2075	1910102	1910102-011	PALMDALE WATER DIST.	Palmdale Water Districy - Water Main Replacement Program	The project will target the replacement of the existing water mains that were constructed between 1950 and 1965 which totals approximately 125,000 linear feet of water main ranging in size of 6-inch to 16-inch. The Palmdale Water District (District) has historically replaced the aged and deteriorated water mains as part of the on-going maintenance of the existing water system, but due to the recent financial hardship, the District has not been replacing a sufficient amount of water mains in order to keep up with increasing number of water main leaks needing repairs. The project will be designed by District staff and consulting engineering firms. The project will be inspected by District staff and constructed by competitively bidding the projects and awarding to qualified pipeline and/or general engineering contractors. The project will allow the District to reduce the amount of potable water that is lost through the distribution system and replace a substantial amount of the aged and deteriorated water distribution system.	M	5	C	The project will target the replacement of the existing water mains that were constructed between 1950 and 1965 which totals approximately 125,000 linear feet of water main ranging in size of 6-inch to 16-inch. The subject water mains are experiencing a high rate of leaks and causing increased operation and maintenance costs, degrading the distribution system water quality, and increasing the unaccounted for water within the distribution system. The project will benefit the local community and rate payers by decreasing the amount of water that is lost in the system due to excessive water main leaks, decrease the rate payers maintenance costs by reducing the labor and material costs spent repairing leaking water mains. The project addresses the immediate need of water conservation within southern California and specifically the high desert region of the Antelope Valley. The Antelope Valley's water supply relies greatly on imported water via the Department of Water Resources, State Water Project, and with cutbacks in the annual allocation over the past several years, the District is looking for projects that will conserve the water supplies currently available to the Palmdale Water District's existing customers.	10,000,000	27,030	105,234	07	Los Angeles	IV	2009

2081	1910039	1910039-010	SAN GABRIEL VALLEY WATER CO.-EL MONTE	Replace 60 year old pipeline to Hacienda Heights	Install a 30-inch diameter pipeline to deliver a reliable water supply to the Hacienda Heights portion of San Gabriel's service area.	M	5	C	Existing transmission pipeline providing water to the Hacienda Heights area is nearly 60 years old and must be replaced	2,000,000	46,304	161,945	22	Los Angeles	IV	2007
2082	3710020	3710020-008	San Diego - City of	Rancho Bernardo reservoir	Replacement of the 10 million gallon concrete reservoir with two 5 million gallon prestressed circular concrete reservoirs.	M	5	C	Existing reservoir is deteriorated and needs to be refurbished and strenghtened to meet current seismic standards.	5,300,000	273,015	1,266,731	14	San Diego	V	1998
2083	3710020	3710020-060	San Diego - City of	San Carlos Reservoir Enhancement	The San Carlos Reservoir Interior Enhancements Project will install a synthetic membrane lining system to prevent leakage from the 5.0 MG pre stressed wire-wrapped concrete circular potable water tank located at the intersection of Wing Span Drive and Tommy Drive in the San Carlos community. The reservoir, originally built in 1965, was substantially rehabilitated in 2001. That work included a seismic retrofit plus valve, pipeline, and appurtenance upgrades to bring the facility up to code. This is the final step in the complete rehabilitation process.This project is statutorily exempt from CEQA, pursuant to CEQA Guidelines Section 15301.	M	5	C	This project is not associated with a current DPH Compliance Order, however it continues the structural work identified in Department of Public Health Compliance Order, No. 04-14-96-22, Compliance Items No. 16; No. 19; No. 24. These specific items mandated the City of San Diego to construct and complete structural work on the San Carlos Reservoir. The San Carlos Reservoir Enhancement project will continue this effort by eliminating the reservoir's leak problem.	1,167,531	273,015	1,266,731	14	San Diego	V	2009
2084	3710020	3710020-005	San Diego - City of	South SD reservoir	Safety, sanitation, appurtenance, exterior and interior surface restoration, cathodic protection, and structural improvements to the 5.2 million gallon tank.	M	5	C	The South SD Reservoir was constructed in 1970. The improvements have been identified in the areas of cicil, structural, and corrosion control to bring the facility up to current seismic standards and comply with the DHS compliance agreement.	2,500,000	273,015	1,266,731	14	San Diego	V	1998
2085	3710042	3710042-005	San Diego County Water Authority	San Vicente Dam Raise and Carryover Storage Project	The San Vicente Dam Raise & Carryover Storage Project allows the San Diego County Water Authority to address the region's vital water requirements by storing an additional 152,000 acre-feet of water, in support of its 3 million residents and a $171 billion regional economy. This project significantly addresses critical supply issues facing San Diego County since up to 90 percent of water used by the region's 3 million residents is imported. The economy, job base, and quality of life in this region are dependent upon increasing the availability of water in the county. The San Vicente Dam Raise and Carryover Storage Project is the largest dam-raise project in the United States and when completed, will be the largest roller-compacted concrete dam raise project in the world. The San Vicente Dam will be raised by 117 feet to more than double the reservoir's water storage capacity – from 90,000 acre-feet to 242,000 acre-feet. The project is ready to start construction immediately. Construction plans and Federal environmental review are complete; all permits from the applicable regulatory agencies have been obtained.The effects of global warming and reductions in water supplies from the Sacramento-San Joaquin Bay-Delta due to hydrologic, judicial and regulatory challenges have significantly reduced water supplies to Southern California. By raising San Vicente Dam, the Water Authority will be able to store an additional 152,000 acre-feet of water,	M	5	C	The San Diego region typically experiences water shortages during periods of drought that are exacerbated by regulatory issues in Northern California concerning the Sacramento-San Joaquin Bay-Delta. Additionally, in the event of a seismic event in California, the San Diego region would be cut off from its water supply. Either of these circumstances would leave the San Diego region in a severe water shortage situation. To mitigate this, the San Diego County Water Authority created the Emergency Storage Program, a large component of which is the San Vicente Dam Raise and Carryover Storage project. This project will mitigate a significant water quantity problem by increasing the capacity of this reservoir by 152,000 acre-feet.	130,000,000	102	3,140,000	14	San Diego	V	2009
2086	3710042	3710042-003	San Diego County Water Authority		Design and construction of a pump station and 12 mile pipeline from San Vicente Reservoir to the second aqueduct.	M	5	C	Lack of distribution system for supplemental emergency water supplies from the San Vicente Reservoir to the second Aqueduct	146,600,000	102	3,140,000	14	San Diego	V	1998

2087	5000132	5000132-001	VALLEY HOME SCHOOL TEXAS	Distribution system replacement	We were told that all potable water pipes from the well to all school site outlets, interior and exterior were to be replaced with new up-to-code materials. That means we will have to trench, abandonand replace old exterior pipe from the well to the classroom building and all out buildings; and cut through interior plaster walls, flooring where required, and replace the existing out-of-code water pipes. This would include four classrooms, the teachers' workroom, custodial quarters/storage, main adminstrative office, library, four restrooms, and outdoor water sources connected to the buildings, as well as the drinking fountains. It has already cost the district $4000.00+ to abandon and seal the older well and hundreds of more dollars for the ongoing monitoring and sampling of the water throughout our educational complex. It's slowly strangling our already underfunded budget.	M	5	P	This funding would help replace all the potable water lines within our classroom building at the Texas Avenue Campus.(Harold Pope School) We have been fighting a lead contamination problem that has forced us to remove all classroom water fountains and shut off all water supply to these rooms as well as continously testing the complete school site for further contamination. the present building was constructed in 1948 and we just sealed one well in the past year as possibly being the culprit in an ongoing bacterialogical contamination problem at the school. fortunately we already had another well drilled to fall back on. In a rural K-8 school district of 160 students it is creating a real burden on us budget-wise and is eating through our reserve fund. We've had to use bottled water for a period of time uring the last academic year and would like to avoid that scenario from recurring. Title 22, Cal Code of Regs, Section 64426.0 & 64426.1 Cal Code of Regs, Section 64676 (b)	60,000	1	26	10	Stanislaus	III	2007
2088	2800569	2800569-001	AETNA SPRINGS RESORT, INC.		Purchase five 5,000 gal tanks. Move chlorination system to location of new tanks to provide more contact time.	M	5	P	25,000 gal tank needs to be repaired or replaced. Chlorination system also needs to be relocated.	25,000	1	100	03	Napa	II	1998
2089	4400758	4400758-001	RENAISSANCE HIGH SCHOOL		Replace two storage tanks and install two submersible well-pump motors. Construct a removable "shell" to surround the submersible well-pump.	M	5	P	System is aging and is not adequate for present needs.	50,000	1	250	05	Santa Cruz	II	1998
2090	3701909	3701909-002	CUYAMACA OUTDOOR SCHOOL	Cuyamaca Reservoir Refurbishment and Filter Installation	We propose to use the funds to drain and clean the tank and refurbish the lining of the existing reservoir and repair all areas of deterioration. Additionally, we propose to install a filter system on the distribution side to eliminate particulates that reduce the drinking water quality and also foul the plumbing system. This will help maintain maximum water levels during fire emergencies and improve the quality of the water to the students and State Park headquarters.Additionally, the well which feeds this small water system produces water in which Manganese was found at levels that exceed the secondary MCL of 50 ppb (i.e. 110 ppb). If the budget permits, we propose to include a filter system that will help eliminate or reduce the Manganese content of the distributed water.	M	5	P	The existing reservoir is a 100,000 gallon underground concrete vault. The structure is over 40 years old and the lining is in need of replacement. Additionally, there are some minor structural repairs that need to be completed (sealing cracks in the walls of the reservoir and replacing lids and level system).Due to the condition of the reservoir, there is sediment that enters the distribution system, causing significant problems with plumbing valves and fixtures at the site. Running water due to sticky valves can cause a loss of water that would reduce our sites' effective reserve to fight fires. Given the recent history of this location (Cuyamaca Rancho State Park), it is essential that the reservoir and distribution system is maintained in a manner that will ensure maximum supply of water during emergency response.	55,000	19	300	14	San Diego	V	2009
2091	4400757	4400757-001	SALSIPUEDES ELEMENTARY		Replace storage tank and construct structure to enclose tanks. Construct an enclosure to surround the well-pump. Replace all water lines.	M	5	P	System is aging and is not adequate for present needs.	60,000	1	790	05	Santa Cruz	II	1998

2102	4310027	4310027-019	Santa Clara Valley Water District	Rinconada Water Treatment Plant Valve Replacement	The project will replace/upgrade the piping, valves and actuators and associated components which are used to operate the filtration process at the treatment plant.	M	0	C	The Rinconada Water Treatment Plant's piping and control valves and actuators used to operate the filtration processes are leaking and/or failing.	6,567,000	25	0	17	Santa Clara	II	2009
2103	1910032	1910032-002	FOOTHILL MUNICIPAL WATER DIST.	Windsor Reservoir Zone Pipe Replacement and Interconnection	With this project an aging PWP pipeline will be replaced and an interconnection constructed between Foothill and Pasadena. Replacement will include 1200 linear feet of 24-inch ductile iron pipe and 600 linear feet 6-inch ductile iron pipe. The interconnection will require 100 linear feet of 16-inch ductile iron pipe, 7 16-inch butterfly valves, 2 16-inch turbo meters, 2 pressure sensors and 2 meter/valve vaults. The flow through this intercoonection would be a maximum of 12 cfs.	M	0	C	This pipeline replacement and interconnection will address reliability within both the Foothill Municipal Water District and Pasadena Water and Power systems. Approximately 1800 linear feet of aging pipeline will be replaced in the PWP system. Additionally, a two-way interconnection will be constructed between the water systems for use during shutdowns or emergencies thus increasing supply reliability for both agencies. Currently, during an emergency or shutdown the Foothill system in this area has no access to imported water beyond the 2.6 MG reservoirs it owns and operates.	606,760	19	0	07	Los Angeles	IV	2009

2104	4310027	4310027-017	Santa Clara Valley Water District	Penitencia Water Treatment Plant Standby Power Upgrade	The objective of the Project is to upgrade the existing standby power system to ensure that the plant can continue to reliably and efficiently treat and provide clean water to District customers during a utility power failure. The Project includes design and construction of following major elements:• Removal of the existing 300 kW diesel-engine generator and associated equipments.• Modifications of the Utility building and surrounding area.• Provision of temporary portable standby engine-generator unit during construction to support plant operation during utility power interruptions.• Installation of new 1000 kW size standby diesel- engine generator unit with a sound attenuated enclosure in the existing Utility building. • Installation of pad-mounted outdoor 480--12,470 volts step-up transformer, 600 volt low voltage cables, 15 kV medium voltage cables, new medium voltage (MV) circuit breaker type automatic transfer switch, and control system modifications for automatic transfer operations, control and alarms.• Obtaining following permits: air permit; building permit including electrical, mechanical, and structural; and hazmat permit from each authority having jurisdiction.• Utilization of the existing 4000 gallon underground diesel fuel tank for the Project.	M	0	C	The Penitencia Water Treatment Plant (PWTP) produces up to 42 million gallons of treated water per day. The primary source of power at PWTP is provided by the Power and Water Resource Pooling Authority (PWRPA) via Pacific Gas and Electric (PG&E) transmission and distribution network.An existing 300 kW diesel generator provides limited standby power to operate the plant in the event of a disruption of the primary power service. The existing standby generator was installed in 1973 when PWTP was originally constructed. Since that time, there have been a number of improvements to the PWTP which have increased operational power demand.The Project will meet plant's increased standby power demand during utility power failure and enhance water production reliability with no impact to the plant neighbors.	2,522,000	25	0 17	Santa Clara	II	2009
2105	4310027	4310027-016	Santa Clara Valley Water District	Penitencia Water Treatment Plant Backwash Pump Replacement	The Project consists of the following key items of work at the Penitencia Water Treatment Plant (PWTP):• Install a new 18,800 gpm pump and new 350 hp motor: a new pump and motor will improve plant reliability while the increase in capacity will enable more efficient and effective backwashing of the filters.• Installing new Adjustable Speed Drive: the pump will be provided with an adjustable speed drive "ASD". The ASD allows flow control by changing the speed, and output, of the pump. As there is no backup backwash pump at the facility, the ASD will be supplied with a service bypass switch and reduced voltage starter that will allow the pump to be operated in the event of ASD failure. The existing butterfly flow control valve will be replaced and will serve as a backup for flow control. Replacement of the existing butterfly valve will improve reliability. The ASD will result in annual energy savings of approximately $2,265 and will have a simple payback period of approximately eight years. The Incremental Internal Rate of Return (IRR), that is, the return on the additional $17,621 capital cost for the ASD is 22% and the Net Present Value is $25,976. Those values assume an average annual electrical cost inflation of 6%, an NPV discount rate of 6%, and a financial life of 20 years. The ASD also has the capability to provide much greater monitoring and control information to the operators through its digital communications gateway into the	M	0	C	The existing single filter backwash constant speed pump and motor, installed in 1974 , is at the end of its service life thereby increasing the risk of failure. As there is no backup pump at the facility, a pump failure would result in the inability to produce treated water at the Penitencia Water Treatment Plant. Furthermore, the pump is undersized and cannot efficiently treat water under high water influent temperature conditions. The EPA recommends granular filter media beds be expanded 20% - 25% during a backwash (EPA 1999). The current backwash pump capacity expands the GAC media ±21% expansion. However 21% bed expansion is at the low end of the recommended range and data indicates that a higher flow rate is required to achieve the greater bed expansion, i.e. >21%, at elevated temperatures. The backwash data collected also indicates that bed expansion is inconsistent throughout yearly water temperature variations. The inability to optimize backwashes can lead to longer filter to waste run times in order to achieve the required the filter NTU. This leads to inefficiencies both with respect to energy use and water conservation. The constant speed motor wastes energy while the underpowered pump requires more water to clean a filter. The regulations and directives which govern filter backwashing and returning the filter to service Are: Title 22 Section 64657 of the CCR, the Cryptosporidium	2,190,000	25	0 17	Santa Clara	II	2009
2106	1910032	1910032-003	FOOTHILL MUNICIPAL WATER DIST.	Sheldon Pressure Zone Interconnection	The interconnection will require the installation of 100 linear feet of 16-inch ductile iron pipe, 4 16 inch butterfly valves, 1 16-inch turbo meter, 1 16-inch ball valve, motor operator and orifice plate, 1 pressure sensor, 1 16-inch check valve and 2 meter/valve vaults. This interconnection would then be able to carry a maximum of 15 cfs of water to Foothill's distribution system which could meet partial needs during peak periods.	M	0	C	This interconnection will address water supply reliability issues with Foothill. Foothill has only one interconnection to its imported water supplier (Metropolitan Water District of Southern California). When there is a shutdown or should there be an emergency and water from the connection is not available, this interconnection will allow water to be delivered into Foothill's system and delivered to all retail agencies. This will afford the 105,000 people living in the service area a greater degree of reliability than currently exists.	121,770	19	0 07	Los Angeles	IV	2009

