MHI threshold). Currently the District's Maximum Day Demand (MDD) is approximately 1800 gpm during the peak summer months. The District's total source capacity is about 1900 gpm, excluding two wells that are currently not used due to poor water quality. The District's largest capacity source is the Iriart well which can pump a maximum of 700 gpm. Therefore, the District currently cannot comply with Section 64554 (c) of the California Waterworks Standards which states "systems shall be capable of meeting MDD with the highest-capacity source offline."The Iriart well is the oldest well in the District and was constructed in the early 1940s. It does not have a sanitary seal, and it is subject to potential surface water contamination. Because the well is over 60 years old a casing failure could occur, thereby reducing the available water supply.The Iriart Well also has the poorest water quality when compared to the District's other operational wells. Nitrate is of concern, because it has been sampled as high as 30 to 37 mg/L edging close to the 45 mg/L Maximum Contaminant Level (MCL). Because it is above the "trigger" level for nitrate, the well requires	240,000	2,796	7,434	19	Kern	III	2009
1341	3610031	3610031-001	MUSCOY MWC NO. 1		Replace transmission lines	M	20	C	Old transmission lines	637,715	1,550	7,500	13	San Bernardino	V	1998
1342	1910160	1910160-006	TRACT 349 MUTUAL WATER CO.	Install Emergency Water Intertie Connection	Install an 8" diameter pipeline from and to existing water lines at both water system, fitted with valves and and two way water meter. The water meter shall be located inside a vault located in a secured area.	M	20	C	Tract 349 Mutual Water Company have no emergency water intertie connection to the City of South Gate.	220,000	908	7,500	07	Los Angeles	IV	2009
1343	3610031	3610031-002	MUSCOY MWC NO. 1		Rehabilitate well and block wall	M	20	C	Well 1 does not meet state standards, structure subject to vandalism	90,000	1,550	7,500	13	San Bernardino	V	1998
1344	1910160	1910160-003	TRACT 349 MUTUAL WATER CO.	Emergency Generator and Controls for Emergency Power	Procure diesel fueled Emergency Generator and necessary controls and install it on site at 4630 Santa Ana Street facility. The Emergency Generator shall be housed in a secured enclosure to protect it from theft, vandalism and sheltered it from the weather.	M	20	C	Tract 349 Mutual Water Company water system has no back up power in the event of power loss in the area. There will be loss of water pressure in the distribution system that may affect water quality, firefighting capability and customer complaint. It will also affect the Well pump that supply water to the distribution system.	160,000	908	7,500	07	Los Angeles	IV	2009

1345	1910160	1910160-004	TRACT 349 MUTUAL WATER CO.	Repair and or Rehabilitate Leaking Distribution System Valves.	In order to repair the leaking valves, the street where the valves are located are to be excavated to exposed the valves. Special stainless steel T-bolts shall be fabricated to replace the existing deteriorated T-bolts. Any cracked and deteriorated follower plates and bent stems must be replaced. All valves shall be repacked. Some valves may have to be completely replaced. After the valves are repaired the hole shall be backfilled and repaved in accordance with the city requirements.	M	20	C	All gate valves with conventional packing in the distribution system are leaking due to old age, broken packing or missing stuffing box bolts and nuts, cracked and deteriorated follower plates and bent stems. These problems with the gate valves prevent us from exercising the valves for the scheduled periodic maintenance because it almost impossible to stop the leaks once it developed causing the water to create possible sinkhole in the street. Leaking valves can also cause water quality problem by back siphonage.	270,000	908	7,500 07	Los Angeles	IV	2009
1346	5410020	5410020-007	Woodlake, City of	Woodlake Water Tank	The City's contract Engineering firm has determined that enough surface area at the project site (a hill) will allow for the construction of a 500,000 gallon tank adjacent to the existing tank. Preliminary design has concluded that a retaining wall must be installed to fortify the new tank and an access road must also be constructed for heavy equipment to access the project site. The project will consist of the installation of the raod way for access; the placement of the retaining wall; the construction of a new water tank and the removal of the exiting facility. Another phase of the project is the removal and replacement of a 150 ft communications tower that has serves the City's franchise cable company. The guide wires supporting this structure will not allow access to the site and there are no other possible access points.	M	20	C	Our 500,000 gallon water storage tank (city has only one) has been determined (by an outside engineering firm) to be in danger of collapse. Portion of their report states "It is this engineer's preliminary assessment that the steel tank is in a state of potential perimeter wall buckling which could be triggered by an increased movement (settlement) of the sub-grade soil or a minor seismic event. Buckling of the side wall could be a trigger for the tank to collapse causing a potntial complete failure and collapse of the tank". It is our opinion, based on the report, that the tank needs to be taken down and replaced by a newer structure.	1,500,000	1,784	7,524 12	Tulare	III	2007
1347	1510038	1510038-001	BEAR VALLEY CSD	Well CV #6	This agricultural well that we own is also rated for drinking water applications but is not connected to our system. It is powered by a diesel pump out in a leased ag. fiel and needs to be repowered to an electric pump. Well pump needs to be pulled, the well inspected by video, pump will be changed and power will be supplied by a 150 hp electric 480v. 3 phase motor, with appropriate motor control center, lighting SCADA controls, disinfection systems amnd controls. Electrical supply will have to be developed and installed to the site. Proper all weather enclosures will have to be built and pipelines constructed to connect to our system, about 1/4 mile away.	M	20	C	water availability is in becomming questionable and will be in serious condition if a critical well is lost. We have an additional high production well available but it must be developed to drinking water status,(it is currently an unused agricultural well) re-powered (diesel to electric), and connected to the system. We believe that developement of this alternative source is critical, especially in view of current drought conditions.	300,000	2,887	7,534 19	Kern	III	2009
1348	4510016	4510016-001	Clear Creek CSD-Anderson		Drill new well and loop deadend lines to provide the reliability required by the Waterworks Standards.	M	20	C	No alternate source of water for emergency. Deadend lines need to be looped to fulfill Section 64560(a)(6) (minimize the effects of equipment failure) and Section 64626 (layout of water mains) of the Waterworks Standards.	850,000	2,645	8,000 02	Shasta	I	1998
1349	1010026	1010026-001	PINEDALE COUNTY WATER DISTRICT	Water Main Replacment	Install new water mains and water meters.	M	20	C	Some of the District's water mains are old and deteriorated.	4,650,000	3,370	8,495 11	Fresno	III	2007
1350	2410010	2410010-002	WINTON WATER & SANITARY DIST	Well 17 Improvements	A well casing has already been constructed. This project will include a new block wall building, site improvements, pumping and electrical equipment, standby diesel generator, connection to an existing water main, etc. Also included is a cellular based SCADA system that will be used to monitor and control the existing well and two of the three existing wells.	M	20	C	The District has three wells. When the highest capacity well is offline the other two wells are not capable of providing maximum day demand as required by CCR Title 22, Chapter 16, Section 64554(c), and water pressures drop significantly, especially in the summer months.	800,000	3,113	8,500 11	Merced	III	2009

1351	2010001	2010001-008	CHOWCHILLA CITY WATER DEPT	Complete Well #14, Piping and Improvements	Drill and develope a production well (#14) on City owned property, install pumps, motors, motor control center, standby generator, automatic transfer switches, SCADA, pipe and appurtances.	M	20	C	Recent agricultural development surrounding the City and the drought has caused a drop in the water table. Many of the older wells in the City are producing less water and are in danger of contamination. During the recent growth the City did collect development fees to provide for the drilling of new wells. In an attempt to do so the City drilled two dry holes. On the third attempt we were able to drill a test well that indicates that we have located a reliable source of clean water. Due to the cost of the previous dry wells the City does not have sufficient funds to drill the production well and install the facilities needed to operate it.	1,200,000	3,073	10,682	11	Madera	III	2009
1352	2010001	2010001-007	CHOWCHILLA CITY WATER DEPT	Installation of a 1 million Gallon Storage Tank and Main Lines	Install a one million gallon storage tank, 1.5 miles of 12 inch pipeline, three booster pumps, standby generator, pump control equipment security fencing and other site improvements.	M	20	C	Much of the growth in the community has occured on the east side of town. The City acquired development fees to drill a new well in this area to provide a more reliable water supply. Testing of the area indicated that a good supply was available in this area. We acquired the land and drilled a test well where recommended. We were unable to find sufficient clean water to make the well viable. The testing leaves us to believe that attemting to drill in another location, in this area, would not be successful. In order to provide a reliable supply to this area, avoid low pressure issues that can result in the issuance of boil orders and line flushing, the City has determined that it will need to construct a water storage facility, additional piping and booster pumps. These facilities would also allow the City to reduce the pumping of its wells during peak electrical demands. This would result in cost savings to City and a benifit to the State power grid.	1,500,000	3,073	10,682	11	Madera	III	2009
1353	2010001	2010001-002	CHOWCHILLA CITY WATER DEPT		CONCRETE SEAL EXISTING OPEN-BOTTOM WELL #5 THAT WAS ABANDONED DUE TO FAILURE IN 1995 AND DRILLED NEW WELL TO LARGER SIZE AND DEPTH TO PROVIDE REQUIRED DOMESTIC AND FIRE FLOWS TO SERVE EXISTING DEVELOPED AREA. OTHER - DESIGN AND CONSTRUCTION	M	20	C	DETERIORATED AND COLLAPSED CASING IN OPEN BOTTOM WELL, SHUT DOWN IN 1995.	400,000	3,073	10,682	11	Madera	III	1998
1354	2010001	2010001-001	CHOWCHILLA CITY WATER DEPT		INSTALL 8" AND 12" PVC PIPE. LOOP THE SYSTEM WITH 12" MAIN CONNECTING TO THE WATER WELL. OTHER - DESIGN AND CONSTRUCTION	M	20	C	UNDERSIZED AND OLD DETERIORATED 4" STL WATER PIPE THAT IS OVER 55 YRS OLD. SYSTEM FAILS TO MEET CURRENT STANDARD DOMESTIC AND FIREFLOW PRESSURES.	335,000	3,073	10,682	11	Madera	III	1998
1355	2010001	2010001-003	CHOWCHILLA CITY WATER DEPT		REPLACE WITH 8" PVC PIPE. OTHER - DESIGN AND CONSTRUCTION	M	20	C	UNDERSIZED MAINS. SYSTEM FAILS CURRENT DOMESTIC AND FIRE FLOW REQUIREMENTS	200,000	3,073	10,682	11	Madera	III	1998
1356	2010001	2010001-005	CHOWCHILLA CITY WATER DEPT		REPLACE PIPE WITH NEW 12" PVC MASTER LOOP SYSTEM FROM WELL #10. OTHER - DESIGN AND CONSTRUCTION	M	20	C	UNDERSIZED AND DETERIORATED 6" AND 8" PIPE. SYSTEM FAILS DOMESTIC AND FIREFLOW REQUIREMENTS	557,000	3,073	10,682	11	Madera	III	1998
1357	2010001	2010001-009	CHOWCHILLA CITY WATER DEPT	Replace Water Mains in the Presidential Streets	This project would consist of the installation of approximately 2600 linear feet of 8 inch water mains, valves and appurtenances, and 110 meter services including lines,valves,meters, and meter boxes.	M	20	C	The mains in this area were installed during world war II and are constructed of steel. Over time they have deteriorated. We are experiencing frequent leaks and service interuptions. Due to our sandy soil conditions these leaks often go undetected for extended periods of time thus resulting in significant water losses at a time when we can least afford to waste this valuable resource.	800,000	3,073	10,682	11	Madera	III	2009

1358	2010001	2010001-010	CHOWCHILLA CITY WATER DEPT	Well 6 improvements	This project consists of installing a smaller pump, throttling valve, chlorination equipment, piping and a flow meter.	M	20	C	This well produced high levels of sand that destroyed the pumps. The City invested in an "Aqua Stream" device designed to create a water calming effect thus, eliminating the sanding issues. Although somewhat successful we are still unable to use the well. At normal flows the "Aqua Stream" device will plug off in a few hours and the well must be shutdown for an extended period before it can be placed back in service. Through some experimentation the City has been able to run the well for extended periods by reducing the flows. The equipment used to accomplish the flow reduction is not reliable for extended periods. New equipment needs to be installed so that this well can be used reliably during peak demand periods.	20,500	3,073	10,682	11	Madera	III	2009
1359	2010001	2010001-004	CHOWCHILLA CITY WATER DEPT		INSTALL NEW 8" WATER PIPE LOOP AND REPLACE PIPE WITH 8" AND 10" PVC. OTHER - DESIGN AND CONSTRUCTION	M	20	C	UNDERSIZED AND DETERIORATED PIPE. SYSTEM FAILS DOMESTIC AND FIREFLOW PRESSURES.	506,000	3,073	10,682	11	Madera	III	1998
1360	2010001	2010001-006	CHOWCHILLA CITY WATER DEPT	Truman Drive/15street Water Main	Install approximately 1200 linear feet of 12 inch diameter pipe, valves and appurtenances in Truman Drive from well 5a to 15th street and proceed southeast on 15th to the point of connection . Restore trench paving.	M	20	C	When the City attempted to drill a new well on Chowchilla Blvd to provide water to the industrial area of the City, that well was dry. We chose to attempt to drill a new well on City owned property that was futher away from the area needed but, was thought to be in an area where water might be found. The attempt was much more successful than anticipated and the existing piping that was intended to service this well is undersized. Due to the cost of drilling the first dry well the City lacks the funds to underake this project at this time. Providing this water to the industrial area is vital to the City's ability to attract job creating industry.	270,000	3,073	10,682	11	Madera	III	2009
1361	0410011	0410011-002	Del Oro Water Co.-Paradise Pines		Construction of 1.5 MG storage tank, and interior sandblasting and recoating plus exterior painting of Tanks #1 and #2.	M	20	C	Storage shortfall and Tanks #1 and #2 need rehabilitation.	1,017,500	4,752	11,405	21	Butte	I	1998
1362	0410011	0410011-001	Del Oro Water Co.-Paradise Pines		Well exploration and development.	M	20	C	Water shortage of 1,000 gpm.	500,000	4,752	11,405	21	Butte	I	1998
1363	1210006	1210006-004	City of Fortuna	12th Street Undersized Water Main Replacement Project	The City of Fortuna proposes to replace approximately 8,500 linear feet of AC pipe with 12-inch PVC C-900 or HDPE pipeline located on 12th Street in the City of Fortuna. The project also includes new hydrants, new valves, and new service laterals. The project will improve water pressure to residences served by these lines and reduce water losses thereby improving water use, energy efficiency, and water quality.	M	20	C	Coinciding with the California governor's goal of achieving a water use reduction of 20 percent per capita, the City of Fortuna needs to upgrade approximately 8,500 linear feet of under-sized water distribution pipeline at 12th Street in the City of Fortuna. Inspection of the under-sized pipe revealed leakage and breakage at many locations. It is estimated that losses along these lines can be as high as 30 percent of the flow through these pipes. City residents served by the undersized and deteriorating pipelines, experience water outages during frequent required repairs and water quantity problems caused by insufficient water delivery capability necessary to supply current demand.Since the existing pipeline was installed, the population of City of Fortuna has grown significantly. Major portions of the existing water distribution system were designed to accommodate flows that would serve significantly less residents. The replacement of undersized water distribution pipelines is proposed to provide adequate water service to the residents of the City of Fortuna. The replacement of the undersized water mains is in support of the California Governor's Order No. S-06-08, which in part orders the Department of Public Health to mitigate impacts from delivery limitations. The project would also support Order No. S-06-08 as well as the California governor's stated goal of achieving a 20 percent reduction in per	2,000,000	4,312	11,649	01	Humboldt	I	2009

1364	1210006	1210006-006	City of Fortuna	Holman Tank Replacement Project	This project is to resolve the current problems with lack of fire flow in Zones 3 and 5 and the need to replace the Holman Tank which is undersized and in poor condition. Several alternatives to correct the problems were evaluated. The proposed solution is to connect the two zones with an 8-inch pipeline and construct an at-grade storage tank. There would be approximately 1,800 feet of 8-inch pipe running cross-country in a new easement, 3,500 feet of 8-inch pipe in existing roads and a new 220,000 gallon steel tank.	M	20	C	The City has fire flow issues due to insufficient pressure supply from the Holman water tank. The tank has sustained serious structural damage due to earthquakes, and the tank is leaning off its base.	1,600,000	4,312	11,649	01	Humboldt	I	2009
1365	1210006	1210006-005	City of Fortuna	Wellhead Improvement Project	This project is to resolve the current problem that, in the event of a major flood, only one of the City's five water supply wells would be operational. The motors of the other four would be flooded and they would be out of service for an extended period of time. Each well pump can supply approximately 900 gpm. The typical demand is 2,000 to 2,200 gpm so at least three pumps are required to meet the demand. The proposed solution is to raise the well heads on two of the pumps to an elevation that will be above the 100 year flood level. This will involve extending the pump casing, pump shaft and column on each well approximately 5 feet, extending the pump house foundation the same amount, and either replacing the existing pump houses on the extended foundation or constructing new well houses. Piping and electrical wiring modifications will also be required to connect to the pump discharge head and motor that will be elevated by about 5 feet.	M	20	C	Four of the City's wells are not protected again the 100-year flood. In the event of a flood water supply would be severely limited as the City needs at least 3 wells to supply the average day water demand.	200,000	4,312	11,649	01	Humboldt	I	2009
1366	2410004	2410004-004	LIVINGSTON-CITY	Waterline Improvements - Phase II	The project involves replacing approximately 13,600 feet of 6" water lines, 2,930 feet of 8" water lines, 287 water meters, and paving of 15,000 feet of alleyways. The project will also include installation of gate valves, house services, fire hydrant assemblies, water meters, air release valves, bacterialogical sampling stations etc.The old and failing waterlines that have been identified as needed to be replaced will be replaced with PVC pipes with sizes that have been determined in the 2008 Water Distribution Master Plan prepared by Carollo Engineers. The sizes of the water lines were determined using the water distribution model developed for the Master Plan. This will ensure that along with the water quality issues being addressed with the elimination of leaking pipes, adequate hydraulic presures in the project area are assured. Currently majority of the alleyways are not paved. The alleyways where water lines are being replaced will be paved to limit damage to the pipelines due to the garbage trucks and heavy maintenance truck traffic accessing the alleyways. City of Livingston has an exceptional record of successful and timely completion of projects using Federal and State grants. During the past four years, City has received and completed the following projects using Federal Grants:Bird Avenue Bridge ConstructionTraffic Signal and Intersection Mdifications at "B" Street and Winton ParkwayProjects	M	20	C	Majority of the older parts of the City's water distribution system were installed as early as the 1920s. These sections of pipelines have been historically prone to leaks and breaks, as well as source of frequent problems of poor water quality. In 2005, City obtained Proposition 13 Grant funding in the amount of $1,906,700 from Department of Water Resources for Water System Infrastructure Rehabilitation Project. City recently completed construction of the project and replaced a total of 19,000 feet of pipelines. The pipelines completed as part of the Prop 13 Grant projects represent less than half of the pipelines that are old and failing. The proposed project is the next phase of the pipeline replacement program aimed at addressing water quality and pressure issues faced by the City due to the failing pipelines.The audit performed in 2003 in support of the Grant application for the Proposition 13 funding revealed that approximately 35% of the water being produced was anaccounted for (this figure preresents the difference between the amount of water produced and the amount of metered water). Although the magnitude of the anaccounted water may have reduced due to the recently completed water line replacements, it is assumed that substantial losses occur in the failing pipelines that have not been replaced. City will provide supporting data with the detailed application.City staff continues to deal with a	3,780,000	2,905	13,795	11	Merced	III	2009

1367	2410004	2410004-003	LIVINGSTON-CITY	Well #9 and Well #13 Conversion to Water Lubrication System	Converting the two wells to water lubrication consists of pulling the pumps, convert to water lube, video well, air lift/blow well, bail oil from well, install new bowl assembly, 240' of new water lube column and shaft assembly etc.	M	20	C	Both the well systems were installed more than 15 years ago. City's maintenance division is proposing to convert from oil lubrication to water lubrication in view of the age of the existing well. City of Livingston relies fully on the water wells for water supply and emergency storage. The proposed project is intended as a preventive maintenance upgrade to ensure the wells are functional.	95,160	2,905	13,795	11	Merced	III	2009

1371	3310032	3310032-001	San Jacinto, City of		The City plans to drill two more wells, build one or two Fe/Mn treatment plants, upgrade and replace the old distribution mains. Add additional surface storage.	M	20	C	Shortage of well capacity, water quality problems due to iron and manganese. Also, the City's distribution system is very old and under sized creating low-pressure problems.	1,500,000	4,030	14,098	20	Riverside	V	1998
1372	3310032	3310032-002	San Jacinto, City of	City of San Jacinto Masterplan Waterline Upgrade Project	In 2005, the City updated its water system master plan and identified all pipelines within its network that require upgrading. The highest priority was given to facilities that are grossly undersized (i.e. 2" diameter) or facilities that are a combination of undersized plus out of compliance with current standards (i.e. 4" diameter steel or ACP pipe).The proposed project will address the highest priority pipeline upgrades within the 2005 master plan update. It will install approximately 10,000 feet of new 8" PVC pipeline along various city streets to replace the aging infrastructure. Appropriate blowoffs, fire hydrants, av/ar valves, and other appertunances will be installed to ensure the locations in question are brought into full compliance with the state's water works standards.The design of the proposed project is already underway and environmental studies are essentially complete. The project will easily be ready for construction by the summer of 2009.	M	20	C	The City of San Jacinto Water System serves the urban core of the City (newer areas of the City are served by Eastern Municipal Water District). Throughout the City's downtown area, the existing water distribution system is made up of pipelines that are undersized, aged, out of compliance with current water works standards, and subject to sudden failure.These waterlines pose a significant threat to the performance of the City's public water system. Their small size (lines are typically 2"-4" diameter) compromises the City's ability to adequately supply demands throughout its service area. Their age and potential for failure increases the possibility that the water system will be compromised with introduction of pollutants. In some facilities (namely those made of asbestos-cement pipe) any maintenance activities are subject to special environmental procedures and as such regular operation and maintenance is cumbersome.	1,500,000	4,030	14,098	20	Riverside	V	2009
1373	1210016	1210016-001	McKinleyville C.S.D.		Construct new wells and retrofit existing facilities.	M	20	C	Need backup supply; vulnerability to seismic disruption.	946,790	5,042	15,132	01	Humboldt	I	1998
1374	1510019	1510019-008	Shafter, City of	Arsenic Treatment System at City Well 12	The City is proposing to reroute the wells discharge piping from directly connecting to the distribution system to a more accessible site across State Route 43 where the water can either be blended with other other well water at a central storage and mixing tank or through the typical treatment vessel assembly offered by one of the accepted removal technologies. Treated or blended water can then be pumped back to the distribution system. The blending option is preferred because there will not be a need to address disposal of wastewater and on-going costs of purchasing treatment media. With either option, the well will need pump and motor upgrades to address the increased hydraulic demands of having to route water to a new tank and through numerous new stretches of piping and valves. The construction schedule is being pushed back to the Fall of 2009 because it is generally less risky to take a well offline for maintenance and improvements during the low demand periods.	M	20	C	City Well #12 (Source PS Code 28S/25E-10N01 M) has seen its Arsenic levels sharply increase over the past five years. The levels have reached as high as 12 parts per billion but has remained in compliance with the maximum contaminant level of 10 ppb with quarterly averaging of the results. The well site is in a confined area where the addition of treatment vessels and other new infrastructure needed to address the Arsenic issue are probaby not feasible.	2,250,000	3,863	15,609	12	Kern	III	2009

1375	1510019	1510019-001	Shafter, City of		DRILL A NEW WELL IN THIS AREA AND ADDING A STORAGE TANK. OTHER - DESIGN AND CONSTRUCTION	M	20	C	A LOW-INCOME AREA WAS ADDED TO SYSTEM AND IN PUTTING A BURDEN ON THE SYSTEM. THE NEW AREA IS ISOLATED FROM THE SYSTEM	475,000	3,863	15,609	12	Kern	III	1998
1376	2310003	2310003-005	Ukiah, City of	Distribution System Reliability Project	This project would replace approximately 235,000 linear feet of transite pipeline within the City's water distribution system enhancing system reliability, protecting public health, and avoiding future system failures.	M	20	C	The City of Ukiah's water distribution system includes older transite pipe which poses a high risk of catastrophic failure. These types of failures pose a risk in terms of both water supply reliability and water quality. Catastrophic failures interrupt service and also pose a threat to water quality because contaminants can enter the system through the failed pipeline. The City has already experienced such failures in the existing water distribution system.	10,800,000	5,486	15,955	03	Mendocino	II	2009
1377	1510022	1510022-002	West Kern CWD		Construction of 900,000 gallon water storage tank.	M	20	C	Residents experience lower than normal water pressure and minimum flow for fire hydrants cannot be maintained by the District.	898,754	7,589	16,630	12	Kern	III	2004

1384	1510021	1510021-002	Wasco, City of	Water Tank #1 Construction	PROJECT DESCRIPTION: The City of Wasco requests funding to construct a tank, groundwater well and booster station for water storage and to procure monitoring equipment. These improvements are needed to meet peak-demand and emergency supply needs and to maintain adequate water pressure. A pre-construction feasibility study was completed in May 2007 on Wasco's water supply and pressure deficiencies. An above-ground water storage facility was recommended as the most feasible solution for emergency water storage requirements and for providing adequate pressures at hydrants for fire-fighting purposes, especially during periods of peak demand. In response to the Infrastructure Rehabilitation Feasibility Study and the Water Master Plan, the City of Wasco procured an engineer's estimate for the engineering design and construction of a water storage facility. The project will construct a new 2,000 gpm groundwater extraction well with a 250-hp pump, a two-million gallon at-grade welded steel water storage reservoir, and a 4,000 gpm booster station. Equipment for monitoring compliance with drinking water standards will be purchased and installed. The estimated bid for materials, installation and design totals $4,979,600. The facility will be located on City-owned land. The project will begin June 2009 and be completed by January 2011. The Water Tank #1	M	20	C	PROBLEM DESCRIPTION: Wasco's water distribution system has no emergency storage capacity. During peak demand conditions, water pressure can be hazardously low. The City of Wasco provides domestic water service and fire flow needs for local residents and businesses. The system is stressed by heat, service disruptions and growing demand. Summers in Wasco are hot and very dry. May through September, temperatures will peak over 100° F; today's forecast high, for example, is 108° F! The last two water years have yielded less than half the 6.5-inch average annual precipitation rate. Leaks and disruptions in power or water pressure frequently take the system off-line. The community's population has grown 22% since 1998 and, since 2003, the number of service connections increased from 3,681 to 4,270. Groundwater from the Kern County Subbasin aquifer is the sole water source. The City's groundwater management needs are covered by the Poso Creek Integrated Regional Water Management Plan. A 2007 Department of Water Resources Infrastructure Rehabilitation Feasibility Study examined Wasco's water distribution system and found it lacks the capacity to meet demand. Water is supplied from six of eight groundwater wells. Under average conditions, the system has an estimated peak hour demand of 6.1 MGD. The pumps have the capacity to produce 9.6 MGD, but, because only three have back-up	4,979,600	4,588	19,448	12	Kern	III	2008
1385	1510021	1510021-004	Wasco, City of	12" Water Line to Loop Water Main at Filburn & Central	Describe the facilities to be constructed or installed:The City of Wasco is requesting $412,830 from the Safe Drinking Water State Revolving Fund to install 2,850 linear feet of 12-inch water line. The new water line will connect two termination points in southwest Wasco. Beginning at the present termination point near Central Avenue and Flower Street, the water line will travel south along Central Avenue to Filburn Avenue. At Filburn Avenue, the line will turn east and travel along Filburn Avenue to the termination point at Filburn Avenue and Beckes Street. This will complete the water main and create a continuous loop around the periphery of the city. Besides the 12-inch water line, the project will install nine 12-inch gate valves, two 12-inch stub-outs, and three 12-inch tees. The construction costs total $305,800 and the Contingency and Engineering costs combined total $107,030.This water line project is ready to proceed. Environmental documentation, including CEQA, will be completed in March 2009. Final plans and specifications will be completed in April 2009. Using a bid process, construction will begin as soon as June 2009. The City of Wasco has managed similar water infrastructure projects and is experienced providing the financial oversight and reporting required by State and Federal contract agreements. The project will be managed by the City's Public Works Director. As the water utility	M	20	C	Describe the water system problem(s) to be addressed:Water delivery in Wasco is hampered by unstable water pressure and inadequate fire flows (City of Wasco Water Master Plan, 2007). Wells pump water directly into the distribution system, but water flow is disrupted by dead ends in the main line. Wasco is a disadvantaged community with a median household income (MHI) of $38,535 in 2007 (City-Data.com). This is 66% of the statewide MHI. The City of Wasco operates the water utility. It supplies water to 18,702 residents (Calif. Dept. of Finance, 2008) and 4,630 service connections; note, the DWP data provided in Part 1 B. Applicant Water System needs to be changed. Water for domestic service and fire flow is supplied by six groundwater wells and a distribution system. Pipes in the distribution system range in size from 4 inches in diameter to the 12-inch diameter water mains. There are no above-ground water storage facilities. Wasco's population has grown 22% since 2000 (Calif. Dept. of Finance, 2008). Demands on the local water system are expected to increase by 1,137 people per year through 2026 (City of Wasco Water Master Plan, 2007). The southern and western portions of the community are experiencing much of this growth. In the southwest corner of the city, the water mains travel west along Filburn Avenue and south along Central Avenue. One quarter mile before these roads bisect, the lines dead	412,830	4,588	19,448	12	Kern	III	2009

1397	5110002	5110002-035	City of Yuba City	Orange to Scott Waterline Replacement	Replace approximately 6,650 linear feet of 80+ year old 2-inch, 3-inch, and 4-inch galvanized iron pipe with 8-inch diameter distribution mains on Orange Street, Olive Street, Chestnut Street, Almond Street, Walnut Avenue, and Scott Street, south of Highway 20, in order to provide clean, dependable water to our customers in this area.	M	20	C	Lack of adequate water supply in this area adjoining the historic old town business district discourages development that would provide jobs for the residents. The distribution lines in this older section of Yuba City consist of 2-inch, 3-inch, and 4-inch diameter galvanized iron pipes that are over 80 years old and now in poor condition. This area has experienced water quality issues including high turbidity, pipeline failures and corrosion requiring higher levels of chlorine use and resulting in higher chlorine residues than would be necessary with the new pipe. Due to the size and condition of these existing pipes the City could not meet fire flow demands in an emergency. Replacing the lines with 8-inch diameter distribution mains will provide dependable, clean water service to the citizens, improve fire flows to the area and encourage commercial development. Replacement of these old pipes would also decrease the City's expenses for maintenance of the system.	1,529,500	13,550	51,504	21	Sutter	I	2009
1398	5110002	5110002-030	City of Yuba City	Feather River Intake System & Fish Screen	Construction of a new intake system that would increase capacity to 48 mgd (74 cfs) and provide a more reliable supply of surface water. Installaion of a fish screen that will meet the State and Federal fry criteria of 1.75 mm slot size opening and 0.33 fps approach velocity. The screen will protect multiple species of anadromous juveniles that migrate past the Yuba City Feather River diversion year around.	M	20	C	Yuba City has a multi-facited need for constructing a new water intake system on the Feather River. For the reasons listed below this project is the City's top priority: 1) The Yuba City intake system is the largest unscreened such system on the Feather River. Part of the 2008 CalFed Eco-system Restoration Program Implementation Plan calls for fish screens along the Feather River to improve the survival rate of juvenile anadromous fish. 2) The current intake system is subject to flooding contamination. The new system is designed to mitigate the adverse impact of flooding to the water supply. 3) Yuba City is currently in the process of transferring ground water users to surface water. That together with the growth of the City has resulted in the current expansion of the water treatment facility. The current intake system is too small to adequately serve our current and future customers.	6,200,000	13,550	51,504	21	Sutter	I	2009
1399	5110002	5110002-034	City of Yuba City	Underground Electrical to Low Lift Station	Construct an underground electrical system to the lowlift pumping station in the Feather River.	M	20	C	The current low lift station is located at the Feather River in the Flood Plain. Approximately every two years the river flows outside the normal channel for several weeks. During this time there is no access to the station and the electrical supply is subject to failure due to floating debris damaging an electrical pole. It is common for entire trees to be floating in the river during this time. Without electrical power to the low lift the City's generator operate for 24 hours and then the City will be without water. This station cannot be accessed via boat or helicopter during high water events.	250,000	13,550	51,504	21	Sutter	I	2009

1400	5110002	5110002-028	City of Yuba City	Caustic or Zinc Orthophosphate System	Construction of a Caustic or Zink Orthophosphate system including tank, pumps, and associated plumbing.	M	20	C	Corrosion control study indicated that the Calcium Hydroxide lime slurry that the WTP currently uses is not the most reliable system. The current 45% Calcium Hydroxide slurry contains grit that plugs up the feed lines and deposits grit in our clearwell and distribution system. Construction of a Caustic or Zinc Orthophosphate System including tank, pumps, and associated plumbing is a more reliable and maintenance free system. Caustic and Zinc Orthophosphate are available in a liquid form that requires minimal maintenance.	450,000	13,550	51,504	21	Sutter	I	2009
1401	5110002	5110002-037	City of Yuba City	Louise-Woodward 12-inch Waterline Replacement	Replace approximately 1,395 linear feet of 12-inch diameter Techite distribution main with ductile iron and install related appurtenances from the intersection of Louise Avenue and Rocca Way, across State Route 99, to Woodward Street.	M	20	C	This pipeline is one of only three crossings of Hwy 99 and provides a vital loop for the distribution system. The existing Techite (fiberglass) water main was installed in 1970 and is at the point of failure where it crosses Hwy 99. Techite pipe is no longer manufactured due to the high number of structural failures. Several leaks have developed over recent months and a temporary service main has been installed to serve customers. The original water main cannot be placed back in to permanent service due to the deteriorated condition of the pipeline.	390,000	13,550	51,504	21	Sutter	I	2009
1402	1510005	1510005-004	Delano, City of	Deteriorated waterline replacement project	The City will replace 12,450 lineal feet of deteriorated outside diameter (OD) steel water distribution pipelines and leaking valves. The pipes were previously installed between 1930 and 1940. The 4" OD pipes will be replace with 8" PVC pipe. The main line valves will be replace to allow isolation of areas effectively. The existing galvanized water services will be replaced with plastic tubing.By replacing the pipes and valves, the city will be able to address the Disinfection Byproducts Rule (high levels of Trihalomethanes and Haloacetic Acids). It will also address the change for bacterial increase. Chlorine is absorbed into the buildup of corrosion on the inside of the pipes. By replacing the pipes, the amount of chlorine that used is reduced. The city receives numerous customer compaints on their water quality. The water has a rust color with sand.At this time, the City of Delano is not able to meet fire flow requirements as set by Kern County. Through implementing this project, the city will be better equipped to meet the safety needs of the community. The project will reduce the amount of shut-downs to the system.The city will also be able to address the substanial water loss for the leaking pipes. During this time of drought, the city and the state need to work together to ensure that water loss is addressed and repaired immediately.	M	20	C	The City of Delano needs to immediately replace 12,450 lineal feet of deteriorated 4" to 8" OD steel water distribution pipelines and leaking valves. There are over 100 water breaks per year that require emergency excavation and repair in the proposed area. There is substantial water loss due to the leaks.The drinking water regulations that will be addressed through the replacement of the pipelines and valves is the Disinfection By Products Rule. Due to the leaks, there is a reaction causing Trihalomethanes and Haloacetic Acids. The leaking pipe are also causing an interruption of water services and impeding the City's ability through the system to meet fire protection capacity as determined by Kern County Fire Department to various locations within the City because of substandard water pressure.The City is bisected by State Highway 99. Higher ground within the city is the eastern portion of the community thereby creating a gravity flow from east to west. The central core of the community of Delano is serviced by OD Steel water distribution pipe. The downtown areas of the city is situated in a location that effects the ability to move of water to the easten portion of the community. It was discovered through flow tests that several highly populated east side areas of the city do not meet the fire flow requirements of 1000 gallons per minute. Turning off valves to push the water uphill to the easten portion of the city requires	2,400,000	8,670	53,855	12	Kern	III	2009

1403	0910002	0910002-018	South Tahoe PUD - Main	STPUD Consolidation with Lukins Water Company	STPUD and LBWC seek State Revolving Loan funds to consolidate the two systems in order to provide sufficient water delivery capability and storage capacity, allowing the LBWC supply wells with PCE issues to be retired. However, the two systems cannot be consolidated without full upgrades to the 57000 feet of water main to match current STPUD pipe standards. The project is the proposed installation of 57000 linear feet of 8" and 12" pipe, installation of 929 residential water meters, and the installation of 105 fire hydrants. The project will be completed in five phases with construction beginning in 2013 and completion and full consolidation expected by 2017. The phases have been reconfigured from the original LBWC 2009 Master Plan design to allow for continued water supply by the existing LBWC well to the customers in the unimproved areas of the system. As each phase is completed, STPUD will begin providing services to the residents in that area. After reviewing the existing cost estimates prepared for LBWC by Haen Engineering in 2009, the proposed new well construction and storage tank with booster pump (totaling $7 Million) were removed as STPUD can provide the necessary water supply utilizing current infrastructure. Revised cost estimates for the five phases resulted in a total project cost of $28,150,967.	M	20	C	Lukins Brothers Water Company (LBWC), located in South Lake Tahoe, CA, was formed in 1946 and serves 951 customers. The system includes 57000 feet of water main and three production wells. Originally the LBWC had five production wells, but two were abandoned due to the presence of Synthetic Organic Chemicals (SOC's). Currently, of the three operating wells, 2 wells have historically shown traces of Perchloroethylene (PCE's) in samplings. LBWC primarily relies on the one remaining well for its main water supply. South Tahoe Public Utility District (STPUD) is the largest water supplier in South Lake Tahoe with approximately 14,000 water connections. STPUD and LBWC maintain emergency interties and the most recent use of this intertie occurred on September 4, 2011 when a power generation failure caused the LBWC well to stop functioning and STPUD provided water supply from their system. LBWC does not have any storage capacity and must rely on the intertie for emergency situations. In addition to recent insufficient water delivery capability, the entire system is comprised of non-metered residential service connections. In order to correct these insufficiencies and bring the system current to existing codes, LBWC would need system wide upgrades totaling $29,797,939 according to the Master Plan developed in May 2009. (This cost estimate is based on the engineering estimates performed by	28,150,967	13,635	60,000	09	El Dorado	I	2012
1404	3310021	3310021-004	Jurupa Community SD		Construct a 12" CML/CMC from the District's Bain St. pipeline along Mission Blvd. To Avon St. (Figure 1). 1417	2410009	2410009-004	MERCED, CITY OF	City of Merced - Arsenic Removal - Wellhead Treatment at Well Site 13	The City proposes to treat Well 13 for arsenic removal using either a coagulation/filtration treatment process or an adsorptive media treatment process. The project would be executed in two phases.• Phase 1 would consist of a pilot study evaluating the performance of both coagulation/filtration and adsorptive media technologies. The study would develop sufficient information to establish treatment feasibility, equipment configuration, capital and operating cost estimates, and the need for pH adjustment before and after arsenic removal. The final treatment system selection would be made after the pilot study was completed.• Phase 2 of the project would consist of design and construction of the selected treatment process. The following treatment system description and the "Total Project Costs" identified earlier in this application are based on the assumption that coagulation/filtration treatment will ultimately be selected. The project cost for an adsorptive treatment system would most likely be lower than for a coagulation/filtration system.It is anticipated that the components for a coagulation/filtration system would include a static mixer, three 7' diameter by 14' long filter vessels, actuated control valves, a filter system control panel, a 20' diameter by 32' tall washwater holding tank and supernatant reclaim pump, ferric chloride chemical feed system with approximately 1,000-	M	20	C	Well 13 produces water with arsenic levels that approach the regulatory limit of 10 µg/L. Recorded arsenic levels at Well 13 have been as high as 9 µg/L and the running annual average value routinely exceeds 8 µg/L.	2,635,250	20,262	80,608	11	Merced	III	2009
1418	2410009	2410009-005	MERCED, CITY OF	City of Merced - Nitrate Removal - Wellhead Treatment at Well Site 7	The City proposes to install ion exchange wellhead treatment at Well Site 7 for nitrate removal. The treatment system will utilize a strong-base anion exchange resin and will have an initial capacity sufficient to treat wells 7A and 7B with provisions for expansion to treat Well 7C. Approximately 37% of the water produced by wells 7A and 7B will be treated through the IX system and then blended with the untreated water to provide a target nitrate level of 34 mg/L in the finished water. The low sulfate and chloride levels in the water will results in high ion exchange efficiencies. The brine waste stream produced during resin regeneration will be buffered in a waste holding tank and then slowly discharged into a nearby sewer.The treatment equipment is anticipated to include three 12' diameter ion exchange vessels (two active and one in regeneration), a brine storage tank, brine waste storage tank, brine/rinse pumps, water softener for brine makeup and resin rinsing, nitrate analyzer, and a system control panel. The existing site has sufficient available area for the proposed treatment equipment.	M	20	C	Well Site 7 includes three potable water wells that pump into a common elevated water storage tank. The three wells (7A, 7B, and 7C) have capacities of 2,500, 2,500, and 2,800 gpm, respectively. The water produced by two of the three wells (Wells 7A and 7B) contains nitrate at levels that exceed the regulatory limit of 45 mg/L (as nitrate). Recent nitrate measurements at Well 7A and 7B have reached 46 mg/L and 57 mg/L, respectively. There is a clear upward trend in the nitrate levels at both of these wells with the levels having doubled over the last six years. The third well (7C) contains nitrate levels as high as 18 mg/L and is experiencing an upward trend in nitrate levels. The City currently blends the three well sources in the water storage tank. However, if nitrate levels continue to rise or if well 7C is removed from service; the City will be forced to shut down all three wells. The 7,800 gpm produced by the three wells accounts for approximately 15% of the City's production capacity.	3,108,250	20,262	80,608	11	Merced	III	2009

1419	2410009	2410009-006	MERCED, CITY OF	City of Merced - Arsenic Removal - Wellhead Treatment at Well Site 2C	The City proposes to treat Well 2C for arsenic removal using either a coagulation/filtration treatment process or an adsorptive media treatment process. The project would be executed in two phases:• Phase 1 would consist of a pilot study evaluating the performance of both coagulation/filtration and adsorptive media technologies. The study would develop sufficient information to establish treatment feasibility, equipment configuration, capital and operating cost estimates, and the need for pH adjustment before and after arsenic removal. The final treatment system selection would be made after the pilot study was completed.• Phase 2 of the project would consist of design and construction of the selected treatment process. The following treatment system description and the "Total Project Costs" identified earlier in this application are based on the assumption that coagulation/filtration treatment will ultimately be selected. The project cost for an adsorptive treatment system would most likely be lower than for a coagulation/filtration system.It is anticipated that the components for a coagulation/filtration system would include a static mixer; three 7' diameter by 14' long filter vessels, actuated control valves, a filter system control panel, a 30' diameter by 16' tall washwater holding tank and supernatant reclaim pump, ferric chloride chemical feed system with approximately 1,000-	M	20	C	City of Merced Well 2C produces water with arsenic levels that exceed the arsenic rule maximum contaminant level of 10 µg/L. Arsenic levels measured at Well 2C from 2001 to the present have been as high as 12 µg/L, and the running annual average value routinely exceeds the 10 µg/L MCL. The City currently blends Well 2C with two other nearby wells (2A and 2B) in order to meet the arsenic standard. The need to blend the water produced by Well 2C limits the City's flexibility in operating this high-production (2,500-gpm) well. Since blending does not allow for the three wells to operate simultaneously, it reduces available capacity.	2,635,250	20,262	80,608	11	Merced	III	2009
1420	3610039	3610039-033	SAN BERNARDINO CITY	Water Distribution Pipelines Replacement	The Water Distribution Pipeline Replacement Project will replace approximately 40,000 linear feet (approximately 7 ½ miles) of drinking water distribution lines that are antiquated and/or undersized to meet "maximum day" and fire flow demands in the service area. Priority areas were identified in the 2007 SBMWD Master Plan. All of the areas served by this project meet the criteria for "economically disadvantaged." This project will replace approximately 75% of Priority 1 pipelines in the Mountain Pressure Zone and Upper Pressure Zone. Each of the pipelines will include valves and fire hydrants.In the Mountain Pressure Zone the following pipelines will be replaced: Mountain Pump Station Transmission Line Sierra Way between 40th Street and Sepulveda 40th Street between Sierra Way and Waterman Miscellaneous Distribution Lines - will be upgraded from 4" to 8"In the Upper Pressure Zone, these pipelines will be replaced in the Mallory and 16th Street areas: California Avenue, 26th Street, Pennsylvania Street, 23rd street; 19th Street; Lincoln Street; 16th Street; Magnolia Street; Pennsylavania Street. Construction is expected to last approximately 2 years and will generate approximately 75 full and part time jobs during that duration. The plans and specifications will be complete by June 2009. Approval of the CEQA determination is scheduled for April 2009.	M	20	C	City of San Bernardino Municipal Water Department Pipeline Replacement ProjectSetting:The City of San Bernardino Municipal Water Department's (SBMWD) service area is located at the crossroads of the Interstate 215 and Interstate 10 freeways. The City of San Bernardino is the county seat of San Bernardino County and has an estimated population of 205,010, making it the 18th largest city in California and the 101st largest city in the United States. In addition, San Bernardino is part of the Riverside-Ontario-San Bernardino Metropolitan area, the 14th largest in the nation, commonly referred to as the "Inland Empire." According to 2007 census information, the average San Bernardino family household is 3.83, with a median family income of $41,010, which is $19,364 below the 2007 national average. Approximately 25% of City residents are considered to be at or below the poverty level. SBMWD's service area encompasses approximately 45 square miles. The SBMWD serves most of the City of San Bernardino, portions of Loma Linda and Redlands as well as unincorporated areas of the County. SBMWD produces its water supply from 57 groundwater production wells located throughout its service area. The wells range from 50 to 1,300 feet deep and have production capacities of 50 to 3,500 gallons per minute (gpm). Water is delivered to SBMWD customers with a series of pump stations,	4,500,000	42,301	173,359	13	San Bernardino	V	2009

1421	1010007	1010007-022	FRESNO, CITY OF	NE Surface Water Treatment Facility Overflow Spill Basin	The project will consist of the construction of a large ponding basin at the Northeast Surface Water Treatment Facility to collect water in case of emergency shutdown or extreme flooding.	M	20	C	The City's 30 Million Gallon daily Surface Water Treatment Facility (SWTF) was completed in June 2004 and has been in full operation since that time. This facility can be susceptible to power outages and treatment upsets. Raw water supplied to this facility is conveyed in Fresno Irrigation District's Enterprise Canal and has limited conveyance capacities downstream of the SWTF, especially during periods of rain when storm waters are also diverted to the conveyance system. To prevent downstream flooding during emergency shutdowns it is necessary to divert deliveries several miles upstream to another canal and then capture the flows between this diversion point and the SWTF in an onsite spill basin.	500,000	128,152	457,511	11	Fresno	III	2009
1422	1010007	1010007-021	FRESNO, CITY OF	Water Main Replacement at Shaw/Barstow-Fruit/Tielman Avenues	This project will construct 3 miles of 8" water main that will service 300 customers along Shaw/Barstow and Fruit/Tielman. This new system will replace 50 year old steel water main.	M	20	C	Water mains in many older parts of the City have aged and deteriorated and are in need of replacement. Leaks in aging mains can be expensive to repair. For example, many obsolete mains, particularly in acquired old County Water Works Districts, are located along easements at the rear of lot lines. Repairs in these areas require hand digging under fences and landscaping, which results in some very difficult working conditions and is disruptive to customers. Relocation of those mains to a public street eliminates the problems associated with this inaccessibility. Also replacement of aging water mains with modern materials will help ensure safe and reliable delivery of drinking water both now and in the future.	1,448,000	128,152	457,511	11	Fresno	III	2009
1423	1010007	1010007-023	FRESNO, CITY OF	NE Surface Water Treatment Facility Telemetry Tower Construction	The City will construct a 100 feet tall telemetry tower to be used for data collection and repeating to coordinate surface water and production water facilities.	M	20	C	The City's 30 Million Gallon Daily Surface Water Treatment Facility (SWTF) was completed in June 2004 and has been in full operation since that time. A 100 foot tall telemetry tower was permitted for this project but has not been constructed. This tower is now needed to receive readings from a fixed network automatic meter reading system.	100,000	128,152	457,511	11	Fresno	III	2009
1424	1010007	1010007-024	FRESNO, CITY OF	Emergency Power Generators for Pump Stations 132 and 318	This project will fund the installation of two back-up power generators including modification to the electrical panels, switchgear, breaker panels and the telemetry system. This project will help ensure a safe and reliable water supply during a prolonged power outage.	M	20	C	The City of Fresno needs to achieve security and reliability of the water delivery system to ensure a safe and reliable water supply during a prolonged power outage, especially for delivery to critical care facilities and for fire suppression. The City is seeking funding to install two back-up generators to pump stations 132 and 318 to increment the security and reliability of its water delivery system.	264,000	128,152	457,511	11	Fresno	III	2009

1431	1000194	1000194-002	PACIFIC UNION ELEMENTARY SCHOOL	Pacific Union Repipe	Replacement of water suppy lines that have deteriorated. Addition of anti-siphon valves at drinking fountains and faucetts. Replacement of kitchen dishwasher and kitchen water supply lines and installation of anti-siphon valves. Detection and capping of abandoned water supply lines that are still connected to the water supply system.	M	20	P	Our water system and had to notify users of Coliform bacteria contamination in the last several years. The presence of bacteria has caused us to chlorinate the water supply system. The school plant is fifty years old and much of the plumbing and kitchen equipment is just as old. We would like to address the bacteria problem by replacing old kitchen appliances with newer equipment and add anti-siphon safeguards throughout the school.	115,000	1	490	23	Fresno	III	2009
1432	3900511	3900511-001	SJC MICKE GROVE PARK	Connection of Water Supply From The City of Lodi's Domestic Water System	This project includes supplying domestic water to the Park from the City of Lodi's domestic water system. The point of connection would be located near the intersection of Harney and West Lane in Lodi. Domestic water would be conveyed through pipeline to the park and stored in a storage tank. Onsite demand would be met using a booster pump station with a hydro-pneumatic tank. The offsite improvements include connecting to the City's existing domestic water distribution system, installing a water meter, backflow prevention device and conveyance pipeline. The City will also require that the County pay an impact fee to 'buy-into" the existing domestic water system, which has been categorized as an offsite improvement for the purposes of this application. The impact fee represents the monetary value of the production and distribution capacity of the existing potable water system that the City will use to supply Micke Grove Park. The impact fee compensates the City for that capacity. The magnitude of the impact fee is dependent on the usage at Micke Grove Park. The estimated values provided by the City of Lodi are as follows: 43,700 gpd would be approximately $63,654 and 81,020 gpd would amount to approximately $118,016. These charges are subject ot change depending on the City of Lodi's fee schedule. Point of Connection at the City's domestic distribution system would be made by the City. A 6 or 8 inch stub	M	20	P	The Micke Grove Regional Park is located approximately 2 miles south of City of Lodi. The Park includes picnic areas, a zoo, museum, a small amusement park, and public golf course. There are three permanent residences onsite for caretakers and maintenance personnel. Historically, domestic water has been supplied throughout the Park from two onsite domestic water wells. The water is provided to drinking fountains, public restrooms, the golf course, zoo, museum, the Treetop Cafe, amusement park and permanent residences.By 1991, levels of dibromochloropropane (DBCP) were detected which exceeded the Department of Health Services (DOHS) maximum concentration limit of 0.2 parts per billion (ppb) in drinking water. The are no other detectable organic compounds present. The County had installed small carbon systems to treat water for use within the three on site residences, the Tree Top Cafe, amusement park and the golf course clubhouse. Reportedly, these units have been very effective in removing DBCP. In June 2000, the San Joaquin County Public Health Services-Environmental Division, the regulatory agency responsible for overseeing the domestic water at the Park, issued Compliance Order no. 00-02 which required the Parks water system be brought into compliance by either developing a new groundwater source which meets the water quality and quantity requirements, treatment of	3,701,500	8	1,000	10	San Joaquin	III	2011
1433	1000217	1000217-001	CENTRAL HIGH SCHOOL WEST	Central High School West Tank and Well Addition	The project will begin with a preliminary design report that will analyze the feasibility of the proposed well site and water storage tank. The goal of the project is to provide clean drinking water as well as the necessary water storage for both domestic and fire supply. The report will address issues such as well pump size, tank size, preferred location, and alternative solutions. Once the report is complete, the construction documents will be prepared and the project will be put out to bid. The preferred solution will consists of a new well site and water storage tank. A test well will be drilled, zone tested, and analysed for water quality prior to construction of the production well. Additional system improvements will be required such as piping modifications and the addition of booster pumps. These improvements will provide the facility with the necessary water quality, quantity, and pressure.	M	20	P	The Central High School West Campus water system consists of a facility with a single well that serves approximately 2,000 users (students and staff). The school is located at 2045 North Dickenson Avenue, Fresno, CA (Northwest corner of McKinley and Dickenson Avenues). The site consists of approximately 50 acres and is comprised of buildings, sports fields, parking lots and other typical high school facilities. The site is approximately 4 miles west of the City of Fresno. Recent tests have indicated the presence of hydrocarbon, lead, and copper contaminations in the water. Additionally, the aging well is not meeting the current supply and fire flow requirements due to its shallow depth.	1,160,000	10	1,127	23	Fresno	III	2011

1434	3400259	3400259-001	GRANT HIGH SCHOOL (SWS)	Grant High Water project	The project will consisit of tying (consolodating) with a large water system. Trenching 800 ft. to city tie in. Installing six inch water main to school. installing backflow device at city tie in. Re-routing of existing water line to new six inch main. Removing old water storage tank. Capping off old well. Removing old motor and associated electrical connections.	M	20	P	The site well and associated motor and storage tank are deteriorating and have reached the end of their life cycle. These were installed when the school was built in the early forty's. The well water has often times tested positive for Coliform. The project will allow the students and staff to have a safe and dependable drinking water system.	185,000	12	1,400	09	Sacramento	I	2007
1435	4300608	4300608-001	Gavilan Jr. College	Replacement - Water Supply System	Replace the entire water system by connecting to the City of Gilroy water system.	M	20	P	Old water system installed in 1966 and needs replacement.	20,472,948	22	4,987	17	Santa Clara	II	2009
1436	4200872	4200872-005	VENTUCOPA WATER SUPPLY	Water Supply Project	The project is to integrate an existing Well #2 into the water system and make the necessary upgrades to meet the state standards. This would include waterlines, storage tank, hydropneumatic tank, booster pump station, and fire hydrants.	M	20	N	The Ventucopa community water system is now classified as a community water system by the Santa Barbara County Environmental Health Services Division, which is the local primacy agency.The water system has historically had nitrate levels exceeding the MCL due to adjacent agriculture crop fertilizing. However during drought periods such as now when the water table is below the contaminated ground level the nitrate level is below the MCL. However the water system only has one well at only 170 feet deep and there is a serious risk of loosing the water supply if the drought continues or if agricultural pumping during the summer periods continues to drop the water table. The water system needs another well to meet the water works standards and to prevent water outages.Additionally the water system experiences low pressures in the summer because the system can not meet the water demands. The antiquated water system was constructed in the 1940s and needs to be replaced to provide adequate quantity of water and to deliver water quality meeting the drinking water standards. In the past, building permits have been restricted in the Community becasue of the water system inadequacies.	380,000	9	25	06	Santa Barbara	IV	2009

1437	3600452	3600452-001	Lucerne Valley Parks & Rec (CSA 29)	Consolidation of County Service Area 29 with Lucerne Valley Unified School District	Sources of water in the Lucerne Valley area are individual systems (parcel-by-parcel, well-by-well) operated by property owners and small mutual water companies, some of which currently cannot meet service requirements and will not likely be able to accommodate new hookups. There are numerous independent small water systems within the area that are overseen by the County of San Bernardino. Some wells in the higher groundwater levels upgradient of the Helendale Fault have shown evidence of somewhat higher Nitrate levels, although not to levels exceeding standards. Nitrate levels from tested wells west of the Fault averaged approximately 5 mg/l. Samples for Nitrates were taken at the Lucerne Valley Elementary School in April of 2005 and levels were observed to be 12 mg/l at this location. Higher Nitrate levels could be detected where wells and septic tank systems are in proximity to each other. Improvements to consolidate up to six water systems in the Lucerne Valley area were studied and evaluated in the Lucerne Valley Water & Sewer Preliminary Study, completed in 2006 by Nolte Associates. The project was conceived to take place in two phases. This project is part of a bigger water system consolidation effort among the Lucerne Vista Water Mutual Water	M	20	N	Source Reliability	3,700,000	6	26	13	San Bernardino	V	2007

1441	4700517	4700517-004	Sawyers Bar County Water District	SBCWD holding tank demolition and replacement	Sawyers Bar County Water District proposes demolition of the small, failing holding tank and construction of an 80,000 gallon tank, bearing on an engineered concrete footing. The new tank would double the capacity of our water system, and allow for extended water service in a drought, fire, or other natural or man-made disaster. In addition to water volume, a new holding tank would help us improve water quality and the security of our water supply.Sawyers Bar County Water District has contracted with B&H Tank, Fresno, California to provide footing engineering, tank construction and installation. Engineering documents could be completed within two weeks, and tank fabrication could begin immediately, with installation complete by the end of August.	M	20	N	Sawyers Bar County Water Districts' 20,000 gallon holding tank for domestic water needs immediate replacement. The tank has been in service for an unknown number of years and sets directly on bare soil. The bottom is badly rusted, and the inside of the tank is in very poor condition. The tank is too small to allow adequate water supply should our volume of surface water decrease. The tank is also too small to provide enough water in a fire emergency.	120,000	1	100	01	Siskiyou	I	2009
1442	4700517	4700517-003	Sawyers Bar County Water District	SBCWD well pump replacement	Sawyers Bar County Water District proposes the replacement of a 4" submersible pump, 6500 watt gas generator, and miscellaneous plumbing and electrical components needed to fix our water district well. We have contracted with Scott River Pump, Fort Jones, California, to perform the needed repairs in the spring of 2009. This will allow us to provide emergency water supply for the community by utilizing the existing well, which at present, does not function. This is critical not only for a reliable, secure drinking water source, but for sustained fire suppression capability.	M	20	N	Sawyers Bar uses surface water to supply our treatment plant. There is an existing well plumbed into our water system, but the pump and generator for the well are non-operational. In the event of a natural or man-made disaster, we have no alternative water source.	10,000	1	100	01	Siskiyou	I	2009

1444	3200155	3200155-003	FRCCSD - HOT SPRINGS CSD	Bring Hot Springs Water System Into Compliance With State Standards	On October 26, 2006, Jerry Sipe directorof the Plumas County Environmental Health Department cited the System for the following deficiencies.1. Quantity of water available is reported as insufficient to meet summer demands. Water Works standards require minimun of this size well to be 15 gpm. This wellis 30% under that.correct all deficiencies	M	15	C	On October 26, 2006, Jerry Sipe directorof the Plumas County Environmental Health Department cited the System for the following deficiencies.1. Quantity of water available is reported as insufficient to meet summer demands. Water Works standards require minimun of this size well to be 15 gpm. This wellis 30% under that.2.Well head not adequately protected from potential insect contamination.3. Each tank has a mechanical water level guage installed tat may allow entrance of rain and snow melt, insects & dirt into the tank through the roof.4. Tank access hatches are not secured with locks to deter tampering and portable access ladder is non compliant.5. Overglow lines and treatment plant backwash and drain line are not protected from contamination.6.Plumbing from water well lacks hose bib necessary to obtain the required analysis samples.7. Plumbing from water well has open stand pipe that could allow system contamination.8. Tratment plant building lacks sufficient venilation that causes pipe sweating and mold buildup inside, as well as numerous areas of corrosion on pipes and filter tank.9.Building in extremely deteriorated condition and needing repair.Health & Safety violations routinely noted during inspections.	48,000	17	13	02	Plumas	I	2009
1445	1400109	1400109-001	Sierra North Community Services District		Construct new well and tank	M	15	C	Inadequate source and storage capacity	25,000	16	28	13	Inyo	V	1998
1446	0300053	0300053-003	Rancho Del Oro MHP	Rancho Del Oro Mobile Home Community Water Storage Tank Replacement Project	In summer 2010, the owner of the Rancho Del Oro water system spent over $25,000 to drill and construct a new source well. This was a very costly project. The owner states that he does not have the necessary funding to replace the storage tank and is seeking financial assistance for this project. Specifically, the water system is requesting funding assistance for a new 32,000-gallon (minimum) water storage tank. This new tank will replace the existing 10,000-gallon storage tank, which is more than 30 years old and appears to be a source coliform contamination. A new 32,000-gallon storage tank will not only accomodate current maximum day demand, but will also provide adequate storage for future park expansion. Funding, if awarded, will be used to purchase the tank, as well as cover engineering and other associated costs (e.g. plumbing, permits, possible environmental documents, foundation, and labor). A survey of the property line near the tank may also be needed. The new tank will comply with applicable sections of the California Waterworks Standards.	M	15	C	The water system exceeded the Total Coliform Maximum Contaminant Level (Section 64426.1) during the months of August 2011 and September 2011. Public notification is in effect at this time. The sampling results to date indicate the source of the coliform contamination is the existing steel storage tank. The existing steel 10,000-gallon tank is at least 30 years old; Amador LPA records document that the tank has been in use by the water system since at least 1982. There is evidence, however, that the tank itself may be much older. In a 1982 engineering report for the water system, it was noted that the tank was actually a reconditioned gas or oil tank. Other anecdotal information indicates that the tank may have been previously used by a nearby municipality as a filter housing before it was installed at Rancho Del Oro. In its report following a November 21, 2008 sanitary survey, the Amador LPA acknowledged that the water system should begin planning for replacing the tank. Both the recent coliform contamination, as well as the tank's current physical condition indicate the tank is nearing the end of its life expectancy. There is evidence that the liner in the tank is degraded (or gone completely) and corrosion has taken place on the interior of the tank. The existing tanks needs to be replaced for other reasons as well. First, the tank is undersized. The tank's capacity is only 10,000-gallons. This is less than the	60,000	24	34	10	Amador	III	2012
1447	1400034	1400034-001	Keough s Hot Springs		Construct new distribution system	M	15	C	Old, substandard distribution system	75,000	24	40	13	Inyo	V	1998
1448	1500398	1500398-003	FRONTIER TRAIL HOMEOWNERS ASSOC, INC	Frontier trails to CWS intertie	Intertie to Calwater systems would create a viable emergency and standby connection to a treated potable water source. Currently we have to post warnings about the clarity and drink ability of our water , this would eliminate this process and provide clean, clear water	M	15	C	Our current drinking water system is supplied by two wells, one of which, our standby system is too shallow and too close to the Kern River thus creating a system impacted by direct influence of surface water	40,000	36	40	19	Kern	III	2009
1449	1400034	1400034-003	Keough s Hot Springs		Construct new well and tank	M	15	C	Inadequate source and storage capacity	50,000	24	40	13	Inyo	V	1998

1451	2300668	2300668-001	Point Cabrillo Highlands	Cabrillo Rejuvenation and Maintenance (CRAM) Project	All supply distribution lines would be replaced with state of the art components. This will entail a study to determine the most efficient and practical routing of supply lines to service each and every user. The new system will be sized to provide proper water pressure and volume to each residence. A system of control and safety valves and water meters will be included. A 10,000 gallon water tank will be installed. Documentation of the system will be prepared to assist the Watermaster in the course of the water system maintenance process.	M	15	C	The existing water system is very old and consists of World War II components. It is susceptable to frequent ruptures and outages. The exact location of much of the distribution system is unknown making repairs extremely difficult and of long duration. A recent rupture caused a loss of about 7000 gallons per day for several days as the source of the leakage was not apparent. It was found to be in a leach field. This water system dates back to about the 1940's and services a small community of low cost housing residents. There are no water meters. A new distribution system is necessary to service the residents so that frequent and long interuptions of water supply may be avoided. The source of water is adaequate but the loss of large amounts of water from the aquafer should be stopped.	52,500	21	42 03	Mendocino	II	2009
1452	3400401	3400401-001	PLANTATION MOBILE HOME PARK	Redundant Source	Intertie with a large water system with appropriate piping and backflow preventer.	M	15	C	Provide a redundant source to a single source water system.	10,000	45	44 09	Sacramento	I	2008

1454	2600621	2600621-001	WHITE MOUNTAIN ESTATES	Tank Lining Rehabilitation and System Redundancy Project	White Mountain Mutual Water Company is seeking support from the Economic Recovery funding program to correct tank facility's deteriation and source of supply redundancy issues within the system. Without this necessary funding, the water system cannot afford to address these critical concerns within it's community.The proposed project will consist of the following improvements:1.In order to facilitate the tank lining rehabilitation a back-up potable water supply tank will be put into service. The entire exisiting tank coating will be removed, including tank inspection and repair to correct all cracks, organic growth concerns and water seepage conditions. The facility's existing rubber based coating will then be replaced with an approved gunite type coating. This new coating will permanently seal the tank interior from root intrusion, contamination and leakage.2. A new source water submersible pumping system will be installed to facilitate meeting source water redundancy requirements. This project will add an additional pump system in the existing groundwater supply well. Professional review and pump tests have indicated the source capacity ability to support this two pump system. This project will include a submersible pump and motor assembly, piping and electrical system. This critical improvement will facilitate the systems compliance with Water Works Standards.	M	15	C	White Mountain Mutual Water Company a California Corporation was established in 1980, and operates as a non-profit community water system. The system supplies 43 connections and approximately 87 customers within it's service area. The water company's 70,000 gallon in-ground, concrete, cinder block water storage reservoir is in severe need of lining rehabilitation. The storage facilities existing coating is in the advanced stages of deteriation including blistering and delamination, due to this coating failure, tank seepage and organic root growth intrusion has developed. This organic growth has created high potential for bacteriological contamination within the system. The tank floor, shell walls, and interior roof structure also have various cracks that need structural correction to prevent exterior water and debris from contaminating the water supply. This is the water company's only water supply storage facility, and is a critical component to the function of the system's operations.The Water Company in addition to the tank facilities deterioration issue, does not meet Water Works Standards for source water redundancy. The water system's source of supply is currently supplied by one groundwater well. State Waterworks Standards require that systems meet requirements for source of supply redundancy. White Mountain Mutual seeks to achieve this requirement through the proposed project.	110,000	25	50 13	Mono	V	2009

1466	5500041	5500041-001	ALPINE ACRES MUTUAL WATER CO	Alpine Acres Infrastructure Replacement Project	This project is in addition to a separate application for an intertie with Tuolumne Utilities District's Crystal Falls system. This project upgrades virtually all mains and laterals in the Company's system to current water works standards. It includes:3,200 l.f. of 8-inch water line2,300 l.f. of 6-inch water lineInstallation of a new 250,000 gallon storage tank, with telemetry & electrical controlsMiscellaneous costs including paving repairs, engineering, inspections etc.	M	15	C	Alpine Acres MWC seeks to consolidate its operations with Tuolumne Utilities District to improve the reliability of water supply and delivery operations. The Company currently relies on two wells to serve its customers. This groundwater supply fails to meet secondary standards for Manganese and/or Iron content. The system includes no treatment facilities. Currently, untreated water is served to all customers. Further, the ground water supply has been unpredictable leading to service interruptions. This intertie project will convert the system's supply to more reliable treated surface water.Alpine Acres MWC's small size presents operational challenges. Maintenance of the delivery systems using primarily volunteer labor from the company's membership has led to service interruptions. Consolidation with TUD will provide access to TUD's maintenance staff and will reduce duration of future service interruptions.Alpine Acres facilities were installed approximately 45 years ago and do not meet current water works standards. For example, the main line from the wells to the storage facilities is 3-inch steel pipe which is vulnerable to failures due to its age; Other mains range from 1-inch to 3-inch PVC. These lines do not provide adequate fire flows and do not meet current minimum standards of 4 inches. As a condition of consolidation, we believe that TUD will require that the Company's infrastructure be brought	1,331,238	61	100 11	Tuolumne	III	2009

1467	0900217	0900217-001	BEAR STATE WATER WORKS		Add new well, storage, and treatment facilities. Involves study, design and construction.	M	15	C	Needs second source and storage tank.	200,000	33	100 09	El Dorado	I	1998

M	15	C	Potable water is distributed throughout a 65 space mobile home park.The water is ditributed throuh an old poly ethylene piping system that has deteriorated with age.The system breaks down on a continual basis requiring repair work.The constant shut down and restart of the potable water system poses a potential health hazard to the residents as well as the inconvenience of having their water shut off for periods of time.	165,000	59	150 11	Tuolumne	III	2009

1480	1000041	1000041-001	FCWWD #38/SKY HARBOUR	Construct a surface water treatment facility and water line to lake pump	The cost estimate to build a surface water treatment plant is approximately $500,000 for the water treatment facility and $300,000 to dredge the existing pump, rehabilitate it, anchor it properly to the lake floor, and install water pipelines to the treatment facility.	M	15	C	This District, which was formed in 1964, has a water system that has one 121,000 gallon storage tank which uses gravity feed to provide water to the dstribution system. The existing well is 810 feet deep and the pump is set at 750 feet. It uses a 15 horse power pump and pumps approximately 50 GPM. The original developer and the successor were required to provide a minimum flow of 164 gallons per minute and 155 feet of annual storage of water to the subdivision for full build out. Although the original source of this water was supposed to be from wells, the developers were not able to secure this amount of water from the existing source. A submersible pump was then placed in Millerton Lake and an agreement was secured with the right to use up to 155 acre feet per year of water directly from Millerton Lake through the Cross Valley Canal program. The existing Lake Pump was tied to barrels and sunk into the lake. It does not meet current regulatory requirments for operation. A surface water treatment plant was not developed. On November 3, 2008, the CDPH issued condtions with the water system permit. One of the conditions is that another well be develop in case the current operating well fails. Rather than trying to seek a backup water source by drilling another well which may not provide sufficient supply or may impact surrounding well production, it would be more prudent to develop a surface water treatment	800,000	30	150 23	Fresno	III	2009

1495	5500193	5500193-002	TAMARRON MOBILE HOME PARK	Tamarron MHP Potable Water Storage	Funds are requested for the purpose of designing and building a water storage system to be integrated with an existing distribution system.The storage system will be designed by a registered,prfessional engineer and constructed by a competent contractor.The system will in corporate appropriate controls,valves,and distribution pumps.	M	15	C	Tamarron Mobile Home Park is a 90 space mobile home community in Sonora,Ca (Tuolumne Co).Potable water is distributed through the park from a well.The existing distribution system has mimimal storage capacity which leads to loss of pressure problems when there is an outage.Loss of pressure is a potential health problem.Funds are requested to design and build a storage tank system which significantly mitigate the potential health problems we incur when we have a problem in the system that requires shutting off the well.	45,000	85	273 11	Tuolumne	III	2009
1496	2000509	2000509-007	CASCADEL MUTUAL WATER SYSTEM	Water Storage Replacement And Supplementation ER	The project would entail removing three existing 15,000 gallon tanks and constructing 100,000 gallons of storage. All costs of deconstruction, site prep, construction, controls and engineering are included. This additional storage, and other planned storage, will help to alleviate the risk to public health, welfare and safety in Cascadel Woods.	M	15	C	The project proposes to replace three, leaking 15,000 gallon storage tanks with a new storage tank. The existing tanks were inspected in 2007 and found to be deficient. These tanks tanks hold approximately 1/3 of the system's storage. Additionally, the project proposes to add 55,000 gallons of storage to meet minimum flows for domestic and fire needs. Cascadel Woods is at extreme risk of catastrophic wildfire and currently has insufficient water storage, hydrants and access.	250,000	137	300 11	Madera	III	2009

1497	2000509	2000509-010	CASCADEL MUTUAL WATER SYSTEM	Cascadel Road Water System and Hydrants Completion CMWC ER	Approximately 3000 feet of 10 inch water main and 6 hydrants to be installed in two incomplete areas of the original planned system. Local Tribal monitors will be hired.	M	15	C	When the Cascadel Mutual Water Company upgraded to a new system in 1996 with both federal grant funds and a 40-year low interest USDA loan portions of the system were not completed. Due to fiscal difficulties and the challenge of serving a very small community with limited funds the Water Company has not yet completed these planned sections of system.Cascadel Woods is in hilly terrain surrounding a central meadow area essentially bisected by a year round creek that reaches flood proportions some very wet winters. Roughly half of our customers are on the East side of Cascadel, the other half on the West.Cascadel Woods is at very high risk for catastrophic wildfire due to steep terrain, heavily wooded areas, unacceptably high fuel loads and inadequate access. Cascadel Woods is named as the #1 top priority in the Community Wildfire Protection Plan of Madera County, for good reason.The incomplete portions of the system involve two sections of Cascadel Road, one area East of Whiskey Creek, one on the West side. This involves another crossing of Whiskey Creek. Cascadel Road is a fuel break mentioned in the Community Wildfire Protection Plan. Ultimately consolidating all areas into the system so hydrants will be available in areas currently not served is the bigger long range goal. This project addresses two areas that can later be extended to help reach this goal. The developed are is 480 acres of former Cascadel	250,000	137	300 11	Madera	III	2009
1498	2000509	2000509-008	CASCADEL MUTUAL WATER SYSTEM	Groundwater Source Development	Drill an additional 8" inch water well at the Well #3 location with controls and tie-in to existing infrastructure.	M	15	C	The Cascadel Mutual Water Company Inc. relies on two groundwater wells and a spring as its primary water sources. A third pair of closely communicating wells exceed EPA regs for uranium. The two wells can provide approximately 20gpm combined continuously.The 40 gpm freshwater spring traditionally made up two-thirds or more of our usage because it is gravity feed and we'd minimize our pumping costs and wear on the wells by relying on the spring.Recently, Cal DHS tentatively classified the spring as being under the direct influence of surface water (GWUI) evidently because the ntu rises slightly in winter and bacT has been present some of these times. The spring was redeveloped and is currently being monitored for ntu and bacT.On advice of Cal DHS's Eugene Reade the CMWC constructed a new well to offset this source, but the well only produces 10gpm at this time. The spring produces 40gpm. Our needs can reach 50gpm in the summer, the time of greatest risk of fire. Our tanks are hard hit at these times of year leaving insufficient fire suppression water when needed most. We are addressing the storage and hydrant issues in other projects but need more sources of water.Rather than install a costly treatment plant with associated high operation and maintenance costs we propose to develop sufficient groundwater wells to meet our needs as Eugene Reade recommended. We are also looking at consolidating	125,000	137	300 11	Madera	III	2009
1499	2000509	2000509-011	CASCADEL MUTUAL WATER SYSTEM	Water System Control And Monitoring	This project would install automatic controls and monitoring systems at all groundwater sources and storage locations. Currently there are five water sources and two storage locations. Additional storage locations are planned.	M	15	C	The project proposes install monitoring equipment and automatic controls at all storage and pumping facilities. Currently only the primary storage location has monitoring equipment w/ alarms. Pumps are operated manually with the use of timers. Current regulations require automatic controls, per the latest inspection report from Madera County.	20,000	137	300 11	Madera	III	2009

1500	2000509	2000509-012	CASCADEL MUTUAL WATER SYSTEM	Cascadel Woods Fire Protection Water Storage ER	At the Well #3 site there is sufficient level ground to install two water storage tanks of minimum size of 100,000 gallons each. Tank pairs are advantageous for smaller footprints and servicing one tank while leaving another online. A single large tank is in design consideration.Associated automatic controls, monitoring and tie-in to the existing 4 inch main will be included.	M	15	C	Cascadel Woods in a State Responsibility Area in a remote heavily wooded area on steep terrain with unacceptably high fuel loads, inadequate access and high density housing on typical third acre lots. Cascadel Woods is too remote from the North Fork Water System to afford physical consolidation, and at a much higher elevation.In a partnership with the Eastern Madera County Fire Safe Council Inc. the local community is addressing these issues.The Cascadel Fire of 2008 illustrated the dangers we face here in Cascadel, and highlighted how inadequate are our water supplies and storage. Cascadel narrowly escaped what could have been a catastrophic fire event.Recently, the Cascadel Mutual Water Company built a new groundwater source at an old tank location ideally located for additional storage. Planned additional storage at this location of 200,000+ gallons will be addressed through this project.This additional water storage (and planned eventual system extension adding additional hydrants throughout the entire area) will greatly enhance the public health, welfare and safety of our area through immediate and readily available fire suppression water of more sufficient quantity.This project specifically addresses building additional storage tanks at the existing well #3 location.	500,000	137	300	11	Madera	III	2009
1501	3700922	3700922-003	LIVE OAK SPRINGS WATER COMPANY	Well replacement, storage, shut off valves.	This water system is over 70 years old. One of the wells put in only gives us 5 gallons per minute. We need a new well because the old well is contaminated and we cannot replace it as we spent our money putting in this well. The water system requires a new storage tank. The old tanks were purchased from Lake Morena water district used, they need to be replaced as they are not adaquate for the service connections. The tanks must be chlorinated becaues of their old condition. The pipes are so old that the DEH orderded chloration. The water system needs shut off valves every 1,000 feet we only have three shut off valves in the system. All of these items need to be adressed to be in compliance with the State Drinking Water Standards. The system was under boil notice for over thirty days in 2006. One well out of two was shut down by DEH services. The owners spent over 100,000 dollars and any more money spent will cause a rate increase of over seven hundred percent. The customers went through a three hundred and fifty percent rate increase already. The water company was fined by DEH for non compliance and it was the first such fine imposed on a small water company for non compliance.	M	15	C	This water system is over 70 years old. 1503	2000509	2000509-009	CASCADEL MUTUAL WATER SYSTEM	Well #3 Deepening	Improve Well #3 by removing or drilling out the lining and deepening the well for substantially higher yields. This is the most cost effective first attempt at developing wells further.	M	15	C	On advice of Cal DHS's Eugene Reade the Cascadel Mutual Water Company Inc. drilled an additional water well, dubbed Well #3.At the time of drilling, the air lift indicated a potential production of 120 gpm reached at the very bottom of its 858 feet. As is typical, actual production proved to be less, however, much much less. We can only get about 10 gpm continuously from this well.The main aquifer producing the water was hit at the very bottom of the 858 feet of well. After consulting with the well driller and pump company a determination was made that removing the lining and drilling deeper will produce a reasonable likelihood of getting additional water, either by clearing any blockages that developed at the main aquifer, or by deepening, or both.This project proposes to improve Well #3 with the aim of increasing its output substantially.	35,000	137	300	11	Madera	III	2009
1504	2400167	2400167-002	BALLICO COMMUNITY SERV. DIST.	Additional Well for Ballico CSD	Locate and purchase property for new well site. Design well construction, wellhead features, connection to existing distribution system, and wellhead protection/security. Drill test well, conduct test well monitoring. Construct well, wellhead. Purchase and install pressure tank. Connect new well to existing distribution system. Purchase and install emergency electrical generator. Install wellhead protection and security.	M	15	C	Water system lacks adequate and reliable water supply because it has only one well as its total water source. System does not have any storage capacity. Loss of this well or pump will result in loss of all water to the entier community until correction is made.Title 22, Section 116555. Operational requirements.(a) Any person who owns a public water system shall ensure that the system does all of the following:(3) Provides a reliable and adequate supply of pure, wholesome, healthful, and potable water.Title 22, Section 64554. New and Existing Source Capacity.(a) At all times, a public water system's water source(s) shall have the capacity to meet the system's maximum day demand (MDD). MDD shall be determined pursuant to subsection (b).	700,000	53	309	11	Merced	III	2009
1505	2300591	2300591-005	Pine Mountain Mutual Water Co.		Replace water main with 6 inch PVC as well as lateral services.	M	15	C	Aging water main starting to have more leaks.	775,500	130	310	03	Mendocino	II	1998
1506	1800534	1800534-001	Spaulding/Eagle Lake MWC		Replace 2-inch pipes with 6-inch pipes throughout the water system.	M	15	C	Low water pressure.	125,000	77	325	02	Lassen	I	1998
1507	5100107	5100107-003	Sutter Co. WWD#1 (Robbins)	Robbins Water Main Replacement Project	The project will replace 7600 lineal feet of aging galvanized pipe with PVC C900 to current adopted County standards. The distribution pipe size will be increased to allow better fire flow capacity. The improvements will also include the addition of thrust blocks, gate valves and fire hydrants at 500 foot spacing.	M	15	C	A portion of the Robbins water distribution system is nearly 60 years old. The main distribution lines were constructed with galvanized iron pipe and is deteriorating leading to many failures and costly repairs. Many portions of the system have dead end lines leading to secondary water quality issues. Public safety is also a concern due to a lack of fire hydrants in some sections of the community.	330,000	94	336	21	Sutter	I	2007
1508	3900831	3900831-001	ARBOR MOBILE HOME PARK		RENOVATE BACK-UP WELL. OTHER = DESIGN AND CONSTRUCTION	M	15	C	SYSTEM HAS SINGLE WELL	10,000	173	340	10	San Joaquin	III	2006

1516	2310013	2310013-008	Point Arena Water Works	Water Mains	Upgrade a 60 year old 540 foot section of the existing main line to a 12" main line. This upgrade will increase the Fire Flow protection of the City of Point Arena as well as secure the integrity of the infrastructure of the distribution pipes in that part of the water system.	M	15	C	Installation of approximately 540 feet of 12" main line on Mill Street, Point Arena to replace a deteriorated section of 6" main line, which is over 60 years old.	75,900	210	465	03	Mendocino	II	2009
1517	2310013	2310013-009	Point Arena Water Works	Security Gate and Fences	Install an electric gate and security fence at the Main water storage tanks located at 135 Riverside Drive, Point Arena. Install security fence around the Garcia River Well located on Windy Hollow Road, Point Arena, California.	M	15	C	Lack of security around Main Water Storage tanks and well.	41,300	210	465	03	Mendocino	II	2009
1518	4000568	4000568-002	SAN SIMEON CSD		Construct an upgraded parallel line to the reservoir.	M	15	C	Single source of supply from reservoir to distribution system.Low flow/pressure to customers.	100,000	206	499	06	San Luis Obispo	IV	2002
1519	5000005	5000005-003	CROWS LANDING COMM SVC DISTRICT	Replacement of water mains	The propose project consists of installation of 14,900 linear feet of eight (8) inch PVC pipe and 3000 linear feet of twelve (12) inch PVC plus 4600 linear feet of sixteen inch PVC. This will include 66 eight-inch gate valves and 30 twelve-inch butterfly valves plus 21 sixteen inch butterfly valves. There will be 42 fire hydrants and one 60 KW standby generator with automatic transfer switch. The distribution will be design to be a grid system to eliminate deadends. The standby generator will provide water to the community during power outages. The project will improve the health and safety of the community by providing proper fire flows and the quality of the water will also improve with the new piping.	M	15	C	The existing land uses in the Crows Landing community consist of residential, commercial,and industrial developments, in addition to a public school. The Community of Crows Landing currently receives its potable water supply from two groundwater wells. One of the wells is located on the northwestern portion of the community and the other well is on the east side. The wells have potentials of 400-500 gallons per minute (gpm). The wells were constructed in 1993 and have not been maintained as required for lack of funding. One of the wells stopped pumping in 2007. This well required repairs that totaled $37,000. The community is currently paying $35.00 per month for water service which covers the operation but no funds for preventive maintenance. The following list explains the District's other concern:1. Undersized distribution network - 1-inch to 3-inch galvanized mains.2. Old galvanized piping throughout the community - many water leaks.3. Shut-off valves are inoperable requiring the shut down of water wells for repairs.4. Lack of fire protection - Wharf - 3-inch fire hydrants throughout the community.5. Many deadends on the system.6. No back up power supply.7. Lack of accurate maps for the system.8. Staining of water fixtures throughout the community.	2,276,000	138	500	10	Stanislaus	III	2009

1520	4600009	4600009-004	Sierra Brooks PSD	Sierra Brook Water System Improvment	The project scope includes the following improvements to the water system:1. Installation of 2,500 feet of 10" pipeline.2. Installation of 4900 feet of 8" pipeline.3. Installation of approximately 800 feet of 6" pipeline.4. Construct inter-ties between upper pressure zone and lower pressure zone.5. Install 20 new isolation gate valves6. Install 21 new fire hydrants (includes replacement of nine standpipe hydrants.)7. Install new water meters.8. Install standby generators for uninterrupted water service during a time of power supply failure.	M	15	C	Sierra Brooks water system was developed to support the Sierra Brooks residential subdivision. This community encompasses approximately 400 acres originally consisting of 398 single family residential parcels along with open space areas. The subdivision also includes a community center, firehouse, and campground.The Sierra Brooks water system is owned and operated by Sierra County. The system is comprised of two wells, two storage tanks and a distribution pipeline system. One tank is for residential distribution while the second tank is used exclusively for fire suppression storage through a single hydrant. Through a number of parcel mergers the subdivision currently has 377 parcels. Thirty eight parcels are currently without water service from the water system, and eleven of those have private domestic wells.Currently Sierra Brooks Water system is has an inadequate water source capacity. Using the past 5 years records the current maximum daily demand (MDD) is 721 gpm and the current water source capacity is 475 gpm. With current water conservation plans the MDD can be reduced to 655 gpm.The water storage capacity is another significant problem for this water system. The current system Minimum Storage Volume(mg) is 0.521 while the required build out Minimum Storage Volume (mg) is 0.620. In order to reach this objective the system needs an additional	1,500,000	210	515 02	Sierra	I	2009
1521	1800511	1800511-001	Lake Forest Mutual W.C.		Recoat largest storage tank. Build new tank. Replace and add fire hydrants.	M	15	C	Storage tank needs rehabilitation. Storage capacity is inadequate. Need more fire hydrants.	100,000	271	568 02	Lassen	I	2006

1524	3110023	3110023-004	North Tahoe PUD - Carnelian Woods		Replace 2,400 ft of pipe. Involves design and construction.	M	15	C	Ineffcient water line.	409,600	273	600 02	Placer	I	2006
1525	3110048	3110048-002	Placer CSA - Sheridan	Sheridan Water Supply and Distribution Project	Sheridan, a small, rural community located in the western portion of Placer County is an area of relatively level topography spanning approximately 200-acres, a grid of approximately 5 by 6 city blocks. Sheridan's water system was originally built in 1969 and is comprised of approximately 15,700 lineal feet of 2 to 6-inch distribution piping, two (2) public water wells, and appurtenances. Each water well is approximately 200-feet deep. Well 1 has a generator for standby power and Well 2 does not. The water system serves 200 residential and 6 commercial connections for a total of 210 EDUs. As with many rural communities, Sheridan faces the problems of poverty, aged housing and infrastructure. A Household Income Survey was performed by Mercy Housing California which determined that the MHI for Sheridan was $29,800. The County reviewed the existing water system configuration and believes that the improvements described herein would enable the water system to reliably meet the maximum daily water demand.a. Upsize the well pump at existing Well 2 to maximize the output of the well and install a backup generator to reduce the risk of system pressure loss – Well 1 is currently the greatest water producing well for the water system. Well 1 and Well 2 have approximately the same depth, diameter, and design. However, the pump motor at Well 1 is 25-hp and the pump motor at	M	15	C	Placer County Community Service Area 28, Zone 6 (CSA), owns and operates the Sheridan Public Water System (water system) in the community of Sheridan, California. The water system consists of two (2) public water supply wells and a network of distribution piping and appurtenances. Water is disinfected at the wells via liquid chlorine injection, and water pressure is maintained by pump-controlling pressure switches at each well site. Only one (1) well has a backup power generator. The water system serves a population of approximately 600 residents. The water system and the CSA's associated wastewater treatment and conveyance system lack capacity for additional connections. The CSA has operated under a self-imposed connection moratorium since approximately 1985. 1. Why the facility is needed: The moratorium on new connections has prevented infill development within the community, limiting economic growth and school enrollment. Community stagnation is a likely cause of the aging housing inventory, lack of property upkeep and increased criminal activity. On October 27, 2008, the County received an inspection report letter from the California Department of Public Health (CDPH) stating that the water system has "insufficient source and storage capacity to meet current Waterworks Standards" (22 CCR 64551 et seq.). These new standards require the water system to be able to supply	950,000	232	600 02	Placer	I	2009
1526	3110023	3110023-001	North Tahoe PUD - Carnelian Woods		Construct an 8,330 ft, 12" diameter intertie to District's main water system. Involves design and construction.	M	15	C	Unreliable system supply.	1,082,500	273	600 02	Placer	I	2006
1527	3110023	3110023-002	North Tahoe PUD - Carnelian Woods		Construct a new well. Involves design and construction.	M	15	C	Well is unreliable and is at risk for outages and reduced water pressure.	280,000	273	600 02	Placer	I	2006

1529	3610023	3610023-004	GREEN VALLEY MWC	Angeles main replacement	This is a pipeline replacement project. The pipeline will replace a substandard asbestos Cement - 4 inch diameter water transmission main with metered service connections. The new pipeline will be of PVC C-900 and 6 inch diameter to meet current supply and fire flow standards. Included in the project will be replacement of fire suppression facilities such as hydrants and appurtenances. Included is the installation of water quality blow offs for a dead end.	M	15	C	Replacement of 50 year old water main and fire hydrants and service connections. Pipe is composed of AC Pipe.	275,000	1,135	700	13	San Bernardino	V	2009
1530	2010009	2010009-001	MADERA CO SA NO 19-ROLLING HILLS		INSTALL A NEW WELL AND A STANDBY GENERATOR.	M	15	C	THE SYSTEM HAS TWO WELLS, THE MAIN WELL (NO. 1) HAS EXPERIENCED SANDING PROBLEMS WHICH HAS RESULTED IN ITS REDUCED CAPACITY. THE SYSTEM HAS HAD LOW PRESSURE PROBLEMS DURING THE SUMMER MONTHS.	500,000	333	727	11	Madera	III	1998
1531	1410005	1410005-001	INDIAN CREEK COMMUNITY SERVICE DISTRICT		Construct a 500,000 gallon storage tank	M	15	C	Inadequate storage results in low pressure problems in higher pressure zone during summer	600,000	213	785	13	Inyo	V	1998
1532	3110036	3110036-003	North Tahoe PUD - Dollar Cove		Replace 4,510 ft of water mains. Involves design and construction.	M	15	C	Water mains leak; lines are deteriorated and do not provide proper circulation of water.	419,000	273	800	02	Placer	I	2006
1533	1510051	1510051-013	LEBEC COUNTY WATER DISTRICT	Up-size Water Main for Phillips Pressure zone	Approximately 3,200 lineal feet of 3-inch pipeline would be replaced with 6-inch diameter water main.	M	15	C	The existing 3-inch diameter pipeline that serves the Phillips Pressure Zone is inadequate for fire flows, high water demands and future demands. In addition the pipe size does not meet current standards for a water main as allowed by the California Waterworks Standards.	110,000	243	830	19	Kern	III	2009
1534	1510051	1510051-003	LEBEC COUNTY WATER DISTRICT	Starter Booster for State Well	The project would modify the existing electrical system to provide a separate starter for the booster pump	M	15	C	The State Well pump and State Well tank booster use the same electrical system and motor starter. If the State Well pump is out of service then the booster pump is off line.	25,000	243	830	19	Kern	III	2009
1535	1510051	1510051-008	LEBEC COUNTY WATER DISTRICT	New Tank Lebec Zone	The project would provide additional storage capacity at the Lebec Tank site. It would consist of the addition of a 100,000 gallon tank at the existing Lebec Tank site.	M	15	C	Not enough storage in the Lebec Zone to handle current and future maximum daily demand.	260,000	243	830	19	Kern	III	2009
1536	1510051	1510051-012	LEBEC COUNTY WATER DISTRICT	Portable Emergency Generator	The project would consist of retrofitting important well sites or booster pump stations with generator receptacles and a portable generator mounted on a trailer.	M	15	C	The District does not have a portable emergency generator to allow pumping during electrical outages. The problem is made worse because the nearest rental agency is about an hour drives away from the District. Additionally, the well sites are not equipped with generator receptacles to quickly connect the generator to the system.	40,000	243	830	19	Kern	III	2009
1537	1510051	1510051-011	LEBEC COUNTY WATER DISTRICT	Lebec - New Tank Chimney Canyon Zone	Demolish the current 40,000 gallon tank and replace it with a 250,000 gallon tank. Because the tank has the highest elevation of the system it could also feed the lower elevation zones.	M	15	C	This zone has the highest demand and there is not enough capacity with existing tank.	500,000	243	830	19	Kern	III	2009
1538	1510051	1510051-010	LEBEC COUNTY WATER DISTRICT	Alarm and SCADA systems	the installation of a Supervisory Control and Data Acquisition (SCADA) system would allow operators to monitor on a computer selected parameters including tank levels, pumping flow rates, pressure, well pump status, etc. This will reduce the time operators have to check on the status of the distribution system and alert the operator to a potential emergency.	M	15	C	Currently, well pumps are turned on automatically by a timer system or by manual operation. Timer can be adjusted as needed to account for seasonal variations in demand. If a high demand occurs, the tank levels could drop to a critical level, or a well could go out and there would be no immediate notification.	450,000	243	830	19	Kern	III	2009
1539	1510051	1510051-002	LEBEC COUNTY WATER DISTRICT	Flow Meters at Wells	The installation of three flow meters at each of the Districts source wells.	M	15	C	No flow meters at well sites. With the addition of flow meters the District will be able to account for water losses and keep track of pump performance and efficiency.	40,000	243	830	19	Kern	III	2009
1540	1510051	1510051-006	LEBEC COUNTY WATER DISTRICT	Lebec - New Tank/Booster system	The project would provide additional storage capacity for the system. It would consist of a 250,000 gallon storage tank that would be connect to the distribution system by 6,000 Lineal feet of 8-inch diameter water main. In addition a booster pump would be installed to deliver water.	M	15	C	There is not enough storage capacity to meet current and future demand for the system.	750,000	243	830	19	Kern	III	2009
1541	1510051	1510051-009	LEBEC COUNTY WATER DISTRICT	Booster pump from State to Chimney Zone	The project would consist of adding a booster pump to add additional MDD capacity.	M	15	C	Currently a large portion of the district has insufficient source capacity.	80,000	243	830	19	Kern	III	2009

1542	1510051	1510051-005	LEBEC COUNTY WATER DISTRICT	State and Lebec Zone Interconnections	The Project would be an interconnection of approximately 1,600 feet of 6 inch water main and a pressure reducer valve assembly.	M	15	C	System is divided by the 5-freeway with only one connection. If the connection were to break, only available water is storage tank with limited capacity and this line also crosses the 5 freeway.	65,000	243	830 19	Kern	III	2009
1543	1610006	1610006-003	Stratford PUD	System Pressure and Source Capacity Enhancement	The project consists of purchasing additional property adjacent to Well 6, construction of a 600,000 gallon ground level storage tank, installing booster pumps, electrical, controls, hydropneumatic tank, piping Well 7 to the site, distribution system modification to distribute the flow from the tank and a stand-by generator. The improvements will allow the District to pump out of storage to meet peak demands. Storage will also be provided in the tank for fire flow. Well 5 will also be equipped with a VFD. The water distribution system improvements will improve the distribution of water from the tank and booster pump site into the distribution system. These improvements will improve water source reliability and pressure within the system.	M	15	C	The Stratford Public Utility District (District) provides both water and sewer service to the unincorporated community of Stratford. The District's water supply consists of three wells. The wells pump directly into the distribution system with an elevated storage tank. Well 6 is currently not in operation due to sanding problems. Well 7 which was completed in 2004 to improve the water system reliability is shut down because of methane gas. The level of gas in the well has resulted in the District not being able to use the well except for a short time during critical periods. The District has principally been operating on only Well 5. The District has low pressure and inadequate source of supply. The system will not meet Title 22 Waterworks Standards. The residents within the community are low income with the median house income of $29,205 based on the 2000 census. There are 380 service connections in the District with a population of approximately 1,500.	1,700,000	294	837 12	Kings	III	2009
1544	0610003	0610003-001	Maxwell Public Utility District	Research/Develop Well#6 with Security & Montoring System	Due to what was described above the Maxwell Public Utility District has no other option but to put in a new well but do not have the funds to follow through with the project. Project would consist of a well house, well casing, well, pump, pipeline from facilities to the distribution system. Also with the ability to operate as a backup in outages. The project would require a scada system to interface with the existing system and operate during power outages. There will be no destruction of an old facility, only a construction of a new facility.	M	15	C	Maxwell Utilities is unable to deliver an adequate amount of water to supply the needs for the residents and businesses in the town of Maxwell, due to one of two wells not able to provide significant water quantity or quality due to the age and shape of the well. Maxwell Utilities also has a backup well used incase of emergency only. This well is high in maganeese and high in minerals therefore is undesireable to the public of Maxwell. The current well system does not allow for poweroutages due to having no backup faculty to run the system. In the summer of 2009 Maxwell Public Utility has no recourse but to instrumentate mandatory water rationing.	700,000	395	850 21	Colusa	I	2009
1545	5510026	5510026-001	PHOENIX LAKE ESTATES CC MWC	Service Connection Replacement, Phase 1	This project will replace approximately 175 2-inch galvanized service lines with flexible poly-type plastic. Trenching, plumbing, and asphalt replacement will be required. No concrete sidewalks are involved. This project is labor intensive. Materials are estimated at only 20% of the total cost.	M	15	C	Our water system is 40+ years o ld and service lines are galvanized steel. There are many leaks in these service lines, and many of the curb stops are leaking or non-functional as well. All need to be replaced to ensure system sanitation and to save wasted water. This project will replace the oldest of our service lines. No public notification, other than common sense courtesy, is required. No special permits or environmental documents are required.	350,000	350	870 11	Tuolumne	III	2009
1546	5510026	5510026-002	PHOENIX LAKE ESTATES CC MWC	Upgrade Lateral Pipelines	This project will replace approximately 240 feet of 2-inch pipe with 4-inch pipe in order to increase water flow rate to a critical fire hydrant. The project will also replace approximately 120 feet of 1-inch pipe with 2-inch pipe in order to more adequately serve four residences. Trenching, plumbing, and asphalt replacement will be required. This project is labor intensive. Materials are estimated at only 20% of the total cost.	M	15	C	We have one fire hydrant in our system that is connected to the water main through only a 2" pipe. This pipe is too small for a sufficient flow of water to the hydrant, and the hydrant is located in an area where access by fire tanker trucks is extremely difficult if not impossible. In the same area we have four homes that are served by a common 1" pipeline from the mainline. Again, this pipe is too small for application.	18,000	350	870 11	Tuolumne	III	2009

1547	5510026	5510026-003	PHOENIX LAKE ESTATES CC MWC	Service Connection Replacement, Phase 2	This project will replace approximately 175 2-inch galvanized service lines with flexible poly-type plastic. Trenching, plumbing, and asphalt replacement will be required. No Concrete sidewalks are involved. This project is labor intensive. Materials are estimated at only 20% of the total cost.	M	15	C	Our water system is 40+ years o ld and service lines are galvanized steel. There are many leaks in these service lines, and many of the curb stops are leaking or non-functional as well. All need to be replaced to ensure system sanitation and to save wasted water. This project will replace old service lines. No public notification, other than common sense courtesy, is required. No special permits or environmental documents are required.	350,000	350	870	11	Tuolumne	III	2009
1548	5510026	5510026-004	PHOENIX LAKE ESTATES CC MWC	Fire Hydrant Replacement	Replace approximately 50 fire hydrants and install shut off gate valves between mainline and hydrant. Work includes trenching, plumbing, and asphalt replacement. No concrete sidewalks are involved.	M	15	C	Our water system is 40+ years old. Many of our dry barrel type fire hydrants are failing. The oldest of our hydrants need to be replaced and most also need shut off gate valves installed. At the present time we are replacing hydrants as they fail -- either because of leaks or a failure in the operating mechanism. No public notification, other than common sense courtesy, is required. No special permits or environmental documents are required.	300,000	350	870	11	Tuolumne	III	2009
1549	5400631	5400631-003	LINNELL FARM LABOR CENTER	Linnell Farm Labor Center new water system	The drinking water system needs to be replaced starting at the well, and ending at the last of the 191 home sites. There are two existing wells. The South well has the original pump, and the North well's pump was replaced in 1999. The watertower was also replaced with a pressurized system in 1999. The project in addition to requiring a new pump, needs to replace all of the old orginal water lines with new lines, and the addition of street located shut-off valves. Please remember that the original lines are now 72 years old. To currently perform any water line repairs requires turning of the entire system. Above ground shut off valves would eliminate that problem. Last but not least would be the addition of on site generators. The loss of electricity also means the loss of drinking water. Also the loss of electricity, and no water means no Fire protection. A generator would help protect against the threat of any fire. large or small. Waiting until the lines collapse before addressing the problem is not a wise decision. A methodical plan designed to replace the old system now is a much better approach to the problem, verus waiting for major problems to start occuring at inconvient times. A project of this size would require a large crew from start to finish. Plumbers, electricians, carpenters and approximately 5 other trades would be needed at some point in time during the construction phase of the project. It would be safe to say that 20-30 skilled	M	15	C	The Linnell Farm Labor Center (FLC) was built in 1937. It was known then simply as the Linnell Labor Camp. Since its inception, the center has been through remodels, and modernization projects large and small. Plus over the years, additional housing has been added to meet the continued need for expansion and growth. Linnell now seerves 191 families year around. All of the tenants work in farm related employment. Rents are determined by the tenants income. The rental income from the FLC covers the basic maintenance and repair of all the home sites. However, there is never enough cash reserves to cover the cost of major improvements to the site.The original water system that was used in 1937 is still in place and fully operational today. As the center continued to grow, new lines were added, however the original system was never replaced. Simple math says that we have a 72 year old system that is in serious need of total replacement. The existing sewer system and wastewater treatment plant duplicates the fresh water story. It is also 70+ years old. Rental income generated at the FLC will never be enough to cover the cost of purchasing a new water system.The diverse number of crops grown in Tulare County and the manpower needed to harvest the crops each year means that the FLC will be here for another 70 years, and the water system must continue to meet the needs of the families living in this community.In	1,500,000	190	896	12	Tulare	III	2009

1554	4510004	4510004-003	Shasta Co. Service Area #6	CSA #6 Silverthorn Distribution Replacement	The current water system consists of three inch galvanized steel water mains, gate valves, and wharf hydrants. The small pipes limit fire fighting capacity. The system cannot meet the required flow of 1000 gpm. In a fire emergency the existing system will not maintain a 20 psi residual pressure. Modeling indicates that the pressure in most of the system will drop to near zero. California Waterworks Standard Section 64602 indicates that a 20 psi residual pressure should be maintained at all time. The low system pressures and flows make it difficult to flush the system properly. Currently, sand has settled in much of the system further reducing flow capacityThe proposed project will replace the existing distribution system with new pipes, valves, and fire hydrants meeting all current standards. The steel pipes will be replaced with larger PVC pipes. Approximately one mile of pipe will be replaced. Fire hydrants will meet current standards. Because the distribution system is failing, the only viable alternative is full replacement.	M	15	C	The current system consist of aging (25 year old) 3 inch galvanized water mains, gate valves, and wharf hydrants. The galvanized pipes are prone to leak and are in generally poor condition. The water system has been modeled for fire fighting capacity. It fails to meet fire flow standards. During a fire pressures in the system do not meet California Water Works Standards section 64002. The system cannot maintain a 20 psi residual pressure during a fire event.	1,000,000	377	1,119	02	Shasta	I	2009

1557	2410018	2410018-002	SANTA NELLA COUNTY WATER DISTRICT	Water Supply Project	The project would construct a potable water well and necessary pipelines and interconnections to facilitate blending and provide efficient uninterrupted water delivery. Needed water storage capacity would also be provided.	M	15	C	Additional water supply is needed to serve the areas of the District not elgible for treated aqueduct water, to provide blending water for treated surface water containing TTHMS, and for a backup supply during treatment plant emergencies, or periods when the aqueduct surface water may not be available due to drought, environmental, or regulatory conditions limiting water delivery. In the spring of 2009 there was a preliminary notice of restricted CVP water deliveries the would have severly impacted SNCWD if it had materilized. California Aqueduct flows have been and may be further reduced to protect fish species and their habitat. As a result the reliability of the California Aqueduct as a source of water for SNCWD may decline significantly. Also the water system lacks adequate storage capacity, transmission pipelines, and interconnections to adequately utilize new water sources for blending and water supply purposes.	1,900,000	494	1,500	11	Merced	III	2009