2110	4310027	4310027-012	Santa Clara Valley Water District	Pacheco Pumping Plant Pump #5 & #11 Rebuild	Pacheco Pumping Plant Rebuild Program: PPP has been in service since 1987. The PPP rebuild program began in 1993 and after several rebuilds the District decided to enter into a sole source arrangement with Unico Mechanical Corp. the only authorized Ebara representative in the United States. The Ebarra pumps are 3 stage vertical lift pumps with 300' shafts. Each pump costs ~$650,000 to rebuild. The parts; i.e. impellers, bowls, etc. are purchased from Ebarra in Japan and can exceed $400,000 or more per pump (depending on the damage found) with the cost of the shafts at $250,000 alone. The District attempts to rebuild 2 pumps per year and at that rate will be on schedule in another 3 years at which point the rebuild scehdule will be scaled back to 1 pump per year or as necessary. However, it is absolutely critical to the water supply for Santa Clara County that all 12 pumps be fully operational during the peak delivery months for Conveyance and Distribution of Raw Water.	M	0	C	The Santa Clara Valley Water District relies on the San Felipe Division to deliver half of its imported water (Bureau of Reclamation allotment 153,500 acre feet) and the San Benito County Water District relies on the San Felipe Division for all of its imported water. The 12 Pumps at the Pacheco Pumping Plant are a critical link in the system. It is imperative that the pumps be maintained in good condition as failur of the pumps could lead to disruptions in water delivery. It is crucial that the Santa Clara Valley Water District stay current with its PPP pump rebuilding program in order to meet peak demand for both agencies during the summer months. Due to the nature of the rebuild program; i.e scheduling, availability of resources, etc. it is possible to rebuild only 2 pumps each year and as such all 12 pumps are in various states of condition with different delivery capacities.	1,700,000	25	0 17	Santa Clara	II	2009
2111	1910041	1910041-008	THREE VALLEYS MWD	Emergency Interconnection from SGVMWD to WFA/TVMWD for Water Supply Reliability	The Project's purpose is to increase water supply reliability to three community water systems. Those water supply systems are Three Valleys Municipal Water District (TVWMD), Water Facilities Authority (WFA), & Inland Empire Utilities Agency (IEUA). The completed project will address & resolve the increasing demand for a reliable water source in the event of reduced or truncated water supplies from the existing Rialto Feeder transmission line. This project will allow the community water systems to reduce their dependence from their existing single supply line by offsetting their demand with a new emergency inter-tie connection to the San Gabriel Valley Municipal Water District (SGVMWD) system, and continued development of existing groundwater supplies.Physically, the project will have two components. The first part will consist of a raw water connection from SGVMWD with 4,100 linear feet of 36-inch diameter pipeline to WFA. The first part will also include a pump station and three automated valves. The second part of the project will be a 36-inch diameter 3,600 linear foot emergency inter-tie pipeline that connects WFA to TVMWD via a treated water interconnection system which also includes automated valves.	M	0	C	The current problem for Water Facilities Authority and Three Valleys Municipal Water District is that they receive their raw water supply from just one source, the Metropolitan Water District's (MWD) Rialto Feeder line, making both agencies vulnerable to shut downs (for several reasons). Shut downs have the potential ability to disrupt between 500,000 to 850,000 people served between the two community water systems. Because of the anticipated drop in water supply reliability from MWD in the coming years, the two water systems, along with Inland Empire Utilities Agency (WFA delivers potable water to ~50% of IEUA's customers) are working to eliminate future disruptions due to shut downs & the much anticipated reduced water supply, by creating an emergency inter-tie to the existing system via the San Gabriel Valley Municipal Water District system. Continued development of local supplies will also be connected to the new interconnection at a later time which will further enhance supply reliability during emergencies or water shortages.	3,550,000	11	0 07	Los Angeles	IV	2009

2112	1910087	1910087-014	Metropolitian Dist. of So. Cal.	Robert B. Diemer Treatment Plant Emergency Access Road	The project consists of earthwork, retaining walls, storm drain system, bridge (flatbed railcar) system, approximately 1.3 miles of road construction, lighting, security, railings, erosion control, landscaping, and other appurtenant work. The road will begin south of State Route 142, within the city of Brea, either sharing or being directly adjacent to the new entrance of the future CHSP visitor center. The initial 0.2 mile of the proposed road will cross State Parks land and Carbon Canyon Creek. The remaining 1.1 miles will be located within Metropolitan property, traversing the northern side of the solids lagoons before the road transitions up the Diemer plant's north slope. It will intersect with the existing (primary) plant entrance road at the southeast corner of the Diemer plant. Mitigation features incorporated into the project include: reduction of the road width to the minimum required to meet Orange County Fire Authority emergency road criteria; installation of a "card-reader" device and security gates to prohibit unauthorized access to the road from park visitors and to ensure compliance with use limitations agreed to by Metropolitan and State Parks; installation of a mechanically stabilized earth retaining wall system with plantable facades to minimize aesthetic impacts on CHSP and the city of Brea, and to restore native plant communities; incorporation of a comprehensive native plant restoration program on the north slope of the	M	0	C	The 520-mgd Diemer plant, located on the crest of a hill, needs a secondary emergency access road. Securing an adequate secondary access road for the Diemer plant is a long-term objective which would improve emergency access to the plant and provide an overall higher degree of operational flexibility and safety. A secondary access road would also enhance the safety and security of the Diemer plant's north boundary by providing access for patrol, security monitoring, and emergency response purposes, such as fire fighting. Since the plant was built in 1963, plant personnel have relied on a single entrance gate for primary access to the plant. This main entrance gate, located on Valley View Circle in the city of Yorba Linda, is situated in a residential neighborhood. A second unimproved plant entrance is located on Carbon Canyon Road, providing limited access via an easement through Chino Hills State Park (CHSP). This easement, commonly known as Telegraph Canyon Trail, provides access to Metropolitan's north solids lagoons and to existing Metropolitan infrastructure within CHSP. This easement cannot presently be used to access the main Diemer plant. Over the past decade, staff has assessed alternative alignments for a secondary access road several times, including routes from the south. Discussions have been held with the city of Yorba Linda, the principal landowner south of the Diemer plant. These previous assessments were unsuccessful in	12,000,000	647	0 16	Los Angeles	IV	2009
2113	4310027	4310027-010	Santa Clara Valley Water District	Santa Teresa Water Treatment Plant Incompatible Materials Project	The Project consists of the following key items of work at the Santa Teresa Water Treatment Plant (PWTP):• Provide adequate separation and containment of incompatible materials in the chemical metering areas, in the chemical distribution trenches, and in the chemical drainage systems. This includes the following:1. Installation of New Chemical Trench: Install a new caustic soda/aqua ammonia chemical trench from the storage tank area to the chemical feed room in the operations building. 2. Chemical Trench Modifications: Demolish spare and seldom used chemical piping, and reduce discharge pipe sizes for the liquid alum/ferric chloride, caustic soda, phosphoric acid, aqueous ammonia and sodium hypochlorite chemical feed systems to create room in trenches for secondary contained piping. Provide leak detection systems on all the double contained piping. 3. Chemical Feed Room Modifications: Demolish selected spare and seldom used chemical systems in the chemical feed room to allow for relocation of the liquid alum and phosphoric acid metering pumps and control panels. This relocation will separate these systems from the alkaline equipment and containment areas. Chemical piping mounted on the wall will be double contained in areas above incompatible secondary containment areas and adjacent to incompatible chemical piping.4. Chemical Feed Systems Modifications: To provide	M	0	C	The existing chemical feed piping, chemical feed area, and chemical storage areas are not in compliance with current hazardous materials regulations providing for separation or double containment of incompatible chemicals.Liquid alum/ferric chloride, caustic soda, phosphoric acid, aqueous (aqua) ammonia, sodium hypochlorite and cationic polymer are conveyed in single walled pipes in common trenches and/or adjacent to each other in feed areas. Additionally, the liquid alum feed pumps share a common secondary containment area with the caustic soda and aqua ammonia feed pumps. The phosphoric acid feed pumps, while in a separate containment area, is immediately adjacent to the ammonia feed pumps. The close proximity of incompatible chemical piping and feed systems presents a safety issue in the event of a pipe failure and comingling of incompatible chemicals.Floor drains in the secondary containment areas in the chemical feed area and chemical storage areas allow all chemical spills to enter a common chemical drain system. This creates a safety issue due to possible comingling of incompatible chemicals in the drainage system. In addition, once the chemical enters the drain system, it has the potential to flow to either the drying beds or the washwater recovery ponds which could impact water quality and upset treatment plant operations. Finally, the chemical spill enters the	6,500,000	25	0 17	Santa Clara	II	2009
2114	1910128	1910128-009	COVINA IRRIGATION CO.	Baldwin Park Well #2 Pump to Waste and Annular Seal	The proposed project is to bring this active source up to current standards by constructing an annular seal and including additional piping necessary to deliver the water produced to a nearby flood control channel until water quality is acceptable. This will include water quality monitoring equipment and an additional flow meter to account for water loss. This project is (and has been) considered a high priority by CDPH following routine inspections.	M	0	C	This well was constructed in 1911 and does not include any type of surface seal such as an Annular Seal to protect it from contamination. Positive Total Coliform results have been observed over the years, including recent monitoring. There is also no provision for pump-to-waste upon start up, since piping only exists to deliver the water produced directly to the adjacent reservoir.	250,000	12	0 15	Los Angeles	IV	2009

2115	3610086	3610086-001	West End Consolidated Water Company	Pipeline replacement	Replumb pumping lines from wells to booster station, install new reservoir and control valve at booster station	M	0	C	An upgraded iner-tie is needed with SBCsA 70 zone L system due to susecptible MTBE contamination	275,000	1	0	13	San Bernardino	V	2000
2116	1910087	1910087-009	Metropolitian Dist. of So. Cal.	Weymouth Treatment Plant Filter Rehabilitation	Under this project, the four filters will be rebuilt with new media and different configurations of design enhancements, so that the performance of these four filters can be monitored and evaluated at full-scale when the four filters are returned to service. The estimated construction contract cost is $2 million. The full-scale evaluation of filter modifications will include alternate types and layers of filter media, a new underdrain system, an air-scour system, and new washwater troughs. Test protocols will be followed to ensure that all water quality criteria are met during the evaluation period. During the planned nine-month test period, Metropolitan staff will assess performance with respect to water quality and the impacts of physical constraints within the existing filter cells, in order to identify the optimal configuration for rehabilitation of the remaining 44 Weymouth plant filters.	M	0	C	At the present time, four filters at the 520-mgd Weymouth plant have been removed from service due to unacceptably high outlet turbidity levels. Although staff has conducted filter surveillance and box excavations to investigate filter performance, and has varied operating conditions by reducing the filter rate, changing the backwash rate, and adding filter-aid polymer, the performance of these four filters is inadequate and they remain out of service. The 48 filters at the Weymouth plant range in age from 40 to nearly 70 years old. While they were state-of-the-art at the time of their construction, the filters were designed to meet much less stringent performance and water quality standards than exist today. The filters were originally designed to operate at lower filtration rates, using a fine sand monomedia and low backwash rates. Since then, the filters have been retrofitted with a dual media composed of anthracite coal and silica sand to enhance performance. However, no other appurtenances that support the filtration process (e.g., troughs, underdrains, etc.) were changed to accommodate the higher performance expected of the filters. By modern standards, the existing filter cells are constrained by their shallow depth. Metropolitan has standardized on a tri-media filter design wherever possible. Because of the shallow filters and hydraulic constraints at the Weymouth plant, however, the tri-	2,000,000	647	0	16	Los Angeles	IV	2009
2117	1910128	1910128-014	COVINA IRRIGATION CO.	San Gabriel River Diversion Structure	A diversion structure has been designed from a matrix of possible options given the nature and topography of the river at the existing location where levees are typically constructed.	M	0	C	Covina Irrigating Company is a part of the San Gabriel River Water Committee, which diverts surface water for treatment and subsequent potable use. If water is not available from the Azusa Conduit, water must diverted into a structure downstream from Morris Dam. Currently, levees are constructed on an as-needed basis for this, which will at some point no longer be possible because of regulatory changes. If the Conduit fails, and this has happened within the last 5 years, there is no reliable means to divert water for treatment to two plants with a total capacity of 24 MGD. Should this occur, the negative impact to the local water supply situation will be disastrous.	3,500,000	12	0	15	Los Angeles	IV	2009
2118	1910128	1910128-012	COVINA IRRIGATION CO.	Baldwin Park Well #1 Pump to Waste and Annular Seal	The proposed project is to bring this active source up to current standards by constructing an annular seal and including additional piping necessary to deliver the water produced to a nearby flood control channel until water quality is acceptable. This will include water quality monitoring equipment and an additional flow meter to account for water loss. This project is (and has been) considered a high priority by CDPH following routine inspections.	M	0	C	This well was constructed in 1910 and does not include any type of surface seal such as an Annular Seal to protect it from contamination. Positive Total Coliform results have been observed over the years, including recent monitoring. There is also no provision for pump-to-waste upon start up, since piping only exists to deliver the water produced directly to the adjacent reservoir.	250,000	12	0	15	Los Angeles	IV	2009
2119	4310027	4310027-008	Santa Clara Valley Water District	Distribution System - ARV Improvements	Each below-grade ARV on the Treated Water Pipelines will be equipped with a vent attached to the ARV that will extend one foot above flood levels. Project will also include seismic bracing of the ARVs and replacment of old isolation valves.	M	0	C	Existing Air/Vacuum Relief Valves (ARVs)throughout the distribution system are located below grade. The ARVs are in need of replacement due to old age and can cause disruption in treated water delivery.	21,066,000	25	0	17	Santa Clara	II	2006

2120	4310027	4310027-015	Santa Clara Valley Water District	Rinconada Water Treatment Plant Clarifier Rehabilitation Project	The project will rehabilitate the clarifiers at the Rinconada Water Treatment Plant. Work includes replacing the clarifier mechanisms and other mechanical components with new equipment, coating of steel components, and performing minor repairs to the existing concrete structures.	M	0	C	The clarifiers at the Rinconada Water Treatment Plant are over 40 years old and need to be rehabilitated. This will extend the useful life of the treatment plant and improve its reliability.	8,974,000	25	0	17	Santa Clara	II	2009
2121	4310027	4310027-018	Santa Clara Valley Water District	Treated Water Pipelines Inspection-Rehab and ARV Installation	The Santa Clara Valley Water District (District) is planning maintenance, rehabilitation and air release valve (ARV) vent installation on two pipelines in 2009/2010. The work will include the West Pipeline from the Cox turnout structure to the Turnout structure for the Mountain View Pipeline and the East Pipeline from the Patt Ave Line Valve to the Ocala Line Valve. Failures have occured on these pipelines over the past few years and work is needed to reduce the risk of failure. District staff and selected contractors will perform inspection and maintenance work at approximately sixty vault and Christy box sites and approximately 8.3 miles of treated water transmission pipelines that extend through portions of the cities of San Jose, Saratoga, Cupertino, and Los Altos as well as a portion of the county of Santa Clara. The majority of the work involves removing ARV's, combination air/vacuum release valves (VAR's) and replacing them with new valves and replacing blind flange gaskets and associated piping work in vaults and Christy box sites. The ARV valves range in size from 1 to 6 inch. Welding of new 4-inch nozzles on the pipeline and blind flanges will be a requirement at many of the sites. The work also includes replacement of blow-off valves used for emptying water from the pipeline. The work also includes venting the ARV's. The vents modifications are a specific requirement of the new Waterworks Standard	M	0	C	This work is required to rehabilitate treated water pipelines that have had significant failures in recent years. In the fall of 2008, a major failure almost resulted in the loss of supply to several communities in East San Jose. The replacement of Air Release Valves (ARVs) require vents and modifications that are a specific requirement of the new Waterworks Standard regulation issued by the California Department of Public Health (CDPH). The work will be perfromed in accordance with American Water Works Association Standard C512-04 and Manual M51 (2001).	2,800,000	25	0	17	Santa Clara	II	2009
2122	1000405	1000405-001	DOYALS MOBILE HOME PARK	New well to augment single well	Drill a new well or interconnection if possible.	M	0	C	Single well, if it fails, system is out of water	200,000	15	16	23	Fresno	III	2008
2123	1700519	1700519-002	Crescent Bay Improvement Company	Crescent Bay Improvement Company-Distribution System Improvements	Our capital improvement plan includes replacing the aging distribution lines within the next 20 years. The lines run down the sides of the only road serving the community, and will require replacing the water system distribution lines,	M	0	C	Crescent Bay improvement Company has been on a Boil Water Order since 1999. It draws surface water from Clear Lake for a community of 23 hookups. It has been unable to meet compliance standards for turbidity and disinfectant byproducts under Surface Water Treatment Rule Sections 64664, 64652(a), 64655(b), 64657.40(c), 64646(a), 64659 and 64661. The company was established in 1935, and the distribution system dates back to the late 1930s. The California Department of Public Health regulator has advised us to seek ground water as a source for our system rather than surface water. replace the aging distribution lines	500,000	24	18	03	Lake	II	2012
2124	5400660	5400660-001	LAKE SUCCESS MOBILE LODGE	Lake Success Mobile Lodge Water Supply Reliability Project	Lake Success Mobile Lodge currently obtains its potable water supply from one community groundwater well. If this well were to fail due to dropping groundwater levels or other emergencies, the community would have no source of domestic water. In addition, the well has a history of violating the MCL for nitrates, and an additional/replacement source of water is desired. The proposed project would drill and equip one additional community water well including related appurtenances, and also including applicable engineering and design costs, land acquisition, well development, CEQA/NEPA requirements, and legal/contract costs.	M	0	C	Lake Success Mobile Lodge is supplied with potable water by one groundwater well, which has a history of nitrate contamination (appx 55 ppm). In light of the current drought conditions being experienced throughout the State of California, relying on a sole source of drinking water leaves residents in a risky and vulnerable position. If drought conditions were to cause groundwater levels to drop, the community could find itself completely out of water. In addition, a collapse or other failure of the well and/or pump would leave water system users without a source of drinking water. Therefore, a second source of domestic water supply is urgently needed.	1,000,000	18	20	12	Tulare	III	2008

2125	1502056	1502056-001	CLARK STREET COMMUNITY WELL	Clark Street Community Well-Second well/intertie with Erskine Creek WC	As part of this project, Clark Street Community Well Water System will either drill a new well or develop intertie with Erskine Creek Water Company	M	0	C	Clark Street Community Well Water System has only one well and that well is hard rock well. Therefore, the water system is unreliable.	500,000	16	25 19	Kern	III	2008
2126	4900665	4900665-001	Russian River Mutual Water Co.		Replace transmission lines, increase storage, and install treatment.	M	0	C	Upgrade transmission, treatment and storage.	75,000	24	25 18	Sonoma	II	1998
2127	1500564	1500564-001	HOMETOWN WATER ASSOCIATION	Second Well for the Water System or inter-tie project for increasing the reliability of the water su	Funds are needed to drill a second well or consolidate with nearby water system. The goal of the project is to ensure served people of a reliable domestic water supply.	M	0	C	With only one well as a source of water supply, this public water system is deemed to have unreliable water supply.	200,000	12	25 19	Kern	III	2008
2128	0400091	0400091-003	BUZZTAIL MUTUAL WATER COMPANY	Replacement of substandard infrastructure	Project would include the acquisition for land and associated fees for property located in or around the north east corner of Sierra Foothills Subdivision (less than 1 acre). Installation of additional holding tank and pressure pump. Installation of trench with rock cutter in area where temporary line was installed. Replacement of deteriorated pipe and installation of required fire hydrants.	M	0	C	In 2000 the Buzztail Community Service District (Water Division) received a request from the Butte County Environmental Health Department to allow the emergency connection of three residences due to well failure. The connections were allowed and a combination of 3" to 1" PVC pipe was extended over 8000ft to serve the homes. Shallow soil and hardpan made proper installation difficult. Pipes were run along the ground and dirt was placed over the line is some areas. portions of the line have been exposed for almost 9 years and have become very brittle. The residences are unable to construct their own well and significant improvements are required to adequately serve the property. Due to the long distance and possible leaks water pressure to these homes is very low and susceptible to contaminant infiltration. Funding would allow for the provision of improvements to state standards.	215,000	31	25 21	Butte	I	2009
2129	3601036	3601036-001	Calico Lakes Homeowners	Replace well, add tank, add back generator	Place a second tank of 20,000 gallons, install back up generator and drill secondary well.	M	0	C	Storage tank is below county standards. No back up power to run distibution pumps. County requesting we have a secondary well. Our community is now 51 connections serving 200 people.	80,000	15	25 13	San Bernardino	V	2011
2130	5602132	5602132-001	WATERS ROAD USERS GROUP	Waters Road Permanent New Booster Pump and Storage Facility	The system modifications proposed for this project include the following:a)Acquisition of a larger easement to house the new equipment.b)Installation of a 105,000-gallon tank situated at the pump station to be filled by the WWD1 supply, and provide a relatively constant head to the pump station for consistent operation. The additional storage also helps in achieving the required Title-22 storage volume even when irrigation demand is taken into account. c)Installation of a duplex booster pump station with a backup unit to provide Title–22 Q0, and also keep up with irrigation demand.d)Installation of a local telemetry system to automatically signal pump operation at pre-set tank volume points, e) Installation of an emergency power generator.f) Install all necessary electrical and controls including VFD.The project also entails:a) Obtaining permits and approvals with Environmental permitting/CEQA reviewb) Engineering and project management	M	0	C	The Waters Road Domestic Users Group system supplies domestic and irrigation water to the 13 services in the service area. The system is comprised of a metered service from Ventura County Waterworks District 1 (WWD1), a small booster pump, and elevated storage. Problems with the system include:1) The service from WWD1 does not deliver a constant pressure, so the booster pump filling the elevated storage sometimes cannot keep up with demand, and the storage often is very low or goes dry, especially during the irrigation season.2) The tank-fill booster pump is not automated, and is run manually when high demand is anticipated. .3) The existing system storage is just barely compliant with Title 22, but since the system combines domestic and irrigation water the irrigation demand often leaves less than the required storage in the tank.4) The existing booster pump supplies less than the title-22 required Q0 when taking into account the combined irrigation demand.5) The system has no emergency back-up power.	377,400	17	25 06	Ventura	IV	2009

2131	0400091	0400091-002	BUZZTAIL MUTUAL WATER COMPANY	Alternative Water Source (2nd Well)	Second well will be drilled to an approximate depth of 800ft. Well will be located on same parcel as the existing well and will attempt to intercept the existing aquifer. Well will be 8"in diameter with a 4" drop pipe. Additional facilities will include an additional 150 feet of metal pipe that will direct water into the existing 80,000 holding tank. Additional facilities will also be required to keep well protected from the elements.	M	0	C	Buzztail Community Service District (Water Division) is not currently in compliance with state standards and only has one water source, has insufficinet holding capacity for residencial systems and does not have minimum pressure, volume and storage for fire suppression. The Existing well is 38 years old and is in a highly deteriorated state. Over 50% of factory installed perforations are clogged. Well pump has failed 3 times since 1999. Well has been sanding in at an increased rate and has forced the water provider to raise the well significantly to avoid rising sediment levels. Pump has been raised to a point where the static water level has fallen below the pump level. Drought in the area has resulted in lower aquifer levels and in 2008 on a number of occasions the water level fell to a point that did not allow pump to function. System has 28 approved connections and 3 emergency connections that were installed on a temporary basis in 2000 due to failure of a neighboring well. The existing well is in desperate need of rehabilitation which cannot be attempted until a second well is drilled and an alternative source is secured.	135,000	31	25 21	Butte	I	2009

2135	2210904	2210904-001	Golden Hill Mobile Home and RV Park	New well to augment single well	The proposed project consists of the construction of a new well.	M	0	C	The existing water system has only one hardrock well. An additional well is needed to supplement the existing well.	200,000	12	25 11	Mariposa	III	2008
2136	1502666	1502666-001	WILCOX WATER SYSTEM	Wilcox Water System-Second Well/intertie with Inyokern CSD	As part of this project, the Wilcox Water System will either drill a second well or develop intertie with Inyokern CSD.	M	0	C	Wilcox Water System has only well. Therefore, the water system is unreliable.	500,000	12	27 19	Kern	III	2008
2137	1500152	1500152-002	MIRASOL COMPANY WATER SYSTEM	Storage Tank For the Water Company	As part of this project, we will have a planning project for a 30,000 gallon storage tank and a meter for the well. Once planning is done and approved, a new tank will be constructed and a meter provided on the well.	M	0	C	Currently, we do not have any storage tank, so the Water System lacks reliability and also in violation of Waterworks Standard by not having storage equivalent to maximum day demand. We also do not have a meter on the well so we are not able to record production.	75,000	13	30 19	Kern	III	2012

2138	1900509	1900509-002	BAXTER MUTUAL WATER CO.	Upgrade existing well	According to the pump company, they would install an inner PVC casing, inside the existing 8 inch casing, and install a submersible pump (replacing the existing turbine pump).	M	0	C	The active Baxter Water System well was drilled in 1968 and has been in use by the local community of 14 homes since then. LA Co. Health Department has suggested that we should be considering a new well.In May 2009, we suddenly had considerable visible contamination from the well. There appeared to be considerable rust coming from the well and the "experts" believe it was likely a part of the well casing breaking off. The contamination cleared up in a few days. One pump company suggested using a inner pvc casing (inside existing 8 inch casing) and installing a submersible pump which would be more energy efficient -- and would extend the life of the well. However, this procedure has not been approved by the County department of Health. I talked to Richard Lavin from the county and he said that he had not heard of this procedure being done in the past. He said we could submit plans and the County would consider it.So this funding would be needed only if the upgrade is approved by the County. If this upgrade is not approved by the county, we will be looking at a much more expensive option, purchasing property for a new well and getting the new well constructed, and would be looking for considerably more funding.	20,000	10	30 16	Los Angeles	IV	2011
2139	1502649	1502649-001	DIXIE WATER COMPANY	Dixie Water - Single Source	Consolidate with Indian Wells Valley WD.	M	0	C	Dixie Water Company has a single well as its source of supply, therefore lacks required system reliability.	800,000	12	30 19	Kern	III	2008
2140	1900509	1900509-001	BAXTER MUTUAL WATER CO.	Install Generator Backup for well	Purchase gas or diesel generator and have it installed, including electrical switching to provide emergency power to the two pumps.	M	0	C	The Baxter well system consists of two electrical components: (1) well turbine pump motor, 440V, 3 phase and (2) pressure pump, 220V, 3 phase. Commercial power is the only source of power for operating these pumps and providing water to the community. In the event of a commercial power outage lasting for more than a few hours, we will be without water with resulting health hazards.In the event of power outage, we will not be able fight fires nor provide water to the Fire Department. The Fire Department occasionally extracts water from our system to fight fires in the surrounding area. The Fire Department has recommended that we have a gas/diesel powered backup generator.	25,000	10	30 16	Los Angeles	IV	2011
2141	2100549	2100549-002	BLUE MOUNTAIN CENTER	New well for back-up water source	A hydrologist will be hired to locate a site for the new well. A new well is to be drilled on hillside above existing storage tanks. All pumps, controls, and electrical and water lines to be installed to connect new well to existing infrastructure.	M	0	C	Current system relies on one vertical well. A second well is required to meet water works requirement for community water systems to have at least two sources, Section 64554©. The proposed well will also improve system reliability and provide added protection from drought conditions.	35,000	11	30 18	Marin	II	2009

2142	1900509	1900509-003	BAXTER MUTUAL WATER CO.	Decommission Inactive Well	Hire licensed contractor to abandon well per this document, http://www.gordens.us/Baxter/RequirementsWellDecommission.pdf, paragraph 10.In addition to the required procedures for abandoning a well, the end of the pump house must be removed/reconstructed, cement pad removed/replaced, power lines temporarily removed, fence removed/replaced, and possibly remove a large tree for access.	M	0	C	This request is for decommissioning old well. The old well is capped and has not been used since late 1960's we believe. None of current residents were here when the well was capped. We were issued a notice from Los Angeles County Public Health Department on 6/18/09 to formally abandon/destroy the well (see http://www.gordens.us/Baxter/AbandonedWellNotice.pdf). However, the water company has not been able to afford the approximate $25,000 cost. There are currently two houses on the system (of 14 total) that are vacant and not paying water distribution fees. Job layoffs and home repossessions within the water community have exacerbated the problem for raising the necessary funding.	25,000	10	30 16	Los Angeles	IV	2011
2143	1500511	1500511-001	V.R. S Trailer Park	Inter-tie project with City of Bakersfield	FUNDS NEEDED TO CONSOLIDATE THIS SMALL SYSTEM WITH THE CITY OF BAKERSFIELD DISTRIBUTION SYSTEM. THE GOAL IS TO ENSURE SERVED PEOPLE OF A RELIABLE DOMESTIC WATER SUPPLY.	M	0	C	With only one well as a source of water supply, this public water system is deemed to have unreliable source capacity.	200,000	27	30 19	Kern	III	2008
2144	1500152	1500152-001	MIRASOL COMPANY WATER SYSTEM	Mirasol Comany has only one well. A second well is needed	Drill a second well.	M	0	C	Mirasol Water Company has only one well.	200,000	13	30 19	Kern	III	2008
2145	2100549	2100549-001	BLUE MOUNTAIN CENTER	Storage capacity improvement	We propose to replace two 8,000 gallon concrete tanks with four 5,000 gallon polyethylene tanks located higher on the hillside and to install all the necessary plumbing to connect these tanks to one 5,000 gallon poly tank already in place at the higher level. The concrete tanks will then be used for irrigation water storage.	M	0	C	Water system is gravity feed from storage tanks located above buildings being served. Existing concrete tanks are located too low on hill to provide adequate pressure to prevent pressure drops in higher elevation buildings.	20,000	11	30 18	Marin	II	2009
2146	0400003	0400003-002	NORTHWOODS MUTUAL WATER SYSTEM		Construct a new roof over 18,000 gallon in ground reservoir.	M	0	C	18,000 gallon in ground reservoir needs a new roof.	10,000	16	31 21	Butte	I	1998
2147	2700669	2700669-001	ORCHARD LN WS #02		Need to drill new well.	M	0	C	System needs new well.	40,000	16	32 05	Monterey	II	1998
2148	1502619	1502619-002	SOUTH DESERT MUTUAL WATER COMPANY	South Desert MWC- Drill a Second Well/ Intertie with Inyokern CSD	Drill a second well or intertie with Inyokern CSD	M	0	C	The source has only one well. A second source of supply is needed.	500,000	13	32 19	Kern	III	2008
2149	2210917	2210917-001	Yosemite Ridge Resort	New well to augment single well	The proposed project consists of the construction of a new well.	M	0	C	The existing water system has only one hardrock well. An additional well is needed to supplement the existing well.	200,000	23	32 11	Mariposa	III	2008
2150	5800851	5800851-001	FEATHER RIVER MANOR	2nd Water Source	This project would include the construction and development of a new production well. The pump, panel and pipelines would also be installed after completion of the new well.	M	0	C	This community PWS currently has only one source of water - a groundwater well. Due to the current drought conditions in California, the need for another water source may be imminent.	250,000	2	35 21	Yuba	I	2008
2151	1502162	1502162-001	LINNS COURT MUTUAL WATER	Linns Court MWC-Drill a Second well	Drill a second well.	M	0	C	The Water System has only one hardrock well. Another source of supply is needed	200,000	16	35 19	Kern	III	2008
2152	2800527	2800527-003	LINDA FALLS TERRACE MUTUAL	Tank and Treatment Replacement	This project will include:Construction of (4-6) 10,000 gallon concrete tanksDemolition and removal of existing tanksRe-plumbing to distribution pipelinesInstallation of full flow 6" Fire HydrantInstallation of Treatment and Chemical Storage ShedInstallation of proportional chlorination treatment equipmentInstallation of pH correction treatment equipment	M	0	C	Currently there are two different water storage tanks. The concrete storage tank is cracked and leaking with structural compromise. The steel tank is suffering from corrosion. The treatment system doses chlorine at levels that vary and needs replacement. There currently is no treatment done for low pH water which causes lead and copper levels to exceed the action level.	120,000	10	35 03	Napa	II	2009