1558	4010010	4010010-003	San Miguel Community Services District	0.65 MG Water Supply Tank II	The District's Water Master Plan, adopted in March 2002, listed new water storage facilities to reduce this deficit as a first priority project. Subsequently, the District has implemented the first phase of this master plan recommendation by constructing a 650,000 gallon welded steel storage tank. This first project will only achieve a portion of the current water storage deficit in the community, and the second 650,000 gallon water tank is much needed to ensure adequate water supply to meet today's demands. The District owns the property on which this new tank will reside, thus no property acquisition is required. This new tank will meet all current California Department of Public Health Standards for design of new potable water tanks.	M	15	C	The San Miguel Community Services District (SMCSD) provides water service for about 1,850 people as well as recreational, public, commercial, and industrial uses. Currently the District has a total potable water storage capacity of 700,000 gallons, with a new 650,000 gallon tank under construction on the west side of the service area, and an existing 50,000 gallon tank on the east side of the service area. To meet current emergency short term outage, fire, and operational storage requirements, the SMCSD requires 1.4 million gallons of storage (1.8 MG at build out). Thus, the SMCSD currently provides only half of the needed storage to ensure adequate water supply during extended outages and fires. This deficiency is a significant threat to health, sanitation, and safety of this community.The unincorporated Community of San Miguel, located in the northern portion of San Luis Obispo County, is one of 6 urban areas within the County of San Luis Obispo Salinas River Planning Area Plan. The 2000 census data indicates that the District's median household income was $33,264. According to the County of San Luis Obispo, the County's Year 2008 median income for a family of four is $67,000.	850,000	668	1,500	06	San Luis Obispo	IV	2009
1559	4510008	4510008-001	Fall River Mills C.S.D.		Drill a new well in second community to provide the reliability required by the Waterworks Standards.	M	15	C	One well serves two communities that are 8 miles apart. System does not fulfill the requirements of Section 64560(a)(6) (minimize the efects of equipment failures) of the Waterworks Standards.	150,000	477	1,600	02	Shasta	I	1998
1560	1610007	1610007-005	Home Garden CSD	Home Garden New Well for Arsenic Standard Compliance	To increase and maximize water pressure throughout the system and improve the District's ability to efficiently provide arsenic treated water for the overall community, it is essential that the District install a new well and lines. Currently, the District has two (2) wells that operate in the community. If one of these wells fails, the District would not have the capacity to treat or deliver arsenic treated water to the community. To avoid such a problem, the District would need to install a back up well. Each of the wells is over thirty (30) years old and there will be a need for their replacement in the future. Maintaining the capability of treating the existing ground water supply for high levels of arsenic is essential to the overall production of clean water to the community.	M	15	C	The Home Garden Community Services District (HGCSD) is an unincorporated district. It provides water to approximately 1800 residents in the community. In 2007, the HGCSD began constructing an Arsenic Removal Project. The State of California has designated Kings County as an extreme draught region. During 2007-2008, precipitation in the Hanford area was only 83% of the normal to date. Dry years have severely impacted the water supply for the District. In the last two years, ground level waters have dropped approximately 60 feet. The lowered water levels indicate groundwater pumping exceeds the recharge and the resulting increased lift adds to the District's operation, maintenance, and energy costs. The water demand during the summer months is high and a greater usage can occur during the maximum hour demand period of the day. As a result of this increase, many water users experience low water pressure. This, coupled with the anticipated growth in the District, would continue to place a strain on existing pumps and the water capacity and usage.	1,060,000	450	1,750	12	Kings	III	2009
1561	1710010	1710010-002	Lower Lake County Water District		Replace with 500K steel stank. Integrate with existing 500K tank with a 16 inch line and have the ability to shut off each tank for maintenance.	M	15	C	Old 100K redwood tank feeds to 500K tank. Restricts inflow limit to 600 gpm. Excess overflows tank.	200,000	886	2,025	03	Lake	II	1998

1562	3610048	3610048-003	TERRACE WATER CO	Terrace Water Co. Transmission Line Replacement	Terrace Water Company is seeking support from the CDPH Economic Recovery funding program to replace the system's main transmission line. Terrace Water Company has completed very few improvements since its establishment in 1890. The main transmission line, which faces structural integrity issues due to its age, heavy traffic, and logistical issues having had a school built on top of it, is in dire need of replacement. The major break that the line suffered during the summer of 2008 and subsequent replacement of 100 feet of line (and total service outage for 36 hours) is an indication of the immediacy of the problems faced. Terrace Water Company's main transmission line, which has significantly exceeded its life expectancy, runs approximately 3 miles from our wells down to our service area. Approximately 1/2 mile of this line is underneath a school and several homes built in the 1960s without regard of the water line. Nearly 2 miles of the remaining line has suffered structural damage due to heavy traffic. We have had a working relationship with Riverside Highland Water Company (RHWCo) for many years. They recently abandoned a large section of their main line, which runs parallel to ours down Rancho Avenue for approximately 2 miles, and have offered to deed the line to us, and we will assume all liability. It is our intention to run 16" HDPE pipe from our wells, and at the intersection of Rancho	M	15	C	Terrace Water Company is seeking to replace the system's main transmission line. Terrace Water Company recently faced a significant break in the main transmission line, leaving customers entirely without water for 36 hours. The existing line is well past its life expectancy and so damaged and delicate that each time a repair band was attached, another piece of the old line broke off. The result was that instead of merely patching the line with repair bands, a 100 foot section of the line had to be removed and replaced with C900 pipe and a 16" gate valve. Terrace Water Company simply cannot afford to continue patching and replacing major sections of this transmission line that is in such bad order and past its life expectancy that it will most certainly continue to fail, leaving our customers without water service for extended periods of time.In addition to the age of the line, the Company's transmission line is compromised by heavy truck traffic and several buildings. The heavy traffic on the street that contains this main line has caused the pipe to flatten into an oval in several sections, greatly compromising its integrity. Another issue with this line is that during the 1960s several homes and an elementary school were built on top of it. A severe leak or a break in this portion of the line that has already surpassed its life expectancy and had several major leaks and failures elsewhere, would result in severe consequences for the school and the	2,600,000	574	2,200	13	San Bernardino	V	2009
1563	4510013	4510013-001	Shasta C.S.D.		Construct 500,000 storage tank and pump station and extend 12-inch main to increase pressure and provide the reliability required by the Waterworks Standards.	M	15	C	Insufficient storage capacity resulting in water outages. System not fulfilling Section 64560(a)(4) (provide adequate capacity) of the Waterworks Standards.	650,000	708	2,320	02	Shasta	I	1998
1564	4510013	4510013-002	Shasta C.S.D.		Produce engineering construction plans and replace restrictive deteriorating line	M	15	C	System experiences low pressure at higher elevations, in violation of waterworks standards	68,000	708	2,320	02	Shasta	I	2000
1565	1010028	1010028-005	Riverdale Public Utility District	Well #2 Replacement	The proposed project will consist of drilling a new well to replace Well 2. The new well site will be located on property that District owns which is located about ½-mile away from the Well 2 site. The replacement well would be designed to replace the existing well capacity. The new well will NOT increase capacity.The project will be implemented in phases. In phase 1 a pilot hole will be drilled to a depth of up to 1,200 feet and zone testing will be conducted. The intent is to isolate a zone with desirable water quality characteristics such that arsenic treatment can be avoided or the cost of such treatment can be minimized. A final production well will be drilled and constructed based on the results of zone testing.In phase 2 the well site improvements will be completed. It is anticipated that site improvements will consist of furnishing and installing the well pump; site piping; electrical service, power and controls; and completing site grading and fencing. Site improvements will include treatment facilities if it is determined that treatment will be required. The District intends to relocate and utilize existing Well 2 treatment equipment at the new well site if treatment is required.The District is beginning design of phase 1 of the project due to the urgent nature of the problem.	M	15	C	Riverdale Public Utility District has three water supply wells that provide water to the community. The District's Well 2 has recently run dry due to declining ground water levels. The groundwater level has dropped below the well bottom and therefore the pump cannot be lowered. Well 2 is less than 300 feet deep and Wells 4 and 5 are less than 500 feet deep.Under normal operations Well 2 and 5 operate as primary supply wells and Well 4 serves as a backup well. The District is currently operating both remaining wells (Well 4 and 5) to meet system demands and has no backup well as a result. Title 22 requires community water systems using only groundwater to have the capability to meet maximum day demands with the highest-capacity source off line. The District cannot meet maximum day demands if Well 4 or 5 go off line.The District's water system has no backup source water or storage facility. The lack of backup supply poses a public health and safety risk. In the event that Well 4 or 5 go down, water system pressure could drop below minimum system pressures and put the system at risk of contamination. In addition, the system would not be able to meet fire flow and pressure requirements.In addition, the District has recently constructed an arsenic removal treatment facility at the Well 2 site. The facility cannot be utilized since Well 2 is down.	800,000	866	2,416	23	Fresno	III	2009
1566	4510002	4510002-002	Mountain Gate C.S.D.	Distribution system	Construction of 250,000 gallon capacity storage tank, booster pump station, 2,500 feet of 6-inch diameter water main.	M	15	C	Very low pressures or customers out of water for extended periods, undersized main lines.	275,000	664	2,500	02	Shasta	I	2002

1567	3210009	3210009-003	Chester Public U.D.	Develop Well No. 5 to Replace Failing Well No. 4 Chester CPUD	The project would consist of developing test well number five into a productive well, piping the well to the storage tanks, providing power to the well pump, well controls and an emergency generator.	M	15	C	Chester's water is currently obtained from four deep wells. The most recent well that was drilled approximately three years ago is now experiencing severe silting problems and has been taken off line after repeated attempts to rehabilitate it at great cost. The Chester Public UtilityDistrict is still working to bring it back on line. However, the consultants that have been hired are not optimistic that it will be productive. Our Summer month's water demands are such that without well number four in operation, we will be facing severe water shortages.Several years ago the District drilled a test well in the proximity of our water storage tanks. The water was of good quality and quantity. It was never developed because the growth of the community was in a direction away from the tanks and our engineer sugested that a well be drilled on the opposite side of the town to balance the system. Now that well four is failing it is imperative that well number five be developed to provide adequate water to the community.	120,000	1,199	2,645	02	Plumas	I	2009
1568	5110007	5110007-002	Sutter Community S.D.		Add a 1mgal tank and replace old pipe in one section of our system	M	15	C	Need additional source of emergency water	400,000	1,025	2,885	21	Sutter	I	1999
1569	2910002	2910002-004	City of Nevada City	Water Distribution System Valve Rehabilitation and Installation	Approximately twenty non-funtional valves will be replaced and approximately ten new valves installed. Although there are many more valves which need replacement/installation in the distribution system to make it fully functional, the construction of the proposed valves will be in strategic locations of greatest need. This will allow much more efficient control of system shut-downs to isolate smaller areas during repairs. Results will be reduced impacts to the public services, increased system reliability, and reduced threat to fire flow demands. Replacement of leaking valves will also conserve water.	M	15	C	Many of the City distribution system water valves were installed in the early 1900's, and some as early as 1890. Many valves are non-functional, which inhibits maintenance and repairs to pipelines. When early pipelines were installed, there were few valves installed at that time, which now necessitates shutting down major sections of the distribution system when repairs are performed on the antiquated pipes. This creates an inconvenient service outage to the public, and endangers fire flow availability in those shut down areas.	150,000	1,205	3,001	21	Nevada	I	2009
1570	2910002	2910002-002	City of Nevada City	Distribution System Inter-ties with Nevada Irrigation District	These circumstances of low pressures and reduced supply, can be caused by several factors. First, many of the water mains are undersized and antiquated, having been in service for over 100 years. The cast iron pipe has become tuberculated with deposits which narrow the effective diameter, and inhibit flow quantitiy. Second, the three storage tanks float on the system without the benefit of altitude control valves, or automated level monitoring, which reduces the assurance of adequate retention of stored water. During periods of high demand, there are times when the water treatment plant (which is over 30 years old) has difficulty in keeping up with demand, which then neccesitates the draw-down on storage facilities to keep up with demand. The reduction of effective storage in the three tanks, threatens the ability to provide fire flow when these circumstances converge. The City storage quantity exceeds the minimum required by a factor of four, so additional storage is not the answer, and is expensive. The small City distribution system is surrounded by the larger Nevada Irrigation District (NID) distribution system. The City system is divided generally into four quadrants by the State Highway 49 freeway and by Deer Creek watercourse. The northwest quadrant has an existing manually operated small diameter pipe inter-tie with the NID distribution system, which has been used in the	M	15	C	During periods of summer peak hour flow, or during fire flow events, portions of the distribution system can experience low pressures, below the State required minimum of 20 psi. The system can also reach conditions of critically short supply during periods of high demand, which can threaten both domestic demand and fire flow demand. These circumstances are abnormal and infrequent, but are in need of correction to provide reliability of supply. System inter-ties with the Nevada Irrigation District would solve the problems.	175,000	1,205	3,001	21	Nevada	I	2009

1571	2910002	2910002-003	City of Nevada City	Water Distribution System Pipeline Replacement	Of the 20 miles of distribution system piping, about 60 percent is 4 to 6 inch cast iron, 38 percent 6 to18 inch ductile iron, and 2 percent 6 to 8 inch PVC. Most of the pipe was installed 50-100 years ago, and is in need of replacement to correct problems of reduced pressure and quantity, and to reduce excessive repair costs. New pipeline will be either C-900 PVC or ductile iron. The proposed pipe runs most in need of immediate replacement are listed below.a) 6-inch main at South Pine St./Cross St., $220,000b) 6-inch main at Woodpecker Lane, $175,000c) 6-inch main at Park Ave., $85,000d) 6-inch main at North Pine St., $160,000e) 4 and 6-inch main at Prospect St., $75,000f) 4-inch main American Hill to Old Downieville Hwy, $95,000Total project cost is $810,000.	M	15	C	A significant portion of the water distribution system piping has out-lived its useful service life. About sixty percent is cast iron pipe, which was installed 50 to 100 years ago. The pipe is heavily tuberculated with mineral deposits, which narrows the diameter and results in reduced pressure during high demand periods, and which threatens fire flow quantities. There are portions of the system which experience service line pressures less than the State mandated 20 psi minimun at peak demand. Corrosion has reduced pipeline wall thicknesses, which promotes frequent leakage, or major blow-outs.	810,000	1,205	3,001	21	Nevada	I	2009
1572	2710019	2710019-001	CWSC Oak Hills		Install a GAC treatment process.	M	15	C	Inactive well with DCE contamination.	200,000	890	3,494	05	Monterey	II	1998
1573	5310001	5310001-005	Weaverville C.S.D.		Replace water transmission main.	M	15	C	Water transmission main supplying 2.1 million gallon hydro reservoir from the East Weaver Treatment Plant is old and deteriorated and needs to be replaced to help ensure reliability of water supply to main pressure zone.	1,050,000	1,577	3,554	01	Trinity	I	1998
1574	1410001	1410001-005	CITY OF BISHOP	West Pine Watermain Improvements	Install new hydrants to provide adequate spacing and uniformity throughout system. Relocate and reconnect water services and install meter boxes to existing homes. Spot repairs on existing distribution pipeline.Survey and geotechnical work have been completed. Environmental documentation is under public review, with public comment scheduled to close 3/2009.	M	15	C	Many of the water services along West Pine Street were installed very close to sanitary sewer service laterals and should be relocated. Many of the sewer laterals are made of metal, and have since thoroughly corroded, contaminating the soil and the potential for contamination of the water services. The hydrant spacing along West Pine Street is inadequate and does not meet fire code. More hydrants are needed and some existing hydrants need to be replaced to shorten the spacing between hydrants and to ensure that the hydrants are uniform. The distribution pipeline along West Pine Street also needs spot repairs in some locations. The City has a commitment of funds from the California Department of Transportation for street improvements, and the City needs financial assistance to improve the water system within West Pine Street prior to the street improvements (scheduled to start Summer 2010).	80,000	1,161	3,643	13	Inyo	V	2009

1575	1410001	1410001-006	CITY OF BISHOP	Sneden Street Water Improvements	Abandon 4 inch cast iron pipe in Sneden Street from Clarke Street to East Line Street and replace with 8 inch plastic pipe. Align 8 inch pipe with 8 inch ductile iron pipe in Sneden Street south of Clarke Street.Replace existing 8 inch "T" and valves at Clarke Street with a cross and 4 new valves.Connect to 8 inch ductile iron pipe on East Line Street with new "T" and 2 new valves (south and east legs).Replace 4 inch cast iron pipe in area affected by construction on Short Street with 8 inch plastic pipe connected to new 8 inch plastic pipe on Sneden Street with 3 new valves.Add fire hydrant at the Short Street intersection.Replace all galvanized steel service laterals and replace copper laterals that are in poor condition or that are smaller than ¾ inch with ¾ inch plastic or other appropriate size. (Laterals that require replacement to be determined by city forces.)Install water meter boxes with meter idlers and "curb stop" valves in planter strip or in sidewalk where there is no planter on each water service.Relocate water services that fall in driveway approaches or are located very close to sewer laterals.Survey and geotechnical work and master planning complete. Environmental documentation currently in public review (2/27/09). The City plans to complete wastewater improvements along Sneden Street; the City has applied for funds from the State Water Resources Control Board for economic stimulus package	M	15	C	The distribution pipeline along Sneden Street are undersized and old. The distribution network is unable to meet water demands for a residential fire. The pipeline is small, old, and corroding. Some of the service connections are located within a few feet of the sewer laterals, violating the 10' minimum separation requirements. Many of the adjacent sewer laterals are made of steel and have significantly corroded, making the potential for contamination of the water services higher. (Sewer lateral improvements are applied for under State Water Resources Control Board Pre-Application)The City's distribution mains replaced in recent years have leaks, causing water and electricity to be wasted. The water system could save water and energy by replacing the pipeline along Sneden Street. The aging, undersized 4" main, appurtenances and service connections need to be replaced with a larger pipeline to provide sufficient flow for fire event, remove the possibility of contamination from collapsed and damaged pipelines.There is inadequate fire hydrant spacing in the area. Additional hydrants are required to meet the minimum separation.	170,000	1,161	3,643	13	Inyo	V	2009
1576	1410001	1410001-003	CITY OF BISHOP	Hanby Street Water Improvements	Replace existing deteriorated 6 inch galvanized steel water line on Hanby Avenue from Line Street to East Pine Street with 8 inch plastic pipe for a distance of about 1000 feet. Construct new connections with water lines on Line, Willow, and May street including valves. Replace service laterals to provide separation from sewer laterals. Construct new 8 inch plastic water line along Hanby from Pine to East Yaney with valves and with service connections to proposed community improvements at the City Park and to the proposed 15 acre workforce housing development.	M	15	C	The water line in Hanby Avenue is very important to the entire City of Bishop water system. The Hanby water line forms the eastern edge of the grid of water lines in the city. Unfortunately, the existing 6 inch galvanized line is undersized, deteriorated, and leak prone. The existing line is about 1000 feet long. In addition, there is about a 1600 foot gap in this water line that destroys the strong system topology that would otherwise exist. At the south and, particularly, the north sides of this gap are dead end lines that can have difficulty with fire flow and stagnation. The nearest continuous pipe in the grid is almost 1/2 mile west.Hanby Avenue borders the Bishop City Park and land that has been identified for development as work force housing. In addition to the benefits to the water system of the proposed Economic Recovery project, this project would promote the development of affordable housing and the development of recreation facilities in the City Park.The City of Bishop Targeted Income Group is 53%.This project is proposed in conjunction with Economic Recovery projects to reconstruct a portion of Hanby Avenue and to make minor sewer improvements.	492,100	1,161	3,643	13	Inyo	V	2009
1577	1310011	1310011-008	Coachella VWD: I.D. NO. 11	Marina Drive, Sorrel Avenue, and King Avenue Main Replacements	The Marina Drive, Sorrel Avenue and King Avenue Main Replacements project includes installing approximately 1,500 feet of 6-inch and 1,100 feet of 8-inch ductile iron water main including valves, services, hydrants and related appurtenances. This project is categorically exempt under Article 18, Section 15282 of the CEQA Guidelines as a pipeline installation less than a mile in length. A Notice of Exemption will be prepared per CEQA guidelines and filed with Riverside County prior to construction.	M	15	C	The Improvement District No. 11 (ID 11) water system consists of three wells, 16-inch and 18-inch transmission main, distribution piping and one 1.0 MG storage reservoir. ID 11 serves approximately 4,000 customers currently isolated from CVWD's main domestic water system. ID 11 domestic water infractructure is more than 50 years old and consists of 4-inch and 6-inch asbestos concrete pipe that has exceeded its useful life and is in very poor condition. New pipelines are needed to replace this failing infrastructure.	250,000	2,624	4,198	20	Imperial	V	2009

1578	1310011	1310011-006	Coachella VWD: I.D. NO. 11	Salton Drive, Harpur Ave., Rutgers Ave., Haven Drive and Desert Manor Ave. Main Replacements	The Salton Drive, Harpur Ave., Rutgers Ave., Haven Drive and Desert Manor Ave. Main Replacements project includes installing approximately 900 feet of 6-inch and 1,800 feet of 8-inch ductile iron water main including valves, services, hydrants and related appurtenances. This project is categorically exempt under Article 18, Section 15282 of the CEQA Guidelines as a pipeline installation less than a mile in length. A Notice of Exemption will be prepared per CEQA guidelines and filed with Riverside County prior to construction.	M	15	C	The Improvement District No. 11 (ID 11) water system consists of three wells, 16-inch and 18-inch transmission main, distribution piping and one 1.0 MG storage reservoir. ID 11 serves approximately 4,000 customers currently isolated from CVWD's main domestic water system. ID 11 domestic water infractructure is more than 50 years old and consists of 4-inch and 6-inch asbestos concrete pipe that has exceeded its useful life and is in very poor condition. New pipelines are needed to replace this failing infrastructure.	250,000	2,624	4,198	20	Imperial	V	2009
1579	1310011	1310011-005	Coachella VWD: I.D. NO. 11	Citrus Ave., Grand Ave., and Cornell Ave. Main Replacements	The Citrus Ave., Grand Ave. and Cornell Ave. Main Replacements project includes installing approximately 2,000 feet of 6-inch and 100 feet of 8-inch ductile iron water main including valves, services, hydrants and related appurtenances. This project is categorically exempt under Article 18, Section 15282 of the CEQA Guidelines as a pipeline installation less than a mile in length. A Notice of Exemption will be prepared per CEQA guidelines and filed with Riverside County prior to construction.	M	15	C	The Improvement District No. 11 (ID 11) water system consists of three wells, 16-inch and 18-inch transmission main, distribution piping and one 1.0 MG storage reservoir. ID 11 serves approximately 4,000 customers currently isolated from CVWD's main domestic water system. ID 11 domestic water infractructure is more than 50 years old and consists of 4-inch and 6-inch asbestos concrete pipe that has exceeded its useful life and is in very poor condition. 1580	0910003	0910003-008	Placerville, City of - Main	Tunnel Street Waterline Relocation Project	The project involves construction of approximately 4,000 LF of new 6-inch and 8-inch water main along with related valves and appurtenances, and construction of new services for the approximately 50 residences served by the existing main.	M	15	C	The existing water main needs to be replaced with a new water main since the existing main is approximately 45 years old, located in a drainage course, and is situated within 10 feet of an existing sanitary sewer contrary to California Waterworks Standards.	1,100,000	3,399	4,926	09	El Dorado	I	2009
1581	0910003	0910003-005	Placerville, City of - Main	Pardi Way Pipeline Replacement Project	The project will involve construction of approximately 1,000 LF of new 12-inch pipeline and associated valves and tie-ins to assure distribution system reliability in accordance with California Waterworks Standards.	M	15	C	Construction of the pipeline is necessary replace an existing 55 to 75 year old pipeline that includes cast iron pipe with leadite joints, and is in poor condition and subject to frequent outages due to leakage. The pipeline is located on Pardi Way and Big Cut Road.	350,000	3,399	4,926	09	El Dorado	I	2009
1582	3110001	3110001-014	North Tahoe PUD - Main		Construct a 2,660 ft long main. Involves design and construction.	M	15	C	Undersized main line.	267,500	3,294	5,000	02	Placer	I	2006
1583	3110001	3110001-006	North Tahoe PUD - Main		Create a pressurized sub-zone and provide service stubs to properties with pressures. Involves design and construction.	M	15	C	Low head lines due to proximity in elevation to storage reservoir.	94,900	3,294	5,000	02	Placer	I	2006
1584	3110001	3110001-002	North Tahoe PUD - Main		Install a modern, supervisory control and data acquisition system.	M	15	C	Needs SCADA control system.	126,000	3,294	5,000	02	Placer	I	1998

1585	3310048	3310048-002	Coachella VWD: I.D. NO. 8	Reservoir 3601-2	The Reservoir 3601-2 project includeses the construction of a 1.75 MG above-ground, steel, domestic water reservoir on the same site as Reservoir 3601-1. The project includes a concrete ringwall, steel storage reservoir, appurtenances, coating and piping connections. On November 14, 2006, CVWD received State Clearing House #2006101089 which acknowledges compliance with review requirements pursuant to the California Environmental Quality Act. On November 28, 2006, the CVWD Board of Directors adopted a Negative Declaration for Reservoir 3601-2 project by Resolution 2006-263. A Notice of Determination was prepared and filed with the Riverside County Board of Supervisors.	M	15	C	CVWD's Improvement District No. 8 (ID 8) system is comprised of the Upper ID 8 Pressure Zone, Lower ID 8 Pressure Zone, ID 18 Pressure Zone and the Wide Canyon Pressure Zone. Existing Reservoir 3601-1 is the primary storage for the Wide Canyon, Upper ID 8 and ID 18 pressure zones serving nearly 4,000 customers. An independent engineering firm inspected Reservoir 3601-1 in September of 2006 and determined the interior coating has exceeded its expected life and is in poor condition. Reservoir 3601-1 was constructed in 1966 and has never been re-coated. It is currently impractical to take this reservoir out of service for the much needed repairs and upgrades. A new reservoir (Reservoir 3601-2) will enable CVWD to remove Reservoir 3601-1 from service to perform necessary seismic, health and safety upgrades in order to comply with OSHA, CDPH and AWWA standards. In addition, a new domestic water reservoir will provide increased storage for fire protection, diurnal demands and emergencies. The new storage reservoir will also allow filling during off-peak electrical demands which result in energy savings.	2,000,000	1,555	5,132	20	Riverside	V	2009

1594	1910085	1910085-001	MAYWOOD MUTUAL WATER CO. #2		Construct 1.5 MG reservoir. Remove top 30' of two reservoirs. Construct new roofs on two reservoirs, construct hydropneumatic pump station and standby generator. Project involves: Design to solve problem, and Construction.	M	15	C	WW standards defects. Poor reliability of existing aged steel reservoirs. Insufficient storage.	2,000,000	1,908	6,700	16	Los Angeles	IV	2006
1595	1510041	1510041-003	North of the River MWD		Replacement of majority of distribution system, and customer service lines. OTHER - Design and Construction	M	15	C	Old and deteiorating distribution system with many leaks and breaks, under sized mains.	3,300,000	2,025	7,500	12	Kern	III	1998

1596	3310063	3310063-006	Coachella VWD: I.D. NO. 10	Reservoir 6806-2	The Reservoir 6806-2 project includes the construction of a 0.5 MG above-ground, steel, domestic water reservoir on the same site as existing 0.5 MG Reservoir 6806-1, Well 6806-1, Booster Station and Ion Exchange Treatment Plant. The project includes a concrete ringwall, steel storage reservoir, appurtenances, coating and piping connections. On November 27, 2006, CVWD received State Clearing House #2006101090 which acknowledges compliance with review requirements pursuant to the California Environmental Quality Act. On November 28, 2006, the CVWD Board of Directors adopted a Negative Declaration for the Reservoir 6806-2 project by Resolution 2006-264. A Notice of Determination was prepared and filed with the Riverside County Board of Supervisors.	M	15	C	CVWD's Improvement District No. 10 (ID 10) system includes the Mecca Pressure Zone, North Shore Pressure Zone and Bombay Beach Pressure Zone. This project is located within the Mecca Pressure Zone (MPZ) which serves approximately 1,150 homes and consists of two wells, an arsenic removal facility and one 0.5 MG domestic water reservoir (Reservoir 6806-1). Existing water storage volume is marginal for this system and additional loading will soon be added to the system (La Pena Housing Facility and St. Anthony's Mobile Home Park). A new 0.5 MG domestic water reservoir (Reservoir 6806-2) will provide increased storage for fire protection, increasing diurnal demands and emergencies. In addition, the new storage reservoir will allow filling during off-peak electrical demands which result in energy savings. A second reservoir will also allow the existing reservoir to be placed out of service for routine repairs and maintenance.	800,000	2,451	7,598	20	Riverside	V	2009
1597	3310063	3310063-004	Coachella VWD: I.D. NO. 10	Reservoir 7990-2	The Reservoir 7990-2 project includes the construction of a 500,000 gallon above-ground, steel, domestic water reservoir on the same 1-acre parcel as the existing Reservoir 7990-1. The project includes a concrete ringwall, steel storage reservoir, appurtenances, coating and piping connections. On November 7, 2006, CVWD received State Clearing House #2006101002 which acknowledges compliance with review requirements pursuant to the California Environmental Quality Act. On November 14, 2006, the CVWD Board of Directors adopted a Negative Declaration for Reservoir 1092-2 project by Resolution 2006-246. A Notice of Determination was prepared and filed with the Riverside County Board of Supervisors.	M	15	C	CVWD's Improvement District No. 10 (ID 10) system includes the Mecca Pressure Zone, North Shore Pressure Zone and Bombay Beach Pressure Zone. Reservoir 7990-1 is the primary storage (0.5 MG) for the North Shore and Bombay Beach pressure zones. During a recent underwater diving inspection, five feet of sand was removed from this existing reservoir. In addition, an independent engineering inspection confirmed that the interior coating system has failed and is compromising the structural integrity of the reservoir. Reservoir 7990-1 was constructed in 1966 and has never been re-coated. It is currently impractical to take this reservoir out of service for the much needed repairs and upgrades. A new reservoir (Reservoir 7990-2) will enable CVWD to remove Reservoir 7990-1 from service to perform necessary seismic, health and safety upgrades in order to comply with OSHA, CDPH and AWWA standards. In addition, a new 0.5 MG domestic water reservoir will provide increased storage for fire protection, diurnal demands and emergencies. The new storage reservoir will also allow filling during off-peak electrical demands which result in energy savings.	800,000	2,451	7,598	20	Riverside	V	2009
1598	2410010	2410010-001	WINTON WATER & SANITARY DIST		LOCATE BY AREA ALL SUBSTANDARD SIZED LINES AND REPLACE/CONSTRUCT A STORAGE TANK WITH CONNECTING LINES. OTHER - STUDY, DESIGN AND CONSTRUCTION	M	15	C	OLD SUBSTANDARD SIZED LINES CAUSING CONTINUED MAIN LINE BREAKS AND LOW PRESSURE PROBLEMS. WE ALSO HAVE A WATER SUPPLY PROBLEM WHICH REQUIRES A GROUND STORAGE TANK.	2,500,000	3,113	8,500	11	Merced	III	1998
1599	3610044	3610044-005	DWP - BIG BEAR LAKE/MOONRIDGE	Lakeplant Well No. 6 Pump Station Construction	This project includes installing a pump, constructing a pumphouse, and installing the piping necessary to tie the well into the water system.	M	15	C	This well is designed to replace three wells in the same well field that are currently unusable for various reasons. The three wells were drilled in the late 1920's or early 1930's and don't have sanitary seals that meet current standards. One has a hole in the well casing. Two of the three have recurring bacteria contamination and the third feeds into the same forebay which is now unusable due to the reduced water flow from having the two wells offline.	246,950	10,366	8,839	13	San Bernardino	V	2009

1600	3610044	3610044-004	DWP - BIG BEAR LAKE/MOONRIDGE	Division Well No. 8 Drilling	Division Well No. 8 is being drilled to replace two wells in the same well field that developed high manganese concentration levels. Prior to investing in this project, an investigation was performed to evaluate and identify the source of manganese in the existing wells. Additionally, further water sampling was performed at the Division No. 8 test hole to ensure that water of sufficiently high quality could be extracted from the new well to justify using it as a replacement well for the two problem wells. Once Division Well No. 8 is completed and brouoght online, the two problem wells will be abandoned.	M	15	C	The Division No. 8 Well will replace two wells in the same well field that developed high manganese levels due to corrosion of the well casing. The drinking water standard that was being violated was exceedance of the MCL for manganese. Water samples were taken from Division No. 8 test hole to verify that a new well could be brought into production with water quality that met all CDPH well water standards. No public notification was required.	122,276	10,366	8,839	13	San Bernardino	V	2009
1601	3310029	3310029-002	Perris, City of	Downtown Perris Waterline Replacement Program (Phase 3)	The planned project would replace all 2" diameter steel pipelines within the City's water service area and install new pipes with 6" minimum diameter PVC lines. A total of 9,200 ft of pipeline would be replaced. In addition to the new pipe, appropriate blowoffs, fire hydrants, av/ar valves, and other appurtenances will be installed to ensure the locations in question are brought into full compliance with the state's water works standards.The proposed project will be Phase 3 of the City's program to replace inadequate pipeline facilities. The first two phases of this program were constructed in 2003-4, using funding from a state SDWSRF loan. Those projects, with a construction cost of over $2 million, replaced over 6,000 feet of water pipeline in downtown Perris in addition to significant sanitary sewer upgrades.	M	15	C	The City of Perris Water System serves the downtown urban core of the city. The existing water infrastructure is largely made up of aging (50 years old or more) pipelines that do not comply with modern standards. In particular, there are 9,200 feet of 2" steel waterlines in the City. These pipes are out of compliance with water works standards.Due to the age of these facilities, they suffer routine failures and are plagued by leaky services and meters. As a result, the City's ability to adequately supply residents with water service is compromised. The frequent failures in the aging, undersized pipes results in significant maintenance needs, which in turn causes City crews to delay or neglect other important maintenance activities such as regular flushing of lines and exercising of valves.A further problem which is common throughout the project area is inadequate separation between the waterlines in question and sanitary sewer lines (both horizontal and vertical).	1,800,000	2,268	9,000	20	Riverside	V	2009
1602	3310029	3310029-001	Perris, City of	Water Main and Valve Replacement	This Project will entail Water Main Valve locating and Inspection of Condition of valve and water main . All valves and mains that are in poor condition will be identified and scheduled for replacement as part of this project.	M	15	C	The City of Perris Water System has many aging Water Mains and Valves that have not been inspected or maintained . The City is on a Compliance Order by the DPH to maintain its service area to Include a Water Main Flushing Program . This would entail valve exercising and Hydrant Flushing , however It is estimated that a considerable amount of repair and or replacement of Non Conforming Valves would have to be undertaken to have an acceptable Water Main Valve Exercising and Flushing Program.	400,000	2,268	9,000	20	Riverside	V	2009

1603	1810001	1810001-003	City of Susanville	Cady Springs Booster Station, Storage Tank and Pipeline	Work needing to be completed: The installation of a pumping station, the building in which it will be housed. The electrical supply to the pumping station, along with backup generator support. The SCADA equipment for control and monitoring of the pumping station. The chlorine injection pump and safety equipment for treatment. The installation of the Pressure Reducing Station located at the end of the 2.5 miles of exisiting water line. Installation of piping to connect the pumping station to the 10 inch water line previously installed. There will be the completion of three (3) state highway crossings, which underground casings already exist, water piping will have to be installed and tied into the exisiting 2.5 miles of water line. At which time all of the water line will be tested. This will pump water through the new 2.5 miles of new underground main with a new 1 million gallon water reservoir that has been completed. Construction of 11,000 feet of maintenance road along the old transmission line for monitoring, maintenance, emergency repairs and future replacement access. The proposed water system improvements are needed to maintain a reliable and safe water supply with sufficient capacity for providing safe drinking water and fire protection in the event of any interruption in service from the old transmission line, do to the extreme age and vulnerability of the original transmission line.	M	15	C	The proposed project is necessary to maintain a reliable water supply with sufficient capacity for fire demands. The existing transmision main is not consideered reliable because most segments are 30 to 50 years old, and the majority is above-ground on steep slopes with a significant potential for rockfalls and slides. In addition, access for maintenance and emergency repairs is very limited. Concerns regarding pipeline reliability are further heightened because the pipeline transmits such a large portion of the City's water supply. Cady Springs source represents 40 to 45 percent of the City's total annual water consumption. In January 1998 and in June 2008, sections of the transmission line were damaged by falling boulders. Access to damaged sections could be abtained only by foot or helicopter. Although use of a helicopter was attempted, inclement weather prevented it from bring in the needed materials. Consequently, materials had to be hand-carried to the work areas by the water departments crew. Tanker truck were used to provide water to the California Department of Forestry station, Rocky Crest Mobile Home Park and residences during the outage. If a larger section of transmission main were to be damaged during the summer months, it would have a major impact on the City's total water supply and affect all water users. It would also affect the City's ability to provide safe drinking water and adequate fire	1,900,000	3,599	9,137	02	Lassen	I	2009
1604	4010011	4010011-010	MORRO BAY WATER DEPARTMENT	Blanca Pipeline	In 1997 the City of Morro Bay adopted an updated Water Master Plan. This plan included a hydraulic model designed to analyze flows through our system for both current and build out conditions. Based upon the findings of the model a feed line is needed to link the four Blanca water tanks to the Elena Tanks. The line will interconnect two pressure zones, and will facilitate the feeding of the Blanca tanks through the distribution lines.The line will also allow water to be feed to the lower pressure zone eliminating the need for one of the cities booster pump stations and the associated energy consumption. This will eliminate the need to operate and maintain the pump station, reducing both the energy consumption and associated maintenance costs for the pump station.The new line will be constructed of 1580 ft of 16-inch diameter PVC pipe.	M	15	C	The City of Morro Bay feeds the four Blanca water storage tanks by flowing water from another tank site through the water distribution system. In order for the City to operate an efficient and adequate water supply two pressure zones need to be tied together with a dedicated feed line to the Blanca tanks.	85,500	5,425	10,270	06	San Luis Obispo	IV	2009
1605	4010011	4010011-012	MORRO BAY WATER DEPARTMENT	Chorro Valley Pumping Line Slip Lining	The City of Morro Bay Public Services Department has determined that slip lining of the Chorro Valley Pumping Line would provide the most cost effective solution to ensuring the integrity of the pumping line. The 12,800 ft of pumping line will be taken out of service prior to the lining, during such time the City will use other sources of water. A slip liner will be installed in the pumping line and then tested to ensure proper installation and reliable future operation.	M	15	C	The City of Morro bay owns and operates an 8" AC PC 100 pumping line to transport water from the City's groundwater wells to the City's distribution system. The line is old and in need of repair. Since the line is the only means of transporting water to the City from the Chorro Valley groundwater wells, the consequence of failure of the line is high. In addition, the pressure line is operating at a higher pressure then the line is rated for.	4,200,000	5,425	10,270	06	San Luis Obispo	IV	2009

1610	3310003	3310003-002	Blythe - City of	Murphy Street Well Replacement w/Iron & Manganese Treatment	The project will be constructed on an existing site. Improvements will include a 1500-gpm cased well and iron / manganese treatment. As discussed within the problem description, Well No. 7 which is experiencing potential hydrocarbon influx, will be relocated to this site due to this site's sufficient size and capability for expansion. Most improvements required to operate a production facility already exist and include a 2.2-MG reservoir, booster pump, and emergency back-up generator.	M	15	C	City of Blythe Well #7 is at risk from 3 co-mingled hydrocarbon plumes. Co-mingled plumes #1, #2, and #3 are within Well #7's zone of influence. Main constituents of concern within the 3 hydrocarbon containing groundwater plumes are benzene and MTBE. Based on a risk assessment done by FHA, the plume is traveling towards Well #7 and in time will adversely impact well. The most feasible alternative is abandonment and relocation of Well#7 to a new location away from contamination sources.	1,976,150	3,414	12,155	20	Riverside	V	2009

1616	3410704	3410704-004	SCWA Mather-Sunrise		Replace deficient valves and hydrants.	M	15	C	Replace deficient valves and hydrants.	175,000	4,330	15,903	09	Sacramento	I	1998
1617	1610002	1610002-009	Avenal, City of	Water System Replacement	The City of Avenal is proposing to replace all of the defective gates valves and fire hydrants within the distribution system. The City staff will have to coordinate a systematic approach to the gate valve and fire hydrant replacement program to minimumize customer outages.	M	15	C	The City of Avenal's (City) water distribution gate valves were installed in the early 1960's. Currently, a large majority of the original gate valves will not close, or remain broken in the "open" position. Likewise, it is possible the working gate valves have also become stuck in the "closed" position. In 2006 alone, 109 leaks were reported within the City's distribution system. While repairs or connections to the distribution system are made, the gate valves must be closed. Due to the failed condition of the many valves, often a large portion of the system must be shutdown to isolate the repair site, disrupting water service for a minimum of three to four hours to an area that can range from a City block of 60 residences to one-third of the City, including the downtown area and schools. The water system replacement project proposes to replace failing or failed gate valves with new butterfly valves throughout the City distribution systemThe majority of the City's fire hydrants were also installed in the early 1960's, and are not equipped with break off risers and check valves. Thus, the only method available to close the hydrant when unanticipated failures and/or accidents occur is by use of the adjacent failing gate valves. Additionally, many of the existing hydrants are corroded and leaking. The water system replacement project proposes to upgrade approximately 170 fire hydrants.On many occasions the connections are made	3,900,000	1,892	16,737	12	Kings	III	2009
1618	1910161	1910161-002	PARK WC - LYNWOOD		Preliminary and final design of well and construction of well. Project involves: Design, and Construction	M	15	C	Existing wells are over 45 years old. They are declining in both production and water quality.	450,000	4,392	17,124	22	Los Angeles	IV	2006
1619	1910161	1910161-001	PARK WC - LYNWOOD		Final design of well head and construction of well head. Project involves: Design, and Construction	M	15	C	Existing wells are over 45 years old. They are declining in both production and water quality.	730,000	4,392	17,124	22	Los Angeles	IV	2006

1620	2710008	2710008-003	Greenfield, City of	New Domestic Water Well Construction	There are no violations of any water standard nor compliance problems present. The construction of the domestic water well will consist of drilling and construction of a production well on City-owned land near 10th Street and Cherry Avenue. The project will also involve the associated pumps, motors, motor control center including SCADA and pipeline to the existing 1.5 MG water tank on 10th Street.	M	15	C	The proposed construction of the new domestic water well (#8) is necessary to reduce the operating time of the older domestic water wells (#1 and #6), thereby increasing their life expectancy. There is no water standard being violated. The project is to necessary to ensure that the water demands of the City are met.	975,000	3,408	17,547	05	Monterey	II	2009
1621	3610008	3610008-008	BIG BEAR CITY CSD	CIP Project 3 Water Main Replacement	The CIP Project 3 Water Main Replacement involves replacing numerous pipes in the vicinity, and many that are 2" steel pipes which are recommended to be phased out due to age and condition issues. All water lines in this project will be replaced with 8" PVC pipes, and fire hydrants installed at distances approved by the local fire agency. All water services in this project will be replaced with copper pipe.	M	15	C	Hydraulic modeling of the distribution system returned pressure and velocity deficiencies in this area. This area does not meet current fire-flow standards. Big Bear City and the surrounding area is prone to wildfires. This is one of the top priorities for pipeline replacement projects due to inadequate fire flow and wildland / urban interface.	1,224,000	6,356	25,000	13	San Bernardino	V	2009
1622	1010027	1010027-006	REEDLEY, CITY OF	Rehabilitate Well # 9 and Install Back-up Generator	This project will abandon the existing well and drill a new well approximately 50 feet away. The new well will be drilled to a depth of about 500 feet and will require casings and a larger pump to handle the depth. A back-up generator will be installed to run the well during periods of power outages.The City is in the process of seeking funding to complete the City of Reedley's citywide Supervisory Control and Data Acquisition (SCADA) system to monitor and control the City's water, sewer, and storm drain facilities. Once this new well is operational, it too will be connected to the citywide SCADA system.The City is in the process of seeking funding to install chlorine residual analyzers at each of the City's wells to better monitor and control the residual chlorine in the system. This new well will also be fitted with a chlorine residual analyzer as funding becomes available.	M	15	C	The City of Reedley's Well # 9 has been a problem for the City for many years. The City must replace the carbon filtration system media , required to remove the DBCP contaminants from the ground water, each year at a cost of approximately $80,000 annaully. In addition, the well has been shut down since November of 2007 due to high concentrations of nitrates. This well site does not have a back-up generator system and when it was being used would not be available when there were power outages. The existing well is approximately 230 deep, the well needs to be about 500 feet deep to get below the DBCP and nitrate plume.The Well needs to be drilled deeper to get out of the DBCP and nitrate plume. The well needs to have new casing installed to reduce the amount of sand reaching the distribution system. The well also needs a back-up generator to operate the well site during power outages.	750,000	6,619	25,584	11	Fresno	III	2009
1623	1010027	1010027-004	REEDLEY, CITY OF	1.5 Million Gallon Water Tower	The project will allow for a 1.5 million gallon water tower to be constructed in the northern part of the City of Reedley in order to stabilize the water pressure and provide the City with more than 24 hours of reserve capacity. A (Supervisory control and data acquisition) SCADA system will be installed to monitor levels and pressures. The project will also include a chlorine residual monitoring equipment that will inetrface with the SCADA system to provide disinfection status of the towers. The City currently owns property where the water tower is planned to be constructed and is adjacent to a City well site providing minimal work to incorporate the water tower into the City's domestic water system. The water tower would provide the City the opportunity to pump water into the tower during off-peak electrical load periods.	M	15	C	1. Reserve Fireflow Capacity - The City currently only has about 25 minutes of reserve fireflow capacity should there be an extended power outage. The City of Reedley should have a minimum of 24 hours of reserve fireflow capacity. This new water tower will help provide that necessary fireflow reserve capacity.2. Reserve Domestic Water Supply - The City currently has only two 60,000 gallon water towers to provide reserve capacity for a City with a population of about 24,000. There are approximately 5,000 water service connections in the City. This is not adequate should the City experience an extended power outage. This new water tower will help provide the adequate reserve capacity for the residents of Reedley.3. Improve Water Pressure - There are several areas of the City which experience low water pressure on a regular basis (mostly in the northern part of the City). This water tower will help stabilize the water pressure in these areas.The existing water towers are located in the downtown area of the City. A new water tower is being constructed in the southern part of the City and will accommodate the water demand for that area, however another water tower is needed in the northern part of the City to alleviate the water distribution problems (low water pressure) in that area.	8,000,000	6,619	25,584	11	Fresno	III	2009

1624	1010027	1010027-005	REEDLEY, CITY OF	Reed Avenue Water Main Replacement	Construct a 12 inch diameter water main in Reed Avenue from Manning Avenue to South Avenue. All work will be completed within City right of way, no additional right of way will be required. It is anticipated the environmental document will be a CatEx/NegDec. This project will adequately supply domestic water to the City's distribution system.	M	15	C	The City of Reedley has recently constructed a new City domestic water well for the northern part of the City. One of the potential sites of a new water tower may be at the Reedley College site. The water tower would be tied directly into the water main in Reed Avenue The existing water main in Reed Avenue will convey the water from this new well (and water tower) and serve much of the northern portion of the City. The existing water main in Reed Avenue is only 8 inch and is inadequate to serve the tributary area the new well will be serving. The water mains tying into the main in Reed Avenue are larger diameter pipes (10" diameter), therefore, for the City water system to perform adequately, the water main in Reed Avenue that will be connected to the new well and water tower will need to be 12 inch in diameter to adequately feed the water mains tying into the Reed Avenue water main.	950,000	6,619	25,584	11	Fresno	III	2009
1625	1010027	1010027-003	REEDLEY, CITY OF	Residential Water Main Replacement	Install approximately 25,000 linear feet of 8 inch domestic water mains. This project will provide the adequate domestic water delivery capacity for this area and an adequate fireflow capacity to service the developments that have occured in this area. This is an appropriate time to install the new water main in that the City's future growth will primarily be to the north and west due to the Fresno/Tulare County line being immediately south of the City of Reedley and the City of Dinuba being in close proximity to the east City limits of Reedley. All work will be completed within City right of way and the environmental document for this project would be a CatEx/NegDec.	M	15	C	The southeast quadrant of the City is one of the oldest areas of the City. The City has outgrown much of the infrastructure that was constructed when this area was developed. Many of the residential neighborhoods are served with a 4 inch water main and in some case the water main is only a 2 inch water main. This is insufficient to service the area this system covers. This area sufers from low water pressure and insufficient flow to meet the demand. In addition, the small water mains do not provide sufficient fireflow capacity given the extensive growth in this area. The City has reached its southern expansion limit in that the south City Limits/Sphere of Influence is located along the northern Tulare County line (Reedley lies in Fresno County). The City is limited in its ability to grow much further to the east due to the close proximity to the City of Dinuba. The 4 and 2 inch water mains need to be replaced with an 8 inch water main to provide adequate water delivery capacity.	2,500,000	6,619	25,584	11	Fresno	III	2009
1626	1910021	1910021-001	PARK WC - COMPTON		Final design of well head and construction of well head. Project involves: Design, and Construction	M	15	C	Aged wells are declining in both production and water quality.	1,180,000	6,852	27,236	22	Los Angeles	IV	1998

1628	3610043	3610043-003	GOLDEN STATE WATER CO - BARSTOW	GSWC-Barstow System-Bear Valley Reservoir, Phase 1	To furnish and erect a new 0.75 MG welded steel water storage reservoir with appurtenances; including ring wall foundation, and reservoir sub grade preparation. Also included in the scope of this project is to abandon and replace portions of the existing onsite piping. The plans for the project are completed and the estimated construction start date will be in July of 2009.	M	15	C	The old Bear Valley Reservoir was a post tensioned concrete reservoir that no longer conformed to current AWWA codes. The new reservoir will replace this recently demolished concrete reservoir and old onsite piping which have reached the end of their useful life.	1,586,989	9,233	30,469	13	San Bernardino	V	2009

1629	3610043	3610043-004	GOLDEN STATE WATER CO - BARSTOW	GSWC-Barstow System-Barstow Pipeline Replacement Project	The proposed project is to replace the existing mains in Leona Rd. south of Arrowhead Ave.; Camerillo Ave from State 58 and ending at Palermo St.; State 58 between Irwin Rd. and Boulder Ave.; Irwin Rd. between Gabiland St. to Exeter St. and in Irwin Rd. between Exeter St. and Old CA-58; State 58 west of Irwin Rd.; Arrowhead Ave. west of Irwin Rd.; Radio Ave. west of Irwin Rd.; Crooks west of 1st continuing into Pierce; May between Main and Buena Vista; 1st Ave. between Main St. and Buena Vista St.; Silver Lane from Buena Vista ends on Silver Lane; Fredericks St. between 1st and Barstow; 5th south of Clark St.; 6th Ave. and Williams St.; A Ave. between Nancy and Flora; 6th Ave. from Pioneer St. and ends at Barstow Rd.; Lance Dr. between 7th Ave. and Barstow Rd and Lillian between Mountain View St. and Elizabeth St.; Lillian Dr. north of Bigger ending at Melissa; Buena Vista St. to Mountain View St.; Arville Ave. between Mountain View St and 1st Ave.; Flora St. and A Ave.; 2nd Ave and Fairview St.; Grace St to Grace St. and install check valve; Mountain View Dr. between Murriel Dr. and Elm Ave.; Mountain View between Yucca and Patricia; Main St. between Coldwater and west of Yucca; Ann St. between Lillian Dr. and Bassett Dr.; Montara Rd. and ends before Barstow freeway; Chateau between Armory and Crescent and Armory and Colonial; Guadalupe Dr. south of Teton Dr.; Juniper between Lotebush and Wisteria; Windy Pass west of	M	15	C	There are fire flow deficiencies in the Barstow system due to undersized 1920's era mains installed that range in size from 4 inch to 12 inch in diameter.	18,304,000	9,233	30,469	13	San Bernardino	V	2009
1630	4210006	4210006-002	LOMPOC-CITY WATER UTILITY DIV	City of Lompoc Flocculation and Clarification Replacements	This equipment has been in use for 45 years and has undergone annual maintenance to extend it's life, assure reliability and SDWA compliance. The drive motors are no longer available and will be replaced with upgrades. Structural modifications will be made to accomodate the new drive motors. Sweep arms and flocculator shafts will be rehabilitated and upgraded, and reinstalled with new shaft seals.	M	15	C	Replacement of the processing equipment for the flocculation and clarification basins (2 each) is needed to assure SDWA compliance and treated water delivery reliability. The basins contain moving rake arms and paddles that are mechanically driven by electric motors. This aging equipment was installed in 1963 and, because of its age, much of it is no longer available. The equipment must be upgraded and replaced. Failure of this equipment will cause a 50% production capacity reduction, which would place restrictions upon the community during high demand periods when both basins are required. This project has been postponed due to lack of funding during our budget process.	820,000	9,647	38,311	06	Santa Barbara	IV	2009

1634	4410011	4410011-001	Watsonville, City of	Corralitos Membrane Plant	The project will address three solutions:Solution 1: Convert the existing slow-sand filtration plant into a 2.5 mgd membrane plant. The water treatment plant will meet current state surface water treatment requirements. The membrane filtration plant will provide a higher, more reliable level of treatment for the surface water sources, and will be able to overcome the regulatory issues associated with high turbidity water that cannot be addressed by the existing slow-sand filtration plant. Solution 2: The membrane water treatment plant will run year-round and will provide a continuous, reliable source of water. It will solve the problem of "water outages" associated with the existing slow-sand filtration plant. Solution 3: The water treatment plant will increase surface water sources in an over-drafted groundwater basin. The City has historically produced 1,100 AFY from this water source. This project will increase production to 2,000 AFY. Project Details: The project scope includes removal of the existing slow-sand filter plant, and construction of a pretreatment system, membrane filtration plant and pump station, solids handling facilities, a clearwell, and all associated electrical and instrumentation control systems.Pretreatment includes installation of flash mix, flocculation, and a pre-fabricated package plate settling unit (with coagulant and polymer addition) for color and total organic carbon removal to ensure compliance with	M	15	C	Problem 1: The existing water treatment plant has filtration treatment deficiencies and does not meet current state surface water treatment requirements. Corralitos Creek, the source water for the existing surface water treatment plant, is classified as "Grossly Contaminated" by CDPH (total coliform levels over 1000 organisms per 100 ml of sample). CDPH requires the existing slow-sand filtration plant be shut down when the source water exceeds 10 NTU, generally during the winter. The prevalence of high-intensity storms and significantly increased creek flow rates during the rainy season results in turbidity spikes over 100 NTU and sustained turbidity events (longer than 1 week) over 20 NTU.Elevated coliform levels have necessitated additional log removal requirements for Giardia and Cryptosporidium to comply with the Long Term 2 Enhanced Surface Water Treatment Rule. Sources of bacteriological contamination are varied and include runoff from lands with livestock and leaking septic systems. The plant may not treat water until the source water remains below 10 NTU for 48 hours. As a result, the bulk of surface water available to the City from Corralitos and Browns Creeks remains unused.CDPH has declared the City's 70-year old slow-sand filtration plant to be inadequate for treating high turbidity flows, as indicated in the system's operating permit.Problem 2: The existing water treatment plant is plagued with	12,000,000	15,448	51,703 05	Santa Cruz	II	2009
1635	4410011	4410011-004	Watsonville, City of	Hames and Rider Pump Station Replacement	The project will address these solutions: Solution 1: The most cost effective way to replace the Hames and Rider Booster Stations is to combine facilities and build a new single booster station. The new booster pump station will be located at the existing Hames Road Reservoir site. The pumps at this booster pump station will share a single electrical service, auxiliary power generator and controls system. Two 280 gpm vertical turbine pumps will be installed in the new booster pump station. These pumps will be dedicated to Zone 5 and will replace the Hames Booster Station. These pumps will allow the Zone 5 Reservoir (Rider Reservoir) to be refilled during PG&E night time off peak electrical rate times.Two 153 gpm vertical turbine pumps fitted with variable frequency drives will be installed in the new booster pump station. These pumps are sized to meet peak domestic day demand and will be dedicated to Zone 5A and will replace the Rider Booster Pump Station. Solution 2: A 500 gpm vertical turbine pump fitted with a variable frequency drive will be installed at the new booster pump station to provide the additional fire flow capacity required.Solution 3: To provide back-up power for continuous operations and increase system reliability, a 150 kw diesel powered standby generator with automatic transfer switch will be installed at the new pump station.Solution 4: To decrease fluctuations in the water pressure provided by the booster station, a	M	15	C	Problem 1: The Hames and Rider Booster Stations are now 37 years old, are no longer reliable, and need to be replaced. The worn and obsolete equipment at these booster stations can no longer simply be maintained, but need to be upgraded to modern standards. The Hames Booster Station, built in 1972, provides water to the City of Watsonville Pressure Zone 5. The Rider Booster Station, built in 1972 in conjunction with a hydro-pneumatic tank, provides water to Pressure Zone 5A. Problem 2: The Rider Booster Station does not meet fire flow standards, and is a potential risk to community safety. Additional pumping capacity is needed in order to improve the system's reliability.Problem 3: The Hames and Rider Booster Stations require a stationary generator to provide backup power for continuous operations and increased system reliability.Problem 4: The current system pressure can vary by 20 PSI, and does not meet the City's standards for providing water service. The City would like to minimize the pressure fluctuations and limit it to 6 PSI by modernizing Zone 5A pressure control. Problem 5: The pumps and generator are open to the environment, and are vulnerable to vandalism. They are also a source of irritating noise in the neighborhood. The facility needs to be enclosed inside a building to increase water system security and decrease noise complaints associated with this facility.	775,000	15,448	51,703 05	Santa Cruz	II	2009

1636	4410011	4410011-002	Watsonville, City of	Augmentation of System Groundwater Supply	The project will address the need for additional source water capacity:Solution: To supply current demand and bring the City into compliance with the California Water Works Standards, two wells with a capacity of 1,500 gpm each will be constructed. This project will increase the City's groundwater source capacity by approximately 3,000 gpm. The project will increase system reliability, and will help prepare the City for future drought conditions and associated water supply reductions.Major project components for the construction/installation of the two ground water wells consist of the following:1. Drill test wells, finalize well design based on test-well results, and drill production wells of approximately 2 million gallons/day each (1500 gpm).2. Construct two well houses including electrical service, housing for major plumbing, chlorination equipment and auxiliary generator.3. Install two stationary generators to provide backup power for continuous operations.4. Install variable frequency drives for flow and speed control for each well.5. Install and program modern programmable logic control system and associated instrumentation interfaced with the City's Supervisory Control and Data Acquisition (SCADA) system to control the well pumps and associated equipment.6. Install chlorination equipment at each well.	M	15	C	The City's water system has a significant water quantity problem caused by source water capacity that is insufficient to supply current demand. The City's water system is under-capacity based on the California Water Works Standards. The City needs to increase groundwater source capacity by 3,000 gallons per minute (gpm). California Department of Public Health (CDPH) indicated in their system inspection summary of 2004 that the required source capacity for the City of Watsonville water system is 14,000 gpm and that "the city is under-capacity based on the California Water Works Standards." Since the 2004 CDPH inspection, additional water demands have increased the City's required source capacity to 15,375 gpm, while the City's current actual production capacity has been reduced to 12,495 gpm. The addition of two 1,500 gpm wells would provide sufficient additional capacity to meet the City's required source capacity as indicated by CDPH. While demands on the water system have increased substantially over the last several years, there has also been a significant decrease in ground water production capacity for several of the City's wells, particularly during the high demand summer months. This is a major concern to the future reliability of the system if these trends continue. In addition, new environmental requirements severely limit the amount of water that can be diverted from the City's surface water sources	2,950,000	15,448	51,703	05	Santa Cruz	II	2009
1637	1610003	1610003-002	Hanford, City of		DEVELOP NEW DEEP WELL USING ZONES WITH LOW ARSENIC LEVELS.	M	15	C	HIGH ARSENIC IN FIVE ACTIVE WELLS	750,000	14,557	53,320	12	Kings	III	1998
1638	2010002	2010002-012	MADERA-CITY	City of Madera Well and Pipeline Replacement Program	The project would be to complete two additional water wells (wells number 38 and 39) to add to the existing 18 wells that makes up the City of Madera's water distribution system. The completed wells will be cased during the drilling process. There will be a surface seal placed on each well to prevent surface contamination of the wells. The surface seal creates an impermeable seal from the surface to the next confining layer that keeps contaminants from traveling down the outer sidewalls of the casing or borehole and into the aquifer. Each of the wells will be caped with either an engineered well cap or seal that vents air through a screen into the well, but keeps insects, small animals, and unauthorized persons from accessing the wells. Based on the formation of each well, at the bottom of the wells will be placed a screenting device, filter pack, slotted casing, or open bore hole to allow the flow of water into the wells. This allows the water to be filtered of unwanted materials before entering the wells and pumping zones. Each of the two wells will be production wells constucted for extracing water from the aquifer by a pump.Completion of wells number 38and 39 is considered the most cost effective method to ensure available water to the City of Madera's commerical and residential customers with sufficient system capacity and backup in an emergency situation. The balance of the grant will go to upgrade older water lines up to 12"	M	15	C	The City of Madera has 18 water wells which provide water to its commercial and residental customers. This year two wells had to be pulled off-line due to mechanical failure and routine maintenance. The remaining 16 wells had to operate at the same time during peak hours to meet normal water system demand. The problem then became there was no backup capacity during this peroid of well repair and maintenacne. An additional concern is that in case of an emergency need by the City's Fire Department to fight fires, the overvall water capacity would have been compromised. The City would be better prepared to ensure availble water to all its customers including emergency backup for emergency use by the City's Fire Department if two additional wells are developed and brought on line. There is also a need to upgrade older installed pipes up to a 12" size in various parts of the City. This pre-application is to pay for the costs of developing two more water wells (wells number 38 and 39) for the City of Madera. It is anticipated that each of the two wells would cost up to $1,400,000.00 each to complete and bring on line for commerical and residential use. Two more water wells would also ensure adequate emergency water use by the City's Fire Department when that added need arises. The balance of the grant request will pay for the replacement of older lines up to a distribution size of 12".	3,000,000	12,419	57,318	11	Madera	III	2009

1639	0910002	0910002-005	South Tahoe PUD - Main	Waterline Replacement Project	The proposed project is the replacement of 11,700 linear feet of leaking 1 to 2 inch water supply lines with 8 inch lines; 6,046 linear feet of waterlines in the Al Tahoe subdivision and 5,700 linear feet of waterlines in the Sonora subdivision. The estimated cost of replacement is $245 per linear foot for a total project cost of $2,866,500. STPUD engineers are responsible for the planning, design, and management of the project, with the actual construction being outsourced to local contractors. This project has completed the planning phase with a 100% set of plans and specifications and is ready to go out to bid. CEQA has also been completed and a Categorical Exemption will be filed with all the appropriate agencies. Construction is planned for May 2009 and will be completed by December 2009.	M	15	C	The current water delivery system in the South Tahoe Public Utility District (STPUD) service areas of the Al Tahoe and Sonora subdivisions is in serious need of waterline replacements. Both areas, classified as disadvantaged communities, have populations where the majority of the residents are living in multiplex units. The waterline replacement projects proposed are due to aged and leaking water pipes that serve these units. Water pipes have a lifetime expectancy of 40-50 years depending upon placement, material constructed of, and use. In municipal water systems, the largest percentage of lost water is due to leaking in the water pipe delivery system. There are two ways to stop leaks in the water supply line delivery system: utilize leak detection and repair or replace the line. In cases where the water lines have deteriorated and corroded from long use (as is the case for the waterline replacement projects proposed) leak repair is no longer sufficient to stop water loss and the lines must be replaced. These units are currently being supplied water by 1 or 2 inch waterlines that are leaking water, causing wastage, and require frequent, costly repairs. According to the American Water Works Association (AWWA), it is estimated that water losses from leaks account for 10-15% of daily water usage. STPUD also estimates that water supply line leakage represents 10% of the District's water production annually. This water line	2,281,500	13,635	60,000	09	El Dorado	I	2009
1640	3610052	3610052-004	VICTOR VALLEY WATER DISTRICT	Pipeline Replacement	Replacement of aging stainless steel pipeline placed in service in excess of 50 years ago, along with ancillary infrastucture.	M	15	C	This pipeline will replace of approximately 3 miles of stainless steel pipe to maintain water quality and improve infrastructure efficiency.	2,000,000	22,257	81,418	13	San Bernardino	V	2009
1641	3610052	3610052-002	VICTOR VALLEY WATER DISTRICT	Well #142 Replacement	Well 142 has already been drilled and the proposed project is to install pumping equipment and related infrastructure.	M	15	C	This well replaces an existing well that was originally constructed in 1951 and was taken out of service due to declining production and efficiency.	1,300,000	22,257	81,418	13	San Bernardino	V	2009
1642	1910152	1910152-002	SOUTH GATE-CITY, WATER DEPT.	City of South Gate- SCADA System	The City is currently using an outdated SCADA system of which part are no longer available or becoming scarce. SCADA manages the entire water system consisting of 14 wells, 12 boosters, 14 pump motors, five reservoirs, and the security system as required by Homeland Security. This projects serves the entire population of the City of approximately 105,000; it monitors water availability on a 24 hr basis. It ensures all facilities are monitored for terrorist actions, including contamination and water supply as requested by Homeland Security. Full funding is requested.	M	15	C	The City is currently using an outdated SCADA system of which part are no longer available or becoming scarce. SCADA manages the entire water system consisting of 14 wells, 12 boosters, 14 pump motors, five reservoirs, and the security system as required by Homeland Security.	2,000,000	16,500	96,375	22	Los Angeles	IV	2009
1643	1910152	1910152-003	SOUTH GATE-CITY, WATER DEPT.	Water Main Improvement Project	The City's water distribution system has grown and developed with the City. As a result the system contains a mixture of pipe of different ages. The hydraulics characters of the pipe changes as it ages due to corrosion, scaling, and other physical and chemical processes. The City has done a commendable effort in upgrading such deficiencies, but there remain several areas though out the City that lacks adequate service. About 48% of the distribution main serving the City's 105,000 residents are 6 inches in diameter or smaller. This deficiency creates an issue with water pressure and fire flows. The City is requesting full funding as alternate source of funding has not been made available.	M	15	C	Approximately 48% of the City Water Mains are deficient. The lines need to be upgraded to provide adequate fire flow and distribution pressure.	15,000,000	16,500	96,375	22	Los Angeles	IV	2009

1648	3310009	3310009-064	Eastern Municipal WD	Hemet/San Jacinto Integrated Recharge and Recovery Program	The goals of the Hemet/San Jacinto Integrated Recharge and Recovery Program (IRRP) are:• reduce Nitrate migration and protect nearby potable water wells;• provide high quality recharge water to ensure long-term basin water quality• mitigate overdraft that reduces the supply to local water systems• increase supply reliability during droughts and emergencies• reduce reliance on imported water suppliesFacilities to be constructed under the IRRP include:• Warren Road and Commonwealth Booster upgrades – additional capacity required to supply replenishment water to recharge ponds;• Recharge ponds – 35 acres of ponds along the San Jacinto River;• Well pipelines and recharge pipeline laterals – to convey water from new extractions wells to local distribution systems and replenishment water to ponds for recharge;• Monitoring wells – three wells to monitor recharge operations;In addition to the above facilities, the program includes drilling and equipping of three new extraction wells which are in progress and scheduled for completion in Summer, 2009. Once the program infrastructure is in place, Metropolitan Water District of Southern California (MWD) will supply an average of 7,500 acre-feet of replenishment water per year for groundwater recharge as part of a settlement of an outstanding rights dispute in accordance with the Soboba Band of Luiseño Indians Settlement Act of 2007, P.L. 110-297. Additional replenishment water for	M	15	C	The IRRP has been formulated to address groundwater quality and dramatically declining water levels in the San Jacinto Valley. In a number of wells water levels have declined in excess of 240 feet over the last 50 years. The goals of the Hemet/San Jacinto Integrated Recharge and Recovery Program (IRRP) are:• reduce Nitrate migration and protect nearby potable water wells;• provide high quality recharge water to ensure long-term basin water quality• mitigate overdraft that reduces the supply to local water systems• increase supply reliability during droughts and emergencies• reduce reliance on imported water suppliesThe precipitous decline in water levels has made the area more and more dependent on imported water sources. Additionally, a number of wells in the groundwater management zone have Nitrate (as N) levels in excess of the Maximum Contaminant Level (MCL) of 10 mg/L.Once the project infrastructure is in place, Metropolitan Water District of Southern California will supply an average of 7,500 acre-feet of water per year for replenishment activities in accordance with a stipulated judgment satisfying a water rights lawsuit brought by the Soboba Band of Luiseño Indians. The program is funded by local agencies, including Eastern Municipal Water District (EMWD), Lake Hemet Municipal Water District, City of Hemet and City of San Jacinto, who will serve on the board for the future	8,199,200	141,243	414,710	20	Riverside	V	2009
1649	3310009	3310009-060	Eastern Municipal WD	Western Way Pump Station	The Western Way Pump Station (WWPS) will provide a regional supply of treated water from the Henry J. Mills Water Filtration Plant (Mills) of the Metropolitan Water District of Southern California (MWD). The MWD will deliver up to a maximum flow of 145 cubic feet per second (cfs.) at the designated EM-24 connection located at the boundary of the Eastern Municipal Water District (EMWD). The District is completing the final design phase of the Western Way Pump Station (WWPS). The WWPS will be located at the intersection of Western Way and Harley Knox Avenue (aka Oleander) within the EMWD Perris Valley Service Area. The WWPS will utilize up to five (5) duty and one (1) stand-by 300 Hp and two (2) duty and one (1) stand-by 60 Hp vertical turbine pumps to raise the hydraulic grade from the discharge side of the Perris Valley Pipeline to the Oleander Transmission Pipelines serving the 1627 and 1705 PZ's. Once the water is discharged into the Oleander Transmission Pipelines, the existing distribution systems across the 1627 and 1705 PZ's will be able to convey the water supply to all users, wholesale customers and economically disadvantaged customers served within the and from the Perris Valley Service Area. The supply from the build-out of the WWPS and additional transmission facilities is anticipated to provide enough supply to allow the district to serve its existing and future customers	M	15	C	Eastern Municipal Water District (EMWD) provides water to a 555-square mile area in western Riverside County, serving approximately 675,000 people. EMWD's total potable water demand of 134,000 acre feet per year (AFY) includes 82% of imported water from the State Water Project and Colorado River Aqueduct and the remainder is provided by local groundwater.EMWD has recently completed an updated Water Facilities Master Plan (WFMP). The WFMP has identified supply and demand scenarios, deficiencies and required infrastructure improvements through ultimate buildout. The required infrastructure improvements include major supply, conveyance and storage facilities within the District's four major service areas, Moreno Valley, Perris Valley, East Valley and South Valley. The largest service area is the Perris Valley Service Area and due to the pace of growth in recent years will require the largest investment for supply, conveyance and storage facilities to meet existing and ultimate demands.The Perris Valley Service Area lies almost entirely within the 1627 Pressure Zone (PZ) and is the District's largest base zone serving the largest number of customers including several disadvantaged communities and wholesale connections.EMWD in conjunction with the Metropolitan Water District of Southern California (MWD) and Western Municipal Water District (WMWD)	15,740,000	141,243	414,710	20	Riverside	V	2009

1650	3310009	3310009-062	Eastern Municipal WD	Perris II Desalter	The Perris II Desalter will provide up to 5 million gallons per day (MGD) of potable water from brackish wells feeding into a reverse osmosis (RO) desalination plant. The plant will be constructed to an initial capacity of 3 MGD with the ability to upgrade to an ultimate capacity of 5 MGD. This new water source will supply up to 11,000 families in the disadvantaged community of Perris, California, and reduce imported water demands at a rate of 1 to 1. The proposed Perris II Desalter project consists of pre-treatment facilities (iron and manganese removal), the RO treatment facilities, chemical storage/feed facilities and pumping facilities to dispose of the brine concentrate and deliver the finished potable water to the distribution system. The iron and manganese facilities will pre-treat the entire raw well water feed to remove the potential foulant to the RO membranes. The RO treatment facilities will include cartridge filters, RO feed pumps, RO membranes, chemical storage and feed (for the addition of disinfectant, control of PH, threshold inhibitor, and RO membrane cleaning agents). The project includes pumping facilities to dispose of the brine concentrate and to deliver the finished water to the distribution system. The project includes other required supporting facilities including instrumentation and control, laboratory facilities, maintenance facilities, HVAC, and electrical.EMWD is funding the construction	M	15	C	The goals of this project are to:• Mitigate exceedances of the primary MCLs for Nitrate and Perchlorate;• Mitigate exceedances of the secondary MCL for Total Dissolved Solids (TDS);• Reduce demand on imported water;• Protect drinking water sources; and• Supplement water supplies for disadvantaged communities using:o Desalination which provides an efficient use of local water resources and is more energy efficient than imported water supplies thereby reducing our Greenhouse Gas footprint; and o Water that would not otherwise be usable thereby conserving water resources for use in other areas.Eastern Municipal Water District (EMWD) provides water to a 555-square mile area in western Riverside County, serving approximately 660,000 people. EMWD's total potable water demand of 134,000 acre feet per year (AFY) includes 82% of imported water from the State Water Project and Colorado River Aqueduct and the remainder is provided by local groundwater. EMWD has successfully constructed two groundwater desalination plants and implemented a desalination program in the Perris Valley. Currently, up to 8 million gallons per day (MGD) of locally-derived potable water can be generated by the desalters. These efforts were implemented in order to:• Increase reliance on local groundwater, decreasing dependence on imported water;• Increase reliance on local water resources in	53,000,000	141,243	414,710	20	Riverside	V	2009

1661	2100545	2100545-003	WALKER CREEK RANCH EDUCATIONAL CENT	Replacement of Primary Potable Water Storage Tank at Walker Creek Ranch	This project is to replace the existing 100,000 gallon redwood water storage tank, which serves as the primary potable water storage tank at the Walker Creek Ranch campus. The plan is to identify and purchase a replacement tank that will most cost effectively serve the long term water storage needs of the campus, to remove, disassemble, and recycle the existing tank, to prepare a base for and install the new tank. This project will further efforts to become a Marin County Certified Green Business by minimizing and eliminating water loss, and supporting water conservation efforts.Redwood planks from the existing tanks will be used to provide amphitheater and bench seating for students and guests.The Main County Outdoor School at Walker Creek Ranch serves about 6,000 elementary school students per year from around the Bay Area region for a five day residential outdoor science school program. On weekends and over the summer the facility is utilized as a residential science camp site and as a retreat and conference center, which serves over 100 separate groups and over 5,000 guests annually. The summer camp programs provide scholarship opportunities for economically disadvantaged students, and includes a day camp program for special needs students.	M	15	P	The existing 100,000 gallon redwood storage tank, which serves as the primary potable water storage tank for the Walker Creek Ranch Campus, is approximately 50 years old, and is approaching the end of its life expectancy. Recent estimates are that the tank is loosing 2 to 3 gallons per minute, due to leaks, which equates to over 1 million gallons annually. With the water system being fed by two wells on the property, the additional draw on the water table from this water loss is a growing concern, in the midst of the third consecutive year of drought conditions. This project aims to replace the existing tank with a new tank, in an effort to minimize and eliminate water loss due to leaks in the storage system.	375,000	21	100	18	Marin	II	2009

1667	3701010	3701010-002	WARNER UNIFIED SCHOOL DISTRICT	Backup Water System	A new well system in operation at a different location. This is due to our district having permanent housing for our FFA animals that the students are raising. We are still within a safe distance but, it would be ideal to be safe at our choice of where the well should be. Basically the well system would include materials dealing with the well system. Maybe my estimate is not correct with some costs but, this is where I would need help in determining the cost to get this job going. Also to have one of of expertise look at the location to determine if it is a safe location to set up a well system. As I mentioned before we took out a current well due to the fact rain moisture affected it and it was too old and costly to try to make repairs. The well had existed since the 1940s. The cost would have been quite high as you can imagine. The costs would include materials, pump,electrical,pipes ect.. Trenching and well drilling of course.	M	15	P	Currently we have no back up water system for our public school. As of now we have 1 potable water system or well. This could in fact create a problem should something happen to our our existing well system. Our school would have to shut down due to no water. Our back up well we had # 2 has been out of operation for the past 3 years, so as you can see there is a need for a new well. We would very much appreciate your help in getting our school a back up system so we can breathe a little easier and make it a positive environment for our students as well safer.	60,000	15	250	14	San Diego	V	2009

1669	3700018	3700018-001	CAMPO ELEMENTARY SCHOOL	new campo elementary/new well/new storage tank	the new well would provide the school with safe water. the storage tank would insure that we have an adequate supply of drinking water,our current tank is setup to where we can access only 30% (the rest is for fire).the sampling stations would provide more accurate results	M	15	P	our top producing well is over the max. m.c.l. in nitrates we also need to install (5) sampling stations in order to better test	80,000	4	300	14	San Diego	V	2009
1670	3700963	3700963-001	POTRERO ELEMENTARY SCHOOL	potrero/new well/new storage tank	drill existing well deeper/replace existing storage tank and possibly move to new location. install (5) water sampling stations to improve water testing	M	15	P	this school is always high or above in nitrates (mcl) the storage tank should replaced because of its age and condition.(5) water sampling stations need to be installed for better water quality	60,000	2	300	14	San Diego	V	2009
1671	0900111	0900111-001	PIONEER SCHOOL	Pioneer School/Mountain Creek School	Create additional source (another well). Install new holding tank and storage system. Involves design and construction;	M	15	P	System does not have adequate source capacity.	35,000	5	350	09	El Dorado	I	2006
1672	1000020	1000020-001	FCSA #1/TAMARACK	Replace 30,000 gallon water storage tank and 1/2 mile of transite piping	The District shall replace the water storage tank. The cost estimate to replace the tank is enhanced because the tank is located on a hill. In order to remove the existing tank, a helicopter service shall be required to haul the tank off of the hill. Brush leading up to the hill must be removed. A galvanized steel water storage tank shall be reconstructed in the same location as the previous tank. The cost estimate to clear brush, remove the existing tank, and construct a new water storage tank is approximately $150,000. An alternative measure could be to relocate the water storage tank site and purchase a hydropneumatic water pressure tank. The cost estimate to remove the existing tank from the hill, install a water storage tank, and install a hydro tank is over $200,000. We estimate that this alternate course of action would be more costly than replacing the tank on the hill. The 1/2 mile of transite piping shall be dug out and removed from the water easements adjacent to the streets within the District. The piping must then be properly disposed of since it contains asbestos material. The cost estimate to replace the piping and dispose of the transite piping is approximately $25,000.	M	15	N	CSA 1 must be able to serve water to 45 single family residential lots and a 10-unit motel. The water storage tank and water distribution system was originally installed in 1962. The 30,000 gallon water storage tank receives water from 2 well sources. It is located on a hill and uses gravity-feed to distribute water to the community. The water storage tank has been leaking for several years. The leakes are plugged using epoxy, but the epoxy plugs only last a short time before the leaking resumes. The water storage tank has exceeded it's life expectancy and has deteriorated beyond repair. Additionally, the pontential for tank corrosion to leach into the water system represents a health hazard that must be addressed. The 1/2 mile transite piping distribution system is made of concrete and asbestos. The piping shall be replaced with PVC or PEX piping in order to prevent an asbestos related health hazard. Once the piping has been replaced, the trenching within the water easements adjacent to the public roads shall be back filled and rebuilt to their original standards.	175,000	33	18	23	Fresno	III	2009

1673	4300814	4300814-001	SCC Animal Shelter/Airport		Implement all recommendations of certified cross-connection control specialist's survey (included with pre-application).	M	15	N	Inadequate backflow and cross-connection protection. Significant risk of contamination to potable water system.	20,000	2	25	17	Santa Clara	II	1998
1674	1000024	1000024-001	FCSA #23/EXCHEQUER HEIGHTS	Replace water storage tank, piping, and a fire hydrant	The project will consist of dismantling and removing the existing storage tank which will be salvaged through a recycler. A new 30,000 gallon water storage tank will be constructed at the same location. The estimated cost to replace the tank is $100,000. The steel piping will be excavated and removed and replaced with PEX or PVC piping system. The estimated cost to replace the 800 feet of piping is $25,000. The cost estimate to repalce the inoperable fire hydrant is $5,000	M	15	N	CSA No. 23 provides potable water to 16 residential parcels located between Shaver Lake and the Dinkey Creek area. The existing water infrastructure was constructed in 1970. It consists of two wells, a 30,000 gallon water storage tank and approximately 800 feet of buried galvanized steel water pipe. The storage tank is corroded and water is being lost. Corrosion of the tank represents a potential health hazard if corrosive material leaches into the water system. The have been numerous pipe bursts over the years due to excessive freezing and thawing during the winter season. The one fire hydrant serving the CSA No. 23 is non-operational. Because the development is surrounded by the Sierra National Forest at about the 6000 foot elevation, having an operating fire hydrant is essential.	130,000	15	25	23	Fresno	III	2009

1678	1910253	1910253-007	Central Basin MWD	Central Basin MWD WQPP SCADA System Upgrade	CBMWD SCADA System UpgradeA new, SCADA system would be constructed under this project. It would allow monitoring and control capability at Central Basin's headquarters and be linked to two water wells and the granular activated carbon treatment facility located in the city of Whittier through District's operators instead of using contract operator. Part of the facilities installed include, remote transmitting units, receivers, and computer hardware and software.Well Pump ReplacementThe well pumps for CB-1 and CB-2 would be replaced with new, energy efficient pumps. Project ScheduleAt present, the District is in the process on completing CEQA documents for the project. The designs for the above projects will be completed by February 2010. District plans to start construction in March 2010 for completion in September 2010. The facilities will be in operation in the Fall of 2010.	M	10	C	BackgroundIn the 1980's a contaminated plume was found in San Gabriel Valley, posing a threat to the areas groundwater supply. In order to remedy the contamination, Central Basin Municipal Water District (CBMWD), with the partnership of other impacted agencies, built two extraction wells to pump contaminated water to a treatment facility where the water is cleaned and distributed to the purveyors. This project, Water Quality Protection Project (WQPP) of CBMWD, has been in operation since 2005. This project serves two purposes: 1) Prevent spread of a volatile organic carbon (VOC) plume into downstream aquifers and thereby polluting a large number water wells in the downstream of the aquifers impacting water supply to many cities; and2) Producing potable water for neighboring citiesThe existing WQPP facilities consist of two water wells (CB-1 and CB-2), and granular activated carbon water treatment system to remove VOC in the groundwater, primarily PCE and TCE. These facilities are fully automated, and operated, maintained, and monitored by the operators contracted by the CBMWD. ProblemCBMWD currently relies on Supervisory Control and Data Acquisition System (SCADA) maintained by contract service providers to control and monitor this crucial facility. The existing SCADA systems are linked to control centers of the service providers with no information being transmitted to the CBMWD on a	250,000	3	0	15	Los Angeles	IV	2009
1679	4010022	4010022-008	LOPEZ PROJECT	Lopez Project - Distribution System Telemetry at Turnouts and Outlet Works	The Lopez Distribution Telemetry at Turnouts and Outlet Works Project involves the installation of instrumentation, programmable logic controllers, radios, and other equipment necessary to provide a complete supervisory control and data acquisition (SCADA) system for the Lopez distribution system's five turnouts and outlet works. The project will also include integration of the new telemetry controls into the existing Lopez Water Treatment Plant SCADA system.	M	10	C	The Lopez Water Treatment Plant (LWTP) is a six MGD treatment plant that treats surface water from Lopez Reservoir. Its distribution system has five turnouts serving the City of Arroyo Grande, City of Grover Beach, City of Pismo Beach, community of Oceano, and community of Avila Beach. Controls and data acquisition for each of the turnouts and the system's outlet works are manual, creating inefficiency in operations and no way to measure or adjust flows to each turnout in real time.	250,000	31	0	06	San Luis Obispo	IV	2009

1680	5000218	5000218-006	COUNTRY VILLA APTS	Main Well 2 - Renovation for Back-Up Well	This project proposes to renovate an existing out-of-service well (Main Well No. 2) sufficient to be used as a stand-by water source in the event the North Well is temporarily removed from service for repairs.This project would consist of removal of the existing hydropneumatic tank, piping and pump, and cleaning of the existing well casing. Installation of a new 5 HP submersible pump, 1800 gallon hydropneumatic tank and related piping and a new electrical panel. This project would also include the proper destruction of a nearby existing abandoned well including removal of the wellhead.Although the Owners privately funded the design and construction of the North Well, pump and hydropneumatic tank, there is insufficient funding available to complete the remaining necessary improvements to the water system including the renovation of Main Well No. 2 to be used as back-up well. Project participants include the Owner of Country Villa Apartments, Robyn Dorius, a licensed California Professional Engineer and a Certified Water Distribution Operator.	M	10	C	Country Villa Apartments, built in 1950 in an unincorporated area of Stanislaus County, has a single well (North Well) that serves 23 service connections (approximately 75 residents). The 400 foot deep North Well, 10 HP pump, 2500 gallon hydropneumatic tank, and related piping wer all installed in 2007 to replace an older well that repeatedly violated the Total Coliform MCL. The North Well is in violation of the State of California Drinking Water Regulation for Arsenic (allowable is 10 ppb). The North Well currently has an Arsenic level of 22 ppb that requires public notification to all residents every 90 days.Due to a lack of adequate funds, the Owners must seek outside funding to complete the following water system upgrades: 1) Arsenic Treatment study, 2) Arsenic Treatment Filter, 3) Wellhead Protection Improvements, 4) Emergency Back-Up Electrical Generator, 5) Underground Distribution Piping Replacement, and 6) Renovation of Out-of-Service Back-Up Well.The North Well is the only potable water well in service at Country Villa Apartments. If the North Well must be placed out of service temporarily for maintenance or repairs, there is currently no back-up well. The North Well was built in 2007 to replace the older Main Well No. 2. This project proposes to renovate Main Well No. 2 sufficient to provide a back-up water source on an emergency basis only. This project would include cleaning the well casing,	46,500	23	30 10	Stanislaus	III	2009
1681	5000218	5000218-004	COUNTRY VILLA APTS	Underground Distribution Piping Replacement	This project provides for the replacement of all underground galvanized distribution piping with PVC Schedule 80 piping from the North Well location to all 23 service connections.This project includes the replacement of:850 feet of 2 inch pipe.300 feet of 3 inch pipe.25 valvesAssorted fittingsAlthough the Owners privately funded the design and construction of the North Well, pump and hydropneumatic tank, there is insufficient funding available to complete the remaining necessary improvements to the water system including the replacement of the existing underground distribution piping system.Project participants include the Owner of Country Villa Apartments, Robyn Dorius, a licensed California Professional Engineer and a Certified Water Distribution Operator.	M	10	C	Country Villa Apartments, built in 1950 in an unincorporated area of Stanislaus County, has a single well (North Well) that serves 23 service connections (approximately 75 residents). The underground distribution piping is undersized galvanized piping that is now 60 years old. Although the North Well was built in 2007 to provide an 80 gpm flow, the existing undersized and aged distribution system causes insufficient water pressure to the residents. This project proposes to replace the existing underground	52,500	23	30 10	Stanislaus	III	2009
1682	2300502	2300502-001	Albion Mutual Water Company	Reservoir Roof Replacement	The new roof will be a 5:12, wood frame, gable with a South facing slope to accommodate the future installation of a solar panel array. The "attic" area will provide for material storage and space for future relocation of water treatment functions. Design services are being provided "pro-bono" by an Architect who is a member of the Water Company.	M	10	C	The flat, wood-frame roof on our 70,000 gallon concrete water tank is over 30 years old. The membrane roofing was replaced approximately 15 years ago. The perimeter venting system has been patched and repaired over time and the exposed wood edge blocking is crumbling. Major structural elements of the roof are deteriorating rapidly.	20,000	26	40 03	Mendocino	II	2007
1683	2700622	2700622-001	OUTLOOK WA		Replace existing tanks with two concrete tanks and replace water mains, misc. plumbing, etc.	M	10	C	Water storage tanks and main service lines are 30 years old and need replacement.	24,773	19	45 05	Monterey	II	1998

1684	3100019	3100019-001	NORTH EDEN VALLEY		Construct an additional well to 400 ft. Add additonal 20,000 gallons of storage capacity.	M	10	C	Single well source not reliable. Needs second well.	45,000	16	45 02	Placer	I	1998
1685	4700630	4700630-003	Shasta View Heights Owners Association	Shasta View Heights Owners Assoc. Water Project	We need to re-drill and reline a collaping lower shaft in well 1 and replace structures housing wells 1 &2 a reconnect well 1 to stoarage tanks by replacing destroyed piping. Pipe footage to be replaced is approx. 3000 feet.Replace existing 2" & 4" lines with 8" c-900 pipe in upper loop & in Bennet Drive run to tank. Original and existing pipe is 2" & 4" grey electrical conduit pipe. Replace existing 2" & 4" lines with 6" C-900 pipes in lower loopAdd adequate fire hydrants to bring fire protection up to current standards.	M	10	C	Well number 1 is collapsing and Well number 2 has broken pipes, supply line failure and insufficient storage. Low water levels in summer. Water treatment is occasional chlorine with daily reading and monthly testing.	200,000	17	50 01	Siskiyou	I	2009
1686	1500455	1500455-002	WILLIAM FISHER MEMORIAL WATER COMPA	Upgrade Distribution System	Replace distribution system with 8" C900 PVC.	M	10	C	Distribution system consists primarily of inadequate 2" and 4" mains.	100,000	18	51 19	Kern	III	2007
1687	1900038	1900038-002	LANCASTER PARK MOBILE HOME PARK	Lancaster Mobile Park - ARSENIC Treatment and Additional Well	The Lancaster Mobile Estates is a water system in need of an additional water source to meet the demands of the community and including treatment for ARSENIC concentrations that exceed the Maximum Contaminant Level. The Water system has insufficient water storage for fire protection. In addition, the water system is in need of additional water source, a new ground well, and improvements to the water distribution lines.	M	10	C	The Lancaster Park Mobile Estates is a water system in need of an additional water source to meet the demands of the community and including treatment for ARSENIC concentrations that exceed the Maximum Contaminant Level. The Water system has insufficient water storage for fire protection. In addition, the water system is in need of additional water source, a new ground well, and improvements to the water distribution lines.	100,000	21	53 16	Los Angeles	IV	2009
1688	2700547	2700547-002	DESMOND RD WS #03		The electrical panel, tanks, and some water lines all need to be replaced. The application says the project only involves design, but it seems like it would also involve construction.	M	10	C	Add storage and replace mains.	30,000	19	55 05	Monterey	II	1998
1689	1200687	1200687-001	Riverbend MHP	Riverbend MHP water system	We do not know yet if it would be possible to use the existing well and merely upgrade the treatment and distribution system. We have been advised that storage tanks up the incline would be more efficient, but we will need to have an engineer assess the problems and suggest the most cost effective plan. Our intent is to consult such an engineer and upgrade to an effective community water system.	M	10	C	This is an older mobile home park in an isolated area, with 29 spaces. The nearest city, Fortuna, is 45 miles over small country roads. The park is built on a flood plain of the Van Duzen River, about 1/2 mile from the Dinsmore airport. The population of the park is universally low income. The well is barely adequate for the population of the park when we are at capacity (which is currently the case). The well is currently in the middle of the occupied area of the park, and the distribution infrastructure is contained in the utility system (essentially a ditch down the middle of the occupied area which also contains the electrical and the septic systems). We have had some violations of drinking water standards in our tests and have been chlorinating sporadically. There are times when the water system has been offline for more than a day while we were working on it, and we had to import portapotties and bottled water for the tenants. We have upgraded both the well and the septic system, but old piping remains underground and probably will cause continuing problems. We have been advised that it would be optimal if we were to become a community water system.	250,000	28	60 01	Humboldt	I	2009
1690	2700579	2700579-002	ELKHORN RD WS #04		Replace tank.	M	10	C	Water storage tank needs replacement.	20,000	20	60 05	Monterey	II	1998
1691	2700579	2700579-001	ELKHORN RD WS #04		Replace pipes with new material which is up to standard.	M	10	C	System has inconsistent pipe types and sizes - the locations of which are unknown and need to be determined.	21,500	20	60 05	Monterey	II	1998

1692	2702110	2702110-001	DELANY WC	Tank repair/replacement and installation of wireless remote DeLany Sys.	Initially, the tanks will need to be drained to install proper valving so that tanks can be isolated to proceed with the maintenance and upgrade. Man access doors will need to be cut into the side walls for safe cleaning, sand blasting and re-epoxy procedures. Tanks will be re-finished inside and re-painted outside to extend their lives for (hopefully) another 30 years. Since the tanks appear to be structurally sound, this wil be a much more affordable option than tank replacement with poly tanks that could total up to $40,000. I am currently operating the pump manually because we have lost communication between the float switch and the pump relay. Because of the terrain (steep hillsides, heavily wooded), re-trenching and installing new wires in conduit would be cost-prohibitive. The much more elegant soution is the installation of a low frequency radio controlled switch to trigger the pump relay. Since electricity is not readily available at the tank site, a solar panel/battery system will need to be installed to power the transmitter.	M	10	C	Our two 15,000 gallon storage tanks are over 30 years old. Because the tanks were allowed to be installed without shut-off valves, it has been impossible to isolate individual tanks for maintenance. Several small leaks have developed and been repaired, but it is time for a complete refurbishing of the tanks inside and out, and upgrading to code with proper shut-offs and man-access side doors. Concurrently, the direct wired connection between the tank float switch and pump relay has been compromised (gophers, earth movement?). I would like to replace the problematic connection with a radio controlled remote switch.	15,000	19	60 05	Monterey	II	2009
1693	2700624	2700624-001	LEAFWOOD COMMUNITY WA		Replace storage tank with a steel tank. Possibly add a chlorination system.	M	10	C	Replace old, concrete storage tank.	35,000	23	66 05	Monterey	II	2006

1703	1900975	1900975-003	WHITE ROCK LAKE RV PARK	White Rock Lake Well / Water Tank replacement	As a part of our commitment to comply, we are requesting grant funding to replace the water tanks which are old, and have suffered some corrosion due to extreme cold in winter, and extreme heat in summer. Temps reached 100-105 consistently for over a three week period when we had positive coliform tests. Morrison Well Maintenance indicated that many wells were experiencing the same type of test problems due to high summer temperature readings. I would also like to be able to replace some piping, and add an additional pump, and upgrade the electrical system for the new tanks as they were put in many years ago. I sincerely feel that the immediate replacement of the tanks will resolve the coliform positive tests. I have quotes available for the 2 tanks, $8,018 from Triple J Tanks phone 661-399-3943. There will be additional hookup and installation charges verbal quotes $2,000.00 to 3,000.00 from Morrison well maintenance. Written quotes pending. Will have quotes on an additional pump, pipe replacement and electric upgrade pertaining to new water tanks. A.S.A.P. We do need extra time to work on pipe replacement as it is a large job, and will take some time and planning. It will be optional, only if the New Tanks resolve all coliform positive test issues going forward. Current word count is 346 Word count limit is 500To update word count, click Here	M	10	C	Received County of Los Angeles Public Health Ltr: dated February 19,2009. Indicating that June 2008, and July 2008, the White Rock Lake Water System was in violation: 2CCR,Title22,Chapter15,Article3,Section66426.1(b)(2) I will be checking with issuing agency as the violation referenced is the June 2007, & July 2007 and it appears, that the 2008 violation's references are a typing error. Boil water order posted on 07/14/07. Boil water lifted, after White Rock Lake water samples tested negative for coliform. Morrison Well Maintenance had been hired (State liscensed and recommended) and serviced our water system, and have been maintaining it per state requirements. They also installed a new chlorination system. I am requested to attend a hearing on March the 18,2009, and the purpose of the hearing exact quote. "As a result, a representative of White Rock Lake RV Park Water System is hereby requested to appear at an Administrative Hearing regarding this violation. The representative will need to explain because why this matter should not be referred to the District Attorney's Office for further legal action. ...etc.Again the Date of violation is listed on this letter as June and July 2007, nothing indicative of a June and July 2008 violation. Because we had complied in 2007, and did everything we were requested to do per Richard Lavin the DHS representative that services our	20,000	50	100 16	Los Angeles	IV	2009

1729	3600166	3600166-002	Mill Creek MSC	Mountain Home Village Water Storage and Distribution Project	Our project entails the purchase and installation of an additional water storage tank, to bring our water company into compliance with CCR Section 64565, and a 4-inch water distribution main line, to comply with CCR Section 64628.We have a quote of $86,750 for a 141,039 gallon steel-bolted water tank. The foundation preparation and tank installation (including plumbing materials) is quoted at $14,000.1988 feet of our main water distribution line is deteriorated 2-inch steel pipe. We have a quote of $88,000 ($44./foot) to replace this water main with 4-inch PVC Schedule 40 pipe. This quote includes labor, all materials (pipe, valves, and hydrants), and roadway repair (asphalt, equipment, and labor) in conjunction with installing the new 4-inch water main.	M	10	C	Our water company does not currently comply with Sections 64565 and 64628 of California Code of Regulations requiring current standards for water storage capacity and water main distribution lines.We have a 42,000 gallon steel-bolted water storage tank with a chlorination facility. The stored water is distributed through a main water line that, for 1,998 feet of run, is 2-inch steel pipe (the rest is 4-inch steel or Schedule 40 PVC pipe). On hot days, in spite of water conservation measures, our tank is occasionally drained to the extent that some residents we serve are deprived of adequate domestic water. Extrended electrical power outages resulting from storms, local forest fires and other causes stop operation of the water well pump.Our water storage tank becomes vulnerable to drainage, which jeopardizes both domestic water distribution and fire fighting resources.	174,500	63	315 13	San Bernardino	V	2009
1730	1500557	1500557-001	STOCKDALE RANCHOS MUTUAL WATER CO	Stockdale Ranchos-Second Well or Intertie with City of Bakersfield	As part of the project, a second well will be drilled or intertie with City of Bakersfeld will be developed.	M	10	C	Stockdale ranchos MWC has only one well. With only one source of supply, the water system is deemed to be unreliable.	500,000	91	325 19	Kern	III	2008
1731	5510007	5510007-001	DEL ORO WATER COMPANY - STRAWBERRY	Del Oro Water Company - Strawberry District - Replacement of Upper Diamond Tank	Replacement of the Upper Diamond Tank in kind.	M	10	C	The Upper Diamond Lake Tank is leaking and is beyond repair. Leakage, in addition to loss of water in a water poor area, is eroding the hillside	500,000	373	330 11	Tuolumne	III	2009

1732	5510007	5510007-002	DEL ORO WATER COMPANY - STRAWBERRY	Strawberry District - Replace Upper Diamond Tank	The project would consist of replacement of the existing 25,000 gallon Upper Diamond Lake Tank to a 200,000 gallon tank. The tank will be designed to meet current storage requirements as detailed in the California Waterworks Standards.	M	10	C	The Upper Diamond Lake Tank is leaking and beyond repair. Leakage, in addition to loss of water in a water poor area, is eroding the hillside. The existing tank is undersized and obsolete for the water system.	500,000	373	330	11	Tuolumne	III	2009
1733	3702754	3702754-001	RANCHO CORRIDO RV RESORT	Water storage increase for supply and fire protection	As a minimum: recommend installation of two pressure tanks (1000 gallons each) and a back-up propane powered generator at the well head (with 24 hour propane capacity).(This would (a) eliminate the need for a dedicated transmission line, (b) provide flow during peak intervals with 20 psi or higher at the highest elevation, (c) increase fire protection capability, (d) provide flow during frequent power outages and (e) allow for maintenance without shutting down the complete system.Ideally, a minimum 40, 000 gallon storage tank should also be installed and this would a substantial additional cost.	M	10	C	Current system has no storage and relies on what can be pumped out of the well. There is no back-up well and no generator. When outages occur, the system is at risk for introduction of contamination from low pressures.This would violate the Total Coliform Rule and specific sections of the California Safe Drinking Water Act, Title 22.	60,000	130	350	14	San Diego	V	2009
1734	3702754	3702754-004	RANCHO CORRIDO RV RESORT	Storage Tank	A minimum 40,000 gallon storage tank would be constructed to compliment supply from a high yield well (nominal 500 gallon/minute). Plan checking, proof of seismic stability of the soil, disinfection, construction of a manway, safety access ladder, chemical testing and installation of a fire hydrant at the storage tank site are considered.The storage tank would meet AWWA Specifications and requirements of Title 22.The result would be ability to meet minimum fire protection constructs in the event of an outage.	M	10	C	There is no storage tank for this system and supply is dependent on the nominal 500 gallon / minute well with supply with a variable flow demand device. The frequency of outages puts this system at risk for introduction of contamination and the lack of storage hinders the capability for fire protection.This "existing community" water system is not in compliance with the California Safe Drinking Water Act - Title 22 of the California Code of Regulations because it lacks a storage capability in the event of an electrical outage.Note: A back-up well and upgraded distribution system are being addressed as a separate matter.	80,000	130	350	14	San Diego	V	2009
1735	3702754	3702754-002	RANCHO CORRIDO RV RESORT	Construction of second well for back-up.	A minimum 8 inch diameter well with a 100 foot annular seal (to bypass nitrate bearing sources) to a nominal depth of 300 feet. A larger diameter well is desirable but would incur additional costs. The drilling is more difficult than normal appearances infer because of large subsurface boulders in the alluvium.	M	10	C	The existing system has no back-up well and has frequent outages. A back-up well would assure a safe and continuous water supply when the existing well might be out of service. (A generator has been recommended for emergency power to the main well and could be utilized for the back-up well too).Construction of the well would be more costly than appearance because of massive subsurface boulders in the alluvium. Funding is requested for a minimum size well and not to benefit the owner with a larger diameter and yield with public monies and if a larger capacity well is desired, the cost difference would not be from other funding.	85,000	130	350	14	San Diego	V	2009
1736	3702754	3702754-003	RANCHO CORRIDO RV RESORT	Distribution system upgrade	Construction of a replacement distribution system (abandonment of the existing 2 inch PVC pipe) with 4 inch pipe meeting AWWA C-9-00 specifications; installation of fire hydrants and other appurtanances to conform to Title 25 (Mobil Home Park Act) and Title 22 sections related to the California Safe Drinking Water Act.	M	10	C	The existing distribution system is only 2 inch diameter and doesn't allow a minimum flow of 130 gal./min for fire flow. Upgrading to a 4 inch diameter and AWWA C-900 PVC would bring compliance with the California Code of Regulations-Title 22. In the event of a power outage, there is no water for fire protection. (A back-up well and new storage capacity is a separate matter).	95,000	130	350	14	San Diego	V	2009
1737	5700712	5700712-002	DUNNIGAN WATER WORKS	Dunnigan WaterWorks - New Well	Drill, construct an install necessary equipment for a new well to a depth of approximately 1100'. Add new PG&E electric service and 850' of 4" C900 piping for connection to existing system.	M	10	C	Dunnigan Water Works (DWW) is a small communmity water and sewer system that depends on one well as their source for safe drinking water. The old backup well produces coliforms, is shallow and groundwater table is dropping.	325,000	68	400	09	Yolo	I	2009
1738	1500459	1500459-001	LAKE OF THE WOODS MOBILE VILLAGE	Lake of the Woods Mobile Village-Second Well/intertie with Lake of the Woods MWC	As part of this project, Lake of the Woods Mobile Village will either drill a second well or develop an intertie with Lake of the Woods Mutual Water Company.	M	10	C	Lake of the Woods Mobile Village has only hardrcok well. Therefore, the water system is not reliable.	500,000	106	465	19	Kern	III	2008

1739	1210024	1210024-004	Westhaven C.S.D.	New tank and repair existing tank	The proposed solution involves construction of a second tank of approximately 80,000 gallons, which could be used to serve the system during replacement of the roof on the existing tank and then to supplement the system's storage capacity once both tanks become operational.Because the system is located in a highly corrosive coastal environment, both the new tank and the replacement roof are proposed to be constructed of materials having high resistance to corrosion.Recent quotes obtained by the District are as follows:$153,429 for an 83,000 gallon glass-fused-to-steel bolted tank with aluminum roof.$149,500 ($130,000 +/- 15%) for an all-aluminum replacement roof on the existing tank.The additional $97,000 in the request is for project management, engineering, piping, pumps and appurtenances.	M	10	C	The water system has just one storage tank, which has a total capacity of 100,000 gallons and a service capacity of 85,000 gallons. The system's maximum day demand in 2008 was approximately 56,000.The concrete tank, constructed in 1985, has a metal roof supported by fir trusses. Constant dampness within the roof space has led to rotting of some of the truss work. The rotting is seriously advanced in portions of the structure. Failure to address the problem is expected to lead to contamination of the treated water by debris falling from the rotting trusses and ultimately to lead to the collapse of the roof, allowing further contamination from the outside environment.Following a CDPH annual inspection in 2005, replacement of the tank roof was listed in the System Deficiency Record as "system or operational defect and/or potential health hazard - costly to correct - to be included in any long-range water improvement project". To replace this roof while continuing to provide safe drinking water from the tank seems impractical at best and more likely impossible.Otherwise, the tank is in excellent condition. It has a 60 mil PVC liner installed in 1991 and could potentially provide many more years of reliable service once the roof has been replaced.The District currently has approximately $120,000 in capital reserves and several miles of 40-year-old, undersized water mains in need of replacement. The average water bill of the	320,000	213	490 01	Humboldt	I	2009
1740	5510027	5510027-002	TUD-Cuesta Center-Lambert Lakes	Subsurface reservoir liners in the Cuesta / Lambert system	This project would provide funding to purchase and installation of the liner with a floating cover.	M	10	C	There are two subsurface treated water reservoirs in the Cuesta / Lambert system. Although they are gunite lined and are under a roof neither of them have modified PVC liners with floating covers. Without complete liners with floating covers the treated water is subject to contamination. This contamination can be from rodents or debris from the roofing system.	76,000	200	491 11	Tuolumne	III	2009
1741	2701676	2701676-003	SAN LUCAS WD		Design and engineering of a new water tank.	M	10	C	Potential contamination from aging, leaking, and weakened wooden water tank.	77,000	88	500 05	Monterey	II	1998