2153	2800527	2800527-004	LINDA FALLS TERRACE MUTUAL	Replacement of main water line	The main line system that needs replacement would entail trenching a new line along our private road way to deliver water to each of the 16 homes and homesights in our comunity. We would also replace the old and badly needed fire hydrants. The distance of the trench would be 0.4 mi and mainly in volcanic tuffa. The old line was hand dug and only a foot or two deep. This fact has lead to open exposure of pipe and therefore the need for a main line that is up to code and safe.	M	0	C	Our Main water line is 50 years old and galvanized metal. It has developed leaks over the recent years and the threat of water contamination from the residential septic system is a real and likely concern. This main line needs replacement with state of the art pipe that is non corrosible.	500,000	10	35 03	Napa	II	2009
2154	1500448	1500448-001	HILLVIEW ACRES MUTUAL WATER COMPAN'	Hillview Acres-Second Well for the Water System	As part of the project, Hillview Acres will drill a second well to increase system reliability.	M	0	C	Hillview Acres MWC has one hard rock active well. Therefore the water system is not reliable.	200,000	47	35 19	Kern	III	2008
2155	1500344	1500344-002	SOUTH KERN MUTUAL WATER COMPANY	South Kern MWC- Drill a Second Well/Intertie with City of Bakersfield	Drill a second well or intertie with the City of Bakersfield	M	0	C	The water system has only one well. A second well or an intertie with City of Bakersfield is needed	1,300,000	14	35 19	Kern	III	2008
2156	2300596	2300596-002	Big River Vista Mutual Water Company	Big River Vista Water Company Stop Water Leakage from 45,000 Gallon Redwood Water Storage Tank	Mendocino Coast Water Works, contractor license 887988, will provide the time and materials to drain and clean the redwood tank in preparaton for the installation of a Hypalon Liner by New World Mfg. Inc, contractor's license 618911. Mendocino Water Works scope of work includes installation of scaffolding for safe access, draining and cleaning of the tank. Post Hypalon liner installation work includes the installation of new tank fittings for water tight seal from the liner One fitting to be for main service, the other will be for emergency and drainage. New valves to be installed on tank fittings, valves to be 3" AWNA resilient gate valves. Main connection to be fitted for a 2" meter bypass in Ductile Iron pipe. Existing meter to be reused. Cleaning of roof and installation of new screening and galvanized flashing for roof. New World Mfg. Inc. will install a 45 MIL Hypalon Liner cut 19' 6" in diameter by 19' 7" high. The Liner will be made in 3 to 4 sections and completed in the tank. The required plumbing permit for this project has been approved by the Mendocino County Department of Building and Planning.	M	0	C	The Big River Vista Water Company's primary water storage facility is a 45,000 gallon redwood water tank. This tank is approximately 50 years old and has been repaired over the years to minimize water leakage. We are currently experiencing water loss from tank leakage in excess of 120 gallon per day. The condition of the tank has reached the point where it is no longer feasible to attempt repairs to the tank structure itself. The recommended repair to eliminate leakage is to install a fitted Hypalon liner in the existing redwood tank. The 45 mil Hypalon liner has a 30 year limited warrenty, it is expected to last between 30 and 40 years. Hypalon is a high grade material that is used for the containment of potable water. It is not affected by ultraviolet light, ozone, chlorine, water fluctuations or sitting empty ofr long periods of time. On February 10, 2009 the Mendocino City Community Service District declared a Stage 3 Water Shortage directive that requires a 20% reduction in water allotments. The installation of the water tank liner will be necessary for the Big River Vista Water Company to comply with this community directive.	25,424	18	36 03	Mendocino	II	2009
2157	1600007	1600007-001	COUTURE FARMS	Couture Farms Back-up Well	To drill a new well to serve as a back-up. Wells in this area are typically over 1000 feet deep.	M	0	C	This small community system is served by a single source (one well). This application is for a back-up well to insure adequate water.	200,000	15	38 12	Kings	III	2008
2158	1000075	1000075-001	TRACT 1199 WATER SYSTEM	Drill a new well to augment single well	Drill a new well or inconnection if possible.	M	0	C	System supplied by one well and if it goes out due to drought, the systme would be out of water.	200,000	13	39 23	Fresno	III	2008
2159	3400130	3400130-004	GREGG WATER CO	Redundant Source	Drill a new well and install associated piping and pumps.	M	0	C	The CWS does not have a redundant source. Intertie and/consolidation are not viable options because those system have similar problems and are non-community water systems	20,000	19	40 09	Sacramento	I	2008
2160	1502597	1502597-001	DEL SOL WATER CO-OP		Replace the old storage tanks w/ new polyvinyl tanks.	M	0	C	The three storage tanks are old, have running rust, and have developed leaks.	10,000	12	40 19	Kern	III	1998

2161	2000573	2000573-001	THE VILLAGE	The Village-Source improvement	Consultation with Engineers and Pump contractors to trouble shoot electrical and mechanical issues with the pump or they may have to drill a new well.	M	0	C	Population served by this community water system are retired and on a fixed income. The water system consists of 2 wells with only one well in active status and a storage tank with a 60,000 gallons capacity. The storage tank is used for both fire flow requirements and potable use. The other well is inactive due to well pump 's mechanical and electrical problems. The water system is in financial hardship and is not able to afford to hire consultants and contractors to trouble shoot and fix the problem. Without the use of this other well, the water system is only served by a single source and supply is not adequate in case of emergencies.	75,000	21	40 11	Madera	III	2008
2162	1500560	1500560-001	KRANENBURG WATER SYSTEM	Kranenburg-Second Well/Inter-tie with Vaughn Water Company	Funds are needed to drill a second well or consolidate with Vaughn Water Company, a nearby water system. The goal of the project is to ensure served people of a reliable domestic water supply.	M	0	C	only one well as a source of water supply, this public water system is deemed to have unreliable water supply.	500,000	14	40 19	Kern	III	2008
2163	1502659	1502659-001	OWENS PEAK SOUTH	Owens Peak South-An Intertie with Inyokern CSD or Drill Second Well	An intertie with Inyokern CSD or drill a second well is needed.	M	0	C	The water system has only one well. A second source of supply is needed.	500,000	17	40 19	Kern	III	2008
2164	1000407	1000407-001	GEORGE COX WATER SYSTEM	New well to augment single well	Drill a new well or interconnection	M	0	C	Single well, if it fails, the system is out of water	200,000	20	40 23	Fresno	III	2008
2165	5400767	5400767-001	WATERTEK - E PLANO	Watertek E. Plano Water Supply Reliability Project	The community of East Plano currently obtains its potable water supply from one community groundwater well. If this well were to fail due to dropping groundwater levels or other emergencies, the community would have no source of domestic water. The proposed project would drill and equip one additional community water well including related appurtenances, and also including applicable engineering and design costs, land acquisition, well development, CEQA/NEPA requirements, and legal/contract costs.	M	0	C	The unincorporated Tulare County community of East Plano is served with potable water by Watertek. The water system is supplied with water by one groundwater well. In light of the current drought conditions being experienced throughout the State of California, relying on a sole source of drinking water leaves East Plano in a risky and vulnerable position. If drought conditions were to cause groundwater levels to drop, the community could find itself completely out of water. In addition, a collapse or other failure of the well and/or pump would leave water system users without a source of drinking water. Therefore, a second source of domestic water supply is urgently needed.	1,000,000	20	40 12	Tulare	III	2008
2166	1500398	1500398-001	FRONTIER TRAIL HOMEOWNERS ASSOC, INC	Frontier Trails Water Distribution system	3 addtional 8,500 gallon storage tanks placed into our existing system will generate increased pressure for residential use and provide for mitigation for our will-serve members. The additional tanks will allow FTHA to create a looped distribution system.	M	0	C	Due to low pressure distribution our system is in need of upgrading. Our "Gravity Feed" system requires 3 additional 8500 gallon storage tanks to complete our system, its loop and feed to unaddressed "will-serve" locations	55,000	36	40 19	Kern	III	2008
2167	1000410	1000410-001	SHORTY S PLACE	New well to augment single well	Drill a new well or interconection	M	0	C	Single well, if it fails, the system is out of water	200,000	17	40 23	Fresno	III	2008
2168	1000277	1000277-001	ELM COURT	New well to augment single well	Drill a new well or interconnection if possible.	M	0	C	Single well system, if it fails the system is out of water.	200,000	14	40 23	Fresno	III	2008
2169	0400078	0400078-001	FOREST KNOLLS MUTUAL WATER CO	New Storage Tanks	Installation of two new 30,000 gallon steel tanks above ground or repair existing tank.	M	0	C	According to inspection reports, the cracks in the existing storage tank are the cause of several bacteriological water quality failures of the water system.	60,000	16	41 21	Butte	I	1998
2170	1500543	1500543-001	AGAPE MUTUAL WATER SYSTEM	DRILL A WELL OR CONSOLIDATE WITH ANOTHER SYSTEM.	FUNDS NEEDED TO DRILL A SECOND WELL OR CONSOLIDATE WITH NEARBY WATER SYSTEM. THE GOAL IS TO ENSURE SERVED PEOPLE OF A RELIABLE DOMESTIC WATER SUPPLY.	M	0	C	With only one well as a source of water supply, this public water system is deemed to have unreliable source capacity.	200,000	16	43 19	Kern	III	2008
2171	3400192	3400192-001	TUNNEL TRAILER PARK	Reduntant Source and Source Upgrades	Drill a second well on the property. Bringing the exsiting well to at least 18" above grade and provide security to the well head.	M	0	C	Add an additional source to the existing single well. Also make improvement to the exsiting well to meet the waterworks standards.	25,000	21	44 09	Sacramento	I	2008
2172	2700536	2700536-002	CORRAL DE TIERRA ESTATES WC		Repair or replace inoperable valves throughout the system.	M	0	C	Distribution system valves will not close completely.	10,000	16	45 05	Monterey	II	1998

2173	1700536	1700536-003	Sunrise Shore Mutual Water Company	Sunrise Shores	We have to replace about 4,000 ft of water distribution system. Need to replace our 3" main with minimum 4" we also need to install Fire Hydrants to provide better community fire protecdtion. An additional 10,000 gal storage tank must be added for addional water for fire protection and general use during power interruptions and to handle the possible addition of more homes to the system. We have approximetly 20 vacant lots for home sites. The present system provides water service to 41 homes which would require hook up to the main delivery line. New system would be installed next to the existing lines along the edge of the county road.	M	0	C	Existing distribution system is Military surplus thin walled steel pipe installed in 1958. Pipe was laid in ground with rocks, gravel and earth. No sand was used. During recent years we are having more problelms with the main line as the pipe is bursting and requires expensive repairs, plus interuption of water service to the entire community. Our last leak cost us $3,570.00 to repair. Pipe is also filling with corrosion and we have a very high iron and manganese in our water. DHS has told us that this problem needs to be addressed. We plan to put in a filtration system to address the iron and manganase from our own funds, but we do not have funds to replace the distribution system.	250,000	37	45 03	Lake	II	2007
2174	2000553	2000553-001	MD#28 RIPPERDAN SELF HELP	MD # 28 RIPPERDAN SELF HELP	Drill a new well to serve as a back up (emergency) source.	M	0	C	Single source water system serving a low income community and no storage capacity. In times of drought conditions, vulnerable to water outages and inadequate fire suppression capabilities.	100,000	20	48 11	Madera	III	2008
2175	1502620	1502620-001	POND MUTUAL WATER COMPANY	Pond Mutual WC-Second Well or possible Intertie with City of Wasco	As part of the project, Pond MWC will either drill a second well or develop intertie with City of Wasco.	M	0	C	Pond Mutual Water Company has only well. Therefore, the water system is unreliable.	1,000,000	16	48 19	Kern	III	2008
2176	2701633	2701633-001	PARADISE RD WS #21		Recoat tank, repair back-up well, and install water treatment system.	M	0	C	System facilities (back-up well, main lines, treatment system) need improvement/replacement.	10,000	16	48 05	Monterey	II	1998
2177	5800850	5800850-001	REBEL RIDGE VILLAGE	2nd Water Source	This project would include the construction and development of a new production well. The pump, panel and pipelines would also be installed after completino of the new well.	M	0	C	This community PWS currently has only one source of water - a groundwater well in a fractured rock aquifer. Due to the current drought conditions in California, the need for another water source may be imminent.	250,000	35	48 21	Yuba	I	2008
2178	5400600	5400600-001	GOLDEN KEY APARTMENTS	New Well for PWS distribution and storage	New Well and storand and/or consolidation with larger pws	M	0	C	Shortage of water due to drought in State	500,000	16	48 12	Tulare	III	2008
2179	1900599	1900599-002	VALHALLA WATER ASSOCIATION	Water Main Transmission and Storage Tank Repair and Upgrade	This project will replace the water main (currently 1-1/2" galvinized pipe buried ~ 12" underground with some exposed runs) with 6-inch PVC buried 36" below the road grade. The new main will also be relocated along the Stonyvale Road right-of-way. All service connections will be replaced accordingly.The water storage capacity will be upgraded from 15,000 gallons to 150,000 gallons, at an elevated location to ensure a minimum static pressure of 20 psi. Resulting fire suppression capability will be 1250 gpm for 2 hours, per LA County fire regulations. LA County-approved fire hydrants (6 total) will be installed approximately every 500 feet (per fire department specifications) along Stonyvale Road from one end of the system to the other.	M	0	C	The Station Fire burned this community in August of 2009, damaging a significant portion of the water distribution system and destroying most of the homes in the system. To rebuild the community and renew the water system permit, LA County requires the refurbishment and upgrade of the distribution and storage system to meet California Water Works Standards, as ammended in 2008.LA County also requires the upgrade of the system's fire suppression capability to meet current fire flow regulations for the severe fire-hazard area, a necessary element of the home-rebuild-permit approval process.Additionally, key sections of the water main were damaged by the heat of the Station Fire, and those burned sections of steel pipe are now contaminating the water with iron levels measured above 8000 ppm and turbidity levels measured over 20 NTU. A Do Not Drink Order has been in effect since December 2009.	600,000	17	48 16	Los Angeles	IV	2011

2180	3110049	3110049-001	Tahoe Park Water Co - Skyland/Nielsen	SWTR Compliance	Install filters. Involves design and construction.	M	0	C	System does not have the required reliable source capacity to meet current waterworks standards.	200,000	85	50 02	Placer	I	2006
2181	1500216	1500216-001	OPAL FRY AND SON	second well for Opal Fry & Son system	A second well will be drilled to increase reliability of the water supply.	M	0	C	Community Water System with one well for water supply is deemed unreliable.	200,000	13	50 19	Kern	III	2008
2182	5602130	5602130-002	SOLANO VERDE MUTUAL WATER CO	Reservoir Replacement	We will be dismantling and salvaging our existing 435,000 gallon tank and constructing a 600,000 gallon capacity tank or two 300,000 gallon tanks. Two tanks are preferred because our system is susceptible to compromise as we have one connection to our imported water from Calleguas Municipal Water District and two tanks would assist in operational efficiencies. Rehabilitation of the existing tank was explored but the cost is almost the same as a replacement and the lining of the existing tank is tar which can harbor VOC's.	M	0	C	Based upon our 2008 annual inspection by the CDPH and recommendations by our engineering, firm our above ground reservoir tank needs to be replaced. The tank suffers from corrosion and structural deformation. This comes 25 years earlier than planned for based upon the original useful life of the tank. The replacement is an emergency situation. Our population includes residences and farming entities growing marketable citrus and avocados and covers 600 acres. The reservoir is an integral part of our delivery system as it provides the pressure for our distribution system. We would like to replace the tank with a 600,000 gallon capacity.Favorable bank funding is difficult to secure as many financial institutions are not familiar with the business practices of Mutual Water Companies and loans are considered unsecured by the bank's board.	835,400	38	50 06	Ventura	IV	2009
2183	3700073	3700073-004	H & J WATER COMPANY	Storage Tank Replacement and Water Filter Upgrade	Replacement of 20,000 gallon storage tank. Replace or upgrade water filter.We are in the process of having the plans drawn up for the replacement tank and a soil engineering study completed per county requirements. The approximate cost of the storage tank with installation is $26,000. The cost of the plans and soil study is $2,000. The approximate cost of a replacement or upgraded water filer is $4,000, for a total cost of $32,000. Estimated time for start of installation is November 2010.	M	0	C	Our water system has 35 members / lots sharing a well. There are approximately 20 houses with full time residents, approximately 8 houses with part time residents and 7 empty lots. Currently our 20 thousand gallon unlined metal storage tank has rusted out and needs to be replaced. This tank has been temporally repaired and is now in use. Our daily water use is 12,000 gallons of water in the summer and 6,000 gallons in the winter. Our water has a high iron content, 2,310 ug/L at the well. The Maximum Contaminant Level (MCL) being 300 ug/L. Our water is also exceeding the MCL in Manganese and Turbidity. Recently we discovered that we are exceeding the designed volume limit of our water filter. So our water filter needs to be ungraded or replaced to meet our needs and lower the iron content to below the MCL.	32,000	24	50 14	San Diego	V	2011

M	0	C	Heath Brimhall POA has a single source of supply, therefore does not have required system reliability.	500,000	14	50 19	Kern	III	2008
2185	5301101	5301101-003	Treasure Creek Woods MWC	Water Well replacement, additional storage, emergency power generation	The proposed project includes the construction of two new water wells constructed to the State of California standards for public water systems. The project also includes ground storage of approximately 50,000 gallon capacity and a pressure tank of approximately 2,000 gallon capacity. Emergency power generation equipment is proposed sufficient to operate one well and the booster pump.	M	0	C	The system is served by two very shallow wells that are not constructed to meet public water supply standards. These wells are only about 25 feet deep and are not cased properly. Pressure is maintained by two residential type pressure tanks. This results in very frequent cycling of the well pumps. The cycling rate is approximately every 8 seconds. The system suffers regular outages when power to the area is lost in storms. The system needs reliable backup power.	175,000	28	50 01	Trinity	I	2009
2186	4300792	4300792-001	Aborn Heights Water Mutual Association		Replace existing water tank. Pressurize entire system. Upgrade chlorine injection system.	M	0	C	Insufficient water storage and water pressure. Need new chlorine system.	150,000	19	50 17	Santa Clara	II	1998

2191	1500327	1500327-002	RANCHO SECO INC. WATER SYSTEM	Rancho Seco Water System-Second Well for the Water System	As part of this project, Rancho Seco will drill a second well to increase reliability of the water system.	M	0	C	Rancho Seco Water System has only well. As such the water system is not reliable.	200,000	41	52 19	Kern	III	2008
2192	4300573	4300573-001	Green Acres Mutual Water	Replace Aged, Leaky Supply and Distribution Water Pipes	The supply and distribution water pipes will be replaced with properly sized pipes that meet current standards. Associated fittings, valves, meters, fire hydrants and well head connections are also included in this project.This project will:1. Eliminate the health risks of contaminated water caused by leaky pipes.2. Prevent the loss of 2,000,000 gallons of water per year. 3. Save over $10,000 per year is operating costs ($2,000 for well water production and $8,000 for purchased water).4. Increase water supply during peak usage periods so very expensive water does not have to be hauled in.5. Improve fire protection.The new 2 inch diameter supply pipe length is approximately 2,000 feet in length between the 2 wells and storage tanks.The new 6 inch diameter distribution pipe length is approximately 2,500 feet in length and serves 18 families.	M	0	C	The water system has massive pipe leaks that have the potential of letting contaminates in the soil enter the water supply and adversely affect the health of users. The leaks also prevent the wells from meeting water usage needs during the summer months.The system's water supply and distribution pipes are leaking 2,000,000 gallons of water per year. This is about 60% of the water produced by the two wells in the system. The water loss in the supply line between the two wells and the storage tanks has been measured at 1,000,000 gallons per year. The loss in the distribution lines between the storage tanks and the users' meters has been measured at 1,000,000 gallons per year.These pipes are about 35 years old and were installed by the original developer with substandard, thin-walled irrigation pipes which do not meet current code. The pipes are past their useful life.Attempts to locate major leaks have failed. The professional opinion is that the leaks are occurring throughout the system, primarily in the pipe joints. A leak recently found was at a pipe joint.The 4 inch diameter distribution pipes are also too small to meet fire protection standards.Another serious problem is that this system is unable to supply the water needs of the users because of the massive leaks. In year 2008, $8,000 of water had to be purchased because the wells, with the pipe leaks, were not capable of meeting user demand.To solve these problems we	302,500	18	53 17	Santa Clara	II	2009
2193	2801080	2801080-001	MILTON ROAD WATER COMPANY		Redesign, trench and lay new pipeline, laterals and valves.	M	0	C	Deteriorating water mains.	30,000	24	55 03	Napa	II	1998
2194	2300604	2300604-001	Point of View Mutual Water Co	Add storage capacity and refurbish existing storage tank	Purchase and install new redwood storage tank with 30,000 gallon capacity, all float controls, inlet-outlet; all piping including flexible system couplings to protect agains earthquake damage. Refurbish existing tank to replace inoperable valves, leaking fittings, and replace system connections with earthquake-resistant flexible coupling to system.	M	0	C	The system does not have adequate storage capacity to assure uninterrupted supply in event of continued drought, emergencies and to provide adequate fire flow. System has only 30,000 gallons of storage for 28 services.	75,000	28	57 03	Mendocino	II	2009

M	0	C	Wegis Water System has a single well as its source of water, therefore lacks required water system reliability.	500,000	22	60 19	Kern	III	2008
2199	0707585	0707585-001	MORAGA HEIGHTS MUTUAL WATER		Replace system, expand filtration and develop further resources.	M	0	C	Aging and deteriorating mains, inadequate capacity.	75,000	22	60 04	Contra Costa	II	1998
2200	4900549	4900549-001	Sonoma County CSA 41-Freestone		Replace the old 50,000 gal tank with new steel or redwood 50,000 gal tank.	M	0	C	The old and structurally failing finished water res. is at risk of contamination from storm runoff.	80,000	30	60 18	Sonoma	II	1998

2201	1400066	1400066-001	Aspendell Mutual Water Company	White Pine water line upgrade and fire hydrant	The project is our number one priority. It will involve trenching to at least four feet in depth due to sub-zero temperatures for a distance of 600 feet, then laying four inch PVC pipe from an existing valve to the end of the line and the new fire hydrant. The new four inch line will provide adequate water service to three residents and will provide a fire hydrant in a high threat wildfire area. There is no other solution to solve the two existing problems.	M	0	C	Aspendell is a mountain community at 8,500 foot elevation surrounded by National Forest which is considered a high threat area for wildfires. the project is a water line on White Pine Street which is a one inch line serving three customers. the water pressure at the end of the line is 25PSI at best. When two or more families draw water at the same time the water pressure drops to an unacceptable level. The 600 foot line needs to be replaced by a four inch line which is standard throughout the rest of the system. ADditonally, the two houses at the end of the street are over 600 feet from the nearest fire hydrant. (The Inyo County code maximum allowable distance from a fire hydrant is 500 feet.) The houses are backed by National Forest, which is a high threat area for wildfire. Installation of a firehydrant on the end of the line would greatly improve the fire fighting capability and would provide a means to periodically drain the line which we cannot do now.	16,700	92	60 13	Inyo	V	2007
2202	1502564	1502564-002	SIERRA MEADOWS	Sierra Meadows-Second Well or Intertie with CWS-Kernville System	As part of this project, Sierra Meadows will either drill a second well or develop intertie with the neighbotring CWS-Kernville Water System.	M	0	C	Sierra Meadows Water System has only well. Therefore, the water system is unreliable.	500,000	42	60 19	Kern	III	2008

2210	2700686	2700686-001	GARLEN COURT WS		Design and construct a new roof and make other necessary repairs to the tank.	M	0	C	Roof of water tank does not provide adequate protection from elements and debris.	15,000	23	69 05	Monterey	II	1998
2211	2700686	2700686-003	GARLEN COURT WS		Replace existing distribution lines.	M	0	C	Existing water mains are very old and need to be replaced.	50,000	23	69 05	Monterey	II	1998
2212	3301690	3301690-001	TWIN PINES BOYS RANCH		Install a above ground tank and new service lines. Install back-up well.	M	0	C	The concrete storage tank is over 30 years old and leaking. Some steel pipe are beyond repair. One new well for back-up supply. (Existing: one 200' deep well with 30,000 gallon concrete storage tank system serves 60 residents with 30 daily staff)	90,000	15	70 20	Riverside	V	2001
2213	1000060	1000060-002	MUSICK MEADOWS #1	New well to augment single well	Drill a new well or construct an intertie with another system if possible.	M	0	C	Supplied by single well that if it goes out due to drought would be out of water.	200,000	65	70 23	Fresno	III	2008

2214	4700503	4700503-003	Callahan Water District	Replace old main line & add storage.	Presently 4" line runs 1/4 mile to old main. From this juncture, run 4" pipe 3 miles over McKeen divide and down McKeen road to treatment plant. Two old 10,000 gal concrete tanks will need to be replaced, but are presently servicable. One 7000 gal steel tank and four 5000 gal plastic tanks are presently installed near the treatment plant. An additional 50,000 gal tank would be helpful, especially for fire protection.	M	0	C	New 4" main out of infiltration gallery on Boulder Creek chokes down to 3" old line, and then to 2.5" old line to treatment plant. Sediment clogs old line at bottom of gullies, and unknown quantities of water are lost to leaks along 3 miles of pipe. Last summer in a drought year we ran out of water several times. Replacing old line and adding and replacing storage should alleviate this problem. We will soon add water meters at the infiltration gallery and at the treatment plant to more accurately measure water loss.	500,000	29	70 01	Siskiyou	I	2011
2215	1500413	1500413-001	TEJON RANCH MAIN HEADQUARTERS	Second Well for the Water System for more reliable source capacity	FUNDS NEEDED TO DRILL A SECOND WELL TO ENSURE SERVED PEOPLE OF A RELIABLE DOMESTIC WATER SUPPLY.	M	0	C	With only one well as a source of water supply, this public water system is deemed to have unreliable source capacity.	200,000	22	70 19	Kern	III	2008
2216	2600532	2600532-001	LUNDY MUTUAL WATER COMPANY		Refinance loan, construct new tank and well, purchase generator and other equipment	M	0	C	Additional storage, additional source, standby power, equipment for repairs	500,000	32	70 13	Mono	V	1998
2217	2702026	2702026-001	APRICOT LN WS	Storage tank replacement and security upgrade.	Project is to replace current aging storage tanks that do not have the updated features required (proper vents and overflow), storage tanks that show corrision and potential leakage and to increase storage capacity. To fix the problem, increasing water storage from 18,000 gallons to 35,000 gallons.	M	0	C	Replace aging water storage tanks that are showing signs of corrision and leakage. Provide security around the storage tanks to prevent vandalism and safety concerns.	75,000	24	72 05	Monterey	II	2011
2218	1500556	1500556-001	HART FLAT BEAR MUTUAL WATER	Second Well for the Water System	Funds are needed to drill a second well for the water system. The goal of the project is to ensure served people of a reliable domestic water supply.	M	0	C	With only one well as a source of water supply, this public water system is deemed to have unreliable water supply.	200,000	21	74 19	Kern	III	2008
2219	2100565	2100565-001	GREEN GULCH FARM	Green Gulch Farm - New 20,000-gal Treated Water Storage Tank	The proposed project is the construction of a new 20,000 gallon storage tank to address water quantity issues. It will be built above ground on an existing site, alongside an existing 20,000 gallon storage tank. It will require minimal site work and minimal adjustments to current system layout.	M	0	C	Green Gulch Farm is a community water system with insufficient water storage. A single 20,000 gallon treated water storage tank services the entire system when operating from its primary source. During the dry season, demand exceeds inflow from the primary water source (Spring 01 - groundwater under surface influence). A second 20,000 gallon storage tank will improve storage capacity, extending the amount of time that the primary water source can be used into the dry season, and ensuring the availablity of sufficient volumes of treated water year-around.	40,000	17	75 18	Marin	II	2009
2220	1500540	1500540-002	PINON HILL WATER COMPANY		Drill new well, add storage and replace undersized pipe with 4" diameter mains.	M	0	C	Need backup source and storage, upgrade distribution pipe to 4"	220,000	38	75 19	Kern	III	1999
2221	1900520	1900520-001	SMITH'S VILLAGE MOBILE HOME PARK	Smith's Village Mobile Home Park (2008)	The project is a community water system consisting of 25-99 connections and a treated ground water source. The system is in need of an additional water source, or additional water storage tank.	M	0	C	The Water System is in need of an additional water source to meet the demands of the community, i.e. new ground well. All details can be provided by the LPA- LA County Water Quality Program.	500,000	34	75 16	Los Angeles	IV	2008
2222	2900548	2900548-001	SIERRA RANCH LTD WATER SYSTEM		Install new well and install float-pressure switch for tank.	M	0	C	Needs second well for reliability.	10,000	32	75 21	Nevada	I	1998
2223	4100510	4100510-005	REDWOOD TERRACE MUTUAL	REDWOOD TERRACE STORAGE TANKS	RWT operates from an offset well which water is pumped up through a supply line to our storage tanks and from there water is gravity fed to the properties. RWT needs to replace the two dilpaitated existing actively used tanks with new 20K to 30K tanks to upgrade, to increase capacity which is required for a community system, and to have a safe storage supply for it's users. There will also need to be distribution equipment and piping for connection into the system.	M	0	C	Redwood Terrace (RWT) is in dire need of replacement and additional storage. Two actively used existing 15Kg redwood storage tanks are dilapitated and not restorable and are becoming health risks. The tanks are very old (50+ years) and the covers are becoming unsafe. Currently RWT does not have enough storage capacity to be in compliance with county regulations for a community system and is requesting funds to replace tanks and increase storage capacity.	25,000	28	75 17	San Mateo	II	2009
2224	5400527	5400527-001	SHILOH WATER CO.	Emergency funding for drought related problems	Add a water source, well, distribution, and or consolidation to lager pws	M	0	C	Possibility of water shortage due to drought in State	500,000	20	75 12	Tulare	III	2008
2225	3400149	3400149-001	RANCHO MARINA	Redundant Source	Drill a new well with associated pumps and piping. Purchase a back up generator to cover power loss.	M	0	C	Water system has only one source. Consolidation or intertie are not feasible options. Another well would need to be drilled.	20,000	35	75 09	Sacramento	I	2008

2226	3400149	3400149-003	RANCHO MARINA	Water system infrastructure replacement to limit system failures/outages	The project will involve replacement of all underground water distribution pipes and service connections to each homesite.	M	0	C	Water pipe infrastructure is failing and must be replaced to maintain water service to tenants and limit water system outages. The system outages have resulted in numerous notifications to tenants and numerous bacteriological sampling being required.	75,000	35	75 09	Sacramento	I	2009
2227	4100510	4100510-003	REDWOOD TERRACE MUTUAL	REDWOOD TERRACE PUMP HOUSE, INTAKE SUPPLY AND DISTRIBUTION LINE PIPING	RWT is seeking funds to replace the original (1921) linear 5400' distribution infrastructure which is leaking, corroded and clogging. Additional new piping will be used to connect the new developed spring sites to the required filtration treatment plant and then to the storage tanks. RWT is in dire need to replace the corroded leaking supply line located under the highway feeding water to storage tanks. RWT is also seeking funds to upgrade the existing pump house to today's standards to resolve and fix safety hazard issues.	M	0	C	Redwood Terrace (RWT) needs to replace 5,400 linear feet of old leaking water lines used for supply intake and distribution. The original water lines used for both supply and distribution were laid in 1921 and are now leaking, corroded and clogged. The intake supply line under the highway, which transfers our water from the off-site well to the storage tanks, is leaking and is in dire need of replacement. RWT is also seeking funding for pipes to incorporate the new alternative sources (springs) from the respective spring sites to a filtration treatment plant and then to the storage tanks. RWT is under a cease and desist order CDO ORDER WR 2008 - 0020 EXEC and needs to replace the pipes so that no water is lost or wasted.The pump house located at the off-site well is in need of renovation and upgrades to bring it to standard levels and will need to be completed at the time the piping is replaced so the project can be cost-effective. The pump house was never upgraded since the flood/storm of 1998 and has safety hazard issues.	225,000	28	75 17	San Mateo	II	2009

2235	2700606	2700606-001	HIDDEN VIEWS MHP WS	Number 2 well arsenic treatment	project may include drilling new well, and or new distribution system or treatment facility.	M	0	C	Well #2 tested arsonic levels in June of 2006. The MCL is 10. One test came back 31. In September of 2006 another lab tested .015. Well has been shut down from system since and we rely on Well #1 for the system leaving us without a backup. A new well drilled may solve our problem or possibly a treatment system.	250,000	31	75 05	Monterey	II	2007

2236	1900158	1900158-008	LITTLE BALDY	Water storage tanks	A new 18 inch well needs to be constructed; installed, outfitted, and connected to the transmission line. The well will be enclosed in a small building for security, and will include necessary disinfection equipment.	M	0	C	The system's sources consist of two wells located within Grandview Canyon of the San Gabriel Mountains. The production area is above the LBWC Service Area and more than a mile from the first connection. The wells are less than 70 feet deep, don't have sanitary seals, and produce very poorly. During summer demand months the well production is reduced critically due to drought conditions and the system rations water for consumers.	130,000	27	76 16	Los Angeles	IV	2009
2237	1900158	1900158-006	LITTLE BALDY	Two Water storage tanks	The proposed project is to construct two 98,000-100,000 gal steel bolted storage tanks to allow for more than one day's capacity in storage, and to pressurize the system. This will reduce dependence and wear and tear on the wells. The tanks will be about 34' diameter, 16' tall, and have an overflow at about 15' above the floor. Construction will include appurtenances to connect the tanks to the transmission lines.	M	0	C	Without online storage the system is in violation of Title 22 and also there is no way to pressurize the distribution system as required under California Water Works Standards.No tanks or reservoirs of any sort have ever been part of the community system. Each user is assigned a day of the month during which he must draw water for his needs in the upcoming month. If the user misses the appointed time, the user must make special arrangements or, if no time is available, have water trucked in from elsewhere, or wait until the next month for his next turn.	450,000	27	76 16	Los Angeles	IV	2009