1743	4000222	4000222-003	AVILA BEACH COMM SERVICE DIST		Replace corroded tanks, valves and system piping.	M	10	C	Flow restrictions from old reservoirs to distribution, corrosion problems, old valves & broken.	250,000	171	600 06	San Luis Obispo	IV	2001
1744	3600258	3600258-001	Sky Forest MWC	Kuffle Canyon water main line replacement project	There has never been a compliance problem with this main line. The problem has been providing enough flow to supply the 10 homes and other new homes that are currently being built and those that may be built in the future. In the "Problem Description" section I hopefully described the problem in enough detail for the reviewers to determine project eligibility.	M	10	C	Replace a 1 1/2" steel main line that is approximately 75 years old. This line feeds approximately 10 homes. The line barely provides enough water for 3 homes because it is blocked with a build up of calcium and rust. This line is very fragile and runs along a heavily traveled highway. The line requires constant repair due to the rumbling of heavy trucks. This line should have been replaced years ago, but funding has always been an issue. Our plan is to replace this line with two 2" poly lines on both sides of the highway and reset all ten meters so that the house feeds are not underneath the highway. No drinking water standard has been violated. Public notification would require a Do Not Drink Order 3 days following installation and cleansing of the line.	100,000	121	605 13	San Bernardino	V	2009

1745	3600200	3600200-001	Rancheritos MWC	Phase 3, 4 and 5 Pipeline Rehabilitation Project/Storage tank installation	In the previous phase we installed approx 660 feet of new main but were not able to finish the phase to the well due to the costs of the valves and related equipment. We have an earthquake resistant tank connector which we would like to install but need the attachments to make this happen.This does not include storage tank installation or security fencings of this site.When this section of the rehabilitation is complete, we will have 2 - 1/2mile sections to rehab, and a 1/4 mile w/well tie in #2 to complete the rehabilitation of the one system. System # 2 needs approx 3/4 mile of mainline rehabilitation and well site improvements. i.e. Fencing and security systems. The tank we purchased two years ago is a 225,000 bolted steel tank, three 8' sections high and 40' in diameter. We plan to use 2-8' sections high top and bottom at one well site, and purchase a '8 high section and an additional top and bottom to complete a second tank. This would give us 2-151,000 gal. tanks one at well site #1 and one at well site #3. We purchased 1/3 acre of property several years ago to increase the size of well site #3 in preparation for the installation of future equipment. The installation of tanks will make it necessary to install booster stations at each well site, as we currently use hydrophneumatic pressure tanks to operate the systems. This change would make using expensive power to keep the system under pressure. With	M	10	C	These projects are necessary to replace water mains which were installed in 1956. We are experiencing leaks, and red water complaints. All but 2.5 miles of the 11 mile system have been replaced with C-900 PVC pipe. The Fire Department now insists we replace old 6" mains with 8" mains to address fire flow requirements. This has doubled the costs of installing mains. We currently have only about $50K in our reserves which is needed to handle a well emergency if necessary. This leaves no money to replace aging mains.We also have purchased a 225,000 gal storage tank, but have no funds to install it in our system. The fire department would like to have the tank installed to guarantee fire flow capacities for community safety. We currently do not use chemicals to treat our water, but are just about a 6.0 earthquake from having a catostrophic system failure. With all but 20% of the system in exellent shape, it is sad we are not able at this time to complete the system. We currently operate two seperate systems, with 92 meters on one system and 157 meters on the second. We have 3 wells w/2 on the larger system and one on the smaller system. The two systems are not tied together and are about 1.5 miles apart. In the final area of need, I would like to mention the well sites are currently protected with just chain link fences. We are at the mercy of vandals and thieves with little more than bolt cutters. We would	900,000	131	655 13	San Bernardino	V	2009
1746	5610006	5610006-004	YERBA BUENA WATER COMPANY	Replacement of 56 year old Water Mains	The project consists of replacing approx 5,200 linear feet of old and undersized (3 inch and 4 inch) cast iron water mains with new CL 150 PVC 6 inch and 8 inch mains along with new valves, lateral lines, meters and hydrants appurtenant thereto. There will be no significant environmental impacts. The project is exempt under CEQA and excluded under NEPA since it only involves replacement of existing water lines and appurtenances. All replacement water lines will be within the existing right of way and in the same location.	M	10	C	Approximately 5,200 linear feet of water mains are undersized and at the end of their service life requiring increased maintenance and repair of breaks and leaks. This utility, which draws solely from groundwater wells, is the only source of water for this entire community, as MWD facilities and water are not available.	925,000	240	690 06	Ventura	IV	2009

1753	1510051	1510051-001	LEBEC COUNTY WATER DISTRICT	Replacement of Lebec Road Water Main	The project consists of the replacement of 3,500 feet of 8-inch diameter pipe in Lebec Road. This pipeline is the main backbone that delivers water to the older areas of the District. The other project components include isolation valves, connections with laterals and installation of 4 new fire hydrants assemblies.The implementation of this project will greatly reduce the potential for pipeline breaks and leaks. Ultimately the project could save the District up to 10 AF per year in water losses. More importantly, potential contamination of the distribution system is reduced thereby ensuring compliance with drinking water standards. Also, outages due to breakages will be less likely to occur resulting in better water service to the customers.	M	10	C	The District is located in the Tehachapi Mountains in Kern County, 40 miles south of Bakersfield. The District is within the Lebec Census Designated Place, which has a Median Household Income (MHI) of $39,063 (2000 Census data). Some of the older pipelines in the system have had multiple leaks and breakages occur throughout the year resulting in water losses and financial hardship to the District. The worst pipeline in the system is 3,500 linear feet of 8-inch diameter pipe in Lebec Road. This pipeline is the sole pipeline that delivers water to the older areas of the District. The pipe (installed in the 1970s) is polyvinyl chloride (PVC) with solvent cement-welded joints. The contract operator has noted a high failure rate of these joints probably because of poor construction and lack of joint flexibility. This joint type is now not commonly used in municipal water systems due to past failures. Push-on or mechanical joints are now commonly used and allow pipe flexibility and movement. The District has repaired leaks in this pipeline multiple times in the past year alone. The operating pressure in the pipeline is very high, ranging from 90 to 120 psi, which increases the potential for leaks and breakages. Each time the pipeline breaks, the District incurs a significant loss of water due to the high pressure and the absence of on-call District employed staff.Public health is currently at risk with any leak or breakage in the distribution	300,000	243	830	19	Kern	III	2009
1754	3910024	3910024-003	San Joaquin County - Wilkinson Manor	Morada Emergency Water Interconnects Project	The work, in general, consists of 3 system interconnects with bi-directional flow meters, and the retrofit of 5 existing connections with bi-directional flow meters. The proposed interconnects are as follows: An interconnect of approximately 500 feet of pipe connecting Wilkinson Manor Zone A to Morada Estates. The pipe starts at the intersection of Cole Drive and Mosher Drive, continuing south along Cole Drive, crossing the Cole Drive Bridge and ending at the intersection with Ashley Way.An interconnect of approximately 3,900 feet of pipe interconnecting Morada Manor to Almond Park. The pipe starts on Madeline Drive approximately 200 feet north of Morada Lane and continues east down Morada Lane to Alhambra Avenue, then south to the intersection of Alhambra Avenue and Gary Avenue.An interconnect of approximately 4,800 feet of pipe interconnecting Morada Acres to Gayla Manor. The pipe starts at the intersection of Hildreth Lane and Hope Lane, continuing east down Hildreth Lane, then turns south for approximately 950 feet on Alhambra Avenue, and turns west at the intersection of Alhambra Avenue and Shippee Lane continuing down Shippee Lane, turning south at the intersection of Meath Drive to intersect the Gayla Manor Water System at Meath Drive.	M	10	C	The Morada area water systems consists of fourteen wells feeding into nine independent distribution networks of 6-inch and 8-inch water lines. The systems serve a total of 728 connections operated and maintained by nine special districts: Morada Estates North, Wilkinson Manor, Wilkinson Manor Zone A, Morada Estates, Morada Manor, Morada Acres, Almond Park, Gayla Manor, and Shaded Terrace.Among the nine systems, only three have backup well(s). Without interconnecting the systems together, some networks would not have continuous water service when their only well in the districts require maintenance or repair. Therefore, interconnecting all nine networks into a single distribution system will greatly enhance their service reliability.This project empowers the nine (9) Districts to improve their energy footprints. When we enter a state of emergency for energy, the districts with less efficient wells can acquire water from districts with more efficient wells via the interconnections to reduce the energy consumptions.	2,800,000	261	861	10	San Joaquin	III	2009

1755	3600270	3600270-003	Golden State Water-Mor Del Norte	GSWC-Morongo del Norte-Navajo Tank	The scope of service includes the demolition of the existing bolted steel tank, site preparation including grading for new tank, securing and transporting 0.25 MG Aquastore tank from Wrightwood, erecting tank on new foundation ring wall, and increasing the capacity of the tank to .33 MG in order to sustain local demand (including purchasing and installing missing parts to Aquastore tank and additional tank ring). The scope also includes the installation of site piping, temporary storage tanks, and all other appurtenances. The plans for the project are completed and the estimated construction start date will be in July of 2009.	M	10	C	The existing Navajo Reservoir is too small to meet the current water demand. The existing tank is also old, and has reached the end of its useful life. Based on the current master plan, a new and larger tank is needed to supply adequate storage for current water demand and fire flow.	548,130	174	870	13	San Bernardino	V	2009
1756	3600270	3600270-004	Golden State Water-Mor Del Norte	GSWC - Morongo Del Norte - Pipeline Replacement Project	The proposed project is to replace the existing mains along 29 Palms Highway from Lanning to Piedras, Bella Vista North of 29 Palms, Sundown Trail, Bella Vista South of 29 Palms, Various Lines at 29 Palms Highway, Lanning Lane, Elm Street, Cedar Drive and the North End of Navajo Trail as identified in the recently completed master plan for the Morongo Del Norte System.	M	10	C	There are fire flow deficiencies in the Morongo Del Norte system due to undersized 1950's era mains installed that range in size from 2 inch to 4 inch in diameter.	2,777,000	174	870	13	San Bernardino	V	2009
1757	3610108	3610108-001	GOLDEN STATE WATER CO - LUCERNE	GSWC - Lucerne Valley Pipeline Replacement Project	The proposed project is to replace the existing mains in Custer Ave., Carson Rd., Agate Rd., Butte St., Amber Rd., Mesa Rd. north of Meb Plant, Tradepost Rd., Zircon Rd., Onyx Rd., Topaz Rd., Carnelian Rd., Azurite Rd., Spinel Rd. and install new pipeline to connect to the Emerald Plant; Mesa Rd., Sapphire Rd., and Emerald Rd. as identified in the recently completed master plan for the Lucerne Valley system.	M	10	C	There are fire flow deficiencies in the Lucerne Valley system due to undersized 1950s era mains that range in size from 4 inch to 8 inch in diameter.	7,996,000	302	996	13	San Bernardino	V	2009
1758	1210019	1210019-002	Hydesville Co. W.D.	Transmission Main Project	1200 feet of 12-inch main (flat) and 225 feet of main (upslope). New main will provide second route from source and increase reliability.	M	10	C	Project #2: System relies on 30 year old, 6-inch main to supply water from source. Main traverses steep slope and has failed in past, isolating source. Subject to failure in earthquake.	118,000	394	1,200	01	Humboldt	I	1998
1759	1210019	1210019-001	Hydesville Co. W.D.	Loop Main Project	1500 feet of 8-inch main to loop system and increase reliability.	M	10	C	Project #1: Area of system served by deadend main is isolated in case of main breaks.	91,000	394	1,200	01	Humboldt	I	1998
1760	1210019	1210019-003	Hydesville Co. W.D.	Water Tank Seismic Retrofit	Retrofit tank and loop dead end mains on Guido Lane and Rohnerville Road.	M	10	C	The water tank is in need of seismic retrofitting, repair, and recoating. It is recommended that these repairs take place along with recoating and seismic retrofit	650,000	394	1,200	01	Humboldt	I	2002

1764	1210002	1210002-002	City of Blue Lake		Design and replace failing pumping facility; replace all failed valves in system; design and construct telemetry system and alarms.	M	10	C	Booster pump station capital replacement; storage tank structural replacement; replace system valves; add telemetry.	600,000	651	1,500	01	Humboldt	I	1999
1765	5410011	5410011-003	Springville PUD	Treatment Plant Study	Study to evaluate existing water treatment process, alternatives, and design of modifications. Also investigate source water delivery redundancy, alternatives, and design of improvements.	M	10	C	1. Reliability achieving LT1ESWTR filter performance requirements. 2. Lack of redundancy in source water delivery system.	60,000	369	1,500	12	Tulare	III	2006
1766	5410011	5410011-002	Springville PUD	Distribution Repair	Repair or replace portions of the distribution system.	M	10	C	Leaks in water distribution system.	1,000,000	369	1,500	12	Tulare	III	2004
1767	3210010	3210010-001	Hamilton Branch CSD		Replace 3" steam pipe with 6" C900 PVC pipe.	M	10	C	Much of the water system is old and water mains are 3" steam pipe installed in 1957.	200,000	495	1,624	02	Plumas	I	1998

1768	1210020	1210020-006	Fieldbrook Glendale C.S.D.	water reservoir repair and expansion	The project includes two related activities. The first is construction of a new 400,000 gallon steel water tank, adjacent to the existing tank. The site has already been graded to accept this new tank and the project will require a minor amount of underground piping to serve the new tank.Once the new tank is on line, the existing tank will be removed from service and drained. The existing roof will then be demolished and a new aluminum dome roof will be installed.	M	10	C	This project includes repair to an existing 400,000 gallon redwood water tank and the addition of a new 400,000 gallon steel water tank. The existing water tank is the only water tank that serves the District and has had a series of problems due to it's age. The existing tank has a history of leaking and has been repaired several times over the last 15 years, with the most recent repair being a liner installed in 2004. Recently, the District has determined that the wooden roof structure is rotted and in danger of collapsing. This project will also correct existing deficiencies related to a lack of redundancy for water storage. The District only has the one existing water tank described above to serve the entire community. Whenever repairs or inspections need to be performed on the existing water tank, the District is without adequate storage facilities or fire protection.	900,000	531	1,670	01	Humboldt	I	2009
1769	3610060	3610060-002	SBDNO COUNTY SERVICE AREA W-1		Develop Water Master Plan for the system	M	10	C	Need a Water Master Plan developed to plan the current and future requirements of the district to provide safe, reliable water for the district users and adequately meet growth needs.	50,000	506	1,670	13	San Bernardino	V	2000
1770	5710007	5710007-005	Esparto C.S.D.	Esparto CSD upgrade to needed Capacity, Redrilling of Well#4	The progect is to drill a test well to 1000 ft of depth to see if it is possible to utilize different stratas to avoid the sand and come up with 1000 GPM or as close to that as possible. Then we will drill the Test well again to the proper 30 inch casing size and set the Well casing and perforations to the proper depths, install the electical panels and scada controls along with the Pump and electic motor. At this point the well driller will develope the well by pumping it as required to complete the project the water would be tested for all required DHS monitoring as well as the bacterialogic testing. Once all testing is complet the New Well #4 would be tied into the distribution system of the district.	M	10	C	The Project is for drilling a new well to reolace our Well #4 because it has the Casing perforations opened up to the point of pumping sand terribly and we have tried lining the casing with a smaller casing to provide additional sand removing gravel pact put it did not work so we are down 750 GPM for this well and we also had Well #5 do the same thing but were able to save the well by relining it but lost 150 GPM out of it. So Total that we need to get out of the proposed well is approximatly 900 GPM. The Well #5 Was worn to badly to be used again so we had to replace the pump and motor also and Well #4 is older and has had more sand issues than Well #5 so we are planning to replace the electrical panels and pump and motor also along with a sand trap just to be safe. The discharge will be either 8" or 10" depending on what the out put of the well turns out to be.	750,000	688	2,000	09	Yolo	I	2009
1771	1010039	1010039-011	Caruthers Comm Serv Dist	Water Line Looping	Install approximately 7,000 LF of new water main.	M	10	C	Water service pressure and supply not reliable.	500,000	672	2,103	23	Fresno	III	2004

1772	3610105	3610105-003	GOLDEN STATE WATER CO - APPLE VLY NOR	Apple Valley North Pipeline Replacement Project	The proposed project is to replace the existing mains in Yucca Rd. from Valley Crest Ter. to Papago Rd., and continuing on Papago Rd. to Ocotilla Rd.; Ocotilla Rd. from Papago Rd. to Chipeta Rd.; Mesquite Rd. from Papago Rd. to Chipeta Rd.; Ouray Rd. from Papago Rd. to Chipeta Rd.; Dexter Rd. from Pauhaska Rd. to Sycamore Ln.; Valley Crest Ter. from Yucca Rd. to Pahata Rd. along Tokata Rd. from Valley Crest Ter. to Tiama Rd.; Taos Rd. from Yucca Rd. to approx. 600 ft north of Waalew Rd.; Waalew Rd. from Yucca Rd. to Taos Rd.; Waalew Rd. from Walpi Rd. to Mesquite Rd.; Pauhaska Rd. from El Centro Rd. to Neenach Rd.; Motnocab Rd. from Nawakwa Rd. to intersection of Motnocab Rd. and Pauhask Rd.; Neenach Rd. from South Rd. to Nalatapa Rd.; Nalatapa Rd. from Neenach Rd. to Nawakwa Rd.; Neenach Rd. from Nalatapa Rd. to El Centro Rd.; along El Centro Rd. from Neenach Rd. to approx. 550 ft east of Nawakwa Rd.; Central Rd. from South Rd. to Walpi Rd. continuing on Walpi Rd. then turning to Huasna Rd. as identified in the recently completed master plan for the Apple Valley North system. The plans for these projects will be completed by June of 2009 and the estimated construction start date will be in July of 2009.	M	10	C	There are fire flow deficiencies in the Apple Valley North system due to undersized 1940's era mains installed that range in size from 4 inch to 12 inch in diameter.	3,816,000	679	2,240	13	San Bernardino	V	2009
1773	3610105	3610105-002	GOLDEN STATE WATER CO - APPLE VLY NOR	Pipeline replacement	Replace mainline	M	10	C	Old, undersized mainline	150,000	679	2,240	13	San Bernardino	V	1998
1774	1510007	1510007-003	FRAZIER PARK PUD	Frazier Park Safe Drinking Water Project	If the project is funded the district will upgrade of the water system to meet Safe Drinking Water requirements. This project will build a new well to replace well #3, replace undersized and leaking waterlines with 6 and 8 inch waterlines, install hydrants, valves, and telemetry devices and provide additional water system improvements.	M	10	C	Frazier Park is rural, low-income community of about 2,834 people. A 2003 survey of he community documented a Median Household Income of $26,500 for the area. The Frazier Park Public Utility District (District) provides only water to district users. The water system is composed of old, deteriorated water tanks, and rested leak, undersized and exposed water lines situated on steep, eroded dirt roads. Many waterlines are too small to provide an adequate water supply and fail to meet State Title 22 minimum pressure requirements. Pressure control devices are also needed on some lines to reduce extremely high pressures. One well, constructed in 1955 has only an 8 foot cement sanitary seal and must be replaced. The District currently has USDA loans totaling $1,400,000 for the first phase of the project. The current average water bill is $44.08 per month approximately equal to 2% of the Frazier Park MHI.	4,000,000	1,362	2,348	19	Kern	III	2007
1775	3310019	3310019-003	Idyllwild Water District		Regrade site and construct two 210,000 gallon steel tanks.	M	10	C	Due to its age, condition and elevation, one of our downtown storage tanks was taken out of servie in 1995 (Rockdale). The tank must be replaced.	245,000	1,552	2,500	20	Riverside	V	1998
1776	3310019	3310019-006	Idyllwild Water District		Construct new diversion pipeline and pumping station. Construct new roof on forebay tank.	M	10	C	The District's aging creek diversion pipeline and pumping station are in need of replacement.	120,000	1,552	2,500	20	Riverside	V	1998
1777	3310019	3310019-001	Idyllwild Water District		Rehabilitate two existing wells and drill one new well.	M	10	C	The District needs to develop additional sources of water to meet current demand during water short periods. A geohydrology study is currently I progress.	120,000	1,552	2,500	20	Riverside	V	1998

Aspen and Pine, as identified in the recently completed master plan for the Morongo Del Sur System. The plans for these projects will be completed by June of 2009 and the estimated construction start date will be in July of 2009.	M	10	C	There are fire flow deficiencies in the Morongo Del Sur system due to undersized 1950's era mains installed that range in size from 2 inch to 4 inch in diameter.	11,381,000	823	2,716	13	San Bernardino	V	2009
1783	2610003	2610003-001	BRIDGEPORT PUD		Construct new main, generator, and pumps	M	10	C	Backup systems needed	250,000	227	3,000	13	Mono	V	1998
1784	4910028	4910028-008	Sweetwater Springs CWD - Monte Rio	Monte Rio 2009 Infrastructure Improvements	This project replaces existing mains and appurtenances on River Blvd, Alder Rd., Willow Rd., and Railroad Ave, in Monte Rio with approximately 6,000 lf of 6-inch water main, to complete loop. As part of the project, 4,500 lf of parallel undersized water mains will be abandoned and water services transferred to the new larger main. This project improves water qualilty improvements by looping the system and providing larger, newer mains, and provides better system pressure and adequate fireflows to area residents and businesses. It will help the District reduce system losses (approximately 30% systemwide) by replacing the aging mains in this area which are prone to main breaks and probably have undetected leaking as well. This is one of the District's principal problem areas for main breaks and needs to be improved.	M	10	C	This project replaces aging distribution mains and appurtenances in the Alder Road, Pebble Way, and Heller Street area of Monte Rio. The area has older, undersized mains and is plagued by recurring main breaks and low water pressure. The project will improve water quality, reduce system losses (system losses are in the 30% range), improve system water pressure and provide adequate fireflow to the area. There are no violations at this time, but the project is needed to bring this part of the Monte Rio distribution system to an adequate level, particularly to reduce the number of leaks that need immediate response, reducing the system losses, and providing adequate flows and pressures to this part of the system.	1,420,000	1,061	3,000	18	Sonoma	II	2009

1785	5010021	5010021-007	Denair Community Services District	Denair Community Services District 2009 Water Tank Project	The Denair Community Services District 2009 Water Tank Project provides for the design and construction of a 1,000,000 gallon welded steel water tank and booster pumps. The Denair CSD has worked with the Denair Unified School District to set aside the parcel required for the proposed water tank. Previous work has been completed to provide for the connection of two of the district wells to be connected to the water tank which is adjacent to one of the well sites. The project provides for the installation of a generator that will be sized to operate the booster pumps, adjacent well, and a proposed treatment system that will eventually be constructed at the water tank location. The project will provide for much needed storage and additional security in the form of treatment options, and a redundent power supply. The project also proves to be a cost effective solution because of the overall master plan design and consolidation of treatment for two wells and a redundent power source for two pump systems. The project is currently going through environmental review by Stanislaus County and will be ready to construct by June of 2009. A soils report, site plan, and landscape plan have been prepared for the project.	M	10	C	Denair Community Services District currently has over 1300 connections and over 3000 residents withing the service area. The District currently relys totally on ground water wells and pumps for the Districts needs. This project provides the District with storage capacity recommended and required to meet peak and fire flow demands.	1,350,000	1,294	3,225	10	Stanislaus	III	2009
1786	5010021	5010021-003	Denair Community Services District	Denair Community Service District 2009 Well Site 8 Raw Water Line Project	The Denair Community Service District 2009 Raw Water Line Project consist of the construction of approximately 1750 linear feet of 8 inch raw water line, 2-8 inch gate valves, restoration of existing road pavement , and connection to existing facilities. The project will construct an 8 inch dedicated raw water line from existing Denair CSD Well Site No. 8 to the District Corporation Yard.The connection of well site number 8 to the proposed 1,000,000 gallon water tank location and the reconstrcution of ground water Well No. 1 at the site will allow the District to maximize the value associated with the storage, treatment, and booster pump facilities by minimizing cost associated with constructing multiple facilities at both sites.The project site have has been surveyed and construction on the project can be be started in July of 2009 and completed by October 15, 2009.	M	10	C	The Denair Community Services District relys exclusively on ground water wells to supply water for approximately 1300 users and over 3000 residents. The scattering of water wells make it necessary to construct raw water lines required to maximize storage potential of two proposed water tanks and the booster pumps, and proposed treatment facilities which will be constructed at the two tank sites.	300,000	1,294	3,225	10	Stanislaus	III	2009

1787	5010021	5010021-004	Denair Community Services District	Denair Community Services District 2009 Trunk Water Line Project	The Denair Community Services District 2009 Water Main project consist of the construction of 3,060 linear feet of 12 inch PVC C-900 trunk water main and 60 linear feet of 8 inch PCVC C-900 water line through existing streets, 6 8 inch gate valves, 6 12 inch gate valves, restoration of 11,310 square feet of pavement, a 2 inch blow-off, and the bore and jacking of 300 linear feet of 12 inch ductile iron pipe under an existing railroad crossing. The project will effectively replace approximately 1000 linear feet of 6 inch and 4 inch water line, and provide for a 12 inch looped water system that effectively loops the District's Community Development area. The looped system will provide for the connection of the 4 existing ground water well and two proposed replacement ground water wells. Surveying for the project has benn completed. The proposed project in entirely within the existing street system and does not present environmental issues of any kind. The project can be started in late June of 2009 and be completed by October 15th 2009.	M	10	C	The majority of the existing Denair Community Services District water system was constructed in the mid-1960's. The original system was constructed with 4 inch and 6 inch water mains when the district was much smaller. This existing system eventually proved to be undersized as the District community area became more fully developed. For the past 5 years the District has constructed portions of a 12 inch trunk main that is designed to loop around the main development area of the District. The Denair CSD 2009 water line project would provide for completion of the 12 inch trunk loop and would greatly increase pressures and fire flow capacities in the District. The loop would also connect the 4 existing ground water wells that the District, and provide for additional redundency and added safety.	852,040	1,294	3,225	10	Stanislaus	III	2009
1788	5010021	5010021-002	Denair Community Services District	Denair Community Services District 2009 Well Site Generator Project	The purpose of the Denair Community Service District 2009 Well Site Generator Project is to design, purchase, and install backup generators at three existing ground water well sites. The generators will supply backup power to the wells during power outages and provide insurance that water will be available during emergency events.The existing well sites are well site No. 8, Well Site No. 9, and Well Site No. 10.All of the well sites have been surveyed and the power system design, site design, generator purchase, and installation could occur before October 15, 2009.	M	10	C	The Denair Community Services District relies totally on ground water pumping for water supplies required for approximately 1300 customers and 3000 residents. The water wells are dispursed throughout the District and are subject shut down during power outages. This circumstance results in possible health and safety issues due to inadaquate fire flow during power outages.	105,000	1,294	3,225	10	Stanislaus	III	2009
1789	5010021	5010021-005	Denair Community Services District	Denair Community Services District 2009 Water Treatment Facility No. 1 Project	The Denair CSD 2009 Water Treatment Plant No. 1 will design and constrcut a water treatment plan at the location of Denair CSD Water Tank No. 1. The treatment plant will be designed and constructed to elininate nitrates, and other impurities from the drinking water. The construction of the treatment plant, booster pumps, tank, and generator at Water Tank Site No. 1 will allow for increased safety, redundency, and pressure in the water system.	M	10	C	Denair Community Services District Well Site No. has escalating nitrates levels that are projected to exceed drinking water standards in the near future. The construction of Denair CSD Water Tank No. 1 and the connection of Well Site No. 7 and Well Site No 10 to the tank provide for the cost effective opportunity to treat the problem.	600,000	1,294	3,225	10	Stanislaus	III	2009
1790	2710018	2710018-002	Seaside Municipal Water System		Replace tops of tanks.	M	10	C	Tops of two water storage tanks are rusting.	150,000	788	3,300	05	Monterey	II	1998
1791	2710018	2710018-003	Seaside Municipal Water System		Resurface inside of tanks.	M	10	C	Corrosion on the inside of two storage tanks - need to be recoated.	100,000	788	3,300	05	Monterey	II	1998

1792	5510009	5510009-001	GROVELAND COMMUNITY SERV DIST	Big Oak Flat	This project consists of adding a welded steel 500,000 gallon water supply reservoir and 7,000 lineal feet of 12" PVC pipeline in the disadvantaged community of Big Oak Flat. There are 3 components in the storage reservoir; fire flow, operational, and emergency storage. the fire flow is based on a 2500 gallon per minute for a duration of 3 hours which equates to 450,000 gallons. The fire flow rate and duration was determined by the Tuolumne County Fire Marshal. The emegency storage component is the equivalent of one maximum days volume estimated to be 45,000 gallons. The operational component is estimated to be 0.3 times a maximum days flow or the equivalent of 5,000 gallons. The planning criteria for the pipeline was based on a maximum day plus fire flow velocity of 10 feet per second.	M	10	C	Currently, the Big Oak Flat area is served by 4" and 6" pipelines and the maximum fire flow to the area is approximately 300 gallons per minute. There is not a supply reservoir or transmission pipeline. The project fits in CDPH's Category E definition. The average household income for the area code is $25,938 and the community is classified as a disadvantaged community. The zip code tabulation area 95305 was used as the source to determine median household income. Groveland Community Services District has 209 metered customers in the area. About 150 of those meter connections are residences and the other 50+ account for commercial business.	3,000,000	3,201	3,400	11	Tuolumne	III	2009
1793	5510008	5510008-009	LAKE DON PEDRO C S D	Intake Float Pump Replacement	Replace the backup pump on the float with a 150HP pump. When the pump is replaced, additional work will need to be done on the float to correct the changes in buoyancy. This will make sure we have properly functioning pumps in order to secure our water supply. With the required funding in place, this project can be started immediately.	M	10	C	LDPCSD draws its source water from Lake McClure which is increasingly experiencing drought conditions. For example, mid-October 2008 through mid January 2009 the lake level was below our permanent intake structure. The same was true December 2007 through January 2008. When this occurs, we must draw our source water using a float pump intake setup. This includes a float with two pumps attached to it with flexible piping that can be manually moved to changing lake levels. This setup is also currently being used as a bypass system because our permanent intake facility is currently not operating so we are completely dependant on this to supply water to our customers. The secondary pump is no longer working and is under-sized, providing less than one-half the maximum daily demand. If the primary pump were to experience difficulties or stop working, we would be unable to provide water to the 1500 households we service. These households are in two counties, and we are the only water district in the community. It could take several weeks or longer to repair or replace the primary pump which would mean the community would be without water for several weeks. Our water delivery capabilities are severely compromised during drought and bypass conditions. We are also facing our fourth year of constrained revenues due to the economic downturn in our isolated, rural community which has	50,000	1,442	3,600	11	Tuolumne	III	2009

1794	5510008	5510008-008	LAKE DON PEDRO C S D	Emergency Intake Phase II	Purchase and install a new power cable. The options for the cable are being evaluated by our engineer and contractor, but can be resolved in a very short time frame. Reinstall the pump that was rebuilt. The specifications for this are ready to go. Additional items of this project include installation of bracing, pulling of pump wires after the pump installation, the installation and testing of control tubing and related equipment, and inspection of water intake baskets. With the required funding in place, this project can be started immediately.	M	10	C	LDPCSD normally draws it water from Lake McClure through a permanent intake facility. Last year, problems arose with the facility, and it was dismantled and portions were rebuilt. After the removal of one pump, it was determined that the power cable for this pump also needs to be replaced. Due to revenues being much lower than anticipated, the district is unable to complete the project and finish reinstalling the pump and cable to complete the intake facility. This is our primary water source. Without it, our capabilities to deliver water to over 1500 households in two counties are severely compromised. We are the only water district in our community. Without the permanent intake facility in full operation, we are currently using a float intake system as a bypass which has a much lower capacity and is designed for temporary use in drought conditions (low lake level, high pressure head) and does not function well at normal lake levels. We have been able to supply our customers with water using this method during the winter, but when demand increases in summer, we will be unable to deliver as needed to our community. We are also facing our fourth year of constrained revenues due to the economic downturn in our isolated, rural community which has resulted in three years of unbalanced budgets. This project is a top priority that must be completed in order to secure our water source, but funding is currently unavailable.	86,000	1,442	3,600	11	Tuolumne	III	2009
1795	5510008	5510008-004	LAKE DON PEDRO C S D		INSTALL BLOWOFFS ON DEADENDS.	M	10	C	TASTE, ODOR AND COLOR COMPLAINTS DUE TO 85 DEADENDS WITHOUT BLOWOFFS. ALSO RAPID CONSUMPTION OF CHLORINE RESIDUAL LEVELS.	63,750	1,442	3,600	11	Tuolumne	III	1998
1796	5510008	5510008-007	LAKE DON PEDRO C S D	Upgrade Coronado Booster Station	Replace the existing pump and add a second backup pump. This would secure the water supply to those customers serviced by this pressure zone. Plans are completed for this project. With the required funding in place, this project can be started immediately.	M	10	C	The district has a pump station at our Coronado site in the water distribution system. It currently has a single pump where as the rest of our pump stations have two pumps for both backup use and combined use during emergencies. In addition, we alternate the pumps in order to share the wear on each pump. The existing pump has been severely overworked. If this pump were to fail, the next pressure zone would be without supply and the tank would run dry. We are the only water district in our community of 1500 households. Funds are unavailable to complete this project. Our district is facing our fourth year of constrained revenues due to the economic downturn in our isolated, rural community which has resulted in three years of unbalanced budgets.	120,000	1,442	3,600	11	Tuolumne	III	2009

1797	5510008	5510008-010	LAKE DON PEDRO C S D	Intake Float Extension	Increase the float intake piping by an estimated 100 feet. This will allow us to chase the lake level to its lowest level at this position in the lake. This will help secure our water supply. With the required funding in place, this project can be started immediately.	M	10	C	LDPCSD draws its source water from Lake McClure which is increasingly experiencing drought conditions. For example, mid-October 2008 through mid January 2009 the lake level was below our permanent intake structure. The same was true December 2007 through January 2008. When this occurs, we must draw our source water using a float pump intake setup. This includes a float with two pumps attached to it with flexible piping that can be manually moved to changing lake levels. This setup is also currently being used as a bypass system because our permanent intake facility is currently not operating so we are completely dependant on this to supply water to our customers. Utilizing the float, we have the ability to chase the lake level down approximately twenty feet below the permanent intake structure. If the lake drops any further than that, we will no longer have a water source for our community. We service 1500 households in two counties and are the only water district in the community. Our water delivery capabilities are severely compromised during drought conditions. We are also facing our fourth year of constrained revenues due to the economic downturn in our isolated, rural community which has resulted in three years of unbalanced budgets. This project is a top priority to secure our water source, but funding is currently unavailable.	29,000	1,442	3,600	11	Tuolumne	III	2009
1798	5510008	5510008-006	LAKE DON PEDRO C S D	Alamo Tank Generator Upgrade	Install a concrete slab and the generator. Build the pump house. Complete a small amount of site work in order to perform the installation. Plans are completely done for this project. With the required funding in place, this project can be started immediately.	M	10	C	The district has a pressure booster system at our Alamo site in the water distribution system. We are the only water district in our community of 1500 households in a rural, isolated area. At this site when power is disrupted, our customers serviced by this booster system are without water. A generator for this site was purchased. The site also needs to have the booster system pump house, a small building, rebuilt that was blown over. Funds are unavailable to complete this project. Our district is facing our fourth year of constrained revenues due to the economic downturn in our isolated, rural community which has resulted in three years of unbalanced budgets.	31,000	1,442	3,600	11	Tuolumne	III	2009
1799	5510013	5510013-014	TUD - Columbia Water System	Columbia Clear Well	This project would repair the roof structure and replace the interior coating.	M	10	C	The Columbia clearwell has roof structure and interior coating problems. Some of the roof rafter supports have deteriorated and need to be reconstructed in order to prevent a roof collapse. The interior coating is a coal tar based product that has passed its useful life. The coating failure has contributed to the structural failure on the roof system. There are two clearwells. One is 500,000 the other is 150,000. The clearwell in need of repair it the larger of the two.	150,000	1,548	3,646	11	Tuolumne	III	2009
1800	1910117	1910117-002	MONTEBELLO-CITY, WATER DEPT.	Permanent Interconnections For Northern System With Adjacent Potable Water Purveyors	Project :This project is to obtain one or more permanent interconnections with the one or more of the adjacent potable water purveyors, namely San Gabriel Valley Water Company and California Water Service Company, for the City of Montebello Northern Water System. Benefits:The benefit to the City of Montebello Northern Water System is to have an assured reliable water supply to provide minimum water service to all of the customers of the Northern Water System, when the usual supply sources are curtailed.	M	10	C	Existing Condition:The City of Montebello Northern Water System only has a connection with the Metropolitan Water District of Southern California (MWD) for its sole source of potable water supply. When the hydraulic grade in the MWD system drops and or demand for water is high in the Northern System, some classes of water service have to be curtailed. The Northern Water System needs to obtain one or more interconnections with the adjacent potable water purveyors. No public notification is required.	792,000	1,627	3,944	22	Los Angeles	IV	2009

1801	1910117	1910117-001	MONTEBELLO-CITY, WATER DEPT.	Permanent Interconnections For Southern System With Adjacent Potable Water Purveyors	Project :This project is to obtain one or more permanent interconnections with the one or more of the adjacent potable water purveyors, namely City of Commerce and South Montebello Irrigation District, for the City of Montebello Southern Water System. Benefits:The benefit to the City of Montebello Southern Water System is to have an assured reliable water supply to provide minimum water service to all of the customers of the Southern Water System, when the usual supply sources are curtailed.	M	10	C	Existing Condition:The City of Montebello Southern Water System only has a water well and a connection with the Metropolitan Water District of Southern California (MWD) for potable water supply. On occasion when the water well has to be serviced and or the MWD system is out of service, the Southern Water System has only limited reservoir water capacity to rely on. The Southern Water System needs to obtain one or more interconnections with the adjacent potable water purveyors. No public notification is required.	528,000	1,627	3,944 22	Los Angeles	IV	2009
1802	1910117	1910117-003	MONTEBELLO-CITY, WATER DEPT.	Rebuilding City's MWD Connection - Northern Water System	Project :The solution to this situation has two options. Option I is to have MWD enlarge the existing connection. Option II is to obtain a connection with the San Gabriel Valley Water Company (SGVWC), which serves potable water to adjacent areas in the City of Montebello. The purchase of potable water from the SGVWC, which only distributes groundwater to its customers would appear to be more economical then to increase the size of MWD's connection and imported water supply. Before proceeding with either Option I or Option II, the City would need to confirm arrangements with both MWD and SGVWC as to the terms and costs of the respective options. Benefits:The City's Northern Water System definitely needs an increased water source. Either option would be viable to obtain the needed additional water supply to meet additional needs at all times of demand.	M	10	C	Existing Condition:The City's Northern Water System has a sole source of water for the approximately 1,200 metered service customers. This water supply source is a connection with the Metropolitan Water District of Southern California (MWD). The connection has a limited capacity flow size which can not meet the daily water supply needs during the summer peak time. The Northern Water System has two storage reservoirs with a total capacity of 6,500,000 gallons, which are relied on to meet peaking needs. The MWD connection is undersized for the number of customers and on occasions the use of the reservoir capacity is insufficient, such that a major use of water for irrigation purposes has to be temporary terminated.	1,320,000	1,627	3,944 22	Los Angeles	IV	2009
1803	4010018	4010018-002	Golden State Water Company - Nipomo	Nipomo - New Via Alta Mesa Well	Drilling and equipping a new well would provide sufficient supply to rectify the lack of Maximum Day Demand (MDD) supply.	M	10	C	System has inadequate Maximum Day Demand (MDD) supply, as per Title 22 California Regualtions related to Drinking Water, section 64554.	1,500,000	1,493	4,937 06	San Luis Obispo	IV	2009
1804	4010018	4010018-003	Golden State Water Company - Nipomo	Nipomo - Vista Well with Treatment and Boosters	A new well would provide sufficient supply to rectify the lack of Maximum Day Demand (MDD) supply. The wells in this area are traditionally high in Hydrogen Sulfide, iron, and manganese, so traditional oxidation/filtration treatment for these compounds would need to be installed; and additional booster pump capacity and yard piping would be needed to connect the new source of supply to the distribution system.	M	10	C	System has inadequate Maximum Day Demand (MDD) supply, as per Title 22 California Regualtions related to Drinking Water, section 64554.	4,000,000	1,493	4,937 06	San Luis Obispo	IV	2009
1805	4010018	4010018-004	Golden State Water Company - Nipomo	Nipomo - 1.0 MG Vista Reservoir	A new 1.0 MG tank would alleviate the inadequate Maximum Day Demand (MDD) storage and supply issues.	M	10	C	System has inadequate Maximum Day Demand (MDD) storage and supply, as per Title 22 California Regualtions related to Drinking Water, section 64554.	2,100,000	1,493	4,937 06	San Luis Obispo	IV	2009

1806	3610009	3610009-003	BIGHORN - DESERT VIEW WATER AGENCY	Bighorn Reservoir upgrades	Recoat interiors and exteriors for 8 water storage tanks, upgrade sanitary and security and seismic deficiencies to comply with DPW Water Works Standards and OSHA and Homeland Security.	M	10	C	The Bighorn Desert View Water Agency possesses 8 welded s steel tanks. June 2003 the Districts' tanks were inspected Documentation was compiled regarding logistical accessibility, structure proximity, safety compliancy, foundation integrity, sanitary compliancy, security compliancy and heavy metal content in the interior and exterior coatings. All tanks appear to have been constructed in accordance with the version of the AWWA D.100 Welded Tank Construction Standard that was in effect at the time of construction. All tanks appear to have been coated in accordance with the applicable version of the AWWA D.102 standard.INTERIOR COATING CONDITION:All tanks possess one of the following two interior coating systems:- Coal Tar Cutback on Roof and Shell / Coal Tar Enamel on Floor- Solvent Based Epoxy on All Interior Surfaces.- Hot Dipped GalvanizingThe coal tar based system is in place on Tanks B-1, B-2, B-3, B-4, and C-1. This system was most likely applied at the time of original construction in 1977 – 1979 on Tanks B-3, B-4, and C-1. Tanks B-1 and B-2 appear to have been recoated with the coal tar system in the early to mid 1990's. The natural aging and embrittelment of these coatings is resulting in significant concentrations of failure and the onset of base metal degradation. Tank B-4 exhibits the greatest concentrations of coating failure and is the only tank that possesses aggressive corrosion	600,000	1,903	5,000	13	San Bernardino	V	2009
1807	2410012	2410012-004	HILMAR COUNTY WATER DISTRICT	Hilmar County Water District pipeline replacement project	Hilamr County Water DistrictThe proposed project would be to go intothe Irwin area and replace existing pipelines to upgrade the size of the pieline and to remove and replace the blue brute material that has been failing in recent years. The project would require the contractor to place a new distribution main and then connect over the individual services from the existing pipeline.	M	10	C	Hilmar County Water DistrictThe souhtern portion of the district has an area referred to as Irwin. This portion fo the community was constructed in the late 1950's and the water distribution piping is undersized and some of the piping is standard steel pipe with threaded fittings. In the late 1960's a portion fo the piping was replaced with plastic pipe referred to as Blue Brute, this pipe material has had several failures at the bells and along the spring line of the pipe.	2,584,000	1,566	5,000	11	Merced	III	2009
1808	2410012	2410012-001	HILMAR COUNTY WATER DISTRICT		Construct a one million gallon water storage tank.	M	10	C	The water system lacks adequate storage capacity.	1,250,000	1,566	5,000	11	Merced	III	2003
1809	0510009	0510009-001	Blue Lake Springs Mut Wtr		REPLACE UNDERSIZED MAINS WITH NEW, LARGER MAINS	M	10	C	UNDERSIZED MAINS	4,000,000	1,659	5,100	10	Calaveras	III	1998
1810	1910108	1910108-002	BELL GARDENS-CITY, WATER DEPT.	Replacement of Undersized Older Water Mains – Phase-1	Project :This project to replace undersized older water mains – Phase-1 has been separately submitted so as to hold each project construction cost at less than $1,000,000 each, so as to improve the awardability. Benefits:Water supply distribution will be improved so that available flows will provide adequate service without a reduction in pressure and the quality of delivered water.	M	10	C	Existing Condition:The City of Bell Gardens Water System serves 30% of the area of the City. The system was purchased from the Park Water Company, a public Utility in 1990. The best information available indicated that the Park Water Company had not replaced the original water mains that the Company installed many years prior to selling to the City. The age of the water system distribution mains is significant. The City has from available funding sources replaced some of the older smaller diameter water mains to improve the water distribution water system service. There remains significant pipe footage of older substandard water mains to be replaced to properly meet the needs of the Bell Gardens residents and businesses. The City population residential unit is high and therefore the water usage per metered customer is high. No public notification is required.	950,400	1,589	5,247	15	Los Angeles	IV	2009

1811	1910108	1910108-001	BELL GARDENS-CITY, WATER DEPT.	Replacement of Undersized Older Water Mains – Phase-2	Project :This project to replace undersized older water mains – Phase-2 has been separately submitted so as to hold each project construction cost at less than $1,000,000 each, so as to improve the awardability. Benefits:Water supply distribution will be improved so that available flows will provide adequate service without a reduction in pressure and the quality of delivered water.	M	10	C	Existing Condition:The City of Bell Gardens Water System serves 30% of the area of the City. The system was purchased from the Park Water Company, a public Utility in 1990. 1812	1910108	1910108-006	BELL GARDENS-CITY, WATER DEPT.	Installation of SCADA System For Improved Management /Operation	Project :Install a complete modern state of the art SCADA System to interconnect and monitor the operating water facilities and provide a record of the condition of the City Water system. Benefits:Provide Bell Gardens water system with record of the daily water system record of operation and to alert the personnel of problems.	M	10	C	Existing Condition:The City of Bell Gardens Water System has an active water well, an inactive water well, and a connection with Metropolitan Water District of Southern California (MWD) of imported water supply systems. The personnel is responsible for the operation and maintenance of the system and therefore must visit daily every water facility site and physically check on the system operation and take hand notes of operations. To improve the efficiency of the operation and for keeping the management responsible for providing continuous water service of informed of the operation, SCADA System needs to be installed. The SCADA System will also provide a continuous record of the operating conditions. The SCADA System would have the ability to alert operating personnel of any problems of operation on a 24/7 and 365 day basis. No public notification is required.	198,000	1,589	5,247	15	Los Angeles	IV	2009
1813	1910108	1910108-005	BELL GARDENS-CITY, WATER DEPT.	Permanent Water System Interconnections With Adjacent Potable Water Purveyors	Project :This project is to obtain two or more permanent interconnections to one or more of the adjacent potable water systems, which serve the adjacent cities of Commerce, Downey, South Gate and Bell, and in the City of Bell Gardens. Benefits:The benefits to the City of Bell Gardens owned water system and possibility to the interconnected water systems will be to have a back up water supply resource to assure a continuous water supply to the customers of the City of Bell Gardens Water System and possibly in time of need Bell Gardens can supply water to adjacent water purveyors.	M	10	C	Existing Condition:The City of Bell Gardens Water System has one water well as its major source of potable water. The system has a connection with the water system of the Metropolitan Water District of Southern California (MWD) connection, which supplies imported water and is a supplemental water supply source. In the past when there have been disruptions of service from the water well and or the MWD connection, the water system has relied on an emergency temporary interconnection with the adjacent water purveyor in the City. To assure that the water system has a permanent auxiliary supply it can rely on, the City is looking at obtaining two or more permanent interconnections to the adjacent water systems that can be turned on in emergencies, such as, when the City's well or the MWD's connection are out of service. No public notification is required.	528,000	1,589	5,247	15	Los Angeles	IV	2009

1814	5510010	5510010-007	TUD - Crystal Falls Water System	Mono Vista Tank Replacement	This project would construct a new three million tank on district land near the existing tanks. It would significantly increase the storage from 525,000 to 3,000,000.	M	10	C	The Mono Vista tanks are part of the Crystal Falls water system. The tanks are old and deteriorating. They are beyond repair and are in need of replacement. Like all of the tanks in the Crystal Falls system, they were designed and built by others and turned over to the District when the system was consolidated with TUD. The storage in the system is not adequate to meet demands for the number of existing customers in the system during the annual 7 day PG&E outage.	4,300,000	2,232	5,301	11	Tuolumne	III	2009
1815	2410003	2410003-002	GUSTINE CITY	Water Well, Water Storage Tank and Water Treatment	Project consists of constructing one municipal water well, a one million gallon above ground water storage tank with booster pump facility, and well head treatment for nitrate at one existing well.Construction of the proposed improvements will bring the City's water system into compliance with Title 22 Standards and will provide the existing users with safe water and a more reliable distribution system.The proposed well will replace Well No. 1, resulting in immediate benefits in water production and water quality, and ensuring compliance with Title 22 Primary Standards.Construction of the 1 million gallon storage tank will greatly improve the system's ability to operate within an adequate pressure range and will provide storage necessary for sustained fire flows.Well head treatment of Well No. 6 for nitrates will stabilize the well's water quality and enable the City to continue using it. Without the treatment, it is very likely that nitrate levels will continue to rise at a rapid rate and will exceed the MCL in the near future.	M	10	C	The City of Gustine (City) currently utilizes groundwater to meet 100% of the City water demand. The existing system includes four wells (Nos. 1, 4, 5 and 6) and a small (75,000 gallons) above-ground storage tank.The two newer wells (5 and 6) are operated on a full time basis while Well No. 4 is used during the summer to supplement demand. Well No. 1 is only used as a standby because of poor water quality and physical condition.Well No. 5 is the highest production well and has Total Dissolved Solids (TDS) readings above the upper range of the California Code of Regulations (CCR) Title 22 Secondary Standards. Well No. 6 is presently over 50% of the Maximum Contaminant Level (MCL) for nitrate and is steadily rising while Well No. 1 exceeds the MCL for nitrate. Well No. 4 produces considerable amounts of sand.Presently, the City's water system strains to meet the existing demand and lacks redundancy. Computer modeling has shown that the City would currently be unable to meet sustained fire flows, due primarily to deficiencies in storage. Finally, if either Well No. 5 or 6 has to be taken off the system, the City may not be able to meet demand.	4,700,000	1,756	5,311	11	Merced	III	2009
1816	0310003	0310003-002	AWA Sutter Creek		REPLACE THE WATER MAIN. OTHER = DESIGN AND CONSTRUCITON	M	10	C	TRANSMISSION MAIN TO AMADOR CITY SERVICE AREA BREAKS EACH YEAR LEAVING TOWN DEALING WITH OUTAGES.	85,000	1,654	5,458	10	Amador	III	2006
1817	2410006	2410006-004	DELHI CWD	Letteau Ave/Flower Street Water Lines	The project includes construction of about 2,500 feet of 10" diameter water line, valves, and fire hydrants, and also includes three connections to existing water lines.	M	10	C	Installation of about 2,500 feet of water main to provide a loop to a dead-end portion of the District's existing water distribution systems. The loop will also improve overall system pressures.	350,000	2,254	5,548	11	Merced	III	2009