M	0	C	The system consist of two hardrock wells serving a low income community of about 20 service connections. Recent reports of water outages were filed through the Madera County Environmental Health dept. due to mechanical issues and low water level.	75,000	21	80 11	Madera	III	2008
2242	2000530	2000530-001	CRASS MUTUAL WATER COMPANY	CRASS MUTUAL CO. - SINGLE SOURCE	Drill a new well or consolidate with another water system if feasible.	M	0	C	The water system is served by a single source (hard rock) providing water to a low income mountain community. No back up source in case of water outages.	100,000	26	80 11	Madera	III	2008
2243	1907028	1907028-001	SPV WATER CO INC	Water system improvement	Addition of Nitrate treatment and/or drill another well to blend water with. Possible addition of a backup well. Add disinfection equipment to the existing well. Clean the storage tank.	M	0	C	The system has one groundwater well. The well is near exceeding the Nitrate MCL with a January 2007 indication of 43.5. It also had Total coliform exceedance in August 2004. The system does not have disinfection. Their only other backup well is not currently active, is more than 50 years old, and has high iron concentrates. They need a disinfection system, possible Nitrate removal or reduction, and storage tank rehabilitation.	450,000	22	80 16	Los Angeles	IV	2007
2244	1000248	1000248-001	DOUBLE L MOBILE RANCH PARK	New well to augment single well	Drill a new well or interconnection if possible.	M	0	C	Single well if it goes out during drought, system is out of water.	200,000	37	80 23	Fresno	III	2008
2245	1500593	1500593-001	UPLANDS OF THE KERN MUTUAL WATER CO	Upland of the Kern MWC-Second Well/Intertie with Oildale MWC	As part of this project, Uplands of the Kern will either drill a second well or develop an intertie with Oildale MWC.	M	0	C	Uplands of the Kern Water System has only one well. Therefore, the water system is unreliable.	500,000	20	80 19	Kern	III	2008

2246	0400028	0400028-003	BIG BEND MOBILEHOME PARK	Water Distribution Improvement	Drill and install a new, wider, deeper well. Install new booster pump and tank(s) to accomodate the increased capacity. Install new distribution lines and related hardware (valves, meter boxes, etc..). Install new hydrant(current system has no hydrant or capacity to support one)	M	0	C	Current distribution system is beginning to fail. There has been a significant loss of pressure between units 1 - 6 (drop below 20psi). There is currently a temporary fix in place which is not up to AWWA standards to maintain pressure. This item is currently under violation from Butte County Enviornmental Health. There also have been several breaks in the distribution lines that have to be repaired and placed under a boil order notice till resolved. Most recent boil order notice was only a few weeks back. The parks distribution system is a network of old 1" galvanized pipes that date back to the mid 1950s. There are 2 wells that service the water system, and last year well #1 is believed to have gone dry as production from that well was minimal (1000 gallons per month)System is currently exceeding Chemical MCLs for Manganese & Iron	191,775	35	85 21	Butte	I	2009
2247	3500900	3500900-001	Ashford Highlands MWC	Install sand separator and chlorinator at Well #1	Well #1 sand production can be corrected by the installation of a 100 gallon per minute vortex-type sand separator. Coliform bacteria can be removed by installing a Stenner chlorine pump utilizing liquid 12.5% NSF approved Sodium Hypochlorite injected into the system at the well and prior to storage and distribution. The Ashford Highlands Mutual Water Co. is proposing to install these devices to solve lack of adequate production and possible Coliform contamination and to satisfy Health requirements for a stand-by system.	M	0	C	The Ashford Highlands Mutual Water Co. currently serves 52 connections. The system relies on 2 groundwater wells. Well #1 is currently unusable due to excess sand production and coliform bacteria. Well #2 is the sole source of water available to the Mutual at this time. With declining water levels there is a concern that water will be seriously deficient from only one well.	20,000	44	85 05	San Benito	II	2009
2248	2300506	2300506-001	Meadow Estates Mutual	Distribution/Storage/Filtration	Install 100,000 gallon tank, replace distribution system with approved pipe, double filtration capacity.	M	0	C	Insufficient Storage, failing storage tank, failing distribution system, insufficient filtration capacity	350,000	35	85 03	Mendocino	II	2004
2249	1700563	1700563-005	Lake County CSA 22 - Mt. Hannah	Well Controls - Mt. Hannah Water System	Level control sensors (on/off) will be installed on the water storage tank coupled through wireless telemetry to the pump control shelter adjacent to the well. Power to run the unit will be supplied from existing PG&E service at the pump control shelter.	M	0	C	Storage tanks, supply pumps and wells are traditionally connected through a system of level-controls which maintain water at a specified level in the storage tank. The Mt. Hannah system lacks this control and relies on a manually set timer. The level controls would automate this task and better insure water tank levels are maintained for sufficient drinking water and fire flow.HEALTH BENEFIT includes better management of water store - maintaing available drinking water.ECONOMIC BENEFIT includes construction (equipment and technician labor).REGULATORY BENEFIT includes proper operation of the water system (maintaining adequate water storage for drining and fire flow).	10,000	36	88 03	Lake	II	2009
2250	1700563	1700563-003	Lake County CSA 22 - Mt. Hannah	Mt. Hannah Distribution System Looping	The current distribution system was constructed with water mains which dead end at the ends of there service route (six in all). This project will install new pipe to create three loops , one at each dead end pair. Approximatel 900 ft' of pipe (300 ft. for each loop) will be utilized for this project.	M	0	C	The Mt. Hannah Water System serves a small community in County Service Area #22. The distribution system contains several dead ends. This project will loop six dead ends, improving the delivery and quality of drinking water. HEALTH BENEFITS include better supply and quality of drinking water (and fire flow availability).ECONOMIC BENEFITS include construction (engineering, materials and labor).REGULATORY BENEFIT includes a more reliable system, and fire flows.	50,000	36	88 03	Lake	II	2009

2251	1700563	1700563-004	Lake County CSA 22 - Mt. Hannah	Water Distribution System Upgrades	The project will include the design and construction of a new water distribution system for all 37 active connections. A new larger water main will be installed and connected to existing service lines, where possible. New service connections will be installed where existing service lines are damaged or otherwise cannot be used.	M	0	C	The water distribution system was originally constructed out of substandard materials using substandard methods and needs to be replaced. Increased water pressure from the recently constructed 50,000 gallon water tank (2008) is observed through increased maintenance and water loss within the distribution system. The well pumps are working harder to supply the system, at a time when recharge to the aquifer is at an all time seasonal low.The new distribution system will insure continuous water availability and fire flow.HEALTH BENEFIT includes continuous water availability to all customers and fire flow.ECONOMIC BENEFIT includes contruction (engineering, materials and labor)REULATORY BENEFIT includes compliance with DPH permit requirements for continuous water availability.	750,000	36	88 03	Lake	II	2009
2252	1900541	1900541-001	WESTERN SKIES MOBILE HOME PARK	Western Skies Mobile Home Park	The project is a community water system consisting of 25-99 connections and a treated ground water source. The system is in need of an additional water source, or additional water storage tank.	M	0	C	The Water System is in need of an additional water source to meet the demands of the community, i.e. new ground well. All details can be provided by the LPA- LA County Water Quality Program.	500,000	60	90 16	Los Angeles	IV	2008

2255	2900511	2900511-003	SHADY LAKE WATER ASSOCIATION	Shady Lake Water Association / Shut-Off Valves	This system is presently over 25 years old and never has had shut-off valves installed. To have these installed would insure that any repairs could be more quickly and efficiently carried out. Also these valves would be used to shut off the water usage to any members that had refused to pay their yearly dues. This would secure the funds for the Association to be able to maintain and run the system for the members that were responsible for their dues.This installation would entail: Contracting with a local excavator - $115 per hr.@ 2hrs. times 30 membersTotal approx. $6900.00Purchasing valve boxes - $13.87 per box times 22 membersTotal approx. $305.00Purchasing concrete valve boxes - $29.27 per box times 8 membersTotal approx. $234.16Purchasing valves - $77.89 per valve times 30 members. Total approx. $2336.70Grand Total = $9776.00(We would like to request a total of $12,000 to cover any taxes or cost of living increases in the economy that may occur before the grant funds were distributed).	M	0	C	The system is presently over 25 years old and never has had shut-off valves installed. To have these installed would insure that any repairs could be more quickly and efficiently carried out. Also these valves would be used to shut off the water usage to any members that had refused to pay their yearly dues. This would secure the funds for the Association to be able to maintain and run the system for the members that were responsible for their dues.	12,000	32	90 21	Nevada	I	2008

2256	2300606	2300606-003	Lake View Mutual Water Co.	Rehabilitation of Contaminated Well	The McKee Well will undergo a major rehabilitation. This will include: 1. dismantling the current surface seal and surroundng structures 2. removal and replacement of the sanitary seal 3. scrubbing and disinfection of the casing 4. flushing, cleaning and disinfection of all lines 5. pouring a new surface seal 6. trenching and laying electrical, control, and water lines from the well to the pump house 7. installing meters and controls 8. tying the McKee line into the main prior to the chlorination injector point 9. running of a complete array of water quality tests 10. check for bacterialogical contamination 11. obtain Mendocino County inspections 12. submit permit application to the Department of Health Services	M	0	C	We currently have four operating wells that produce a total of 33 gpm. One of these wells, the Lightel Well, reverts to its owner in August 2007. Currently with all four wells pumping at full capacity we can marginally keep up with peak summer demand, despite implementing a graduated rate schedule that is punitive to heavy users. A fifth stand alone well, the McKee Well, now inactive, was found to be contaminated. Despite several clean-ups it continued to be biologicaly "hot" due to defects found by a 1994 inspection by the Department of Health Services, Drinking Water Field Operations Branch; viz., major cracks in the surface seal plus an opening in the sanitary seal that "...is a possible pathway for contaminants to enter the well casing." Furthermore, the water pumped from this well fed directly into the service line. Its disinfection depended upon mixing with the chlorinated water from the other system wells. This process of disinfection was unsatisfactory. Due to these problems the McKee Well was shut down and deactivated in 1998. In 2001 our principle well, the Montalvo Well, began to run dry, dropping from its normal capacity of 33gpm to under 3 gpm. Two geological surveys were commisioned by our company to find a site to dig a new	25,500	25	90 03	Mendocino	II	2007
2257	2900511	2900511-005	SHADY LAKE WATER ASSOCIATION	Shady Lake Water Association/Dedicated line	The project will entail contracting the services of a license equipment operator for all necessary excavation and installation of the waterline. A trench will need to be constructed to place and house the water line, along with a sand bed for it to lay in. A trace wire will need to be installed along the waterline as well. The length of the trench will be approximately 1000 feet, initiating from the well site and continuing to the storage tanks. It will also require the purchasing of 1000 feet of 2 inch pipe, including any and all couplings, valves, adhesives etc.	M	0	C	The system now in place is soley dependent on one line that distributes the water from the well site into the storage tanks. This same line also distributes the water from the storage tanks out to a junction that feeds into the members individual lines to their homes. The Association would like to install a separate line so that the system would have one independent line coming from the well site going into the storage tanks, as well as having a completely separate line initiating from the storage tanks and feeding to the water junction. As it stands currently there is substantial stress being given to the one existing line, and a high potential for break-down. We are concerned that if this were to happen it would place our 30 members in a position of great need. In 2007 we did have a system breakdown of a pressure valve which caused the water from the storage tanks to drain back into the well site. If a second water line had been available to utilize, the water in the storage tanks would have been secured. Estimated costs as of 8/22/08:Excavation & installation of pipe ($150 an hr. times 50 hrs.) - $7500Sand - $25001000 feet of schedule 40/ 2 inch pipe - $720Trace line/solid 8 gauge wire/no coating - $360Couplings - $8.00Valves - $45.00Adhesives - $10.00Elbows - $7.00Tees - $6.00Check Valves(2) - $36.00Grand Total - $11,192(We would like to request a total of $12,000 to cover any taxes or cost of living increases in the economy that	12,000	32	90 21	Nevada	I	2008

2258	2900511	2900511-002	SHADY LAKE WATER ASSOCIATION	Shady Lake Water Association/Second Source of Water	The system is presently dependent on a well site that is over 25 years old, and it services 30 lots in the area. In May of 2007 there was a water usage disruption due to the local water table falling below the depth of the pumps extention. It was necessary to have the pump then lowered by a local drilling company, further into the well, from 105 feet to 135 feet to reach the available water. Thankfully, the system has a 15,000 gallon water storage capacity that kept the 30 members connected to water while this repair was being done. But if the situation had worsened, it would have caused a hardship to many families. The Association would like to have an additional well site installed to ensure our members of uninterupted service in the future. .In 2008 the Nevada County Environmental Health department had suggested this would be prudent). This installation would entail: Contracting with a local drilling company to arrive at the well site area to determine where the most efficient site might be - ($95 per hour) County Permits at the cost of approximately - $534 Boring the hole at the cost of approximately - $4500 Purchasing and having a III Phase 40 gallon per minute pump installed at the cost of approximately - $5500 Installing the appropriate length of 6 inch casing into the hole. Installing a 50 foot sanitary seal at the cost of approx. - $1500 Capping the casing. Labor costs from the drilling company ($95 per hour) Purchasing	M	0	C	single source system; source reliability	15,000	32	90 21	Nevada	I	2008

2283	4900637	4900637-002	Magic Mountain Mutual Water Company	Supply main replacement	Replace 3/4 mile of 50 year old 2' steel service/supply line with 4' pvc, including service connections to households	M	0	C	We have 1.5 miles of 50 year old 2" steel supply line pressurized at up to 440 ft of head. After 45 years it has begun leaking and rupturing. We have had at least 1 significant interruption in service each year since then, and currently leak 1/3 of our total usage. We expect the interruptions to increase to the point that we can no longer provide a reliable source of water. We are attempting to replace piecemeal but, given that most of our population are on fixed incomes, are having difficulty raising funds. In addition, the Fire Marshall has told us that the lines are inadequate to supply a pumper in event of fire, requiring them to use tankers in this rural area. We lost a house to fire two years ago, partially because of the lack of sufficient water. As we spend money repairing ruptures, we use up money we try to save for replacement. We're in a downward spiral.	150,000	67	100	18	Sonoma	II	2009

2285	5800820	5800820-002C	RIVER HIGHLANDS COM.SERV.DIST	River Highlands CSD Public Water System	Water source: new wells need to be located, drilled and placed in service. Wireless monitoring system for wells and tank. Water Treatment: Treatment system will need to be evaluated and installed. Water distribution: The water lines currently travel from the wells to the homes and then travel to the water storage tank. This system needs to be changed so that the water travels first to the storage tank and then to the homes. This will include modifications to the existing tank or installation of a new tank as well as new pipelines installed. Approximately 40 homes will need to have water meters installed. Water meter readers will need to be purchased. The system as a whole needs a telemetry notification system to insure pr	M	0	C	River Highlands CSD supplies water to 85 homes. There is currently no water treatment system. If there was a contamination issue there is nothing in place to treat/filter the water. The wells which supply 100% of the water are not sufficient to adequately supply the needs of the community. Fire protection is also a main concern when water levels are down. Every year we fall below the necessary water supply. The water distribution system (wells to homes to storage tank) has been evaluated and found to be installed incorrectly and major corrective work is needed. Approximately 40 homes have no water meter connected. The water storage tank (285k gallons) is in need of possible repairs and cleaning. The entire water distribution system needs to be monitored manually (almost hourly) to insure it is functioning. This system is in need of a telemetric monitoring system. From the wells (water source) to the treatment to the homes (distribution) this system is in great need.	500,000	24	100 21	Yuba	I	2007

2296	3100011	3100011-003	AUBURN VALLEY COMMUNITY SERVICE DIS	Valve Replacement and New Well	With regards to the valve replacements, it is critical that these valves be replaced. At this time, if there is contamination somewhere in the water system it is impossible to shut down specific areas of the subdivision and repair any problems. Instead we must shut down water to the entire subdivision and repair the problem. With the recent growth of the community it is not realistic to shut down water to a subdivision of 110 homes. Diamond Well Drilling Company has already constructed a plan to replace three faulty valves with limited interuption to water service. With the addition of these valves it will be possible to correct any future problems without disturbing the entire community's water service. Auburn Valley CSD is trying to plan for continued growth in the community and realizes that soon the current wells will not sufficiently supply water to the subdivision. For that reason, they know it is necessary to have another well constructed before a lack of water adversely affects the community. Diamond Well Drilling has designed a well and pump system that will work flawlessly with the SCADA system currently in place. The proposed well site is near the current well #6. The water supply in that vicinity is already known to exist and can likely provide an additional 80-100 GPM.	M	0	C	The gravity feed lines and control valves were installed in the mid 1970's. In 2004 when resolving water impurity problems at Auburn Valley CSD, we were unable to shut down the system using three key valves due to their leakage which was so high that Water Hydrants at full open could not sustain the rework effort. One remaining valve, just below the underground reservoir, was successful in stopping flow. The water lines, circa 1970's, are made of asbestos cement and the failed valves design and materials are also circa 1970's. Therefore, these valves must be replaced with current state of the art valves and must accommodate mateing with the Asbestos Cement lines. A major development (Suncrest Homes) has increased the quantity of homes within the Auburn Valley Community to 110 with some 44 purchased lots awaiting future home construction. As an addition, the Community has added a SCADA "Supervisory Control and Analysis System" to monitor performance of all existing wells. This approach has been very successful. However, it reflects low water production of one well, #2, which was developed in 1989. Another well, #6, developed in 2003, is located 125 feet away from Well #2 and produces 85-100 GPM versus 30-35 GPM for Well #2. With the poor production of one well, and a much greater demand for water with the recent	155,179	42	120 02	Placer	I	2007

2305	0500019	0500019-006	MINERAL MOUNTAIN MUTUAL WATER	MMEWC holding tank replacement	We will be purchasing two 25,000 gal tanks from Pat Biggs of Fresno-who builds stainless steel water tanks. He will build two 10ft diameter tanks in order to make the trip with the tanks up Sheep Ranch Rd and up to the present tank site. They will place one tank next to the present 50,000 gal torn silo bladdered tank and divert the water to this tank in order to guarantee the flow of water as they take down and haul away the old silo 50,000 gal tank and place a second 25,000 tank next to the first one. Our capacity will again be 50,000 gals of stored water. Our 10,000 gal filtered water tank at this time is still good and will not be replaced. We can no longer find sources to build and install the bladders for these tanks and our 50,000 gal tank is torn down to the 8ft mark. This has become an emergency fix for us. The bladders seem to just disintegrate from the heat and we need a better solution for the safety and storage of our water.	M	0	C	Our water system was destroyed in 1993 in the Old Gulch fire. We purchased and set up two steel silos with plastic bladders. One was 50,000 capacity the other was 10,000. Because of the disintegration of the plastic from the heat we experience up here, we have had to replace the bladders several times because of tearing. We now have a tear in the bladder and our capacity is now down to the 8 ft level. We can no longer find anyone who repairs or replaces and installs the bladders. Our only choice to insure safe water to our neighbors is to replace the silos with real storage stainless steel tanks at considerable cost to us. We have applied several time to this fund and have received no help. We have found someone who builds these tanks and at this time will give us a good deal given the need for work. We just need money to this. We have the concrete platforms and will purchase two 25,000 gal tanks. The first will be placed next to the steel silo and water will be diverted to the 25,000 gal tank so there will be no interruption of water flow to our neighborhood. Then the old tank will be taken down and another 25,000 gal tank will be placed next to the first new one. We will again have the capacity for 50,000 gals of storage. Pat Biggs, the storage tank builder in Fresno, will come asap as he feels this is an emergency situation as we are down to 30,000 gals of water to service a population of 35 connections and 100 people (contrary to the county	55,000	24	125	10	Calaveras	III	2011

2309	4200800	4200800-001	EAST VALLEY FARMS MUTUAL WATER	East Valley Farms MWC Supply and Distribution System Improvements	In order to address the deficiencies within the EVFMWC system, a prioritized capital improvement program was prepared for the Company in 2007. The proposed projects are ranked in order of priority, with the highest priority project listed first, as follows:Project 1: Automated disinfection facilitiesIn this project, manual chlorination facilities would be replaced with automated facilities and permanent liquid hypochlorite storage. This project would provide a consistent chlorine residual throughout the system in accordance with applicable Water Works Standards. The cost of this project is estimated at $15,000.Project 2: New water supply wellIn order to provide adequate supply to meet the maximum day demand, a new source of water is required. Based on previous groundwater studies in the area, a single new well would be expected to yield over 300 gpm, which would bring the system into compliance with Waterworks Standards and provide critical supply redundancy. The well would be drilled in convenient proximity to the existing supply system, and could be readily assimilated into the distribution system. The cost for the well is estimated at $150,000.Project 3: Water service backflow prevention devicesAs required by the local Health Department, this project includes the installation of listed reduced pressure principle (RPP) backflow devices to 30 water service connections. Completion of the project will	M	0	C	The EVFMWC system is currently unable to comply with mandatory CDPH requirements for adequate backflow prevention and water supply. In addition, the system lacks adequate design redundancy for periods of power outage and adequate contingency planning for rising groundwater nitrate levels, which are consistently near the MCL. Section 64554 (Title 22, Chapter 16) of the California Waterworks Standards includes the following requirements: “Community water systems using only groundwater shall have a minimum of two approved sources before being granted an initial permit. The system shall be capable of meeting MDD with the highest-capacity source off line.” The existing system includes two wells, with pumping capacities of 291 and 164 gallons per minute (gpm), respectively. The EVFMWC is not able to supply its current maximum day demand (MDD) of 0.4 mgd with the largest well out of service, thereby risking an extended water outage in the event of well failure. If the smaller well is disabled during maximum use conditions, the larger well must pump continuously to keep pace with demand. In addition to the supply deficiency, both wells consistently operate near the MCL for nitrates, with an occasional excursion above the MCL. Currently, the system does not have the ability to remove nitrates and no supplemental blending sources are available to reduce the supply concentration. Finally, chlorination	475,000	21	125 06	Santa Barbara	IV	2008

2311	1900936	1900936-002	AQUA J MUTUAL WATER COMPANY	Project "ENDEAVOR" to arise to standard	Aqua-J-Mutual Water Company will construct and integrate a parellel and alternate drinking water system into the existing physical plant while upgrading and augmenting the electrical panel and pressure delivery system.The primary focus of "Project Endeavor" is to create a secondary system that would give us a fully functional and automated back-up system, allowing major components to be taken off line for maintenance as needed or required.The secondary system would be united and fully integrated with the primary system; however each would have the capability to function independantly and maintain capacity and delivery requirements currently required by County and State.Our board of directors understands, and has thoroughly contemplated this bold undertaking. We are also of the realization; all facets will never be accomplished simultaneously, systematically and timely without pecuniary assistance from outside agencies. It would all merely evolve into a 50 year "piece-meal" endeavor.Our Company is small, but we always think big. The people within our District pursue the dream of a quality life style away from the hustle and bustle of "Metropolis". We sincerely hope our proposal, "Project Endeavor", will be given serious consideration. We have engeering professionals poised to leap to the breech of "Project Endeavor" to assist with planning and implementation.	M	0	C	Aqua-J-Mutual Water Company is a 55 year old company. Since the early 50's "Aqua-J" has delivered a quality product to the members within the District. We are a small rural community and the service has been uninterrupted. Over the years we have upgraded the delivery system and the well itself. Although fiscally difficult, it has been our primary objective to be in compliance with State and County regulations and preserve the quality of life the rural sphere perpetuates. The need for a back-up system is paramount for us. Presently we cannot shut down any of our major components for maintenance for any duration of time. The effective life of the initial exhausted and a second well was drilled and is currently the sole source. Aqua-J's storage capability is truly insufficient. At present we cannot store enough water for 24 hours of consumption and concurrently combat a fire, should it occur within the District. Our storage capacity is slightly over 100,000 gallons. Daily usage is approximately 80,000 gallons. We need atleast that again in our storage tank in preparedness for a natural disaster, i.e. fire.Our system, although in total compliance would not be allow to open in todays world. We are "grandfathered-in" in the area of not having a secondary source. "Project Endeavor" is a bold untertaking to address that problem.	903,350	49	125 16	Los Angeles	IV	2008

2312	4300522	4300522-005	Lake Canyon Mutual Water Company	Extend 6" line to residents in lower canyon area.	Major Project Phases: Planning Permitting Engineering. Excavation. Removal of old line. Installation of new 6" lineScope:. Affects ~ 2 miles pipe (~ 30 homes or ~ 80 residents)Timeline: Expect from planning to installation to take 18 months	M	0	C	Currently approximately 50% of the community is served by an inaequate water main (2" line) which drastically decreases water pressure and is below Cal Fire requirements!With the recent fires in the Santa Cruz Mountains residents and the Board of the Lake Canyon Mutual Water Company are extremely concerned that the distribution system is inadequate to respond in an emergency.It is essential that the Water Company undertake this project as soon as possible; however, other necessary projects have taken priority.	400,000	56	125 17	Santa Clara	II	2008

2322	4900850	4900850-002	Bodega Water Company	Bodega Water System Upgrade	The following upgrades are submitted in order to bring the BWC water system into conformance with safe drinking water system standards.1. Electrical System: The electrical system from the drop pole to two supply wells will be repaired. Overhead conduit will be replaced with 800' of underground copper wire. The conduit will be installed in an 18" trench, and bedded in six" of sand. The existing 60-amp service panels will be replaced with new 200-amp service panels. The existing circuit breakers will be replaced to meet current electric code requirements. 2. Chlorination System: The existing defective chlorinator will be replaced with a new, non-electric, flow-generated chemical injector pump with a 140-mesh inline water filter as recommended by CDHP. The existing chlorine analyzer will be replaced with a Hach chlorine analyzer as recommended by CDHP.3. Storage Tank Upgrade: A new 95,000-gallon steel storage tank will be installed at a more accessible location approximately 2000' from the existing treatment plant. The storage tank will be covered with a water catchment system which will direct water to the treatment plant. 4000' of underground Schedule 80 1¼" line will be installed running in both directions between the new tank and the treatment plant. A new access road will be built to the tank. The project includes design, engineering, permitting, grading, site preparation, materials, and installation. 4. Resource	M	0	C	Bodega Water Company (BWC) seeks funding to upgrade its aged drinking water system and mitigate potential public health risks. BWC serves a small, rural, economically disadvantaged community and is located in a Level 4 Water Scarce Area. This scarcity, inadequate storage capacity, and water lost due to leakage, results in the added expense of hauling water. Members pay higher than average rates. Needed upgrades would require unaffordable rate increases unless grant funding becomes available.The system was designed 30 years ago and most of it is in need of replacement. It is comprised of: three wells; several storage tanks which do not provide sufficient storage; a substandard chlorination system; and approximately three miles of Schedule 40 PVC distribution pipeline. Distribution lines are partially above-ground, poorly mapped and frequently cross private property, creating difficult accessibility. Outdated water meters are poorly located and leak. Less than 20% of the meters include backflow prevention devices, posing a risk of contamination due to the agricultural nature of the community.Portions of the electrical system are not compliant with current electrical codes. The potential for causing a fire is imminent and could disrupt power to the entire system. The damaged and leaking storage tanks are located on a steep hillside making access and space for repairs extremely difficult. The half-mile	800,000	38	150 18	Sonoma	II	2009

2328	1500401	1500401-003	METTLER COUNTY WATER DISTRICT	Mettler Well Project	Design and construction of a test well/community well with a pump and water lines to connect to the community water system. The well site will be on land donated by the Water District. This will provide an alternate water supply to the community when the old well, fails, is out for repairs or contaminated. Consolidation is not an option since the nearest community water system is several miles away.	M	0	C	Mettler is a disadvantaged community located several miles from other community water systems. Their only well is about 14 years old and was drilled to replace two water wells that were contaminated with Nitrates (238 & 98 ppm) from local septic systems. This well is the community's only source of water. If the well pump fails, the well collapses or becomes contaminated; the 180 residents will be without water.A second well is needed to provide a back-up water supply to prevent the community going without water during failure of their only well. A second well will allow the old well to rest and enable repairs to be made without interruption of water supply to residents.A source water assessment has documented the presence of septic systems, and discharge of greywater within 800 feet (Zone A) of the well and the influence on local groundwater (high nitrate levels 238 & 98 ppm in two previous community wells). Drinking water standard: Primary Drinking water standard, Nitrate MCL = 45 ppm	600,000	40	150 19	Kern	III	2008
2329	2000552	2000552-002	MD#24 TEAFORD MEADOW LAKES	MD-24 water outages and system failure	PROJECT DESCRIPTION Drill high production well and install new tank and well controls. Replace current distribution system and storage tank.	M	0	C	System wells are not able to keep up with water demand. Water system is in a critical fire hazard zone. System cannot provide fire protection needs with current production, storage and distribution system. Current storage tank is to small and is beyond its service life.	1,000,000	47	150 11	Madera	III	2007

2330	1400020	1400020-002	Aberdeen Resort	Additional Water storage	The community of Aberdeen currently has a water storage capacity of merely 5,000 gallons. The community can deplete this water in less than 15 minutes. This is with a minimum amount of people within the community. The community if at full capacity of people will deplete this water to the point that the well pump is not able to shut off, and the tank never refills. Not only does this create a water shortage, but this creates an issue when fire flows are needed.We would like to replace the existing 5k gallon water tank with a 50,000 gallon water tank. This capacity would be adequate enough for distribution and provide enough for fire flows. In order to change from the existing tank we would need to install a cement slab to support the tank, as well as upgrade all piping from the well head to the tank and from the tank to the distribution pressure pumps. A contractor would be needed to build the tank and install the cement slab. Alteration of the well house would also be required. The new tank would also require a new liquid level system for pump controls. The existing tank would be sold to another small water system with only 4 hookups.	M	0	C	The community of Aberdeen currently has a water storage capacity of merely 5,000 gallons. The community can deplete this water in less than 15 minutes. This is with a minimum amount of people within the community. The community if at full capacity of people will deplete this water to the point that the well pump is not able to shut off, and the tank never refills. Not only does this create a water shortage, but this creates an issue when fire flows are needed.	400,000	75	150	13	Inyo	V	2008
2331	1000551	1000551-002	FCSA #43/RAISIN CITY	Install fire hydrants and a booster pump	The project seeks to install 17 fire hydrants and a 60 hp booster pump to provide fire protection for this community. Each fire hydrant unit is estimated to cost $10,000 each and the booster pump is estimated to cost $50,000.	M	0	C	The water system in CSA No. 43W was constructed in 2006 to serve the Raisin City Elementary School and approximately 60 dwellings, mostly single family residences. A State grant and community block funds were used to finance the construction of water system, which initally included seventeen fire hydrants. However, because there were not sufficient funds, the fire hydrants and support system were eliminated. With the nearest fire station located more than fifteen miles away from the Raisin City community, and the community having a high density of older dwelling in close proximity to each other, fire hydrants would be essential to reducing the potential of loss of life and property.	220,000	15	150	23	Fresno	III	2009
2332	1000200	1000200-001	Rubys Valley Care Home	New well to augment single well	Drill a new well or interconnect if possible.	M	0	C	System suppled by one well. If it goes out due to drought the system would be out of water.	200,000	1	158	23	Fresno	III	2008