1818	1910018	1910018-003	Bellflower Municipal Water System	Water System Reconstruction Phase 2 {Systems 5 & 6}	PIPELINE IMPROVEMENTS/REPLACEMENTS (47% OF SYSTEM)This program provides for the replacement of approximately 45,000 linear feet of undersized pipelines and includes replacement of fire hydrants and meter assemblies. This project represents the remaining pipelines, which have been in service for up to 65 years and are identified as deficient under current fire flow standards (City Resolution No. 07-21). This Project represents approximately 35,000 linear feet of 4-inch asbestos-cement pipeline. The conditions of these pipelines are expected to be good; however, fire flow requirements cannot be met. (Fire hydrants and meter assemblies are included as separate WSIP projects; therefore, are excluded from the estimated construction cost.)FIRE HYDRANTS – Propose new hydrants at 300-foot spacing; 74,418 If estimates 248 fire hydrants. Most of the BMWS fire hydrants are older models in need of replacement. Existing hydrants were installed at the time the pipeline was constructed,-, therefore, some of the hydrants are up to 65 years old with a spacing exceeding current-day fire protection standards. These include 4- inch risers with a single outlet, which cannot provide the flow capacity of the current fire hydrant models with 6-inch risers and multiple outlets.WATER METERS AND SERVICE - Replacement of 60 percent of existing BMWS services. All residential services affected by pipeline relocation	M	10	C	BACKGROUND - In January 2007, the City acquired the assets of the Peerless Water Company for the sum of $5.8 million. On March 21, 2007, the California Department of Health Services (DHS) made their first site visit and inspection of the water system since 1999. Their engineering report identifies a number of problems, including:a. The water pressure in portions of the system must be limited due to the deteriorated condition of the piping (paragraph 2.4.1).b. Wells 2, 3 and 8 exceed the secondary MCL (Maximum Contaminant Level) for manganese (paragraph 2.6.1.2).c. Well 8 exceeds the secondary MCL for iron (paragraph 2.6.1.2).d. The System Operations Plan does not address sequestering treatment of manganese and iron (paragraph 2.5.2).e. Wells 2, 3 and 8 require the City to initiate proper testing of manganese and iron (paragraph 2.6.1.2).f. Unregulated Chemicals Monitoring Regulation (UCMR) monitoring is deficient. A round of monitoring for hexavalent chromium should have been completed by December 31, 2002. g. The Stage 2 Disinfection Byproducts Plan due to DHS was not submitted by the October 1, 2006 deadline. The plan must be implemented by October 1, 2007 (paragraph 2.6.2.3).h. Wells 4, 5, 6, 7, 9, 11, 12, 14, 15, and 16 (total of 10) are inactive and must be rehabilitated or destroyed in accordance with County Health Department regulations (paragraph 3). i. Wells	5,500,000	1,819	5,967	16	Los Angeles	IV	2009
1819	1910018	1910018-006	Bellflower Municipal Water System	Water System Reconstruction Phase 3 {Systems 8 & 9)	PIPELINE IMPROVEMENTS/REPLACEMENTS (39% OF SYSTEM)This program provides for the replacement of approximately 45,000 linear feet of undersized pipelines and includes replacement of fire hydrants and meter assemblies. This project represents the remaining pipelines, which have been in service for up to 65 years and are identified as deficient under current fire flow standards (City Resolution No. 07-21). This Project represents approximately 35,000 linear feet of 4-inch asbestos-cement pipeline. The conditions of these pipelines are expected to be good; however, fire flow requirements cannot be met. (Fire hydrants and meter assemblies are included as separate WSIP projects; therefore, are excluded from the estimated construction cost.)FIRE HYDRANTS – Propose new hydrants at 300-foot spacing; 74,418 If estimates 248 fire hydrants. Most of the BMWS fire hydrants are older models in need of replacement. Existing hydrants were installed at the time the pipeline was constructed,-, therefore, some of the hydrants are up to 65 years old with a spacing exceeding current-day fire protection standards. These include 4- inch risers with a single outlet, which cannot provide the flow capacity of the current fire hydrant models with 6-inch risers and multiple outlets.WATER METERS AND SERVICE - Replacement of 60 percent of existing BMWS services. All residential services affected by pipeline relocation	M	10	C	BACKGROUND - In January 2007, the City acquired the assets of the Peerless Water Company for the sum of $5.8 million. Wells	500,000	1,819	5,967	16	Los Angeles	IV	2009

1822	4910004	4910004-010	Sweetwater Springs CWD - Guerneville	Guerneville 2009 Infrastructure Improvements	The project is two separate elements to improve the aging, leaking Guernville distribution system. The first element is replacing 1,600 lf of existing main and appurtenances in Riverlands Road, including two ties at Drake Road to create a loop. This will remove aging distribution main reducing the leakage and breaks in the system in this area and looping the system to provide better water quality, system water pressure, and fire flow. The second element is replacing 300 lf of existing main between Hwy 116 and the booster pump at Old Monte Rio Road. This will have similar benefits: providing better water quality, system water pressure, and fire flow. It fits in with past projects that replaced the water main in Hwy 116 and a future project that will replace the main in Old Monte Rio Road. It is important to note that the Guerneville distribution system has water losses in the 30% range - all projects are aimed at helping reduce that level and also allow staff to work proactively in identifying system losses instead of reacting to surfacing leaks.	M	10	C	This project replaces 1600 lineal feet of existing main and appurtenances in Riverlands Road, looping that part of the distribution system, and 300 lf of existing main between Hwy 116 and Old Monte Rio Road looping that part of the distribution system. The project addresses aging infrastructure, leaks, inadequate water pressure and water quality. There are no current violations with the system, but it does have inadequate infrastructure with unacceptable system water losses (approximately 30%).	414,000	2,497	6,000	18	Sonoma	II	2009
1823	5010008	5010008-007	Hughson, City of	Water System Improvement - Pipeline Replacement and Improvement	The City will install approximately one mile of pipelines ranging from 8-inch to 12-inch diameter to improve system pressure and to create looping to the area west of the Santa Fe Rail Road. In addition, three miles of small diameter pipeline replacement would increase all pipelines equal or smaller than 6-inch in diameter to 8-inch diameter pipelines.	M	10	C	The existing water distribution system has very old (greater than 30 years) and small diameter water distribution pipes that are not in very good condition. In addition, there are a number of dead end lines. These small old diameter pipelines are concentrated in the older sections of the City. These areas of the distribution system can not deliver water supply at adequate water pressure due to increased water demands. To improve water system capacity and water quality, 3,000 feet 12-inch water main from Well No. 6 would be installed. The pipe alignment would be east on Pine Street, south on Euclid Ave. and west on Whitmore Ave. Pipeline improvements are also proposed to create a looped system around the west of Santa Fe Rail Road area. These improvement will enhance water quality by reducing the potential for disinfection byproducts generation (total trihalomethanes and haloacetic acid 5), and improve system pressure.	5,626,000	1,779	6,082	10	Stanislaus	III	2008

1824	3610107	3610107-002	GOLDEN STATE WATER CO - APPLE VLY SOU	Apple Valley South Pipeline Replacement Project	The proposed project is to replace the existing mains in Wren St. to Saratoga Rd.; Rambling Rd. to Valencia St.; Rambling Rd. south of Valencia Rd.; Kiowa Rd. to Kiowa Pl.; Marmoset Rd. to Merino Ave.; Merino Ave. To intersection of Merino Ave. and Lancelet Ave.; Lancelet Ave. approx 500 ft south of wren to intersection of Merino Ave. and Lancelet Ave.; Caribou Ave. to Kiowa Rd.; Kiowa Pl. to Kiowa Rd.; Kiowa Rd. to approx 400 ft west of Merio Ave.,; Del Oro Rd. to Itoya Vista Rd.; various lines in Itoya Vista Rd.; Mohawk Rd. to Balsa St.; Tussing Ranch Rd. to Navajo Rd.; Wren St. to Quinnault Rd.; Tussing Ranch Rd. to Wren St.; Balsa St. to Balsa Ct.; Jamul Rd. to Tussing Ranch Rd.; Tecopa Rd. to Tussing Ranch Rd.; Manhasset Rd. to Panoche Rd.; Toltec Rd. to Manhasset Rd.; Cochiti Rd. to Tussing Ranch Rd.; Nambe Rd. to Micmac Rd.; Sauk Rd. to Sauk Ct.; Bear Valley Rd. to Toltec Dr.; Minnetonka Rd. to Nomwakett Ln.; Lone Eagle Rd. to Nomwakett Ln.; various lines in Bear Valley Rd.; Nocola Rd. to Lucilla Rd.; Franceska Rd. to Lucilla Rd.; Powhatan Rd. to Topock Rd. as identified in the recently completed master plan for the Apple Valley South system. The plans for these projects will be completed by June of 2009 and the estimated construction start date will be in July of 2009.	M	10	C	There are fire flow deficiencies in the Apple Valley South system due to undersized 1940's era mains installed that range in size from 3 inch to 12 inch in diameter.	10,791,000	1,894	6,250	13	San Bernardino	V	2009
1825	3610107	3610107-001	GOLDEN STATE WATER CO - APPLE VLY SOUTH		Replace mainline	M	10	C	Old, undersized mainline	38,000	1,894	6,250	13	San Bernardino	V	1998
1826	4810004	4810004-002	City of Rio Vista		replace deteriorated mains and appurtenances.	M	10	C	Sections of distribution system is deteriorated.	2,000,000	3,274	7,376	04	Solano	II	1998
1827	3610015	3610015-001	CRESTLINE VILLAGE CWD - DIVISION 10		Construct four new storage reservoirs for a total of 3.35 MG to meet ww stds.	M	10	C	Insufficient and old storage facilities	2,700,000	4,900	7,400	13	San Bernardino	V	1998
1828	1910160	1910160-007	TRACT 349 MUTUAL WATER CO.	Well replacement, new storage tank & pump station	Drill new well southwest corner of the facility and destroy the existing old well. Installed storage reservoir approximately 1MG capacity. Build new pump station adjacent to well and storage reservoir.	M	10	C	Existing well being used was drilled in 1928 and showing sign of end of life. The existing storage tank or stand pipe does not have the storage capacity requirements for operational equalization, fire suppression reserve and emergency supply. The existing booster pump cannot provide adequate fire flows for most of the service area.	2,500,000	908	7,500	07	Los Angeles	IV	2009
1829	4010005	4010005-003	OCEANO COMM SERVICES DIST.	Waterline Replacement	OCSD proposes to replace the aged, damaged, and undersized existing water lines with new PVC lines, installed with adequate separation from existing sewer lines, where possible. Where adequate separation is not possible, OCSD will install the lines with the following special conditions:1. Maintain a separate trench from the existing sewer trench zone. 2. Use Class 200 PVC water pipe compliant with AWWA C900 requirements and ASTM D- 1869 and E-477 requirements. 3. Trench bottom will be compacted 90% relative compaction. 4. Pipe bedding will be 4 inches thick, consisting of ½" to ¾" river run gravel. 5. Construction inspection will require photographs of each step taken during installation.In the event of another earthquake, the method of installation described above will limit the possibility of cross-contamination in areas where adequate separation is not possible.The flowing projects will replace the lines that offer the greatest risk.1. A 2" steel line, installed in 1952, from the alley north of Cienega Street from the existing 12" pipe east of 19th Street to the existing 8" pipe in 17th Street.2. A 4"steel line, installed in 1952, from the alley northeast of Front Street, running from the alley north of Cienega Street to the 8" pipe in 17th Street.3. A 4" ACP line, installed in 1952, in the alley west of Pacific Blvd., from Mendel Drive to Truman Drive.4. A 6" ACP line on Pier Avenue, installed in 1974,	M	10	C	Various water lines in OCSD's water system pose a safety concern, given the combination of their age (and subsequent frequent leaking), material type (steel and ACP), and close proximity (within 10' in many places) to OCSD sewer lines. Given the age (most lines were installed in 1952), size (some are as small as 1" and 2"), and material (steel and ACP) of the lines in question, there are numerous fire flow deficiencies throughout the district that result in negative pressures under fire flow conditions creating potential for contamination. This risk is furthered by the earthquake that hit Oceano and the surrounding area in December of 2003, damaging many of the sewer and water lines in the OCSD system. While all of the indentified leaks and breaks have been repaired in the interim, the overall integrity of both the sewer and water systems is still in question. Current replacement projects continue to expose unnoticed water and sewer line breaks in proximity to each other create a clear risk of cross-contamination and thereby public health risk. Many of the lines within the water system do not meet current AWWA Standards.	1,200,000	1,987	7,600	06	San Luis Obispo	IV	2009

1830	5010006	5010006-002	City of Modesto, DE Waterford	Water Main and Service Replacement - Waterford	The Waterford Water System will require the replacement and upsizing of water mains and service. Water mains and services will be moved out of the easement areas and installed in the street for easy access. Fire hydrants will also be installed. Adequate water flows will result due to appropriate sized water mains. This will improve water quality and bring sufficient water pressures and volumes for fires and household use. With new piping, water conservation will improve by eliminating water leaks. A total of 52,000 feet of water mains will be upgraded. There are 1,154 meter services that will be replaced during the infrastructure improvements. All meter services will comply with State mandates.	M	10	C	The Waterford Water System infrastructure is aging and in desperate need of major upgrades. Staff spend many hours fixing leaks, maintaining system, and spending money on property damage to customers due to leaks. The water system has insufficient water quantity due to limited water delivery restricting new growth, including residential, industry and school expansions. With the low pressure issues, outdated water mains and services, the Waterford area has limited fire protection; especially during peak hours.There are over 52,000 feet of water main that needs to be upgraded to meet the needs of this community and provide adequate volumes of water for building, industry, schools and fire protection. Well pumping is restricted due to wellhead treatment for DBCP and taste and odor. Also one of six wells cannot be overdrawn due to manganese contamination.	4,570,000	2,214	7,897	10	Stanislaus	III	2009
1831	4910002	4910002-003	Cloverdale, City of	City of Cloverdale - Water Distribution System SCADA Improvements	This project will involve the installation of SCADA monitoring equipment to the nine sotrage tanks and the water treatment plant. A modern SCADA system would provide remote data information sensors and transmitters on all the storage facilities and pump stations throughout the City water distribution system. The SCADA system will allow an operator to monitor all water storage levels and pump station operations from the Water Treatment Plant or remotely. Water tank levels can then be anticipated and responded to before reaching a critical point (empty tanks) and improve the overall safety and reliability fo the City Water system. Fire suppression supply would also be preserved.	M	10	C	Several of the nine existing storage tanks in the municipal lack remote low water level dial-up alarms. Visual inspection of these storage facilities is required to verify water levels. Upon visual inspection, several of the storage facilities have been found to be completely empty. A SCADA (Supervisory Control And Data) system would collect data from various sensors mounted on the stroage tanks and send the data to a central computer which would be used to manage and control the water storage levels. The lack of a SCADA system prevents the knowledge of system outages and the lack of realtime storage data puts the City in an "at risk" mode for adequate fire suppression.	137,340	3,114	8,200	18	Sonoma	II	2009
1832	2710007	2710007-002	Gonzales, City of	2009 Johnson Canyon Water Main Improvement	The general project description: This project includes furnishing all labor, materials, tools, and incidentals required for the construction and installation of approximately 6,600 lineal feet of 12'' PVC water main, valves, fittings, trenching backfill & restoration. The SCADA system will allow the City to remotely monitor the entire system, place any or all wells into hand and run them manually, or disable any well from running, or operate any well in automatic mode based on tank level (with individual on/off setpoints, with or without time-of-day override). The proposed system will easily allow future expansion for the City to include lift stations, future storage tanks, and/or the City's wastewater plant without the need to purchase additional software. The following scope of work shall include all labor and materials (installation of the panels, conduits, and antennas at each wellsite, tanksite, and City Hall);Supply one(1) Master 1 watt ISM spread spectrum RTU unit, Omni directional anntena and cable Supply five(5) Slave 8ADI/9D0 1 watt ISM spread spectrum RTU units with battery back-up power supplies, 20' anntena cables, and Yagii antennasFRM to nstall neccesary current switches/transformers and control wiring at each of 4 wellsites to allow monitoring/control of well pumps and chlorine pumpsSupply one(1) level transducer for Tank #1 - (provisions for 2 additional tanks included)Supply one(1) Dell dual hard drive server	M	10	C	Our City Goal for this project is that our water system continue to be safe, reliable, and energy efficient. Our operational challenges were storage and deliver supply lines. Recently, we increased our storage from one million gallon to seven million gallon of storage capacity, so storage has been addresses. Now our immediate focus is on the main truck line to the new tanks, the existing supply line is not large enough and limits our pumping capabilities. The other is water system control through automation. Our present telemetry system is ancient and only provides control 2 of the 4 city wells. In fact we have been having problems with the system the last couple weeks. The telemetry system is a low voltage contact system that runs via phone lines and the phone company has given us notice that it no longer recognizes this system. The addition of additional water main capacity along with SCADA will permit the city to alter its pumping schedule thus not only lowering operating costs, but is more environmentally attuned.	855,000	1,916	8,803	05	Monterey	II	2009
1833	3310017	3310017-001	South Mesa WC		Replace reservoir with steel tank or rebuild reservoir walls.	M	10	C	Cracks in conrete reservoir number 3. Stability of reservoir questionable.	500,000	2,934	9,018	20	Riverside	V	1998

1834	5510001	5510001-009	TUD - Sonora/Jamestown Water System	Greenley Water Tank Recoating	The project would take the tank off line, remove the existing coating and recoat the tank interior.	M	10	C	The Greenley treated water storage tank, at three million gallons, is the largest storage tank in the Sonora / Jamestown system. It provides treated water and fire flow storage to the Sonora and Jamestown areas. The coal tar based interior coatings are failings which is causing deterioration of the steel tank structure. The coatings, which were applied in the mid 1970's, do not meet current State requirements for new treated water tank coatings.	450,000	4,342	10,294	11	Tuolumne	III	2009
1835	1510018	1510018-013	ROSAMOND CSD	RCSD Replacement Water Mains: Oak, Elm & Orange Streets	RCSD would like to replace the 4" asbestos/cement lines with 8" PVC C-900. The approximate length to be replaced is 5,236' of PVC. When the lines are replaced, the system will be well looped to service the three residential tracts where the current lines are now. The waterlines will be replaced to lay in the street centerline, rather than under residential trees. This project will also reduce the District's water losses.	M	10	C	The water lines on Oak, Elm and Orange are 4" asbestos/cement. The lines were laid in the early 1960's. The pipes are very old, leak and consistently need repairing. After the lines were laid, residents planted trees above the water lines. The roots have caused line breakage and interruption of service. Also at the time the lines were placed, they were not well-looped. This project is categorically exempted from CEQA compliance.	705,000	4,593	10,633	19	Kern	III	2009
1836	1510018	1510018-014	ROSAMOND CSD	RCSD Well #11 Drill and Improvement	The Project site is located ¼ mile south of the intersection of Gaskell Road and future 30th Street West, on the west side of future 30th Street West and will be placed on 1 ¼ acre of land. The APN is 243-021-13. Well #11 is anticipated to produce 1,600 gpm of groundwater drilling to a probable depth of 500+ feet. The well casing will be stainless steel and will have an outside diameter of 16 inches. The conductor casing diameter will be 30 inches, and the bore hole diameter will be 36 inches.The anticipated pump motor size will be 200-250 HP. The pump motor will be sized to produce an average water production/extraction rate of 1,200 gpm with an average discharge pressure of 105-110 psi. The well will have water injection capabilities. Water lubrication will be used for the bearings. An all weather enclosure for electrical controls and variable speed drive will be installed to adjust the pump's rate of flow. The well will be monitored by an existing SCADA system.RCSD Well #11 is located in a flood plain. The entire project site will be over excavated and backfilled with the native soil in 8 inch lifts to 95% relative density. A foundation slab and footings will be placed around the concrete pump pedestal to accommodate a building enclosure. The finished floor elevation of the slab will be 42 inches or higher, if required by Kern County engineering standards, above the minimum requirement to remain above the flood plain.The well	M	10	C	RCSD needs to drill a well to extract groundwater for a town with a population of over 16,000. RCSD has been purchasing about 40% of water used by consumers from Antelope Valley East Kern Agency (AVEK). The amount alloted to RCSD by AVEK has been substantially reduced due a major cut-back from the Bay-Delta area and drought. RCSD considers this an emergency drilling as the well needs to be operational by late summer.	823,793	4,593	10,633	19	Kern	III	2009

1837	1510018	1510018-010	ROSAMOND CSD	RCSD Well #10 Drill and Improvement	Rosamond Community Services District (RCSD) is located at the northern end of the Antelope Valley, California. Rosamond is bisected by the north-south State Route 14. Rosamond Blvd. is east-west, with the town's eastern end of the boulevard terminating at Edwards Air Force Base.The Project site is located 1/4 mile south of the intersection of Gaskell Road and future 40th Street West, on the east side of future 40th Street West and will be placed on 1 1/4 acre of land. The APN is 243-021-11. Well #10 is anticipated to produce 1,600 gpm of groundwater drilling to a probable depth of 500+ feet. The well casing will be stainless steel and will have an outside diameter of 16 inches, the conductor casing diameter will be 30 inches, and the bore hole diameter will be 36 inches.The anticipated pump motor size will be 200-250 HP. The pump motor will be sized to produce an average water production/extraction rate of 1,200 gpm with an average discharge pressure of 105-110 psi. The well will have water injection capabilities. Water lubrication will be used for the bearings. An all weather enclosure for electrical controls and variable speed drive will be installed to adjust the pump's rate of flow. The well will be monitored by an existing SCADA system.RCSD Well #10 is located in a flood plain. The entire project site will be over excavated and backfilled with the native soil in 8 inch lifts to 95% relative density. A foundation slab	M	10	C	RCSD needs to drill a well to extract groundwater for a town with a population of over 16,000. RCSD has been purchasing about 40% of water used by consumers from Antelope Valley East Kern Agency (AVEK). The amount alloted to RCSD by AVEK has been substantially reduced due a major cut-back from the Bay-Delta area and drought. RCSD considers this an emergency drilling as the well needs to be operational by late summer.	773,973	4,593	10,633	19	Kern	III	2009
1838	1510018	1510018-011	ROSAMOND CSD	RCSD Tank #6 Construction	Future Tank #6 will be located adjacent to Tank #3 on ground already prepared for another 2 mg tank. RCSD will use existing piping to fill and discharge as necessary. The Reservoir can be used in conjunction with Tank #3 (water levels rise and fall simultaneously) or can be used independently; i.e., provide service while Tank #3 is down. Tank #6 will be monitored by an existing SCADA system.The District would then have double the storage capacity of the town's principle tank. This is especially important if the District has to support a large firefighting effort, provide water in a supply emergency such as the interruption of AVEK water supply, and can more easily provide water to Tank #5 to the north while still assisting Tank #3 to supply water to the lower elevation customers.	M	10	C	Rosamond Community Services District (RCSD) has determined that additional potable water storage volume is needed for the increasing District water demands based on a growing population, currently around 16,000. RCSD plans to build a 2 mg tank, Tank #6. At this time, the District owns and operates five potable water reservoirs with two of the tanks having 2 mg capacities and the remainder being 1 mg or smaller. The site for future Tank #6 is located at the northern end of 30th Street West in the Rosamond Hills where Tank #3 is currently operating. Roughly half of the town of Rosamond has developed to the east of 30th Street, and half to the west. It is anticipated that development to the west will eventually surpass development to the east and additional storage tanks will be required to be constructed to the west. Tank #3 was constructed in 1989 on a hill side that had to be literally blasted out of dense volcanic rock. The site was prepared for two 2 mg tanks, although only one tank (#3) was built.	2,010,000	4,593	10,633	19	Kern	III	2009

1839	1210016	1210016-005	McKinleyville C.S.D.	MCSD Emergency Water System Intertie	The McKinleyville CSD is proposing two system upgrades to plan for the potential failure of the water transmission line beneath the Mad River in the event of an emergency. The first phase would be to install an A-frame and suspension cable across the Mad River directly above our existing pipeline. The dead-heads to hold the weight of the frames, cable and suspended pipe and the related valving would need to be constructed. Only the concrete abutments would need to stay on site, the A-frames, cable and piping could be kept in storage until an emergency event occurred. While the existing transmission pipe beneath the river is 18" in diameter, the suspended pipe would be 12 inches in diameter. This restriction is due to the weigh of the water and pipe being suspended. This would allow for an emergency supply of water of about 400 GPM, that coupled with rationing, would provide for potable drinking water and maintain fire flow until the undercrossing could be repaired.The second phase of the project would be to install a twelve" pipeline across the Mad River via the Highway 101 bridge. This bridge is currently under replacement and we have received an encroachment permit from CalTrans to place a an emergency 12" water pipeline within the bridge. Fitting and valves will need to be placed in the MCSD Distribution sytem to allow for connection of a temporary above ground pipe that could be extend for	M	10	C	McKinleyville Community Services District receives water from our regional supplier, the Humboldt Bay Municipal Water District. Our single source of supply is through an 18' water transmission main buried beneath the Mad River. We are in a seismic region with potential for a 9+ magnitude earthquake. Additionally, we are subject to extreme flood conditions as seen from past events. Either of these two scenarious could result in a failure of our transmission line under the Mad River.Should a pipeline failure occur the McKinleyville area would have to immediately go to Emergency Water Rationing and would be limited the amount of water within our storage reservoirs. It is unknown how soon the transmission main could be repaired depending upon weather conditions and the type of event. Public health, property loss, fire flow and potatble water delivery would be threatened in the event of a water transmission loss.	750,000	5,042	15,132 01	Humboldt	I	2009
1840	1210016	1210016-004	McKinleyville C.S.D.	Ramey Water Pump Station Upgrade Project and Reservoir Construction	The MCSD water pumping station has four twenty-hp pumps and one forty-hp pump with capacity to pump 3.3 MGD. Due to growth and increased demand we meter peak days of 3.7 MGD. These have been isolated events in mid-summer and have not lasted more than a few days. We are able to meet supply on average days, but should we have a week or more demand above our supply ablity we will be drainging our reservoirs to levels that will not deliver sufficient system pressure and affect fire flow. Our current reservoir storage of 5.25 MG is used to buffer the shortage of delivery. At time we are having our reservoirs drop below 50% and this creates concern for fire flow and sytem pressure.The pump station pre-engineering study recommeds an upgrade to the existing pump station of a manifold sytem with three new stacked turbine pumps with multiple impellars that can be adjusted to meet demand. Two pumps would be constructed immediately with third pedestal capped for future growth. The facility will be upgraded to meet a 4.5 MGD capacity. Along with the pump upgrade, the electrical and emergency generator will also need upsizing for the new horsepower requirement. The SCADA system will be modified to accommodate the newer pumps.The six million gallon reservoir is to be placed on property purchased by the District in the 1980's for this purpose. This tank is on our Capital	M	10	C	The MCSD is not able to deliver sufficient water to meet peak day demand in the summer months. The MCSD has one pump station to pump water from our regional supplier. Currently, we are not able to meet pumping demands on peak days due to inadequate pump capacity and reservoir storage. The MCSD has already retained an enginnering firm to provide an pre-engineering study on the necessary upgrades to our delivery system. The pump station is ready for engineering of the piping, electrical and mechanical systems. We have already completed our environmental documents on this site and they are filed with the State Clearinghouse and the Humboldt County Recorder's Office. The design and constrcution can be completed within 180 days.The 6 million gallon reservoir is needed for additional storage. This project is part of the distribution upgrade and is schedule for completion within one year. The District owns the property and has performed some preliminary geotech study on this site. This project will need environmental review, engineering and construction. We believe this can be accomplished and constructed prior to early summer of 2010. Both phases of this distribution system upgrade are shovel ready and can proceed in a very short time frame with funding assistance.	2,400,000	5,042	15,132 01	Humboldt	I	2009
1841	1910223	1910223-001	GSWC-SOUTH SAN GABRIEL		REPLACE UNDERSIZED MAINS OVER A 2 YEAR PERIOD	M	10	C	3500' OF WATER MAINS LESS THAN 4" IN DIAMETER. THESE MAINS DO NOT COMPLY WITH TITLE 22, SECTION 64628 (a).	350,000	4,836	16,078 07	Los Angeles	IV	1998
1842	2710011	2710011-007	Soledad, City of	Water Main Rehabilitation Project	The project will start by repositioning the water main along Monterey st to gain separation between the Water Main and the Gas Main (a safety hazard). This will require reconecting services latterals to the new Main along the sixteen block repositioning. At the same time the blow-offs at the deadend locations will be installed, which will exacerbate potentential health hazards.	M	10	C	In the older sections of the City there have been multiple line breaks and between West st and eighth st along Monterey st at every intersection a four inch gas main is on top of the water main and in contact. There are also twelve deadends in the water system without blowoffs, which need to be installed to eleminate stale water conditions.	4,900,000	4,951	16,146 05	Monterey	II	2009

1843	2710011	2710011-005	Soledad, City of	Seismic Retrofiting of Reservoirs	Seismic control valves will be purchased and installed on the tank farm system and intergrated with the potable water SCADA system.	M	10	C	Four above ground storage tanks, totaling four million gallons of water, are in a posisition that flooding of homes is likely in the event of an earthquake large enough to damage the tanks.	500,000	4,951	16,146	05	Monterey	II	2009
1844	2710011	2710011-006	Soledad, City of	City of Soledad Vulnerability Assessment Improvements	The funds requested would supply materials, construction and labor to address these critical security issues. Under the rules of the federal vulnerability assessment program (VSAT), the City is unable to describe these critical security measures in detail, as they are considered secret and vital to national security. The City is willing to provide more detailed information in a secure manner that would not compromise the secrecy mandated by the federal government.	M	10	C	In 2007, the City of Soledad prepared and reported to the Federal Government through the vulnerability assessment program, the vulnerabilities of the City's water system. The critical issues and insufficiencies were identified and a plan to address the issues was created by the City and submitted to the government at that time. The City lacks the funds to address these critical security issues.	61,000	4,951	16,146	05	Monterey	II	2009

1853	1510006	1510006-011	East Niles CSD	Kern Citrus Pump Station Improvements	This project involves replacing three existing pumps, motors, control panels, suction and discharge piping. Also included is a masonry block structure to protect against the variable weather conditions and improve onsite security measures.This pump station is the entry point to the distribution system for a tank site that receives groundwater from five sources, three of which are exceeding the MCL for Arsenic. Fifty (50%) percent of the Districts total water demand and ninety five (95%) percent of the Districts groundwater must move through this pump station to be delivered to the customers of the District.	M	10	C	The existing Kern Citrus Pump station was last updated in the mid 1960's excepting one replacement motor and electrical panel. The three original pumps have exceeded their useful life. The suction piping has been maintained well beyond its life and is in dire need of replacement. Corrosion has taken its toll over the last 45 years and replacement is the only viable option left.	1,100,000	7,338	25,500	12	Kern	III	2009
1854	3310044	3310044-011	Rubidoux Community SD	Goldenwest 6 MG Tank	The proposed project consists of clearing, grading, and fencing of the tank site and access road, constructing a tank foundation, preparing the tank site, constructing a 6 MG welded steel water storage tank and appurtenances, installing onsite connection piping, coating and painting the tank, and landscaping the site.	M	10	C	The purpose of the project is to construct a 6 MG welded steel water storage tank, and thereby to improve system operating conditions and reliability by increasing equalization storage, fire protection storage, and emergency storage.The District's proposed Goldenwest 6 MD tank construction project is necessary to augment the District's existing water distribution system so that it can continue to provide safe and reliable service to residents of its service area in accordance with its 1999 Water Facilities Master Plan. The District is obligated to furnish domestic water to its service area that meets standards set by the U.S. Environmental Protection Agency (USEPA) and the California Department of Public Health (CDPH).	4,700,000	6,206	26,177	20	Riverside	V	2009
1855	3310044	3310044-008	Rubidoux Community SD	Pacific Avenue 12" and 16" Water Pipeline	The proposed Pacific Ave 12" & 16" Water Pipeline project involves the installation of approximately 4,100 LF of 12" PVC and approximately 750 LF of 16" DIP within the Pacific Avenue public right-of-way. This project was identified in the District's Water Master Plan to replace the undersized and failing water distribution pipelines in Pacific Ave. The proposed project will also include the replacement of the associated appurtenant facilities (valves, fire hydrants, flow meters, etc). The proposed project will eliminate excessive water loss, and eliminate the threat to health, safety, welfare, and economy in the affected project area.	M	10	C	The proposed Pacific Ave 12" & 16" Water Pipeline project involves the installation of approximately 4,100 LF of 12" PVC and approximately 750 LF of 16" DIP within the Pacific Avenue public right-of-way. This project was identified in the District's Water Master Plan to replace the undersized and failing water distribution pipelines in Pacific Ave. The proposed project will also include the replacement of the associated appurtenant facilities (valves, fire hydrants, flow meters, etc). The proposed project will eliminate excessive water loss, and eliminate the threat to health, safety, welfare, and economy in the affected project area.	950,000	6,206	26,177	20	Riverside	V	2009
1856	3310044	3310044-002	Rubidoux Community SD		Construct 3-1,500 gpm wel pumping plants and a 4,500 gpm nitrate treatment facility..	M	10	C	The district's draft 1997 water facilities master plan identifies a water production deficiency of 4,400 gpm based on current conditions..	7,900,000	6,206	26,177	20	Riverside	V	1998
1857	3310044	3310044-010	Rubidoux Community SD	24" Mission Blvd Pipeline (Carrera to GW Tank)	The proposed project involves the installation of approximately 7,600 LF of 24" CML&C Steel pipe within the Mission Blvd public right-of-way (between Carrera Ct and Sedona Dr) and within the Sedona Dr public right-of-way (between Mission Blvd and the GW Tank site). The proposed project also includes the installation of fire hydrants and other appurtenances.	M	10	C	The purpose of the 24" Mission Blvd Pipeline (Carrera to GW Tank) project is to install approximately 7,600 LF of 24" diameter pipe to improve system operating conditions and reliability by constructing a transmission water main from the terminus of the existing transmission system to the proposed Goldenwest (GW) tank.The proposed pipeline is necessary to augment the District's existing water transmission system so that it can continue to provide safe and reliable service to residents of its service area in accordance with its 1999 Water Facilities Master Plan. The District is obligated to furnish domestic water to its service area that meets standards set by the U.S. Environmental Protection Agency (USEPA) and the California Department of Public Health (CDPH).	1,500,000	6,206	26,177	20	Riverside	V	2009

This project was identified in the District's Water Master Plan to replace the undersized and failing water distribution pipeline in Crestmore Rd as well as to provide an additional link between the existing water transmission/distribution system and our local groundwater well supplies. The proposed project will also include the replacement of the associated appurtenant facilities (valves, fire hydrants, etc). The proposed project will eliminate water loss, and eliminate the threat to health, safety, welfare, and economy in the affected project area.	M	10	C	The proposed Crestmore Rd 24" Water Pipeline project involves the installation of approximately 1,500 LF of 24" CML&C Steel Pipe within the Crestmore Road public right-of-way (between 34th St & Mission Blvd). This project was identified in the District's Water Master Plan to replace the undersized and failing water distribution pipeline in Crestmore Rd as well as to provide an additional link between the existing water transmission/distribution system and our local groundwater well supplies. The proposed project will also include the replacement of the associated appurtenant facilities (valves, fire hydrants, etc). The proposed project will eliminate water loss, and eliminate the threat to health, safety, welfare, and economy in the affected project area.	570,000	6,206	26,177	20	Riverside	V	2009
1859	3310044	3310044-007	Rubidoux Community SD	Rubidoux Community Services District Emergency Interconnections	The Rubidoux Community Services District (District) is a multi-County public agency located in western Riverside and San Bernardino Counties. The District has approximately 6,350 active connections of which over 6,000 are single family residents. Domestic water sources come exclusively from 6 (six) local ground water domestic wells. Further, the District constructed and operates well head treatment facilities for the removal of contaminent constituents which plague our local water supplies. More specifically, the District owns and operates a 4.5 MGD Nitrate removal treatment facilitiy and a 4.3 MGD Manganese filtration and removal treatment plant. Economically, the District is challenged with an annual household income of $36,502.00, and an unemployment rate of 11.35 percent. The District desires to minimize intentional or unintentional disruption of water service to our community. The District, as lead applicant (with co-applicants West Valley Water District & the Jurupa Community Services District), believes emergency interconnections within our service areas greatly improves the reliability and redundancy of our local water supplies in a cost-effective manner to a population of 117,243. The District has an annual demand of approximately 6,700 AF or 4,150 gpm. Each of the 5 (five) proposed	M	10	C	Security Project	2,000,000	6,206	26,177	20	Riverside	V	2007

1860	5610011	5610011-013	Santa Paula Water System	New 4mg Reservoir & Cross Town Pipeline	The project will construct a new 4 million gallon partially buried reservoir and install a new dedicated water transmission line from Steckel Treatment Plant to the proposed reservoir. The reservoir will be a circular concrete reservoir with an inlet and outlet manifold to allow for the proper mixing. The project will also construct solar panels to supply power for level transducer, intrusion alarm, valve position, minor site lighting and radio telemetry equipment. The will be an Edison service to back up the solar system. The site will require grading and fill to prepare for the tank and access road. There will be a security fence made of 1-inch mesh installed around the site.The project will also install a new 16- inch PVC water transmission main from Steckel Treatment Plant to the Main Reservoir. The pipeline will have gate valves every 1000 feet and be installed with air-vac and drain valves. The main will be connected to the distribution system at various locations to allow for taking the main reservoir off line and to allow for more efficient flushing. The project will also address all paving and right of way issues.	M	10	C	Currently the City of Santa Paula has only one main reservoir that was constructed in 1887. This is the only supply for the 200 zone. The entire high elevation zones booster pumps use this reservoir as a source of water. Constructing a new 4 million Gallon reservoir will make the system more reliable and allow the City to take the existing reservoir off line for the required maintenance. The new reservoir will also give the city adequate storage for the system.The water system currently uses the distribution system as the transmission system. For treated water to be pumped to the main reservoir from the Steckel treatment plant it must be pumped through the distribution network of varying size pipes. This causes constantly changing velocities and pressure fluctuations in the distribution system. This set up puts unnecessary back pressure on the pumps and requires the pumps to operate longer while also to filling the reservoir. A direct transmission main would allow the treatment plant to operate efficiently and allow for an increased turn over in the reservoir. The turn over will be increased due to the plant directly filling the reservoir. In addition, all of the system demand would come from the reservoir and not the plant trying to meet the demand and fill the reservoir at the same time	8,500,000	7,150	29,281	06	Ventura	IV	2009
1861	5610011	5610011-006	Santa Paula Water System		Purchase propoert, design, construct and inspect construction of a 2.75 MG reservoir in the 200 Pressure Zone.	M	10	C	Insufficient storage capacity which does not meet Water Works standards.	2,200,000	7,150	29,281	06	Ventura	IV	1998
1862	5610011	5610011-014	Santa Paula Water System	Well 15 Construction	The project will drill a new well 700 feet deep in the Santa Paula Basin. The proposed well will have the screens set between 200 to 700 feet. The project will install a new pump and motor with a new electrical service. There will be a motor control center and PLC with Radio Telemetry system. This well will have an onsite package treatment plant similar to the current well 12 configuration. This new well will provide the City with the redundancy on the east side that it currently lacks. This well was recommended by the 2005 Master Plan.	M	10	C	The City operates one of its wells (1B) which does not pump to the main treatment plant. It pumps directly into the distribution system after it is chlorinated. The well is not near the main well field and is located on leased land. California Department of Public Health supports the City replacing this well that utilizes a proposed on site treatment plant. Another city well runs 24/7 and has an onsite treatment plant. If this well fails or is in need of maintenance, the City is forced to use Well 1B.	3,000,000	7,150	29,281	06	Ventura	IV	2009
1863	5610011	5610011-012	Santa Paula Water System	400/600 Zone Booster Pump Station	The project will replace the existing booster pump stations with a new building that will house the new 400 and 600 Booster Pump Stations. Each station will consist of three new pumps and motors with Variable Frequency Drives (VFD's). This set up will allow the City to have adequate flow to meet fire flow demand and take advantage of different electrical rates to reduce operating costs. The new station will be equipped with proper valves; PLCs, sample ports, security components and a radio telemetry system. The project will replace sections of undersized 8-inch water mains with 12-inch diameter pipelines to improve flow and system reliability. The project was recommended in the City's 2005 Master Plan.	M	10	C	The existing booster station was constructed in the 1930's. It is not sized for the current demand requirements of the water system zones it serves. The existing configuration of the station does not allow for pump and motor replacement. In addition, the capabilities of the pumps do not allow the City to take advantage of time of use electrical rates which would save the city money. The pumps would not be able to keep the system pressurized if there was a large fire event and do not allow for good system management.	1,500,000	7,150	29,281	06	Ventura	IV	2009
1864	5610011	5610011-007	Santa Paula Water System		Purchase property, design, construct, and inspect construction of a 0.50 MG reservoir in the 400 East Zone.	M	10	C	Inadequate storage capacity which does not meet the Water Works standards.	400,000	7,150	29,281	06	Ventura	IV	1998
1865	4110003	4110003-001	City of Burlingame		Contruct an 8 mile pipe line connecting the 3 cities to the Harry Tracy WTP. Combine storage form 12 MG to 23 MG. Storage capacity would meet DOHS -8 - hour demand requirement.	M	10	C	Water supply may be unreliable and storage does not meet Department of Health Services 8-hour requirement.	15,000,000	8,966	29,867	17	San Mateo	II	1998
1866	3610043	3610043-001	GOLDEN STATE WATER CO - BARSTOW		Replace mainline	M	10	C	Undersized mainline	100,000	9,233	30,469	13	San Bernardino	V	1998

1869	1910042	1910042-001	PICO RIVERA - CITY, WATER DEPT.	SCADA Upgrade for the Pico Rivera Water Supply, Storage, and Distribution Systems	The City of Pico Rivera recently completed a comprehensive Water Master Plan (July 2009) of its water supply and distribution system, which evaluated the City's ability to meet State and Federal drinking water regulations and provide a reliable water system to its customers. As result of the study, the City must complete several major capital and operational improvement projects over the next several years. In January 2009, the City adopted a three-year water rate case to support current operations, but only a limited amount of pay-as-you go capital projects. Critical to maintaining and upgrading our water system is the ability to obtain certain Grant Funds to construct the necessary high priority projects in a timely manner. The SCADA Upgrade Project was recommended in the 2009 Water Master Plan and is critical to providing safe and reliable water service. The City must operate at any one time, 10 supply wells, 3 water booster pump station (which include 3 pumping units per station), and three distribution reservoirs, in addition to a secondary supply source from a neighboring agency. Because of the location of the water wells, booster pump stations, and storage tanks throughout the City, it is imperative that water system operations can adequately communicate (from a central location) with each facility and receive real-time pressure and water level information. It is imperative that the City have a reliable and modernized	M	10	C	The City's current SCADA system is antiquated and many components are not reliable, subjecting the City to potential vulnerabilities should major water supply equipment failure occur. The City is extremely concerned that a critical water supply may not be available and operable during a fire flow event, due to the outdated and unreliable SCADA system. In the past several months, the City continues to have repeated outages of the SCADA system, effecting its water supply management and its ability to make necessary daily water operational decisions. The City must have an upgraded SCADA system to improve water system operations and to better respond to its customer's needs. An upgraded SCADA system will also provide for the necessary real-time data to efficiently manage its 24-hour pumping operations.	650,000	9,335	39,000	07	Los Angeles	IV	2009
1870	1910042	1910042-003	PICO RIVERA - CITY, WATER DEPT.	Stand-by Power Upgrade Project for Water Treatment Plant Sites and Supply Wells	The City of Pico Rivera recently completed a comprehensive Water Master Plan (July 2009) of its water supply and distribution system, which evaluated the City's ability to meet State and Federal drinking water regulations and provide a reliable water system to its customers. As a result of the study, the City must complete several major capital and operational improvement projects over the next several years. In January 2009, the City adopted a three-year water rate case to support current operations, but only a limited amount of pay-as-you go capital projects. Critical to maintaining and upgrading our water system is the ability to obtain certain Grant Funds to construct the necessary high priority projects in a timely manner.The Stand-by Power Upgrade Project was recommended in the Water Master Plan and is critical to providing safe and reliable water service. The City must operate at any one time, 10 water supply wells, 3 water booster pump stations and chlorination systems at three treatment plant sites.The Water Master Plan identified the need for three new, permanent diesel generator systems at each of the three water treatment plant sites, to operate the two source wells, the chlorination system, and the booster pumps for fire protection. In addition, a permanent diesel generator is recommended at Well No. 5 to increase the water system reliability and assure fire flow capabilities during	M	10	C	The City is vulnerable to a major seismic event in the Los Angeles and San Gabriel Basins and periodic rolling black-outs during hot weather ("Santa Ana Conditions"). The entire water supply to the City must be continuously pumped and therefore it is critical that major supply wells and booster pumps stations be equipped with permanent stand-by power in the event of a major loss of power to deliver adequate water service. Without a highly redundant emergency power source, fire protection is lost and the health and safety of the community is at risk. Furthermore, a seismic event could disrupt or cause the shut off of the natural gas distribution systems serving the City, thereby rendering the City's only current stand-by power natural-gas generators useless	2,300,000	9,335	39,000	07	Los Angeles	IV	2009

1871	5010028	5010028-008	Ceres, City of	Standby Generators	This project will add a new 450kW generator to provide standby power to reservoir booster pumps and relocate the 250kW generator for standby power at the well pump. The new generator would power four booster pumps, allowing staff to supply enough water to the distribution system at peak hours and maintain minimum pressure. By relocating the 250kW generator to the well pump, staff can take advantage of the generator's useful life and provide for back up power to one of the city's largest wells.	M	10	C	At one of the city's largest wells, there is currently a 250kW generator for the reservoir booster pumps and none for the well pump. This provides inadequate backup power during an outage.As the heart of the city's water system, it is imperative to ensure the operation of enough of the booster pumps at the reservoir to meet peak summer demand. The existing generator can only power two of the existing six booster pumps. It also provides no power to the well, which represents 15% of the city source water. In the event of a power failure, the city can supply less then 6% of normal water production. This could cause a direct threat to water quality and insufficient water for potable and fire needs.ten) plus our reservior.	250,000	10,617	40,943	10	Stanislaus	III	2009
1872	5010028	5010028-010	Ceres, City of	Leak Detection and Valve exercise	The purchase of leak detection equipment will allow staff to quickly locate leaks and audit the system. With a range of 500 feet per reading correlators will allow two staff to audit the entire system in a week. This type of evaluation would take two manyears with our current equipment. A valve actuator tool would allow single person line shutoffs, routine valve exercise program and identification of valves in need of service by recording torque values.	M	10	C	We can assume the water system is losing water through leaks. As we convert to a metered system we will be able to start identifing water loss and need to locate subsurface leaks. With just a microphone we have been unable to locate pipes until the leak has sinkholed or significant. As the infrastructure ages, valve exercise will become more important. As leakage increases, the ability to shut down working (regularly exercised) valves will become more important. Current staffing levels do not allow a manual valve exercise program due to the requirment for two men and 1/2 hour per valve. inibility to identify leaks and shut valves in a timely manner risks water quality contamination and water supply shortfalls, both a significant threat to the water system.	90,000	10,617	40,943	10	Stanislaus	III	2009
1873	1910144	1910144-003	SAN GABRIEL COUNTY WD	SGCWD Mainline Project	The 2010 Pipieline Replacement project will be replacing 2700' of Pipe. All replacement pipe will be 8" ductile iron pipe. We will be replacing 1250' of 4" steel pipe that was installed in 1924 on Norwood place between California St. and Strathmore Ave. we will be replacing 400' of 4" steel and cast iron pipe that was installed in 1927 on Walnut St. between Dewey Ave. and Norwood Place. We will be replacing 400' of 4" steel pipe that was installed in 1931 on Allenreed Ave. south of Hellman Ave. And lastly we will be replacing 650' of 3" steel pipe that was installed in 1923 on Emerson Place west of San Gabriel Blvd. All of the work is going to be done in the city of San Gabriel. With the installation of new 8" ductile iron pipe we will greatly improve fire flows and fire protection in the area. We will also be installing blow offs at the end of Allenreed and Emerson Place which will help with water quality. As of now these two streets do not have blow-offs.	M	10	C	The problem with our lower system has to do with the age of the pipeline,(the pipeline line in the area is at least 78 years old and some of it is 86 years old), lack of blow-offs, fire flows and fire protection. We are looking to correct these problems without having to raise the water rates in this disadvantaged area. Also I took the TMF capacity tune up and we recieved a score of 48% for an infrastruture score. We need to upgrade, and the next five years the Alameda corridor is coming through and we are going to have to use our money that we normally use for mainline upgrades for offsets and valve installations.	450,000	8,943	45,000	07	Los Angeles	IV	2009

1874	3610038	3610038-006	RIALTO-CITY	Riverside Avenue Water Main Replacement Phase II	Replacement of an old water distribution main that provides water from two reservoirs that holds 10 million gallons of potable water to our 48,000 residents. Phase II is the placement of 24" water main in length of 1/4 mile.	M	10	C	The Riverside Avenue Water Main was constructed in 1955 and has experienced numerous line breaks. This mainline has reached its life expectancy and needs to be upgraded and replaced in order to maintain water quality standards prescribed by Department of Health Services and Regional Water Quality Control Board. Phase II is from Baseline Road to Walnut Avenue. The project will ensure the City can continue to provide water during peak day demand and for fire protection. It will also provide continued protection to the system and city streets. The need for replacement ws identified in the Master Water Plan	900,000	11,923	48,418	13	San Bernardino	V	2009
1875	3610029	3610029-019	MONTE VISTA CWD	Saratoga Park Pipeline Replacement Project	The work includes the replacement of 28,000-feet of mostly degraded, main break-laden, bare steel pipeline distribution system in the Saratoga Park area with new class 350, cement mortar-lined ductile iron pipeline, which has an anticipated useful life of 80-plus years. The District has the ability to implement this as either a design-bid-build or design-build project, having recent and relevant experience with both delivery methods.	M	10	C	The work involves the replacement of highly tuberculated, corroded, and aging pipeline infrastructure. This project will greatly improve water quality and water supply reliability.	3,250,000	11,595	51,014	13	San Bernardino	V	2009
1876	3610029	3610029-016	MONTE VISTA CWD	San Bernardino Corridor Pipeline Replacement Project	The work includes the replacement of 52,000-feet of mostly degraded, main break-laden, bare steel pipeline distribution system in the San Bernardino Corridor area with new class 350, cement mortar-lined ductile iron pipeline, which has an anticipated useful life of 80-plus years. The District has the ability to implement this as either a design-bid-build or design-build project, having recent and relevant experience with both delivery methods.	M	10	C	The work involves the replacement of highly tuberculated, corroded, and aging pipeline infrastructure. This project will greatly improve water quality and water supply reliability.	6,000,000	11,595	51,014	13	San Bernardino	V	2009
1877	3610029	3610029-022	MONTE VISTA CWD	Central Pipeline Replacement Project	The work includes the replacement of 34,000-feet of mostly degraded, main break-laden, bare steel pipeline distribution system in the Central Avenue area with new class 350, cement mortar-lined ductile iron pipeline, which has an anticipated useful life of 80-plus years. The District has the ability to implement this as either a design-bid-build or design-build project, having recent and relevant experience with both delivery methods.	M	10	C	The work involves the replacement of highly tuberculated, corroded, and aging pipeline infrastructure. This project will greatly improve water quality and water supply reliability.	4,000,000	11,595	51,014	13	San Bernardino	V	2009
1878	3610029	3610029-018	MONTE VISTA CWD	Northeast Zone 2 Pipeline Replacement Project	The work includes the replacement of 36,000-feet of mostly degraded, main break-laden, bare steel pipeline distribution system in the Norteast Zone 2 area with new class 350, cement mortar-lined ductile iron pipeline, which has an anticipated useful life of 80-plus years. The District has the ability to implement this as either a design-bid-build or design-build project, having recent and relevant experience with both delivery methods.	M	10	C	The work involves the replacement of highly tuberculated, corroded, and aging pipeline infrastructure. This project will greatly improve water quality and water supply reliability.	4,250,000	11,595	51,014	13	San Bernardino	V	2009

1879	3610029	3610029-021	MONTE VISTA CWD	Reservoir 18 Water Quality Improvements and Seismic Upgrade Project	The project involves addressing the water quality and turnover issues by introducting mixers, check valves, and new directional piping so that "first-in" water will be "first-out" water. The reservoirs' seismic issues will be addressed by providing tank anchors and expanding the ring walls so as to better fortify the facility from uplift and overturning moments incurred during seismic activity.	M	10	C	Reservoir 18 (consisting of 3 tanks at the site) has water quality turnover issues which result in degradation of the chlorine residual to near 0.20 mg/L. Additionally, the facility is about 40 years old and by far does not meet current seismic code requirements. Reservoir 18 is a critical storage facility, as it is located in the highest zone of the District's system and is the only source of storage in that zone to meet maximum daily demands and provide for adequate fire flows when needed. The District would be severely challenged to meet its basic water supply mission without maintaining and addressing the needs of the facility.	850,000	11,595	51,014	13	San Bernardino	V	2009
1880	3610029	3610029-015	MONTE VISTA CWD	Mills Corridor Pipeline Replacement Project	The work includes the replacement of 37,000-feet of mostly degraded, main break-laden, bare steel pipeline distribution system in the Mills Corridor area with new class 350, cement mortar-lined ductile iron pipeline, which has an anticipated useful life of 80-plus years. The District has the ability to implement this as either a design-bid-build or design-build project, having recent and relevant experience with both delivery methods.	M	10	C	The work involves the replacement of highly tuberculated, corroded, and aging pipeline infrastructure. This project will greatly improve water quality and water supply reliability.	4,400,000	11,595	51,014	13	San Bernardino	V	2009
1881	3610029	3610029-028	MONTE VISTA CWD	Sunrise Park Pipeline Replacement Project	The work includes the replacement of 24,000-feet of mostly degraded, main break-laden, bare steel pipeline distribution system in the Saratoga Park area with new class 350, cement mortar-lined ductile iron pipeline, which has an anticipated useful life of 80-plus years. The District has the ability to implement this as either a design-bid-build or design-build project, having recent and relevant experience with both delivery methods.	M	10	C	The work involves the replacement of highly tuberculated, corroded, and aging pipeline infrastructure. This project will greatly improve water quality and water supply reliability.	2,900,000	11,595	51,014	13	San Bernardino	V	2009
1882	3610029	3610029-026	MONTE VISTA CWD	Essex Park Pipeline Replacement Project	The work includes the replacement of 38,000-feet of mostly degraded, main break-laden, bare steel pipeline distribution system in the Essex Park area with new class 350, cement mortar-lined ductile iron pipeline, which has an anticipated useful life of 80-plus years. The District has the ability to implement this as either a design-bid-build or design-build project, having recent and relevant experience with both delivery methods.	M	10	C	The work involves the replacement of highly tuberculated, corroded, and aging pipeline infrastructure. This project will greatly improve water quality and water supply reliability.	4,500,000	11,595	51,014	13	San Bernardino	V	2009
1883	3610029	3610029-020	MONTE VISTA CWD	Mission District Pipeline Replacement Project	The work includes the replacement of 43,000-feet of mostly degraded, main break-laden, bare steel pipeline distribution system in the Mission area with new class 350, cement mortar-lined ductile iron pipeline, which has an anticipated useful life of 80-plus years. The District has the ability to implement this as either a design-bid-build or design-build project, having recent and relevant experience with both delivery methods.	M	10	C	The work involves the replacement of highly tuberculated, corroded, and aging pipeline infrastructure. This project will greatly improve water quality and water supply reliability.	5,000,000	11,595	51,014	13	San Bernardino	V	2009

1884	3610029	3610029-017	MONTE VISTA CWD	Rose Avenue Pipeline Replacement Project	The Work includes removal of existing abandoned 8-inch steel water line on San Jose Street to Central Avenue, removal and replacing of existing interfering portions of 6-inch waterline and street curb and gutter per plans and specifications, abandoning in place of the existing 6-inch waterline on Rose Avenue, construction of approximately 1340-L.F. of 6-inch restrained joint Class 350 Ductile Iron Pipe, valves, appurtenances, and tie-ins, construction of a total number of 40 service connections, construction of total number of 5 Fire Hydrants, and the construction of approximately 300-L.F. of 8-inch restrained joint Class 350 Ductile Iron Pipe, valves, appurtenances, and tie-ins.	M	10	C	The work involves the replacement of highly tuberculated, corroded, and aging pipeline infrastructure. This project will greatly improve water quality and water supply reliability.	230,000	11,595	51,014	13	San Bernardino	V	2009

1889	3310049	3310049-002	Western MWD	Dekay Avenue and Gilley Street Pipelines Replacement	The proposed project is located in both Dekay Avenue and Gilley Street at March Air Reserve Base. Within Dekay Avenue approximately 2,000 feet of pipeline between A Street and B Street, in Q Street, between Adams Avenue and B Street, and in W Street from A Street to Gilley Street is proposed for replacement. The project consists of the replacement of existing cast iron pipeline (varying from 6 to 8 inches in diameter) with a new 8 inch PVC pipeline in the aforementioned rights-of-way. Within Gilley Street the proposed project is located between W Street and Adams Street. The project consists of the replacement of approximately 2,000 lineal feet of existing 8 inch cast iron pipeline with a new 8 inch PVC pipeline in the aforementioned rights-of-way.Replacement of the aging cast iron pipe will improve public safety by removing structurally vulnerable pipelines, maintain service to approximately 100 existing customers, improve system efficiency (decrease amount of water lost to leaks and decrease the amount of water used in pipeline flushing) and ensure that Western Municipal Water District is able to deliver water in compliance with drinking water standards.	M	10	C	Both the Dekay Avenue and Gilley Street potable water pipelines consist of aging cast iron pipe (estimated to be over 65 years of age). These pipelines, more than 4,000 lineal feet, are extremely corroded and are experiencing pitting. More than 14 leaks were repaired on these two pipelines in 2008. Corrosion has resulted in loss of strength of the pipe walls and the pipes are vulnerable to bursts and failure. Outage of these pipelines would disrupt service to approximately 100 existing customers as well as potential future customers that could depend on these water lines. In addition, these pipelines have significant tuberculation as well as biofilm growth and require frequent flushing to maintain the necessary disinfection residual. The recurrent leaks, coupled with the frequent flushing, require a great deal of maintenance time and waste large volumes of water.	1,200,000	19,311	60,895	20	Riverside	V	2009

1890	3310049	3310049-003	Western MWD	Chino Desalters Phase 3 Expansion Project - Chino Creek Wellfield	Chino Desalters Phase 3 Expansion Project - Implementation of this project will serve to clean-up the local groundwater basin for improved water quality and increased potable water production. The project will reduce the demands on imported surface water and further diversify the local potable water supply system. Components of the project include:1. New groundwater extraction wells for the Chino I DesalterThe constructed facilites will aid in solving the water problem by providing raw water supply to facilities that:A. Treat brackish groundwater with reverse osmosis to demineralize the water and remove harmful and unwanted water quality constituents. B. Treat brackish groundwater with ion exchange to remove high nitrate concentrations.C. Create an additional local source of potable water versus importing water.D. Implement OBMP recommendations.E. Prevent further degradation of water quality in adjacent watersheds that receive water from the Chino Basin region.F. More efficiently use local groundwater supplies to meet water demands.The overall project involves desalination of brackish groundwater for potable water use to serve the needs of the local community.	M	10	C	The Chino Desalters Phase 3 Expansion Project is part of the ongoing Chino Basin groundwater Optimum Basin Managment Program (OBMP), including the Peace Agreements. This project helps to (1) increase the local potable water supply to meet rapid population increases, (2) decrease dependence of imported Colorado River water, (3) clean-up the groundwater aquifer contaminated with constituents such as nitrate, TCE, TCP, arsenic, perchlorate, and high total dissolved solids and (4) provides hydraulic control for the area to manage groundwater levels and capture and treat brackish groundwater that would otherwise contaminate the Santa Ana River and other downstream aquifers towards Orange County.This project implements the recommendations of the OBMP and the Wildermuth Environmental groundwater report for managing the basin and improving groundwater quality. The OBMP recommends increasing desalter groundwater pumping from the lower Chino Basin to 40,000 AFY. By implementing the Phase 3 projects, the 40,000 AFY groundwater pumping goal will be acheived. Water Quality Standards Exceeded in the brackish groundwater:1. Nitrate (concentrations exceeding 250 mg/l as NO3) The primary MCL for nitrate is 45 mg/l as NO32. TDS (concentrations exceeding 1,300 mg/l)The secondary MCL for TDS is 500 mg/l (recommended maximum concentration)3. TCE (concentrations	2,000,000	19,311	60,895	20	Riverside	V	2009

1892	1910092	1910092-009	MONTEREY PARK-CITY, WATER DEPT.	Monterey Park Bradshawe Reservoir Replacement	The project consists of designing and constructing two new steel reservoirs to replace the outdated systems. These new reservoirs will be modern and seismically approved.	M	10	C	The City's two Bradshawe reservoirs were built in 1948 and 1958 and are now cracked and outdated. The replacement of these reservoirs will increase storage capacity to meet the city's water demand. More importantly, the new reservoirs will meet seismic standards.Besides the obvious benefit of adding storage capacity, the City will be able to reduce it's electricty usage and carbon footprint. These reservoirs will allow us to pump our wells at night, during off-peak hours, while still meeting the water demands of our customers. This practice will reduce the draw of electricity in the region and help to mitigate against rolling blackouts.	3,000,000	13,045	64,000	07	Los Angeles	IV	2009
1893	3610064	3610064-007	EAST VALLEY WD	Live Oak Water main replacement	The construction plans call for 1,019 feet of 8-inch Ductile Iron pipe to be installed in a city street, and 17 homes to be connected to this main. The construction plans for this project are 80% complete. The CEQA for this project is underway and should be completed by March 1, 2009. The project would ensure a leak free supply of water to the affected 35 homes. This project site is within 1/2 mile of the San Adreas Fault and would also help mitigate the damage to this water main in the event of an earthquake on this section of the San Adreas Fualt.	M	10	C	The water main on Live Oak between Summit Drive and Terrace Drive in the City of Highland is a 6-inch water main that was constructed in the early 1950s. This water main supplies drinking water to approximately 35 homes and one water reservoir (District Plant 137). This water main has had numerous leaks in the last two years and is in need of replacement. This main is within 1/2 mile of the San Andreas Fault.	325,000	21,827	68,000	13	San Bernardino	V	2009
1894	3310021	3310021-011	Jurupa Community SD	JCSD Groundwater Production Wells	This project will continue implementation of the Jurupa Community Services District (JCSD) Water Master Plan through development of four additional groundwater production wells in several identified areas to provide water for forecasted future demands. This project will create 80 new jobs.	M	10	C	Continued implementation of Jurupa Community Services District's (JCSD) Water Master Plan projects through the development of four additional groundwater production wells is critical to meet future potable water demands. Groundwater is considered the primary and most cost effective means of meeting increased water demands. Through previous analysis, JCSD identified several potential well sites within the northwestern portion of the service area. JCSD is nearing completion of property acquisition and the environmental process including biological resource investigations.	12,000,000	24,684	68,297	20	Riverside	V	2009
1895	3310021	3310021-013	Jurupa Community SD	Emergency Electrical Generators for JCSD Wells	This project will equip all JCSD well facilities with backup generators in accordance with the US Government Accountability Office (GAO) Critical Infrastructure Protection Report to make the District less dependent on outside resources in the event of incidents involving technological and physical components. This project will create 6 new jobs.	M	10	C	There is a need to equip all Jurupa Community Services District (JCSD) well facilities with backup generators in accordance with the US Government Accountability Office (GAO) Critical Infrastructure Protection Report. JCSD needs to be less dependent on outside resources in the event of incidents involving technological and physical components.	1,300,000	24,684	68,297	20	Riverside	V	2009

1896	1910079	1910079-005	LYNWOOD-CITY, WATER DEPT.	Installing of SCADA System	Project :Install a modern day up to date SCADA System that is in constant communication with all elements of the City of Lynwood water system. Benefits:Better operational control of water system elements and facilities around the clock on daily basis and both at the Central Yard and remotely. Will be able to perform pre programmed functions and allow operation of system by on duty and off duty personnel. The SCADA System will have alarm generation capability to keep system operations and supervisors to be aware at all times of status and conditions of the water system therefore providing better water quality and complying with water quality standards.	M	10	C	Existing Condition:The City of Lynwood Water System, which serves over 95% of the area of the City and its 10,600 metered services, has six operating water wells, a MWD water supply connection, a subterranean storage reservoir of two million gallon capacity, a booster pumping station and three system regulator valve installations. The water system has had a SCADA system which was installed over 20 years ago, according to the City Utility Services Division Staff. A recent review of the existing SCADA system indicated it is out of date and can not be modernized. A modern day SCADA system is needed to provide for full management of the operations of the water system. A modern day SCADA System will permit the City Utility Services Division to properly operate the elements of the facilities of the water system on a 24/7/365 basis from a central location at the Public Works Department Yard as well as allow field personnel to have timely information on the operation of one water well or other facilities sites as well as of the entire water system at any time. Any necessary adjustments in the operation can be made remotely with a modern SCADA System during all hours of the day and all days in the week even though the normal work day of the Utility Services Department is 10 hours a day for 4 days a week (Monday through Thursday). The up dated SCADA System could perform pre-programmed functions to	810,000	9,035	73,212 22	Los Angeles	IV	2009
1897	1910079	1910079-004	LYNWOOD-CITY, WATER DEPT.	Second Pressure Relief Valve Installation/Remodeling of Existing Valve Installation	Project :Install a new Cla-Valve reducing valve battery (3 valves) in a vault in vicinity of reservoir on Bullis Road with appropriate space and convenient access and remodel existing Cla-Valve vault on Imperial Highway at Bullis Road to include space for 3 valves of varying size to minimize cavitation effect. Benefits:New additional reducing valve installation and remodeling of existing reducing valve installation will reduce maintenance requirements and will facilitate more control over goal to provide constant water pressure in the City Water System.	M	10	C	Existing Condition:The City of Lynwood Water System has presently six operating water wells, which pump into the closed water system. Should the pumping result in the system pressure exceeding a set level and the existing two million gallon capacity subterranean storage reservoir is not full, a single existing pressure relief valve operates to adjust the pressure by backfilling the reservoir. The single existing valve, a Cla-valve, which is located in a vault, has to be annually rebuilt due to cavitation on the valve when operating. To rebuild to valve the work has to be done at nighttime and the installation has to be shut down during the repair. This requires significant personnel to manually regulate the water system pressure. The plan is remodel the existing valve chamber vault to accommodate multiple valves to minimize cavitation. To allow a smoother adjustment of the water system pressure, a second new pressure reducing multiple valve installation is to be constructed at another location in the water system at grade with a series of valves with improved access for operation and maintenance. No public notification is required.	231,000	9,035	73,212 22	Los Angeles	IV	2009

1898	1910079	1910079-001	LYNWOOD-CITY, WATER DEPT.	Trailer Mounted Emergency Generator & Well/Booster Pump Equipment	Project :To overcome to a limited degree, the electrical power failures situation, the City believes that by owning a trailer mounted gasoline/diesel fuel engine driven emergency generator that either the major well source and/or the reservoir booster pumping station could be made operational pending SCE restoring electrical power service. The generator would be sized to service the 250 horsepower electrical motor for water well no. 19, the largest electric motor. As a part of the project the electrical panels at each of the existing water well sites and at the booster pumping station would be modified to facilitate the fast hook up (Posilock) and use of the emergency generator. Benefits:This emergency generator would allow the City to operate one water well and/or the booster pump station in a time of electrical power outage of the SCE Company to provide a minimum water supply to the City Water System.	M	10	C	Existing Condition:The City of Lynwood Water System relies for 80% of its needed potable water supplies on pumping of 6 water wells. Each deep well pump is driven by electric motors. The electrical service is provided by the Southern California Edison Company (SCE). The City Water System has one subterranean storage reservoir of two million gallon capacity. To deliver water from the reservoir the City has a multiple pumping unit station. All wells and the pumping station use electric motors to drive the booster pumps. Only 20% of the City's water supply is imported water from the Metropolitan Water District of Southern California (MWD). As can be seen the City Water System is largely dependent on SCE, which electrical service has had on occasion interruption of power services. No public notification is required.	271,000	9,035	73,212	22	Los Angeles	IV	2009
1899	3610052	3610052-001	VICTOR VALLEY WATER DISTRICT		Construct needed facilities to ensure compliance with Waterworks Standards.	M	10	C	Old steel distribution system lines, new wells needed, new storage reservoirs (2) needed.	2,900,000	22,257	81,418	13	San Bernardino	V	1998
1900	1910001	1910001-010	City of Alhambra	Garfield Reservoir Tank 1 Coating and Reroofing	Garfield Reservoir Tank 1 has a holding capacity of 1,000,000 gallons of water, which is used to supply water to the northern part of the City. The residence time of the water in the tank and the condition of the steel is critical to the quality of the water. An epoxy coating will be applied to the interior after removal of the corroded section of steel from the walls and floor. After the application of the epoxy, new cathodic protection will be installed to reduce the amount of future corrosion of the steel. The wood roof system will be removed to the wood planking, and any damaged or corroded planks will be replaced before application of new roofing material. This will ensure a solid, leak-proof system to maintain the quality of the water in the tank. Additionally, repairs and/or replacement of any screening material between the roof tiers will be done, as well as replacement of any metal flashings and copings around the roof perimeter to also ensure that birds or other animals cannot access the interior of the tank.	M	10	C	A recent inspection revealed that the condition of Tank 1 at Garfield Reservoir was severe enough to warrant recoating of the interior steel walls and floor. This tank was constructed in 1955. The interior of the tank is exhibiting corrosion over 70% of the surface, which can potentially affect water quality. In order to maintain compliance with drinking water standards to provide safe drinking water, the recoating of the tank will protect the steel for 25-30 years without the need for further major repairs and/or renovation. The roof is original to the reservoir tank, composed of wood which is over 50 years old. Replacement of the roof will also ensure water quality through solid, sturdy coverings over the tank itself. This project will complete the systemized preservation of the City's eleven steel reservoir tanks.	500,000	17,740	92,158	16	Los Angeles	IV	2009

1901	1910001	1910001-009	City of Alhambra	Garfield Reservoir Booster Pump Station Rehabilitation	The proposed project includes replacing the building, pump equipment, electrical motor control center, and installing an emergency power generator. This facility was origianlly constructed in 1955 and has not had any major upgrades since that time. The existing pumps , with capacities of 1,521 gpm and 1,888 gpm, are undersized for the demand of sending water to the Northern Pressure Zone, which is to be maintained at 40 to 117 psi. Two new pumps (and possibly one back up pump) will run more efficiently and with less mechanical stress. The existing motor control center (MCC) is electrically and mechanically inefficent. This new booster facility will utilize Southern California Edison's (SCE) "Savings By Design" program and premium-efficiency electrical components to reduce electrical costs and be programmed to pump on off-peak hours when demand is lowest.	M	10	C	This booster station facility is one, of only two, sources of supply for the northern pressure zone of the City. The elevation variance in the northern zone is a minimum of 430 feet to a maximum of 585 feet, with pressure ranges of 40 to 117 psi. If this facility fails to perform either adequately, or not at all, the northern pressure zone will have to rely on only one source of supply water (from the Marengo Reservoir) to an entire area with approximately 7,000 service connections. This situation would be extremely critical during the summer months when demand is highest. The system reliability is an important consideration, and since there are only two pumps at this location which operate continuously 24 hours a day to meet the current water demands, the need to reduce the risk of pump malfunction is paramount. The current inlet piping also needs to be modified to allow independent introduction of water from each of the three reservoirs. There is no provision for emergency stand-by power.	1,750,000	17,740	92,158	16	Los Angeles	IV	2009
1902	3310012	3310012-010	Elsinore Valley MWD	Lakeland Village Reservoir and Pump Stations Project	The proposed project consists of a new storage tank and two pump stations. The proposed Adelfa Pump Station will convey water to the proposed 800,000 gallon steel Adelfa Reservoir. The proposed Encina Pump Station will convey water to the existing Encina tank. Elsinore Valley Municipal Water District's Board of Directors adopted the Mitigated Negative Declaration on April 27, 2006 and filed the Notice of Determination on May 3, 2006. The engineering documents have been finalized, the project has been advertised for construction bids, and is ready for construction upon funding and project award.	M	10	C	Elsinore Valley Municipal Water District's Water Distribution Master Plan identified the Lakeland Village water service area as deficient in water storage capacity and its ability to meet fire demands. The purpose of the project is to improve water reliability, water supply, and fire protection in the Lakeland Village community of Riverside County, which is adjacent to the Cleveland National Forest. Lakeland Village is located within Riverside County's Economic Redevelopment Area and the service area has been identified as disadvantaged by the Santa Ana Watershed Project Authority (SAWPA). To meet the system deficiencies, the project would increase the storage and pumping capacities in the service area by constructing a new 800,000 gallon steel reservoir and two new pump stations.	4,200,000	36,817	121,420	20	Riverside	V	2009
1903	3710006	3710006-006	Escondido, City of		Rehabilitate reservoir rather than new. Replace inlet/outlet lines.	M	10	C	A-3 reservoir (1MG) is 60 years old and does not meet current standards. Area transmissions are of same vintage.	750,000	25,828	140,000	14	San Diego	V	1998
1904	1910070	1910070-048	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Avenue M-8 & 70th Street West Water Main	The proposed project consists of installing approximately 2,600 linear feet of 18-inch diameter ductile iron water main along the future Avenue M-8 right-of-way, from the Antelope Valley-East Kern Water Agency turnout near Avenue M-8 and 70th Street West to the District's water storage facility at Avenue M-8 and 75th Street West. This would prevent large water pressure fluctuations.	M	10	C	The existing water system experiences large pressure fluctuations due to a water supply deficit in District 40 and the need for new turnouts to accept more Antelope Valley-East Kern Water Agency water. Because of this, State Water Project water is not efficently utilized.	675,000	46,878	144,215	16	Los Angeles	IV	2009
1905	1910070	1910070-052	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Water Storage Tanks at M5E Site - Phase I	The project consists of constructing five 3-million-gallon water storage tanks at 41956 5th Street East in Palmdale to serve the Los Angeles County Waterworks District No. 40, Antelope Valley. This project will improve storage capacity to meet customer demand.	M	10	C	The existing water system typically experiences a shortage of storage capacity to meet customer demands during the warm summer months and periods of temporary shortage of treated water from the Antelope Valley-East Kern Water Agency.According to the District No. 40 Antelope Valley Draft Master Plan prepared in March 1997, the 2555 pressure zone of District No. 40 Region No. 4 currently has a storage capacity deficit of 38.8 Million Gallons (MG) in order to satisfy fire flow storage requirements and the District's one-day storage under maximum day demand need.	15,000,000	46,878	144,215	16	Los Angeles	IV	2009

1906	1910070	1910070-049	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Avenue K Transmission Water Main - Phase IV	The project consists of installing approximately 5,300 linear feet of 36-inch diameter steel water main on Avenue K between 20th Street East and 30th Street East in Lancaster. The project will increase the capacity of the Lancaster water system to meet the current domestic and fire protection water demands.	M	10	C	Parts of the existing water distribution system experiences large pressure fluctuations due to aged and undersized pipelines.	3,500,000	46,878	144,215	16	Los Angeles	IV	2009
1907	1910070	1910070-050	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Avenue K Transmission Water Main - Phase III	The project consists of constructing approximately 10,600 linear feet of 30-inch diameter steel water main on Avenue K between 30th Street West and 10th Street West in Lancaster. The project will increase the capacity of the Lancaster water system to meet the current domestic and fire protection water demands.	M	10	C	Parts of the existing water distribution system experiences large pressure fluctuations due to aged and undersized pipelines.	3,500,000	46,878	144,215	16	Los Angeles	IV	2009
1908	1910070	1910070-046	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Avenue M and 62nd Street West 3.2 MG Tank	The project is to construct a 3.2 MG water storage tank and appurtenances at a District-owned site located southeast of the intersection of 62nd Street West and Avenue M in the City of Palmdale as recommended by the District No. 40, Antelope Valley, Draft Master Plan. The 3.2 MG tank will help reduce the deficit storage capacity for the system. The tank site will be enclosed by block walls and landscaped with trees and shrubs to mitigate any visual or aesthetic effects. The proposed tank will connect with the existing 36-inch water main located along Avenue M to 60th Street West to feed the east side of the "Lancaster loop" within the 2555 pressure zone.	M	10	C	According to the District No. 40, Antelope Valley, Draft Master Plan prepared in March 1997, the 2555 pressure zone of District No. 40 Region No. 4 currently has a storage capacity deficit of 38.8 Million Gallons (MG) to satisfy fire flow storage requirements and the District's one-day storage under maximum day demand need. Currently, there are only two gravity storage tank sites in the 2555 zone: Avenue M and 7th Street West with 7.6 MG of storage and Avenue M and 5th Street East with 9 MG of storage.	2,900,000	46,878	144,215	16	Los Angeles	IV	2009
1909	1910070	1910070-044	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Water Storage Tanks at M5E Site - Phase II	The project consists of constructing two additional 3-million-gallon water storage tanks at 41956 5th Street East in Palmdale to serve the Los Angeles County Waterworks District No. 40, Antelope Valley. This project will improve storage capacity to meet customer demands.	M	10	C	The existing water system typically experiences a shortage of storage capacity to meet customer demands during the warm summer months and periods of temporary shortage of treated water from the Antelope Valley-East Kern Water Agency.According to the District No. 40 Antelope Valley Draft Master Plan prepared in March 1997, the 2555 pressure zone of District No. 40 Region No. 4 currently has a storage capacity deficit of 38.8 Million Gallons (MG) in order to satisfy fire flow storage requirements and the District's one-day storage under maximum day demand need.	6,000,000	46,878	144,215	16	Los Angeles	IV	2009
1910	1910070	1910070-041	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Avenue K Transmission Water Main - Phase II	The project consists of constructing approximately 8,000 linear feet of 36-inch diameter steel water main along Avenue K between 5th Street East and 20th Street East in Lancaster. The project will increase the capacity of the Lancaster water system to meet the current domestic and fire protection water demands.	M	10	C	Parts of the existing water distribution system experiences large pressure fluctuations due to aged and undersized pipelines.	3,500,000	46,878	144,215	16	Los Angeles	IV	2009
1911	1910070	1910070-045	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Avenue J and Trevor Pump Station	The project will involve the replacement of two smaller, less reliable pumps with four larger capacity pumps. The two existing pump houses, pumps and appurtenances will be demolished and replaced with one larger pump station, four larger capacity pumps, existing pipeline tie-in improvements, the electrical upgrade to support the new pumps and appurtenances.	M	10	C	An upgrade of existing pump station facilities located at Avenue J and Trevor Avenue is needed to improve the reliability of the existing water supply system by replacing two aging and outdated pumps with four new pumps. The four pumps will work together to maintain a more reliable water supply system. Increasing the number of pumps will improve the useful lives of the pumps by reducing loading on each pump, as well as providing redundancy when a pump is shut down for maintenance or due to pump failure. The upgraded facilities will also support the two new wells that are currently being constructed at the proposed site.	2,300,000	46,878	144,215	16	Los Angeles	IV	2009

1912	1910070	1910070-053	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Avenue M & 60th Street West Water Main	The proposed project consists of installing approximately 6,600 linear feet (1.25 miles) of 36-inch diameter transmission main connecting the existing 36-inch main at Avenue L and 60th Street West to the Antelope Valley-East Kern Water Agency (AVEK) turnout 4-53, located at the District-owned site at Avenue L-12 and 60th Street West, and to the location of the future 3.2 MG reservoir at Avenue M and 62nd Street West by way of Avenue M and 60th Street West. In addition, a metering building will be built at the AVEK turnout 4-53 site. This project will increase the capacity of the Lancaster water system to meet the current domestic and fire protection water demands.	M	10	C	The existing water distribution system experiences low water pressure, especially during times of peak demand. This limits the capacity to meet the current domestic and fire protection water demands.	2,300,000	46,878	144,215	16	Los Angeles	IV	2009
1913	1910155	1910155-015	GSWC - SOUTHWEST	GSWC – Doty Plant 1.77 MG Reservoir and Booster Pump Station	The proposed project is to construct a 1.77 million gallon (MG) welded steel reservoir and booster pump station at the existing Doty Plant located 14124 South Doty Avenue in the City of Hawthorne which is within our Southwest District. The reservoir will provide 1.77 MG of storage that can be used for domestic and fire demands in the system in the area of the Doty Plant. The reservoir will fill from the new treatment plant and will deliver water via the new pump station to the distribution system. The booster pump station will consist of four 100 Hp pumps to provide water from the reservoir to the distribution system. The pumps will be housed in a pump building. The pump building will be constructed of blocks and will have four skylights which will allow for pump access and maintenance.	M	10	C	There is insufficient storage capacity in the zone 250 of the Southwest District. The California Public Utilities Commission (CPUC) and California Department of Public Health (CDPH) currently provide no specific requirements for storage volume. Therefore, recommended standards published by the American Water Works Association (AWWA) were considered in the development of this storage project.AWWA Manual of Standard Practices M32 (AWWA, 2005) suggests that a minimum operational storage volume between 10 percent and 30 percent (or more for a small system or in arid areas) of the average Maximum Day Demand (MDD) is appropriate for potable water distribution systems. This project was evaluated based on 25 percent of MDD volume being required for operational storage. A component of operational storage is emergency storage which is a dedicated source of water that can be used as a backup supply in the event a major supply source is interrupted. This can be provided by water from a second independent source, by water stored in reservoirs, or a combination of both. Ten State Standards recommends that emergency storage total between 12 and 24 hours of average day demand (ADD) volume (GLUMRB, 2003). Because the Southwest System contains fire storage, GSWC determined that 12 hours of ADD volume is appropriate.The system-wide supply and storage analysis results for the existing	3,582,000	51,205	168,686	16	Los Angeles	IV	2009
1914	1910155	1910155-005	GSWC - SOUTHWEST		CONSTRUCT A NEW WELL IN A UNCONTAMINATED AQUIFER	M	10	C	2 PRODUCTION WELLS AT THE CHADRON SITE ARE THREATEN DUE TO A KNOWN LEAKING UST ON THE SITE WHICH WAS REMOVED IN 1990.	1,000,000	51,205	168,686	16	Los Angeles	IV	1998
1915	1910155	1910155-016	GSWC - SOUTHWEST	GSWC - Southwest System - Dalton Well No. 2 (Prop.50 Project)	This project is for the drilling, development, and equipping of a new well with a capacity of 1,000 gallons per minute (gpm) and all appurtenant equipment such as a disinfection facility, a chemical storage facility, a motor control center, and all necessary valving and piping. The source of water for this project is groundwater from the West Coast Basin. The well will be approximately 1,000 feet deep with a vertical turbine pump and with sodium hypochlorite and ammonia to provide chloramination for disinfection.	M	10	C	GSWC has applied for Proposition 50 Fund for this project.The Dalton plant is located in the south-central portion of the Southwest System. Its facilities include a non-operational 2.0 million gallon underground reservoir, a non-operational booster station with two pumps, and an active well (Dalton Well No. 1) that supplied the system directly using a vertical turbine pump. The Southwest District is heavily dependent on the Metropolitan Water District of Southern California (MWDSC) water supply due to the lack of reliable local wells. Currently, the Southwest System purchases over 60% of its supply from the West Basin Municipal Water District (WBMWD), a member agency of MWDSC. A new well that make beneficial use of the local groundwater will reduce the current demand on the supply from MWDSC and, thus, will reduce demand on the Colorado River water supply.	3,216,800	51,205	168,686	16	Los Angeles	IV	2009

1918	3610034	3610034-004	ONTARIO, CITY OF	Age Deficient Water Main Replacement in and near Rosewood Court	Replacement of the Age Deficient Water Mains entails providing all the necessary labor, materials, equipment and services. The project includes installing two thousand and four hundred (2,400) linear feet (LF) of 8-inch PVC water main, water services, fire hydrants, gate valves, fittings, and other appurtenances in Rosewood Court and in nearby alleys and streets.	M	10	C	Several pipe segments in and adjacent to Rosewood Court are over fifty (50) years old and are deteriorating. In order to improve the quality of the distribution system and assure adequate water delivery to the customers, these deteriorating pipe segments need to be replaced.	495,000	34,006	172,701	13	San Bernardino	V	2009
1919	3610034	3610034-005	ONTARIO, CITY OF	Equip Well #43	Equipping Well #43 entails providing all the necessary labor, materials, equipment and services to equip the well. The work at the well site includes the construction of the well enclosure building including the vertical turbine pump, motor, and associated piping; onsite hypochlorite generation and feed system; standby power generator building including the diesel generator and associated equipment and piping; electrical; HVAC; plumbing; yard piping, and valving; field survey, staking, and project layout; site work; foundation preparation; asphalt paving; landscaping; site fencing; connection to existing utilities; testing; and disinfection and startup.	M	10	C	A well in the 1212 Zone has had maintenance problems and has become unreliable; therefore a replacement well needs to be constructed in order to maintain existing water production levels.	2,877,000	34,006	172,701	13	San Bernardino	V	2009
1920	5010010	5010010-006	Modesto, City of	Downstream Improvements - Claratina & Virginia Corridor Transmission Mains	This project will install water distribution system improvements needed to accommodate the increased production capacity of the Modesto Regional Water Treatment Plant Expansion. The Tier 1 phase includes new transmission and distribution piping and flow control stations and a new storage tank and booster pump station. These new facilities will enable the City's water system to better meet peak demands, maintain sufficient service pressures, improve water quality, and offsets wells out of service.	M	10	C	The Modesto water system which includes Salida, Empire and surrounding County islands is in need of increased water supply. Due to failing wells from ground water contamination, the original system has been losing needed water production. Surface water is available to the City of Modesto from the Modesto Irrigation District (MID) system. Currently the City purchases 30 mgd from MID. The City and MID have contracted to double this delivery of surface water to Modesto from the Modesto Regional Water Treatment Plant. The existing water system cannot transport additional surface water adequately through the system. Transmission mains, storage tanks, pressure reducing valves, and booster stations need to be constructed.	12,550,000	68,497	212,000	10	Stanislaus	III	2009
1921	5010010	5010010-005	Modesto, City of	Purchase and Install New Generators - Tanks 7 and 8	The existing back-up power generators at Tank 7 and 8 will be replaced with larger generator units. Contractors will remove the existing generators and redesign the electrical panels, foundations and conduits to accommodate the new generators.	M	10	C	Tank 7 and 8 are important storage facility in the South Modesto Water System. Recently, to increase pressures because of growth, the booster stations on these tanks were upgraded. The upgrades included larger motors to pump water and increase system pressure. The larger motors require a larger back-up electrical system in case of power outages. Tank 7 and 8 existing generators are not adequate to operate the new motors in a power outage. This endangers the South Modesto area if fire flows were needed during a power outage.	495,000	68,497	212,000	10	Stanislaus	III	2009
1922	5010010	5010010-007	Modesto, City of	Install New Well - Mildred Perkins	A well site has been selected in the Mildred Perkins Park property. This location is ideal for a large production well to supply water to the Northwest Modesto area. The well has been drilled and tested and meets CDPH standards for quality drinking water. The design for this well is completed. The development will require full construction of the above ground pumping facilities.	M	10	C	The City is losing wells on the Northwest area of the City due to uranium contamination. Contaminated wells exceed the MCLs for uranium and Gross Alpha. Because of the loss of large production wells, the water supply in this area of the City has become taxed during the summer months. The existing operating wells must work at capacity to meet demands and keep the water supply adequate.New wells are needed in this area to meet minimum pressure and fire flow regulations. Development of this site needs to proceed soon for additional water supply this year.	1,300,000	68,497	212,000	10	Stanislaus	III	2009

1923	5010010	5010010-011	Modesto, City of	Water Main and Service Replacement - Airport District	The Modesto Water System has an area called the Airport District. This section of town will require the replacement and upsizing of water mains and service. Water mains and services will be moved out of the easement areas and installed in the street for easy access. Fire hydrants will also be installed. Adequate water flows will result due to appopriate sized water mains. This will improve water quality and bring sufficient water pressures and volumes for fires and household use. With new piping, water conservation will improve by eliminating water leaks. A total of 17,000 feet of water mains will be upgraded. There are 503 meter services that will be replaced during the infrastructure improvements. All meter services will comply with State mandates.	M	10	C	The Modesto Water System has an older residential and industrial area called the Airport District. This section of town has infrastructure that is aging and in desperate need of major upgrades. Staff spend many hours fixing leaks, maintaining the system, and spending money on street repairs and property damage to customers due to leaks. The water system has insufficient water quantity due to limited water delivery restricting new growth, including residential, industry and school expansions. With the low pressure issues, outdated water mains and services, the Airport District area has limited fire protection; especially during peak hours.There is almost 17,000 feet of water main that needs to be upgraded to meet the needs of this community and provide adequate volumes of water for building, industry, schools and fire protection. There are no wells in this area and the entire water supply is dependent on older mains to carry water from other parts of the system.	1,600,000	68,497	212,000	10	Stanislaus	III	2009
1924	5010010	5010010-008	Modesto, City of	Strengthen and Replace Water System - I Street Main	Design work to replace this water main has been completed. A contract will be issued for relining the existing water main under the railroad tracks. The new main will be tied into the existing system on both sides of the railroad tracks. This work must be done without disturbing the railroad schedule. It is very important to complete this work before summer when we expect high water demands in the downtown area.	M	10	C	The "I" Street water main connects the west and east sides of downtown Modesto. The main developed a leak underneath the Union Pacific Railroad (UPRR) tracks. This rail is a main connection through the Central Valley. To prevent damage the railroad, the main was shut down. Since this main inactive, water movement between the east and west sides of town is greatly restricted. The water main needs to be repaired so that the full supply of water can be used in case of fire or other emergencies. The system was originally designed to carry water in either direction, as needed.	435,000	68,497	212,000	10	Stanislaus	III	2009
1925	5010010	5010010-009	Modesto, City of	State Route 132 Water Main Replacement	Design is complete and bids are ready to be requested for full replacement of this 12" main within the State Route 132 corridor. This will include coordinating with State construction, traffic control, replacing services along the State route and temporary pavement.	M	10	C	Modesto has many old steel water mains within State highways. These mains are high maintenance due to leaking of the aging pipes. The State is repaving Highway 132 through Modesto starting in 2009. Several sections of this paving project have 12" water main that is especially problematic. It is necessary to replace this water main prior to paving the highway to avoid damaging the new pavement when repairs are made. The State will place a moratorium for cutting into their new pavement for several years. This will not be possible to adhere to if a water main breaks. Replacing this water main meets the Strategic Plan for the City of Modesto Utilities Division. Also, best management practices adopted by the City require us to replace failing water mains.	1,550,000	68,497	212,000	10	Stanislaus	III	2009

1926	3710010	3710010-004	Helix Water District	Pipeline Project 1400 Mt. Helix	This Project is an infrastructure improvement project that replaces Helix's old cast-iron pipelines with new pipelines. This Project replaces 6,490 feet of cast-iron pipe with 5,350 feet of PVC pipe on Mt. Helix. The existing cast-iron pipe was installed from 1945 to 1949. Pipeline will be replaced within several streets including Wister Drive, Sierra Viats Avenue, Fuerte Drive, Shadow Road, Redondo Drive, Helix Terrace, and several easements. The Project also includes abandonment of a pressure reducing valve vault and installation of a new pressure reducing valve vault. Existing cast-iron pipes break and leak requiring the distribution system to be shut down and water deliveries to customers are impacted until repairs can be made. The old cast-iron pipelines on this Project have had 3 pipe breaks in 1980 and 1999. The Project will replace old cast-iron pipe with PVC pipe that is less prone to failure and more reliable. These infrastructure improvements are also needed to bring the pipelines up to the current design requirements and standards.	M	10	C	This Project is an infrastructure improvement project that replaces Helix's old cast-iron pipelines with new pipelines. Existing cast-iron pipes break and leak requiring the distribution system to be shut down and water deliveries to customers are impacted until repairs can be made. This Project replaces 6,490 feet of cast-iron pipe. The old cast-iron pipeline on this Project have had 3 pipe breaks in 1980 and 1999. These infrastructure improvements are also needed to bring the pipelines up to the current design requirements and standards.	1,475,000	55,497	263,642	14	San Diego	V	2009
1927	3710010	3710010-006	Helix Water District	Pipeline Project 1442 Pepper/Second/Dawnridge	This Project is an infrastructure improvement project that replaces Helix's old cast-iron pipelines with new pipelines. This project replaces 6,800 feet of cast-iron pipe with 6,800 feet of PVC pipe in the unicorporated area of the County of San Diego near El Cajon. The existing cast-iron pipe was installed in 1948 and 1949. Pipeline will be replaced within several streets including Pepper Drive, N. Second Street, Dawnridge Ave., and El Rey Ave.Existing cast-iron pipes break and leak requiring the distribution system to be shut down and water deliveries to customers are impacted until repairs can be made. The old cast-rion pipelines on this project have had one pipe break in 1977. The Project will replace old cast-iron pipe with PVC pipe that is less prone to failure and more reliable. These infrastructure improvemetns are also needed to bring the pipelines up to the current design requirements and standards.	M	10	C	This Project is an infrastructure improvement project that replaces Helix's old cast-iron pipelines with new pipelines. Existing cast-iron pipes break and leak requiring the distribution system to be shut down and water deliveries to customers are impacted until repairs can be made. This Project replaces 6,800 feet of cast-iron pipe. The old cast-iron pipelines on this Project have had one break in 1977. These infrastructure improvements are also needed to bring the pipelines up to the current design requirements and standards.	1,650,000	55,497	263,642	14	San Diego	V	2009
1928	3410020	3410020-022	City of Sacramento		Isolate South Sac as single pressure zone. Modify Florin Reservoir Pump Station to increase discharge head. Construct groundwater well to help supply peak demand. Involves refinancing and construction.	M	10	C	Water pressure levels in South Sac routinely drop below the City's minimum water pressure level.	306,000	137,886	407,018	09	Sacramento	I	2006
1929	3410020	3410020-013	City of Sacramento		Provide new treated water pump station and connecting piping. Involves design and construction.	M	10	C	Existing treated water pump station is aged and structure settlement and pipeline leaks have occurred.	20,000,000	137,886	407,018	09	Sacramento	I	2006

1930	3410020	3410020-032	City of Sacramento	Water Pipe Relacement #2	Citywide replacement of water pipes which have either exceeded their useful life or are undersized due to growth.The project purpose is to ensure the reliability of the water distribution system and reduce the potential for water main breaks. At one time the downtown area had approximately 63,300 feet of riveted steel water transmission main that was placed between 1870 and 1950. These large mains are considered some of the most critical components of the City's water distribution system and are essential in providing a safe and reliable water supply to our customers. These pipelines should be replaced prior to failure. The City has experienced failures of the riveted steel mains in the past that have caused severe damage to businesses and residential properties.	M	10	C	Citywide replacement of water pipes which have either exceeded their useful life or are undersized due to growth.	7,300,000	137,886	407,018	09	Sacramento	I	2009
1931	3410020	3410020-016	City of Sacramento		Repair cracks and place a concrete coating on the slab and wall surfaces.	M	10	C	Concrete slabs and walls in existing basins and filters are cracked and have lost a large part of the cement matrix at the surface exposed to water.	500,000	137,886	407,018	09	Sacramento	I	1998
1932	3410020	3410020-030	City of Sacramento	Water Pipe Installation #1	Main Ave - Blackrock to Rio Linda Bl New Pipe: This project serves three main purposes, 1) it allows for a more reliable water supply to the area by providing redundancy, 2) increases the water supply to area being serviced, and 3) allows for a distribution network for future tie-ins to the system. The most critical purposes are to provide system redundancy and water supply. Folsom Boulevard Pipeline: The construction of 3920 lineal feet of 24-inch diameter water transmission main and related facilities connecting to an existing water transmission main in Folsom Boulevard will allow for the transmission of American River water to the Rosemont service area. This project will also allow for the expansion of conjunctive water management in the area.	M	10	C	Main Ave - Blackrock to Rio Linda Bl New Pipe:Currently, there are only three water mains that feed the entire North Natomas area. Two of these mains are smaller diameter, therefore, there is minimal redundancy to the area. Folsom Boulevard Pipeline: This pipeline will supply water to the Rosemont area which is served by groundwater that is currently impacted, threatened, and in some cases, lost, due to industrial contamination.	9,500,000	137,886	407,018	09	Sacramento	I	2009
1933	3710042	3710042-011	San Diego County Water Authority	Aeration Facilities at Lake Hodges Pump Station	Install aeration facilities at the Lake Hodges Pump Station that will increase oxygen levels in Lake Hodges, resulting in improved water quality and reduced operating costs for the region's water treatment plants.	M	10	C	The San Diego County Water Authority is connecting Lake Hodges to Olivenhain Reservoir and its untreated water conveyance system that supplies seven water treatment plants in the region. The water quality in Lake Hodges is less than optimum compared to the supply in Olivenhain Reservoir and supplied through its regional conveyance system.	130,000	102	3,140,000	14	San Diego	V	2009
1934	3710042	3710042-012	San Diego County Water Authority	Turbidity Curtains at Lake Hodges	Install turbidity curtains at the Lake Hodges Pump Station Inlet/Outlet Tower and the watershe influent. The curtains will increase the quality of the water pumped to Olivenhain Reservoir and returning to Lake Hodges as water is moved from one water body to the other. Improved water quality in Lake Hodges will result in reduced operating costs for the region's water treatment plants.	M	10	C	The San Diego County Water Authority is connecting Lake Hodges to Olivenhain Reservoir and its untreate water conveyance system that supplies seven water treatment plants in the region. The water quality in Lake Hodges is less than optimum compared to the supply in Olivenhain Reservoir and supplied through its regional conveyance system.	380,000	102	3,140,000	14	San Diego	V	2009
1935	3710042	3710042-010	San Diego County Water Authority	Circulation Using Solar Bees at Lake Hodges	Install SolarBees in Lake Hodges to circulate water and improve water quality. SolarBees will improve water quality and result in reduced operating costs for the region's water treatment plants.	M	10	C	The San Diego County Water Authority is connecting Lake Hodges to Olivenhain Reservoir and its untreated water conveyance system that supplies seven water treatment plants in the region. The water quality in Lake Hodges is less than optimum compared to the supply in Olivenhain Reservoir and suppplied through its regional conveyance system.	200,000	102	3,140,000	14	San Diego	V	2009

1936	3710042	3710042-008	San Diego County Water Authority	Quagga Mussel Control Chlorine Feed at Olivenhain Reservoir	Install chlorine feed facilities at the Olivenhain Reservoir to prevent the introduction of viable Quagga Mussel veligers into Lake Hodges from this source water.	M	10	C	The San Diego County Water Authority is connecting Lake Hodges to Olivenhain Reservoir. Olivenhain Reservoir has become infested with the invasive Quagga Mussel. This infestation results in significant maintenance of the reservoir and lake facilities. Water from Olivenhain Reservoir will be conveyed to Lake Hodges on a regular basis when the Hodges Pumped Storage Pump Station is completed in 2010 thereby increasing the probability of Quagga Mussel infestation into Lake Hodges.	1,500,000	102	3,140,000	14	San Diego	V	2009
1937	2702268	2702268-001	NEW CAMALDOLI HERMITAGE WS		Construction of 3 new tanks.	M	10	P	Deteriorating water storage tanks.	12,000	1	25	05	Monterey	II	1998
1938	2702254	2702254-001	PACIFIC VALLEY SCHOOL WS		Need to install new well, storage tank, and pipes.	M	10	P	System facilities (well, storage, distribution) are in poor condition resulting in TCR violations.	30,000	1	55	05	Monterey	II	1998
1939	4700575	4700575-001	Butte Valley Middle School	Deeper Well Needed	The District does not have the funds to pay to get the well problems solved. We just found out about this program and are hoping to be able to get some help before we are no longer able to get any water from our well.This is an agricultural community and the type of agriculture has changed. There is now mostly strawberry fields around the school which are using more water and it seems the underground water levels are dropping every year. Our initial feeling was that we would need to dig down at least 20 feet to insure that we will have a good water supply. We have been told that this would be just a band-aid fix and that we should go down at least 100 feet.A smaller casing than what the original one now is would need to go down through the original so that it was all one piece. After someone is able to come and look at the project it is possible that we could be told that a new well would be the more efficient way to go.No new buildings would be needed and the cost of making the well deeper will also depend on the quality of casing that is used.	M	10	P	Wells are the only water available to Macdoel residents. There is no public water system available. The closest public water system is 11 miles away in Dorris, California. This well is used for our Middle School and Picard Community Day School located in Macdoel, California. We have approximately 80 students and 8 staff members who use this as their only supply for drinking water.We are having a shortage of water available as the water table level is at 68 feet and our well is at 69 feet. We need to make the well deeper so that we can have a steady supply of water for our students and staff. Our well is sometimes sucking air instead of water. We have had to stop watering our school grounds as there isn't enough water. The water is also the only source available for daily use of sanitation needs. If we do not have enough water to take care of sanitation needs we would be forced to close our two schools and there would be nowhere for our students to go as this is the only Middle School within approximately 60 miles.	20,000	1	55	01	Siskiyou	I	2009
1940	4500181	4500181-001	WHITMORE UNION ELEM SCHOOL		Install 125 gallon bladder tank on a steel frame to provide the pressure required by the Waterworks Standards.	M	10	P	Insufficient water pressure. System not fulfilling Section 64566 (system pressure) of the Waterworks Standards.	10,000	1	75	02	Shasta	I	1998
1941	1500517	1500517-002	STOCO MUTUAL WATER COMPANY	Storage Tank and Pressure Tank Install	Water Storage Tank-System does not meet the fire flow requirements set forth in the Kern County Development standards - (System has pressure tank only)Booster Pumps (excluding cement pads)Well Pump RetrofitMiscellaneous Piping (6-inch)6-inch Resilient Seated Gate ValveMagnetic Flow Meter (Inoperable)5/8" Water Meters (replace existing to properly quantify the amount of water being used with each connection)Back - up Generator/ATS (None)Instrumental/ControlsContingencies (15%)Engineering and Administrative Fees - Including Reports (10%)Permit and Legal FeesInstall pressure regulator and combination metering valve with check.Replace 10,000.00 gallon pressure tank. 1942	2100545	2100545-005	WALKER CREEK RANCH EDUCATIONAL CENT	Walker Creek Water System Water Conservation Plan	The project is to replace the primary 100,000 gallon water storage tank and to detect and repair leaks in the distribution system.	M	10	P	The existing primary water storage tank and distribution lines are approximately 50 years old and in need of repair. The system is currently loosing approximately 5,000 gallons per day due to leaks in the primary storage tank and the distriution system, which equates to about 1.8 million gallons per year, and approximately 30% of total annual water consumption by the system. The water loss is a growing concern, in the midst three consecutive years of drought conditions, and the water table dropping.	595,000	21	100	18	Marin	II	2009
1943	3901014	3901014-001	BANTA ELEMENTARY SCHOOL	Corroded water pipe replacement for safe drinking water	The distribution system will need to addressed. The project will require displacing students while construction takes place. this will be an ardous process and will deal with each wing separately.	M	10	P	We are currently unable to provide drinking water for our students as we have coliform in our water. We know it does not emanate from the well or the new bladder system we have put in. we have been told due to the age of our buildings and pipes (Pombo Wing built in 1954 and Emhoff Wing bulit in 1970) that the pipes need to be replaced to eliminate the problem. Thus, we have to replace the pipes in both wings which include a full kitchen and gymnasium.	125,000	1	200	10	San Joaquin	III	2009
1944	1900756	1900756-004	WARM SPRINGS REHABILATION CENTER	Warm Springs Rehabukutation Center	The Water system is in need of an additional water source to meet the demands of the community, and to reduce arsenic concentrations. i.e. new ground water well.	M	10	P	Water Quality from Well #1 has ARSENIC concentrations that exceed the 0.50 milligrams per liter (mg/L) National Primary Drinking Water Standard Maximum Contaminated Level. The water system has insufficient water storage for fire protection.	500,000	1	200	16	Los Angeles	IV	2008
1945	3400268	3400268-001	WALNUT GROVE ELEMENTARY SCHOOL		Install storage tank to increase storage capacity.	M	10	P	Single well source with no storage; unreliable.	50,000	3	300	09	Sacramento	I	1998
1946	3701909	3701909-001	CUYAMACA OUTDOOR SCHOOL	Cuyamaca Well #1 Refurbishment Project	We propose to use the grant funds to refurbish Well #1 to produce potable water and reconnect it to our reservoir. This will consist of replacement of the annular seal, well cap, pump and electrical components and controls, and installation of appropriate pipe between well #1 and the existing reservoir. It may also require "refurbishment" or "fracturing" of the existing well #1 and/or deepening the existing well to ensure appropriate delivery of potable water.It is felt that refurbishing this existing well would be more cost effective than siting and drilling an entirely new well.	M	10	P	The Cuyamaca Outdoor School site provides school camp opportunities for approximately 275 5th and/or 6th grade students from various schools with San Diego County. The water system was previously supported by two wells. Well #1 was removed from service due to cracks in the annular seal and well cap and problems with the well pump and the connection to the reservoir and distribution system. This reduces the site to a single water source with which to serve the school camp and the adjacent State Parks headquarters. Well #2 produces water in which Manganese was found at levels that exceed the secondary MCL of 50 ppb (i.e. 110 ppb). Therefore, it is desirable to refurbish and reconnect Well #1 to produce potable water which will be blended with the water from well #2 in our reservoir so that the average Manganese (ppb) will be reduced. below the secondary MCL.This information is posted in our annual Consumer Confidence Report.	75,000	19	300	14	San Diego	V	2009
1947	1600008	1600008-002	CENTRAL UNION ELEMENTARY	Central Union School well addition	Furnish and Install (F&I) 300 GPM Groundwater Deepwell on Central Union School grounds.F&I 300 GPM Vertical Turbine pumping unitF&I Well Manifold Installation - 2F&I Hydropnuematic Tank InstallationF&I Pipeline Valved ConnectionsF&I Reinforced Concrete - 20 cubic yardsF&I Compacted Aggregate Base - 300 cubic yardsF&I Chlorination Building, Equipment and ControlsF&I Electrical Controls and EquipmentKings County Public Works Application Permit Fees	M	10	P	Central Union School is located in rural Lemoore, Ca. Currently the school operates on one well. The single well is the only supplier of water on the school site. The well was established in 1992 and is currently at a depth of 860 feet with the pump set at 310 feet.	585,000	3	320	12	Kings	III	2009
1948	5700510	5700510-001	DELTA HIGH SCHOOL		Intstall 20,000 gallon storage tank. Involves design and construction.	M	10	P	Not enough storage capacity.	35,000	3	350	09	Yolo	I	2006
1949	4100513	4100513-001	PESCADERO HIGH SCHOOL		Feasibility study to consolidate with CSA 311 San Mateo County.	M	10	P	Cracked well casing needs to be repaired.	15,000	1	400	17	San Mateo	II	2006

1951	2400066	2400066-002	PLANADA SCHOOL	Well water replacement with city water district water	The Planada Elementary School would connect to the Planada Community Services District water supply. The well on the school campus would continue to supply water for landscape irrigation but would no longer be connected to the drinking water system. The Services District would install a double check valve, water meter, 48" water box/extension, 48" water box lid, misc. plumbing material, and labor. The District would perform the water connection to the school.	M	10	P	Currently the Planada Elementary School with 550 students and 40 staff members located at 9525 E. Brodrick, Planada, CA 95365 is supplied with well water located on school properrty. The water from this well supplies drinking and landscape irrigation water to the campus. The water is currently tested monthly and the quality has been satisfactory. However, the well is over fifty years old and is not a deep well for the area. The potential for groundwater contamination is high. The Planada community has a population of 4000 and is surrounded by agriculture crop land making the groundwater suseptible to leaching pesticides. The Planada Community Services District supplies the Planada Community with water and the district would like to connect to the District's water supply.	10,000	1	605 11	Merced	III	2009
1952	0900317	0900317-001	CHIQUITA HOMEOWNERS ASSOC.	Chiquita HOA Distribution System Upgrades	We are attempting to update our system so that it meets the current public health requirements with El Dorado county.	M	10	N	Water system is currently serving 17 homes which are partly supplied with steel pipe and no back flow system currently in place. Our storage also needs updating, venting, seals, etc.	10,000	17	20 09	El Dorado	I	2009
1953	2700999	2700999-001	OAK PARK WS		Install pressure system and replace aging water mains.	M	10	N	System needs to install booster system and replace water mains due to lack of water pressure and aging pipes.	50,000	1	29 05	Monterey	II	1998
1954	2700999	2700999-004	OAK PARK WS		Replace existing potable distribution system with adequate separation.	M	10	N	Non-potable irrigation system is not adequately separated from potable distribution system.	40,000	1	29 05	Monterey	II	1999
1955	3301025	3301025-001	AZALEA TRAILS GIRL SCOUTS CAMP		Would like to construct a 20,000 to 40,000 gallon storage tank and replace approximately 2000' of 4-inch line and approximately 3000 of 2-inch line.	M	10	N	Storage capacity is inadequate. We need a second tank for increased storage. Water lines are close to or on the surface. Lines need to be buried at an adequate depth to prevent freezing.	100,000	9	50 20	Riverside	V	1998
1956	4901207	4901207-001	Sonoma County Parks-Stillwater Cove		Replace well, distribution lines, water pumps, chlorinator and tanks.	M	10	N	Need well, distribution lines, water pumps, chlorinator and tank replacement.	125,000	1	50 18	Sonoma	II	1998
1957	3700063	3700063-001	FREEDOM RANCH	well replacement with booster pump station and additional storage capacity	Construct new well source with new booster pump station and add additional storage to meet capacity demands under the 2008 water works standards, including fire flow. New distribution line to connect to existing storage and main building. Abandon existing well.	M	10	N	Existing source well is over 40 years old and no longer passes the coliform rule. Disinfection proved fruitless, boil water order issued until chlorination system could be installed. Boil water in effect from July through September 2008. No longer in effect due to full time chlorination. Existing well source beyond its useful life.	380,000	1	60 14	San Diego	V	2009
1958	5400505	5400505-001	HARTLAND CHRISTIAN CAMP	Back up well	Locate and drill several test wells with the expectation of landing a good producing well that can be developed and tied in as a back up to our current system.	M	10	N	Limited back up capacity. We currently have only one well and an emergency back up with our neighbors that would not be sustainable for our situation.	75,000	4	140 12	Tulare	III	2009
1959	1000058	1000058-001	MUSICK CREEK TRACT ASSOCIATION		CONSTRUCT A NEW WELL.	M	10	N	THE TWO ACTIVE WELLS HAVE MARGINAL CAPACITY TO MEET THE DEMANDS OF THE SYSTEM, ESPECIALLY DURING DRY YEAR.	15,000	48	165 23	Fresno	III	1998

1960	3600534	3600534-005	De Benneville Pines Inc	Failed Water System Replacement	The planned project will replace existing 2700 feet of 2" galvanized decaying galvanized water mains that range in age from 45 to 65 years with current AWWA and NFTA code lines. The new lines and mains will vary from 6" to 2" in diameter depending on the location in the system. The project will start at the current horizontal well and utilize a 700' in length 2" HDPE (High Density Polyethylene) to supply the existing 45,000 gallon storage tank. This line must remain surface run as portions of this line are located within the San Gorgonio Wilderness located in the San Bernardino National Forest. The well is artesian.The current steel storage tank was relined with fiberglass approximately 10 years ago and has an indefinite life expectancy at this time. However, the tank was modified to allow for the installation of a 6" outlet. Additional connections are designed into the project to allow for the installation and connection of an additional tank if funds are available. The work installing the new outlet was completed in April of 2009.A temporary 2" water main will be installed so that once work on the 6" line commences in late Fall 2009 the existing 700 foot section from the storage tank to the campus can be replaced without fear of destroying the existing line and interrupting service.Camp de Benneville Pines is located in the breeding zones for Southern Spotted Owls. As such, major machine work must occur only during times	M	10	N	Camp de Benneville Pines is a 501c3, not for profit year round camp located in the wilderness of the San Bernardino National Forest. This institution was acquired in 1961 from the Boy Scouts, who operated a facility on this site from the mid to late 1940's. Our existing water delivery system, a combination of 2" galvanized shallow buried pipes installed by both the Boy Scouts in the late 1940's and by Camp de Benneville Pines in the early 1960's has failed in part and we believe a catastrophic failure to be imminent. Due to the age of the existing lines (45-65 years in age) we are experiencing a high level of both water main breaks and leakage. These events have placed our camp population of over 6000 campers per year at risk of drinking contaminated water. We have already experienced water tests indicating organic matter in our drinking water supply. Camp de Benneville Pines is no longer in accordance with NFTA and AWWA codes and standards and we urgently need to solve this problem in its entirety before we are forced to close the camp because our water system has failed completely.A local civil engineering firm has completed plans for the replacement of our dangerously deteriorated 2" galvanized water mains with modern 6" high density polyethylene (HDPE) mains, and we have submitted this engineering design to the San Bernardino County Fire Marshall and the US Forest Service for approval. 1968	4900549	4900549-003	Sonoma County CSA 41-Freestone	Replace failed roof on underground concrete water tank	Plans were prepared for the construction of a new roof structure consisting of Alaskan yellow cedar. The county of Sonoma has submitted bid documents for construction; however there is no source of funds to complete this construction projectThe project consists of installing a temporary tank and pump system, while the existing roof is removed. The galvanized metal roofing will be salvaged and reused when the new roof trusts are completed and placed on the tank.Te dimensions of this tank is 25 feet wide; 40 feet long; and 8 feet deep.This project may be awarded in less than 60 days.	M	5	C	The existing douglas fir roof truss has failed and the entire roof is settling into the under ground finish water storage tank. Emergency repairs have prevented the entry of small animals. The condition is perilous, soon the roof will collapse into the water supply. The community is very small (less than 30 users) and cannot afford a new roof structure constructed with marine Alaskan yellow cedar.	60,000	30	60	18	Sonoma	II	2009
1969	1500489	1500489-001	BRITE LAKE COMMUNITY ASSOCIATION		Replace 2000-3000 ft. of water line. Replace pump and well system	M	5	C	(1) Old decaying water lines that presently deliver water. (2) Back up well to provide water service in case of mechnical breakdown	30,000	18	63	19	Kern	III	1998
1970	2701040	2701040-001	MCCOY RD WS #05		Install tanks holding approx. 30,000 gallons and new pumping station. Install main lines from holding tanks with fire hydrants on new distribution lines.	M	5	C	System needs new storage tank, pump stations, and distribution mains.	150,000	24	72	05	Monterey	II	1998

1971	1900158	1900158-005	LITTLE BALDY	Transmission pipeline replacement	The proposed project is to replace the existing transmission pipelines with ~7,000 feet of 6 inch fusion welded HDPE pipe, and abandon the old leaking concrete line. The new pipeline will reduce the amount of water lost during transmission, and protect customers from potential coliform contamination exposure due to open, unpressurized lines.	M	5	C	The System's transmission line was installed in 1913, was constructed of 10" and 12" unreinforced concrete pipe that is only capable of handling unpressurized flows. 7,000 feet of this remain in service from the well site in the mountain canyon down to the upper edge of the service area. The inability of this existing concrete piping to function as a pressure conduit is in itself a violation of the California Water Works Standards.The lines losses have been estimated to be greater than 30% of all of the water produced, due to a suspected break or crack in the pipe. This water loss takes place between the well field and the distribution system. This leaking transmission line is causing significant water shortage problems, and the system is unable to reliably deliver water to consumers.	300,000	27	76 16	Los Angeles	IV	2009
1972	4900843	4900843-001	Sonoma Ranch Mutual Water Company		Crill new well. Install new storage tank. Upgrade existing tanks or main pipeline. Upgrade existing controls and valves. 1994	4000568	4000568-006	SAN SIMEON CSD	San Simeon Waterline Repair and Improvement	This project is intended to address water distribution system deficiencies identified in the District's 2007 Water Master Plan. The existing potable water system consists of more than 2 miles of distribution piping. The majority of the transmission piping (approximately 8,500 feet) is 6-inch asbestos-cement (ACP) pipe. The proposed project will replace approximately 5,460 feet of 6-inch ACP pipe to improve reliability, increase separation from sanitary sewer, and improve fire protection.	M	5	C	The District operates and maintains over 2 miles of predominately Asbestos-cement distribution piping. The majority of this pipe is undersized and does not provide adequate fire protection for the community. According to records, the District also experiences significant water loss. Additionally, much of this pipe does not maintain adequate separation from sanitary sewer, increasing the risk of cross contamination.	1,370,000	206	499	06	San Luis Obispo	IV	2009
1995	4000568	4000568-005	SAN SIMEON CSD	San Simeon Pipe Bridge Repair/Replacement	This project will replace or repair the bridge to assure water supply to residents for sanitary needs and fire protection.	M	5	C	The 74-foot-long open pipe utility bridge is located over the Arroyo del Juan Creek (approximately 100 yards east of the Pacific coast shoreline and immediately north of the District's sewage treatment plant). This utility bridge supports a critical District water pipelines crossing the creek. A recent structural evaluation of the bridge estimates that due to severe corrosion, if not repaired or replaced, the bridge stability will be critically jeopardized. This work must be performed to ensure safe water supply to District residents.	225,000	206	499	06	San Luis Obispo	IV	2009

1996	4000568	4000568-007	SAN SIMEON CSD	District Reservoir Outlet Pipe Upgrade	Project involves replacing approximately 850 feet of 8-inch ACP pipe with 12-inch PVC pipe to provide water supply and fire protection to the community.	M	5	C	The outlet pipe from the District Reservoir does not have adequate capacity as identified in the District Water Master Plan.	276,000	206	499 06	San Luis Obispo	IV	2009
1997	4000568	4000568-009	SAN SIMEON CSD	Wellfield Rehabilitation Project	San Simeon relies solely on groundwater wells for its potable water supply. Two wells located in the Pico Creek Basin provide the District with water for commercial, residential, and fire protection uses. Through careful operation and management, these wells have performed admirably since 1952 and 1967, respectively, with few problems. However, due to age and constant exposure to corrosive environment, the facilities are in need of repair and replacement. The District has identified necessary repair and maintenance improvements including mechanical equipment, piping, electrical, disinfection, access, security, lighting, and monitoring.	M	5	C	This project is intended to address reliability issues that have occurred at the wellfield due to the age and condition of the facilities.	395,000	206	499 06	San Luis Obispo	IV	2009
1998	2800521	2800521-005	CIRCLE WATER DISTRICT	Circle Oaks Water System Improvement	Replace the existing 50,000 gal redwood tank with a 125,000 gal bolted steel tank at the same hillside location. This will require demolition of the old tank, grading for the new tank footprint, fabrication on site of a reinforced concrete foundation to tank manufacturers specifications, installation of a retaining wall, installation of a shut-off valve, instrumentation to measure water depth and means of transmitting depth to the water treatment plant, and piping to interface to the existing piping. This is estimated at $807415 including a 15% contingency.	M	5	C	The Circle Oaks Water District was established in 1963 with redwood tanks. The tanks have deteriorated considerably and lose water through leakage. We need bolted steel tanks to replace the existing redwood tanks. The tank urgently in need of replacement is at an elevation of 1620 ft and is installed on a pad on a hill adjacent to the District. This is a redwood tank containing 50,000 gallons. We propose to replace this tank with a bolted steel tank of 125,000 gallons to provide water for customers and to satisfy fire protection regulations. The existing tank is rotted at the sides and bottom and has been lined to make it servicable. It is presently at the end of it's servicable life and must be replaced very soon to enable continued water service to customers and to protect property values.	807,415	190	500 03	Napa	II	2009
1999	3700909	3700909-004	Julian Community Services District	Highway 78 Main Improvement and Nessl Tank	Providing funds for this project will enable the District to replace 2,800 feet of 50 plus year old, undersized steel water main out to the Julian CalFire station and residence (Battalion 5), the local continuation high school, the high school bus barn and maintenance facility, the US Post Office, provide a 50% increase in the District's storage capacity and provide a point of intertie to our neighboring water district. The old 3" steel main along Highway 78 would be replaced by the proposed 8" C900 PVC main with 6" dry barrel fire hydrants at 500' intervals. At the approximate mid point of this main, we have planned an 1,800 foot 8" C900 PVC lateral to the proposed 240,000 gallon welded steel storage tank. located on an elevated portion of a 5 acre District owned parcel. The location of the storage tank and improved distribution main is within 3/8 mile of the western most main of our neighboring water district, the Majestic Pines Community Services District. The District has already had the engineering completed and the plans drawn up for this project.	M	5	C	The Julian Community Services District (JCSD) serves the local CalFire Station and residence (Battalion 5), the Ray Redding Continuation High School, the Julian Union High School bus barn and maintenance facility and the Julian Post Office with a 55 year old 3" steel water main. There is a single 2" fire riser providing fire protection to these public occupancies. There is a 6" dry barrel hydrant close to these buildings, but it is located on the opposite side of the very busy State Highway 78. A major fire incident in any of these community services would close the highway for many hours and interrupt the transportation link between the neighborhoods and desert communities to the east and the town of Julian and points to the west.This area of the JCSD is also the closest to the neighboring Majestic Pines Community Services District (MPCSD). The current undersized main is approximately 3/8 mile from the Kentwood portion of the MPCSD.The JCSD currently has a storage capacity of 440,000 gallons of potable water in two welded steel tanks located along the northwestern boundary of the District. The addition of a 220,000 gallon on the southeastern boundary of the District will not only increase the potable storage for the District and increase the hydraulic gradient for the entire eastern portion of the JCSD, but is in an optimum position to allow a gravity fed intertie wth the neighboring MPCSD.As history has shown over the past 6 years, the	800,000	184	578 14	San Diego	V	2009

2002	1900803	1900803-008	El Dorado Mutual Water Co.	New Well El Dorado	Another well would give us an emergency backup in case our existing well stopped working. A new well would also provide 3 other mutuals emergency help if we were to intertie with them.	M	5	C	We have no guaranteed emergency backup and only one well. AVEK is our only backup, and although they have always helped us out, the written agreement is that they can shut down our connection at any time.	250,000	223	648	15	Los Angeles	IV	2009
2003	2010011	2010011-001	MADERA CO SA #1-INDIAN LAKES		INSTALL A NEW WELL AND A 750,000 GALLON STORAGE TANK.	M	5	C	THE WATER SYSTEM NEEDS ADDITIONAL SOURCE AND STORAGE CAPACITY TO MEET THE GROWING DEMANDS OF THE SYSTEM.	300,000	470	1,175	11	Madera	III	1998
2004	1710013	1710013-002	Callayomi County Water District	CCWD-500,000 Gallon Potable Water Reservoir Rehabilitation Project	To prevent additonal corrosion, the District will move forward with this project as soon as possible. The existing water system is not able to meet demands during the summer months with this tank out of service. The interior coating will need to be applied and the tank back in use before May, 2009. On or near March 13th, the tank will need to be drained to allow the repair work to begin. To meet the tight schedule the interior work will be completed first, followed by the exterior. The surface will be properly prepared and then recoated. Upon final inspection and testing the tank will be put back on line to provide the necessary storage for the District.	M	5	C	The Districts 500,000 gallon welded steel tank requires recoating to prevent additional deterioration. Based on a 2007 corrosion inspection report prepared for the tank, the interior is in poor condition with delamination below the water line and the exterior coating had reached its life expectancy of 20 years.	169,500	357	1,200	03	Lake	II	2009
2005	1710013	1710013-001	Callayomi County Water District	CCWD-Rabbit Hill Reservoir Improvements	The existing 125,000 gallon tank will be demolished and a 450,000 gallon tank will be installed in its place. The new tank will be a bolted steel tank in an effort to keep costs down and expedite the installation process. Also in an effort to reduce costs, the District will use their limited staff to construct the necessary piping modifications. Level controls for the new tank will be similar to those used for the old tank. The tank will float with the existing 500,000 gallon tank. To fit the larger tank on the site minor grading will be necessary and the access road will need to be realigned.	M	5	C	The District is in need of additional storage capacity. Their system currently includes two tanks; a 500,000 gallon welded steel tank and a 125,000 gallon welded steel tank. Based on a corrosion report prepared in 2004 the 125,000 gallon tank is in need of coating repairs on the interior and exterior. The tank does not provide sufficient redundancy if the 500,000 gallon tank is taken off line for extended periods of time and the combined storage of the two tanks does not meet demand needs for the District in the near future. Therefor, repairing the 125,000 gallon tank is not feasible. Before the 125,000 gallon tank deteriorates to an unsafe limit the District needs to replace it with a larger (450,000 gallon) tank. The new tank will be placed on the same site as the existing.	395,000	357	1,200	03	Lake	II	2009

2009	0310021	0310021-009	Amador County Service Area #3/Unit 6	Well Control Systems Replacement	Motor control center panels at three groundwater wells are in need of a high level of modification and maintenance on all electrical connections and mechanical devices. Electrical service panels need a high level of modification and maintenance on all electrical connections. SCADA needs moderate to major modifications to correct the original limited design control and alarm functionality. Low well pump shutdown alarming, mercoid switches, low well air reactor system alarming, pump cycle controls, and flow meters all will be modified and updated. The new motor control centers will not be within an enclosed building, but an open structure with a roof will be constructed to shade the motor control center from direct sunlight.	M	5	C	Electrical and control systems were installed in the 1970's at the Lake Camanche Village water system. The Department of Public Health noted in its 2008 inspection report for the system that well electrical and control systems at Lake Camanche were outdated and unreliable. The systems at three older wells should be rebuilt. Lake Camanche Village's source of water is groundwater from four independent and isolated wells. Furthermore, the system is located at the western end of Amador County and at the extreme westerly end of the Amador Water Agency's greater service area. A reliable electrical and control system is imperative. These upgrades significantly improve system reliability and greatly reduce risk of catastrophic failure of well control systems, and violation of Section 64602 of Title 22, California Code of Regulations. Without these improvements, a greater risk of system pressures less than 20 pounds per square inch exists. In addition, these upgrades will allow immediate notification to the operators of a well system failure, improving system reliability.	750,000	723	2,386	10	Amador	III	2009
2010	4110020	4110020-004	Palo Alto Park Mutual Water Company	New 350,000 Gallon Water Storage Tank	This project will consist of an installation of a new 350,000 gallon welded steel water tank at the yard of the existing facility in East Palo Alto, California.	M	5	C	The water system useage is growing and a second water storage tank is necessary for system reliability as well as fire flow protection.	543,750	652	2,500	17	San Mateo	II	2009
2011	4110020	4110020-001	Palo Alto Park Mutual Water Company	Replacement of Asbestos Water Mains	This project will consist of installation of 2,600 lineal feet, of new 8" diameter AWWA C900 PVC pipelines in Bell Street, Green Street and Glen Way in East Palo Alto, California.	M	5	C	The existing water distribution pipelines in this area are asbestos cement pipe and are deteriorating quickly. As such, we are experiencing numerous leaks. These pipelines should be replaced with new pipeline of an approved material.	446,250	652	2,500	17	San Mateo	II	2009
2012	4110020	4110020-005	Palo Alto Park Mutual Water Company	Replacement Well for Failing Well No. 2	This project will consist of installation of a 700 foot deep borehole, gravel pack, screen well casing, well pump, wellhead piping, electrical system andappurtenances at the yard of the existing facility to replace this existing well.	M	5	C	Well No. 2 is failing and a replacement well needs to be installed to replace the 250gpm capacity of this well.	587,500	652	2,500	17	San Mateo	II	2009
2013	5510005	5510005-009	TWAIN HARTE COMMUNITY SERVICES DISTR	Twain Harte Secondary Water Treatment Filter	A new tank has been purchased by the services district and needs to be installed. This will require meida placement and several connections to be added to both the tank as well as the treatment plant. Monitoring and metering equipment will also need to be procured and installed.	M	5	C	Our water treatment system currently has only one multi-media pressure filter installed. Because there is no redunancy the system is always subject to failure. Our water source is via an open ditch and it is critical that minimal down-time be incurred.	175,000	1,530	2,568	11	Tuolumne	III	2009
2014	5510005	5510005-010	TWAIN HARTE COMMUNITY SERVICES DISTR	Sherwood tank Connections	New tank is installed but needs to be connected to the system. New piping and an in ground vault will be used to connect to the system. This will increase district storage by 44,000 gallons.	M	5	C	Water District currently has a new 44,000 gallon potable storage tank installed but is having trouble funding the connection of that tank to the distribution system.	19,000	1,530	2,568	11	Tuolumne	III	2009
2015	5510005	5510005-008	TWAIN HARTE COMMUNITY SERVICES DISTR	SCADA System Upgrade	Current SCADA Control system would be upgraded or replaced to allow for thorough monitoring and control of water treatment system.	M	5	C	Current SCADA contol system only has limited monitoring capability. System needs to be updated to allow for full monitoring capability and control ability. This will increase water conservation efforts and ensure quality standards are met.	70,000	1,530	2,568	11	Tuolumne	III	2009
2016	5510005	5510005-006	TWAIN HARTE COMMUNITY SERVICES DISTR	Water Treatment Clarifier Refurbishment	Re-line existing water treatment clarifier tank with new metal to eliminate exisitng structural integrity issues.	M	5	C	There is currently one clarifier within the water treatment system and it is very old. In year 2005 the clarifier tank was opened and pictures taken of some large, and well developed, rust spots on the tank inner walls. The recommended repair was to mitigate the rust and weld-in new metal. The tank corrosion was never mitigated and the tank is now believed to be structurally unsound.	75,000	1,530	2,568	11	Tuolumne	III	2009

2017	5510005	5510005-007	TWAIN HARTE COMMUNITY SERVICES DISTR	Twain Harte Cedar Pines Water Tank Replacement	Existing 40,000 gallon tank does not meet seis-mic standards and presents a safety hazard to the community. The existing tank does not provide sufficient flow for fire fighting. The existing tank is the only tank in the particular water loop and does not receive scheduled prevenative maintenance because the tank can not be isolated from the potable water system. The District is considering erecting another tank on the same site and retrofitting the existing tank within standards. Another option would be to eliminate the existing tank in favor of a variable frequency pump to increase volume and pressure.	M	5	C	Existing 40,000 gallon tank does not meet seis-mic standards and presents a safety hazard to the community. The existing tank does not provide sufficient flow for fire fighting. 2034	3410007	3410007-001	Del Paso Manor County Water Di	Conjunctive Use Joint Project with Carmichael Water District	This project will construct a pipeline, pump station and well within the Del Paso Manor Water District Service area for supplemental water supply to the Carmichael Water District in the event of severe reductions in surface water resources.	M	5	C	The Carmichael Water District is facing the possible District wide loss of groundwater supply to a regional groundwater contamination plume originating at the Gencorp Aerojet industrial site in Rancho Cordova. The District relies on high quality groundwater to meet its water supply needs and provide a base level of water supply in a potential critically dry year exceeding historical drought conditions. A neighboring water district, Del Paso Manor Water District relies completely on groundwater for supply and is committed to expanding their supply options to include a conjunctive surface water and groundwater mix. Carmichael Water District is completing this project in cooperation with Del Paso Manor Water District.	2,120,000	1,795	4,458	09	Sacramento	I	2009
2035	2010005	2010005-002	YOSEMITE SPRING PARK UTIL CO	Mainline Replacements and 3-Series Boosters Upgrades	Mainline/Service Line ReplacementsWe intend to replace approximately 11 miles of mainline and related service lines and appurtenances ranging in size from 4" to 10" diameter. By replacing these, the most vulnerable lines, we will greatly reduce the number of failures and thereby reduce the potential for system contamination and the occurrence of discolored water events. During the installations, additional isolation valves will be included so that the size of areas affected during a shutdown will be reduced and systematic flushing events can be improved. Fire hydrants and blow-off valves will also be added to improve fire protection capabilities and system flushing efficiency and effectiveness. Additionally, the cost of repairs has driven up the cost of our water. By replacing these pipelines and reducing the number of annual repairs, we hope to eventually reduce the water rates we currently must charge.3-Series Boosters UpgradesBy increasing the size of the booster pumps, motors and piping, we will increase the capacity of each station. This increased capacity (500 gpm) will allow for the production capacity increases that have occurred over the past several years. By being able to move the water produced throughout the system without overtaxing the booster stations, we will not have to reduce production with it is needed most. Additionally, by adding SCADA to these boosters, we can increase the	M	5	C	Mainline/Service Line ReplacementsMainline/service line failures occur annually in our system at an average rate of 45/170 respectfully for the past 10 years. These failures create customer outages, sometime over very large areas of the distribution system and create the potential for system contamination. These failures also strip iron and manganese deposits inside the existing pipelines creating large scale discolored water events affecting customers not directly affected by the outage. Substandard materials and installation practices, combined with the lack of installation of properly spaced distribution system isolation valves during the original construction, are the primary cause of the failures. 3-Series Boosters UpgradesThe 3-Series boosters (3 stations) move water produced at a lower elevations to one of two 1MG main storage tanks for the system. This storage tank serves approximately 50% of our customer base. It also the most difficult tank in our system to fill with water during the high usage period each year. While we have, and continue to improve our production capability, moving the water through the 3-Series Boosters is hindered because of original design limits. This forces us at times to reduce production during times of high production needs because the capacities of the booster stations have reached their maximum potential (200 gpm). When this occurs we are forced to reduce production to avoid over-	12,400,000	1,872	4,653	11	Madera	III	2009
2036	2010005	2010005-003	YOSEMITE SPRING PARK UTIL CO	Storage Tank Conversion, Common Inlet/Outlet to Top Fill/Bottom Drain	We intend to install check valves and new piping to force all incoming water to enter the tank from the top rear of the tank and force out going water to leave the tank from the current exit location at the front bottom of the tank. Additionally, we will pipe Well 36A located in close proximity to Tank #4 directly to the new fill line for this tank. Currently Well 36A pumps directly into the distribution system piping. There are four customer service connections near the tie-in point of the well creating difficulties concerning contact times. The engineering was completed in February 2000 but this project has been delayed due to internal financing constraints. This project and related engineering have already been reviewed and approved by our local CDPH office.	M	5	C	Storage Tank #4 (1/2MG) is the final tank in our system to be converted from a common inlet/outlet configuration to a top fill/bottom drain configuration. The current common inlet/outlet design creates the potential for storage water stagnation which could result in water quality issues such as growth of bacteria as well as taste and order concerns. This project has been mandated by CDPH since 1999. All four of our storage tanks were part of this mandate and we have successfully converted three of the storage tanks to date. Financial constrains continue to cause us to delay the conversion of this tank.	300,000	1,872	4,653	11	Madera	III	2009

2037	2010005	2010005-004	YOSEMITE SPRING PARK UTIL CO	Rehabilitation of Wells 31A and 35A providing iron/manganese removal	This project involves the installation of an iron/manganese removal treatment system followed by a storage reservoir. From the storage reservoir, the water would be piped to the distribution system through one of three booster pumps. This would eliminate the excessive head pressure on the submersible well pumps allow the well pumps to reach their normal life expectancy. The reduced head pressure would also allow for increased production from these wells increasing our ability to meet customer demand. Additionally we would pipe the discharge from the booster pumps to two different pressure zones. This would increase the control over the delivery of this water and allow us to utilize the production in a more efficient manor. The system would be monitored and controlled by the addition of SCADA with alarm notification features. This project would increase water delivery safety and reliability, water quality, and reduce overall operational costs.	M	5	C	Well 31A and 35A both produce water to a pressure zone in an area where the head pressure is approximately 165 psi. Since these wells produce directly to the distribution system against this pressure, premature well failure of the pump and/or motor is commonplace. In addition, production from these wells is greatly reduced because of the excessive head pressure that the submersible pumps must overcome. Wells 31A and 35A are also both heavily impacted by iron and manganese. While we currently operated with a waiver from CDPH and use sequestering treatment to control these constituents, the levels are very high and problems related to these minerals still exist. Currently we limit production from these wells to only times of high demand. Well failures from these wells therefore only occur during the high demand periods when we need the production the most. Loss of production from these sources during times of high demand increases the potential for system outages.	800,000	1,872	4,653	11	Madera	III	2009
2038	4010014	4010014-008	CAMBRIA COMM SERVICES DIST	Rodeo Grounds Pumping Station Replacement	The new pumping sation will consist of two fire pumps, each rated at 2500 gallons per minute (gpm) capacity, as well as an emergency power generator. Three 735 gpm pumps will provide domestic water service. Connecting pipelines will also be increased in diameter to address related system bottlenecks that further limit fire flows. The station will be designed to the latest electrical code standards, and will include having its high-voltage electrical switchgear located in a room that is separated from the main pump room. Operation and performance of the station will be remotely monitored by a Supervisory Control and Data Acquisition (SCADA) system.	M	5	C	The Cambria Community Services District completed a lengthy water master planning process, which was ultimately adopted by its Board of Directors on September 25th, 2008. The water master plan identified several key infrastructure deficiencies within the Distict's water system that are related to improving supply as well as addressing needed public health and safety improvements. Storage volumes and fire flows needed for fire fighting purposes was based on review of the Uniform Fire Code (Table A-III-A-1) and from detailed discussions with the Cambria Fire Chief. Because much of the community borders a long urban/wildland fire interface, it is particularly vulnerable to a major conflagration. To address existing fire fighting deficiencies, the new replacement pumping station will contain fire pumps that will augment fire flows from the system's gravity storage tanks. Besides its primary fire fighting purpose, the new new station replaces an older pumping station that is located in a flood zone, contains obsolete equipment that is prone to failure, and has inherent safety deficiencies due to its outdated design.	2,262,200	3,993	6,500	06	San Luis Obispo	IV	2009
2039	4010014	4010014-006	CAMBRIA COMM SERVICES DIST	Pine Knolls Connector Pipeline	The project will install aproximately 550 feet of 14-inch diameter water main between the District's Pine Knolls storage tanks and Hillcrest Drive in Cambria, California. Work will consist of sheeting and shoring, trenching, pipeline installation, testing, and pavement replacement.	M	5	C	The Cambria Community Services District adopted a water master plan on Septmber 25th, 2008 that identified critical water supply and distribution system infrastructure improvements that are needed to protect health and safety. Hydraulic analyses conducted as part of the water master plan (Task 3 Report, Potable Water Distribution System Analysis, Kennedy/Jenks Engineers) identified a bottleneck within the District's distribution system between a storage tank installation (Pine Knolls) and a primary distribution pipeline on Hillcrest Drive. This project will address fire flow needs by installing a 14-inch diameter pipeline within this area.	225,000	3,993	6,500	06	San Luis Obispo	IV	2009

2040	4010014	4010014-007	CAMBRIA COMM SERVICES DIST	Stuart Street Tank No. 3	The project will consist of a new 365,000- gallon welded-steel storage tank at the District's existing Stuart Street tank facility. The new tank will be 52 feet in diameter and 23 feet high. The project will also include the replacement of undersized inlet piping on two existing tanks with larger diameter piping. The new tank will be monitored remotely by a Supervisory Control and Data Acquisition (SCADA) system.	M	5	C	The Cambria Community Services District completed a lengthy Water Master Planning process that was ultimately adopted by its Board of Directors on September 25th, 2008. A main purpose of the water master plan was to identify water supply and water distribution infrstructure needs to address public safety and health concerns. Hydraulic modeling of the water distribution system that was completed during development of the water master plan found the existing system did not meet fire flow and associated tank storage requirements. This analysis was based on review of the Uniform Fire Code (Table A-III-A-1) and detailed discussions with the Cambria Fire Chief. The additional Stuart Street Tank No. 3, in combination with fire pumps planned as part of the District's Rodeo Grounds Pumping Station Replacement project (for which a separate application was submitted), will provide fire flow capacities needed for the service area.	971,000	3,993	6,500	06	San Luis Obispo	IV	2009
2041	3610062	3610062-006	RUNNING SPRINGS WATER DISTRICT		Replace 4450 ft of main	M	5	C	Old, undersized steel mainline	267,000	3,160	6,713	13	San Bernardino	V	1998

2043	1510045	1510045-004	GOLDEN HILLS CSD		Develop and construct a system of wells in our nonadjudicated area, while continuing to increase our water rights. Other - Design/Construction	M	5	C	District is utilizing it's full capacity from the existing usable wells, all located within our adjudicated area.	800,000	2,796	7,434	19	Kern	III	1998
2044	1510045	1510045-002	GOLDEN HILLS CSD		Construct 4 new wells. Other - Design/Construction	M	5	C	District operates on thirteen wells. Nine wells have an output of less than 300 gpm., three have an output of less than 100 gpm.	400,000	2,796	7,434	19	Kern	III	1998
2045	1510045	1510045-005	GOLDEN HILLS CSD		Construct a 1mg storage tank. Other - Design/Construction	M	5	C	Current district storage capacity only provides water for 24 hours.	500,000	2,796	7,434	19	Kern	III	1998
2046	2610001	2610001-007	MAMMOTH CWD	MCWD: Replacement of Aging Water Distribution Mains	MCWD proposes to remove and replace 12,000 lineal feet of aging water distribution mains with new Ductile Iron Pipe and appurtenances per current AWWA standards. The pipeline replacement will result in decreased water losses and increased operational efficiency.	M	5	C	The Mammoth Community Water District (MCWD) water distribution system includes several thousand feet of aging water distribution mains that are subject to increasing leakage and repairs. Unaccounted for water loss volumes within the MCWD water distribution system are estimated at about 15%, exceeding the industry standard of 5%-10%. The California Urban Water Conservation Council has identified leakage location and repair as a Best Management Practice that results in significant water conservation and more efficient use of available water supply.	1,900,000	3,666	8,214	13	Mono	V	2009

2047	2610001	2610001-002	MAMMOTH CWD	Mammoth Community Water District: Water Main Replacements	Mammoth Community Water District proposes to remove and replace 12,000 lineal feet of aging water distribution mains with Ductile Iron Pipe and appurtenances per current AWWA standards. These pipeline replacements include about 5,700 feet of pipeline along Hillside Drive, Forest Trail and Ridgecrest Drive; 3,600 lineal feet of pipeline along Kelly Road and Davison Road; and, 2,500 lineal feet of pipeline along Mammoth Slopes and Aspen Lane. Several new fire hydrants with flow capacities meeting jurisdictional requirements will also be replaced along the subject alignments. These pipeline replacement projects are shovel-ready in the spring of 2009.	M	5	C	The Mammoth Community Water District (MCWD) water distribution system includes several thousand feet of aging water distribution mains that are subject to increasing leakage and repairs. Unaccounted for water volumes within the MCWD water distribution system are estimated at about 15%, exceeding the industry standard of 5%-10%.MCWD maintenance crews are responding to an increasing number of leakage incidents along water mains within the right-of-ways of Hillside Drive, Forest Trail, Ridgecrest Drive, Kelly Road, Davison Road, Mammoth Slopes and Aspen Lane. The California Urban Water Conservation Coucil has identified leakage location and repair as a Best Management Practice that results in significant water conservation and more efficient use of available water supply. Additionally, along with the aging water main locations decsribed above, there are old fire hydrants with outdated flow capacity which do not meet local jurisdictional requirements.	2,640,000	3,666	8,214	13	Mono	V	2009
2048	0310012	0310012-010	AWA Buckhorn Plant	Buckhorn Water System Reliable Surface Source Supply-Green Infrastructure Project	a. The project will construct a gravity supply line consisting of 33,300 lineal feet of 20-inch pipe diverting raw surface source water from the Tiger Creek regulator to the Buckhorn Water Treatment Plant. The conversion of the existing pumped, high electrical dependency transmission supply system to gravity will achieve green water infrastructure target goals and create a substantial increase in local jobs contributing to the economic recovery of Amador County dependant on tourism and services. The County has seen significantly high job loss impacts from the County's 10 largest employers in the last several months. These job losses place Amador County amongst the highest within the State and above the Federal average unemployment rates. Strategic placement of fire hydrants along the new route will improve capabilities of fire suppression within a commercial timber corridor vulnerable to forest, woodland and grass fires with urban sprawl reducing associated residential and commercial insurance costs. This new raw surface source supply is located up and off stream of the Mokelumne River on Tiger Creek. This location will provide a higher water quality avoiding turbidity events and difficult costly treatment associated with existing raw water supply pumped from the Tiger Creek Afterbay. The new gravity supply line will meet system capacity source demands as the line will be mostly buried thus inaccessible to the	M	5	C	The Buckhorn Water System raw-surface water source supply is subject to water outages, system interruptions, potential interruptions as a direct result of as many as 23 annual power failures during winter weather conditions, i.e., mudslides, snow storms; summer lightning storms and canyon wildland fires; human accidental or deliberate interference with electrical and water infrastructure; as well as State Energy Grid "black-outs". Frequent delivery deficiencies from equipment rapidly reaching its useful life expectancy increasing repairs, leaks and vandalism forces equipment to be removed from service. These "out-of service" conditions often average 2 to 3 days threatening the ability to deliver sufficient supply for current demands. There is no source redundancy or sufficient storage available to sustain the system for more than 2 to 3 days under optimum conditions. Although provided for under contract with PG&E, no alternate raw source supply is available for emergencies or schedule hydroelectric system repairs that could last up to 30 days. Surface source supply is delivered through 2- pump stations:1- at the intake and 1- two-thirds the 8,650' distance with an elevation change of 1,300' in a 12" cold tar-lined and coated steel pipe to the WTP. This source water delivery system is located within a canyon off a local steep, crooked, one-lane minor collector road. The location alone creates delays	8,000,000	2,558	8,508	10	Amador	III	2009
2049	3910015	3910015-001	CITY OF LATHROP		Replace network with larger diameter mains.	M	5	C	Aging network of small diameter mains in oldest part of town	4,500,000	3,675	12,427	10	San Joaquin	III	1999
2050	0710002	0710002-004	Golden State Water Company - Bay Point		Replace 500' of 2" OD steel water main.	M	5	C	replace aging distribution water main to improve system reliability and water quality.	35,000	5,070	16,715	04	Contra Costa	II	1998
2051	1910245	1910245-005	SANTA FE SPRINGS - CITY, WATER DEPT.		Install booster station.	M	5	C	Low pressure in Zone 1.	750,000	5,209	17,438	22	Los Angeles	IV	2003

2052	3610120	3610120-009	Phelan Pinon Hills CSD	Water System Rehabilitation	Water transmission mains will be constructed improve the movement of water across the PPHCSD's water distribution system together to provide the ability to shift water across the system in the event of system shutdown due to seismic damage or operational outages.A distribution main replacement program is also anticipated in this phase for the upgrading and repair of undersized existing pipelines. This will improve service to its customers assuring adequate pressure and fire protections for , residential commercial and industrial uses.	M	5	C	These projects are the initial phase in an overall water infrastructure improvement program, which has been conceived and developed by the PPHCSD to provide supply reliability within its water system. The program is intended to upgrade the Districts' water facilities to provide a more reliable water supply, particularly in the event of an emergency such as a major earthquake or severe drought conditions. The increased system reliability will significantly increase the District's fire fighting capabilities, thus greatly enhancing water quality, public health and safety. The PPHCSD's service area has topography and proximity to a major earthquake fault (San Andreas).	5,000,000	6,267	20,681	13	San Bernardino	V	2009
2053	1910143	1910143-004	SAN FERNANDO-CITY, WATER DEPT.		Upgrade to a computerized telemetry system. Project involves: Study, Design, and Construction	M	5	C	WW standards defect. Reliability of outdated telemetry system.	180,000	5,049	23,564	16	Los Angeles	IV	2006
2054	1910143	1910143-002	SAN FERNANDO-CITY, WATER DEPT.		Design and replace approximately 1.75 miles of 18-inch water transmission lines.	M	5	C	Several key water system transmission lines are damaged from earthquake activity and system aging. Frequent leakage repair creates a potential for water system contamination.	1,100,000	5,049	23,564	16	Los Angeles	IV	2006
2055	1910143	1910143-001	SAN FERNANDO-CITY, WATER DEPT.		Replace the 1.0 million gallon system storage Reservoir No. 4. Project involves: Design to solve problem, and Construction	M	5	C	Reservoir No. 4 was damaged in the 1994 Northridge earthquake. Replacement storage is needed to maintain system pressure.	2,500,000	5,049	23,564	16	Los Angeles	IV	2006
2056	4910013	4910013-006	Valley of the Moon Water District		Install Booster pumps and transmission/distribution pipelines.	M	5	C	Low-head lines in system.	550,000	6,783	23,858	18	Sonoma	II	1998
2057	4910013	4910013-004	Valley of the Moon Water District		Install new larger lines and booster pumps.	M	5	C	Low-head lines in system.	1,800,000	6,783	23,858	18	Sonoma	II	1998
2058	4910013	4910013-008	Valley of the Moon Water District		New distribution pipelines.	M	5	C	Low-head lines in system.	800,000	6,783	23,858	18	Sonoma	II	1998
2059	4910013	4910013-007	Valley of the Moon Water District		New distribution pipelines.	M	5	C	Low-head lines in system.	550,000	6,783	23,858	18	Sonoma	II	1998
2060	3110005	3110005-001	Placer CWA - Auburn/Bowman		Install standby diesel generator. Involves design and construction.	M	5	C	Does not have a standby generator and when power is lost, the plant does not operate. The water treatment plant does not have the required level of reliability as stated in SWTR Section 64659.	200,000	8,242	27,199	02	Placer	I	2006
2061	3410021	3410021-007	San Juan Water District	Auburn-Folsom Road Widening/Water Transmission Main - Middle Phase	This project is a 6,000 foot extension of 24" transmission main, including a pressure control valve and inter-tie with another large pressure zone. This critical transmission main has been desired for decades and must be installed when the road is being widened as a matter of good engineering practices, cost-efficiency, and energy efficiency.	M	5	C	This 24" pipeline will be installed during the middle phase of the Auburn-Folsom Road widening by Placer County this summer. It will provide critical supply redundancy, for the first time, to two large pressure zones serving 20,000 people in Granite Bay. It will also allow for over-all reliability by feeding San Juan Water District (SJWD) pressure zones, during a drought or other emergency, from the SJWD/PCWA Inter-tie. Additionally, this project will result in energy efficiency because it will allow water to flow by gravity from Placer County Water Agency to San Juan Water District. The first phase, completed in the summer/fall of 2008, was also a joint project with Placer County.	1,000,000	10,240	33,792	09	Sacramento	I	2009

2062	3110004	3110004-002	City of Lincoln	City Well 02-Airport South - Equipment Replacement and Upgrade	The Well 02-Airport South (Well 02) Equipment Replacement and Upgrade Project (Project) includes removal, replacement and upgrades to the production facilities components related to Well 02. The Project includes the following major components:- Removal of existing 75 HP motor, pump, pump column/bowls sized for 750 gpm at 90 psi from 16-inch well casing, and motor control center from interior of concrete block and removable metal roofed "pump building"; - Replacement with 125 HP motor, pump, pump column/bowls and motor control center to match new operational parameters (950 gpm at 114 psi discharge pressure) and provide more efficient energy use;- Upgrade standby, stationary 175 KW diesel generator set in adjoining concrete block/metal roof pump building to match new operational parameters, battery replacement, re-test; and- Upgrade Well 02 to include a pump-to-waste capability through new valving, piping, electrical controls installed at the hydro-pneumatic tank south of the pump building through an air gap into a new 230 ft 12-inch gravity drain through a buried flow stabilization structure and into the nearby in 30-inch City storm drain in Nicolaus Road. - Upgrade Well 02 to include about 230 ft of 8-inch gravity sewer for proper discharge of chlorine analyzer waste and other liquids used in the pump building flowing into the existing 12-inch sanitary sewer in Nicolaus Road.	M	5	C	Well 02-Airport South (Well 02) is a critical element of the City's conjunctive-use program, with groundwater meeting about 10% of annual demand and about 20% of monthly seasonal demand from 5 wells. Well 02 cannot meet distribution system discharge head requirement, does not meet the CDPHS pump-to-waste requirement upon well startup, and proper discharge of chlorine analyzer waste stream and other liquids used in the pump building. Well 02 is essential to provide potable groundwater for peak demand management and emergency backup for the City of Lincoln's municipal water system. Historically the City has experienced complete 100% loss of its wholesale treated surface water supply for days at a time (3 occurrences since 1997), and seasonal reductions in wholesale deliveries. As a result, the City has developed groundwater sources to meet at least 75% of average day demand for the Lincoln municipal water system.Well 02 has provided groundwater, meeting Title 22 water quality standards with disinfection only, to the City's municipal water system since 1984. Well 02 is permitted by the CDPH but was inactivated in December, 2008 per City request. In 2003, the City eliminated its Zone B service area to provide unrestricted, improved flows to the City Airport and surrounding Industrial/Commercial area. The Zone B elimination was achieved by opening up the Nicolaus Road pressure reducing station and several in-line	980,000	16,238	38,000	02	Placer	I	2009
2063	3410004	3410004-002	Carmichael Water District		Replace 35 miles of water main. Involves design and construction.	M	5	C	Water main is causing water quality and delivery problems.	17,000,000	11,548	40,000	09	Sacramento	I	2006
2064	3410004	3410004-010	Carmichael Water District	Conjunctive Use Joint Project with Del Paso Manor Water District	This project will construct a pipeline, pump station and well within the Del Paso Manor Water District Service area for supplemental water supply to the Carmichael Water District in the event of severe reductions in surface water resources.	M	5	C	The Carmichael Water District is facing the possible District wide loss of groundwater supply to a regional groundwater contamination plume originating at the Gencorp Aerojet industrial site in Rancho Cordova. The District relies on high quality groundwater to meet its water supply needs and provide a base level of water supply in a potential critically dry year exceeding historical drought conditions. A neighboring water district, Del Paso Manor Water District relies completely on groundwater for supply and is committed to expanding their supply options to include a conjunctive surface water and groundwater mix. Carmichael Water District is competing this project in cooperation with Del Paso Manor Water District.	1,100,000	11,548	40,000	09	Sacramento	I	2009
2065	3410004	3410004-011	Carmichael Water District	Fair Oaks Boulevard Pipeline Replacement Project	This project will install approximately 18,000 feet of 18-inch diameter transmission main, service conversions, and connect the Carmichael Water District (District) surface water treatment plant with the District's largest storage reservoir. The work is being coordinated with a Sacramento County Department of Transportation project to avoid disruption of a newly constructed roadway. This project is also in response to potential loss of well production capacity due to a massive regional groundwater contamination plume associated with the Gencorp Aerojet industrial site in Rancho Cordova, CA.	M	5	C	Groundwater contamination has caused the Carmichael Water District to revised its water supply planning away from the historical reliance on a conjunctive supply of surface water and groundwater. The contamination is coming from the Gencorp/Aerojet regional superfund site. In addition, Sacramento County is preparing for a major arterial roadway project (Fair Oaks Boulevard) through the center of the Water District Service Area. The District pipelines in Fair Oaks Boulevard range from fairly recent construction to over 70 years old. The transmission capacity design was based on the combined groundwater and surface water supply approach and is inadequate for a surface water only system. This project will provide additional distribution transmission capacity to respond to groundwater contamination and allow for coordination with a major transportation project.	3,960,000	11,548	40,000	09	Sacramento	I	2009
2066	3610029	3610029-009	MONTE VISTA CWD		Replace mainline Phase III	M	5	C	Old undersized mainline	2,200,000	11,595	51,014	13	San Bernardino	V	1998

2070	3610029	3610029-010	MONTE VISTA CWD		Replace mainline Phase IV	M	5	C	Old undersized mainline	2,200,000	11,595	51,014	13	San Bernardino	V	1998
2071	5710006	5710006-004	City of Woodland	Ground Level Tank Construction	This project involves the installation od 2 million gallons tank and a pump staion to improve system presure.	M	5	C	This tank is needed for emergency fire flow. It will also enable proper mixing of poor quality water with good quality water which can eventually reduce the cost of drilling wells.	3,000,000	14,065	56,000	09	Yolo	I	2009
2072	5710006	5710006-007	City of Woodland	Water Tank Replacement Project	At the moment there is a 300,000 gallons existing tank that was constructed 50 years ago. This tank does not meet the current Siesmic Code, the replacement tank is aimed at complying with the current Siesmic Code. The replacement tank will be a 400,000 gallons tank to provide aditional storage for emergency. The existing tank is approximately 115 ft high, the replacement tank would be approximately 135ft high to comply with a minimum of 40 psi service pressure requirement in the south west region of the City. Currently the City has 20 wells operational, some of these wells have increasing Nitrate concentration which sometimes calls for their cut off from the system. The new tank will be fed from well 4 which produces good quality water to offset water supply shortage from the other wells due to higher nitrate concentration.	M	5	C	The project is aimed at improving fire flow to the south west area of the City. It is also aimed at increasing emergency storage for the City in order to comply with Title 22 and Water Code requirements.	4,500,000	14,065	56,000	09	Yolo	I	2009
2073	1910211	1910211-001	PARK WC - BELLFLOWER-NORWALK		Preliminary and final design and construction of replacement well.	M	5	C	Aged wells are declining in both production and water quality.	1,180,000	16,702	66,256	22	Los Angeles	IV	2006
2074	1910009	1910009-007	VALLEY COUNTY WATER DIST.		Design and construct a new 3,500 gpm groundwater replacement well.	M	5	C	Expected shortage of water supply, based upon present growth projections for the fiscal year 1998/99. Need additional source of supply.	550,000	12,323	77,130	15	Los Angeles	IV	2006