2333	3600209	3600209-001	Rocky Comfort MWC	Rocky Comfort MWC Pump and Tank for Pressure Interruptions	The MWC recently contracted with an engineering firm to investigate alternatives for ensuring continuous adequate pressure. Three system improvements were evaluated. One alternative was based on the storage needs to allow for the simultaneous irrigation of all groves while meeting all household demands. With the contracted limit of 162 gpm, the storage requirement would be 250,000 gallons. The Preliminary Engineer's Estimate for this alterantive was $310,400.The second alternative considered that irrigators would stagger their water use to alternate days so that storage requirements would be reduced. This alternative includes a variable flow pump and a small hydropneumatic bladder-type tank. The Preliminary Engieer's Estimate is $143,030.The third alternative was the installation of booster pumps at each individual service. This is the least-cost alternative (approximately $2,300/service) but removes the MWC's control of the contract with the City. Alternatives 1 and 2 could include a device to regulate flows so that the contracted amount of 162 gpm of supply is not exceeded.The requested project is Alternative 2 as evaluated by the Engineer. This Alternative will add pumping and stroage facilities to Rocky Comfort MWC's system to allow it to continuously meet Title 22 pressure requirements. Facilities required to ensure adequate pressure would be the installation a 3-inch double check valve backflow,	M	0	C	Rocky Comfort MWC has been receiving its domestic water supply directly from the City of Redlands since 1924. The MWC has one metered connection with the City and is billed monthly for water use in accordance with the 1924 Agreement. The Agreement limits water use to 162 gpm and does not require that the City meet a minimum pressure. Rocky Comfort MWC has 34 metered connections within 40 acres; approximately 50% of the area is irrigated groves, accounting for 5 meters. Buildout within the MWC is not expected to exceed its 162 gpm contract limitation. Rocky Comfort bills its customers bi-monthly for meterd water use. All meters and service laterals are owned and maintened by property owners who are also shareholders. Historically, the MWC has received water directly from the City that often does not meet State-mandated minimum pressure requirements. Extremely low pressure (less than 10 psi) incidents occur in the summer. When the City's Tate Water Treatment Plant is operating, the water pressure delivered to Rocky Comfort MWC normally averages above 40 psi. However, when the treatment plant is shut down because of high sedimentation in the surface water source of supply, the City switches the MWC's supply to a downgradient well that is not able to provide 20 psi.For many years, the City Water Department has told Rocky Comfort MWC that once its planned	143,000	32	160 13	San Bernardino	V	2008
2334	5800832	5800832-001	CASTLEWOOD MOBILE HOME PARK	2nd Water Source	This project would include construction and development of a new production well. The pump, panel and pipelines would also be installed after completion of the new well.	M	0	C	This community PWS currently has only one source of water - a groundwater well. Due to the current drought conditions in California, the need for another source may be eminent.	250,000	88	161 21	Yuba	I	2008
2335	2700772	2700772-001	STRUVE RD WS #02		Build storage tanks and take measures for well head protection. These projects would involve study, design, and construction.	M	0	C	Insufficient water storage capacity.	50,000	81	166 05	Monterey	II	1998
2336	0707569	0707569-001	ANGLERS SUBDIVISION 4		Install 3" - 4" lines throughout entire system. To each lot/hook-up.	M	0	C	Inadequate mains, low pressure not in compliance with WW Standards.	560,000	70	168 04	Contra Costa	II	1998
2337	5400682	5400682-001	CENTRAL WATER CO.	Central Water Company Water Supply Reliability Project	This portion of the community of Plainview currently obtains its potable water supply from one community groundwater well. If this well were to fail due to dropping groundwater levels or other emergencies, the community would have no source of domestic water. The proposed project would drill and equip one additional community water well including related appurtenances, and also including applicable engineering and design costs, land acquisition, well development, CEQA/NEPA requirements, and legal/contract costs. The scope of this project could include consolidation and/or a permanent interconnection with Plainview Mutual Water Company.	M	0	C	A portion of the unincorporated Tulare County community of Plainview is served with potable water by Central Water Company. The water system is supplied with water by one groundwater well. In light of the current drought conditions being experienced throughout the State of California, relying on a sole source of drinking water leaves residents in a risky and vulnerable position. If drought conditions were to cause groundwater levels to drop, the community could find itself completely out of water. In addition, a collapse or other failure of the well and/or pump would leave water system users without a source of drinking water. Therefore, a second source of domestic water supply is urgently needed.	1,000,000	42	170 12	Tulare	III	2008
2338	1700511	1700511-001	Harbin Hot Springs	Distribution/Storage Improvements	Replace old galvanized pipe and install new 100,000 gallon storage tank.	M	0	C	Old pipes in poor condition and inadequate storage	300,000	47	170 03	Lake	II	2002

2339	1000042	1000042-003	FCWWD #40/SHAVER SPRINGS	Replace water storage tank, construct water distribution system, destroy wells	1. Approximately 1/2 mile of water pipeline shall be constructed to access the new well source. The cost estimate to construct this pipeline is $350,000. This includes the cost of booster pumps and/or pressure tanks required to pressurize the distribution system.2. The existing 40,000 gallon water storage tank shall be replaced. The cost estimate to replace this tank is $100,000.3. The 5 existing wells shall be destroyed. The cost estimate is $25,000.4. The new well source may require a more recent pump test to meet State requirements. The cost estimate for a pump test is $25,000.	M	0	C	The District is currently searching for a new water source since 5 of their 6 wells are chemically or radiologically contaminated. Currently, the District does not have potable water. The District must also carefully manage its water use because the 2 active wells produce an average day demand of 9.0 gpm whereas the approximate yield of both wells is 9.1 gpm. During summer months, the water system becomes severely strained. The District has located 2 wells of interest and are assessing the water quantity/quality. Once the District selects a clean water source, they wish to purchase water rights to the source. Part of the project shall involve constructing approximately 1/2 mile of water pipes to access the water source and upgrade the current water infrastructure. One of the three 40,000 gallon water storage tanks for this water system is approximately 30 years old and has deteriorated beyond repair. Four of the five existing wells must be destroyed per recommendations from CDPH.	500,000	51	172 23	Fresno	III	2009
2340	1000484	1000484-001	FCSA #34/BRIGHTON CREST	Millerton Lake Pump and Pipeline Improvements	Within this context, staff, in consultation with engineering consultant, is recommending that the overall situation be address in two phases. Phase I could be implemented immediately to address most of the problems caused by a draining pipeline and provide emergency pumping capabilities and Phase II would address a comprehensive solution to the system's problems. Phase IImmediate measures that can be taken to ameliorate the effects of a draining pipeline and provide emergency pumping capabilities.Task I: Install a 12" check valve on the water line at the high water mark of the lake. This would prevent the line from draining to a point below the newly installed check value and reduce or eliminate the problem of metering water twice. However, this would not remove the requirement of having a functional check valve on each of the individual valves and would not insure the operation of the system if a serious leak or malfunction occurred below water. The estimated cost is $5,000.Task II: For emergencies, install a tee connection, branch and gate valve on water line near the check valve above the high water line. If a serious problem occurred with the pumps or underwater portion of the pipeline, a portable pump could be set up near the lake edge, drawing lake water through a temporary pipe to the branch and into the above water portion of the pipe as an emergency supply. The	M	0	C	County Services Area (CSA) No. 34 encompasses the Millerton New Town Plan Area. It is located on the north and south side of Millerton Road approximately 1.5 miles east of the unincorporated community of Friant. Raw water is drawn from Millerton Lake by two pumps and electric motors on a platform submerged in the Lake. Each pump feeds water through an attached check valve and manifold into a twelve inch diameter water line submerged in the lake and in ground from the lake edge. The water line has a meter station approximately ¼ mile from the submerged platform and the water line travels generally south from the lake across Millerton Road to a pond which is located on the Brighten Crest golf course. Water in the pond is drawn from another water line that provides irrigation for the golf course. Another water line from the pond transports water to a raw water storage tank, where it is feed into a water treatment plant. In December 2007, it was noticed that the water line partially drained when the system had been shut down over night due to low water demand. A pump test was done and no flow was observed at the meter station until 18.5 minutes of operation. A leak was suspected between the pumps and the meter station. Confirmation of the leak occurred during an air test of the water line. An underwater camera picked up a large air bubble over one of the pump's check values. No leaks were seen in	400,000	70	175 11	Fresno	III	2008
2341	5400718	5400718-002	WILLIAMS MUTUAL WATER CO.	Williams Mutual Water Supply Reliability Project	A portion of the community of Cotton Center currently obtains its potable water supply from one community groundwater well. If this well were to fail due to dropping groundwater levels or other emergencies, the community would have no source of domestic water. The proposed project would drill and equip one additional community water well including related appurtenances, and also including applicable engineering and design costs, land acquisition, well development, CEQA/NEPA requirements, and legal/contract costs. An alternative solution to be evaluated within the scope of the project is an interconnection and/or emergency connection to Poplar Community Service District.	M	0	C	A portion of the unincorporated Tulare County community of Cotton Center is served with potable water by Williams Mutual Water Company. The water system is supplied with water by one groundwater well. In light of the current drought conditions being experienced throughout the State of California, relying on a sole source of drinking water leaves the Water Company in a risky and vulnerable position. If drought conditions were to cause groundwater levels to drop, the community could find itself completely out of water. In addition, a collapse or other failure of the well and/or pump would leave water system users without a source of drinking water. Therefore, a second source of domestic water supply is urgently needed.	1,000,000	50	180 12	Tulare	III	2008

The Engineer determined that a plan of action should be implemented to deal with the "severe degree and extent of corrosion damage on the laterals". In most instances, leaking laterals cannot be repaired due to the corroded/thin pipe wall and complete replacement of each lateral is necessary when a leak occurs.	844,521	810	185 02	Placer	I	2009
2346	4100509	4100509-003	COUNTY SERVICE AREA 7	Pescadero creek road pipe	Lay new piping (3") along Pescadero Creek Road to Alpine Creek Bridge.	M	0	C	Replace deteriorated piping	100,000	62	186 17	San Mateo	II	1998

2347	4100509	4100509-005	COUNTY SERVICE AREA 7	County Service Area No. 7 Water Distribution System Improvements	A master plan for the water system was prepared in 1998 to identify water system needs and capital improvement projects. This project includes implementation of a majority of the recommendations of the master plan to improve the water distribution system to comply with the requirements of Title 22 of the California Code of Regulations.The project consists, in general, of the following improvements:1. Replace existing 0.75 inch to 2 inch diameter pipes with 4 inch diameter pipes to deliver a 200-gpm fire flow coincident with the maximum-day demand while maintaining a 20-psig residual pressure at most locations. The new pipes will be installed with proper bedding and backfill material and cover.2. Reroute approximately 2,500 feet of pipeline currently in private property to public right-of-way to correct low water pressure deficiencies at the northwest end of the distribution system (Memory Lane and Pope Road areas).3. Install a new looping water main, approximately 6,500 feet in length, along Pescadero Creek Road. This work is recommended since the existing distribution system consists only of unlooped branches and completion of this loop would provide greater capacity to maintain service in remote locations in the unexpected event of pipeline or equipment failure.4. Install County Fire Marshal approved fire hydrants as part of the pipeline replacement work. There are no existing fire hydrants	M	0	C	Most of the distribution system water pipelines in CSA-7 are old, poorly installed, and undersized based on current water industry standards - Title 22 of the California Code of Regulations. Pipe materials include galvanized steel, cast iron, ductile iron, asbestos cement, and high density polyethylene. Pipe diameters range from 0.75 inches to 4 inches. The water pipeline serving a residential area (Memory Lane) runs through a privately owned Trailer Park where service by County staff is difficult and pressure is lower than the required 20 psi due to the undersized distribution system pipes. In addition, line breaks are occurring more frequently throughout the system as pipes deteriorate, for portions of the system date back to the early 1920s and without adequate cover exposing the pipes to the elements and damage from falling trees or branches. Replacement of the distribution system pipes will provide the required pressure and help prevent line breaks, which can lead to system failure and be detrimental to public health.	1,000,000	62	186 17	San Mateo	II	2008
2348	5400728	5400728-001	GRIER MUTUAL WATER CO.	New Well and Storage	New well, storage, and distribution system and or consolidation to larger pws.	M	0	C	Possibility of water shortage and storage for this community water system	500,000	89	190 12	Tulare	III	2008

2351	4300560	4300560-006	Green Mountain Water Company	Replace/upgrade water distribution infrastructure	Engineering study has been completed with recommendations on replacing/upgrading the existing PVC sections of the existing distribution lines. Project will require trenching alongside the existing roadway throughout the service area, installation of 6" PVC distribution lines, installation of pressure reducing stations (water is gravity fed from existing storage tank through distribution lines), connection to existing metered domestic service lines and fire hydrants, backfill trench and restoration of roadway. Old distribution lines will be abandoned.	M	0	C	Distribution system infrastructure was built in 1965 of 3" steel and 2 1/2" PVC piping. Repairs to the PVC section have been necessary to ensure safe adequate water for domestic service. The entire section should be replaced to increase distribution capacity, provide for easier maintenance and repair (such as after a major earthquake), eliminate water loss due to leakage in existing line and ensure water quality to all customers.	400,000	49	190 17	Santa Clara	II	2011

2354	1900843	1900843-001	CALIFORNIAN MOBILE HOME PARK	Californian Mobile Home Park	The project is a community water system consisting of 100-199 connections and a treated ground water source. The system is in need of an additional water source or additional water storage tank.	M	0	C	The Water System is in need of additional water sources to meet the demands of the community, i.e. new ground well. All details can be provided by the LPA - LA County Water Quality Program.	500,000	148	190 16	Los Angeles	IV	2008
2355	3600297	3600297-002	Gordon Acres (Stewart WC)		Construct new well and two new reservoirs	M	0	C	Inadequate source and storage capacity	150,000	39	195 13	San Bernardino	V	1998

2356	3600297	3600297-004	Gordon Acres (Stewart WC)	Gordon Acres Water Company updated refurbishment Project	Replace almost all of the existing pipe infrastructure. Refurbish or replace existing old wells and pumps. A 50,000 gallon storage tank will be installed per direction of Environmental health. A new well will be installed to replace/support old existing units. Fire hydrants will be replaced as well as a number of disfuctional/non-existant isolation valves.	M	0	C	The Water Company plans to replace the majority of distribution pipes, (approx. 15,000 feet), many sections of which have been in place since the 1950's. Leaks are a chronic problem, often requiring shuting down the system, depribing customers of water. Both wells and pumps are in serious need of refurbishment and upgrades. The system has been neglected for years and funds for spares, repairs and upgrades have not been available. Environmental Health has recommended that a new 50,000 gallon storage tank be installed. Approx. 30 new fire hydrants are required to comply with San Bernardino Fire Codes. A system of shut off valves as needed to isolate leaks and prevent system shut downs when leaks occur. New security fencing is needed for the two pump/storage areas.	200,000	39	195	13	San Bernardino	V	2011
2357	1500578	1500578-001	LONG CANYON WATER COMPANY CORP.		DRILL NEW WELL. OTHER - DESIGN AND CONSTRUCTION	M	0	C	DIMINISHING CAPACITY FROM WELL	50,000	67	197	19	Kern	III	1998

2359	5400957	5400957-002	WEST GOSHEN MUTUAL WATER CO.	West Goshen Water Supply Reliability Project	The proposed project would drill a new 12" backup well to a depth of at least 400" and equip it with a 40hp pump. In addition, a 150,000 gallon storage tank and residential water meters would be installed, ensuring a high degree of water supply reliability for the community. The project would also include environmental and design work, and acquisition of land, if necessary.	M	0	C	West Goshen Mutual Water Company's system is overburdened. The primary well is equipped with a 60-HP pump that is just barely able to handle the demand placed upon it by the community's water needs. The backup well is insufficient to provide the redundancy that would ensure water supply reliabilty for the community. Should the primary well fail, the backup 8" well, which is equipped with a small 15hp pump that is over 30 years old, will not be able to meet the water demands of the community. The 8" well is too small to be upgraded to a larger pump, so drilling a new well is necessary. Additionally, the community has insufficient storage capacity, which further jeopardizes water supply reliability for residents. A storage tank of approximately 150,000 gallons is needed.	350,000	69	200	12	Tulare	III	2011

2362	1400070	1400070-007	Sierra Grande Estates Mutual Water Co.	Sierra Grande Pump Station	Installation of a new 5000 gallon hydro-pneumatic pressure tank with a staged 4 pump system- 25- 750 gpm- and backup power generator set. The pumping system will provide redundancy and capacity while increasing the efficiency of the facility. The project will reduce electric costs and ensure system pressure when the power is out. The project will enclose the pump system and electrical panels for freeze protection and security. The staged pump system will be simpler to maintain than a VFD system for this remote location.	M	0	C	The water system pumps well water into above ground storage tanks, then the water is pumped into the distribution system as required. The current system's hydro-pneumatic tank is rusted and has been removed from service. The system is pressurized by a single 15 Hp pump (NOT VFD) that runs all the time. This single pump supplies all water demands to the system. The pumping system lack redundancy and the system loses pressure when the grid power goes out. The electric panels and pump are not protected from the elements and lack security measures.	290,000	49	200	13	Inyo	V	2009
2363	5500053	5500053-003	LEISURE PINES MUTUAL WATER CO	New Storage and Pump Facilities	Install additional storage and pumping facilities.	M	0	C	Need more storage capacity, especially for fire protection.	87,000	85	200	11	Tuolumne	III	2004
2364	5400957	5400957-001	WEST GOSHEN MUTUAL WATER CO.	Water Improvement Project	The project would provide a needed reliable water source by constructing a water tank, booster pumps, and new pump in the backup well, along with providing chlorination and needed water meters to regulate the water usage.	M	0	C	Water system lacks the capacity in the backup well to meet water system demands. It does not have any water storage and therefore does not meet the waterworks standards or fire protection. The system does not have capability to disinfect the source water or water sytem. Also the system does not have water meters to equitably generate revenue to sustain the water system and promote water conservation.	475,000	69	200	12	Tulare	III	2009

2365	1900100	1900100-002	METTLER VALLEY MUTUAL	Mettler Valley Mutual	The project is a community water system consisting of 15 to 24 connections and a treated ground water source. The system is in need of an additional water source, or additional water storage tank.	M	0	C	The Water System is in need of an additional water source to meet the demands of the community, i.e new ground well. 2366	4900660	4900660-001	Yulupa Mutual Water Company	Yulupa MWC - Tank Project	Construct two tanks: 96,000 and 65,000-gallon tanks.	M	0	C	Insufficient storage	400,000	60	200	18	Sonoma	II	2004
2367	4400572	4400572-002	FERN GROVE WATER CLUB	Aging Pipes	replace current galvinized pipe w/ PVC pipe. Replace metering boxes and 6 or 7 stainless steel tanks	M	0	C	Aging pipes and aging water tanks	500,000	64	211	05	Santa Cruz	II	2007
2368	3601010	3601010-001	Crystal Lake Prop Owners	Water delivery pipeline upgrade	The project consists of the installation of approximately 1.6 miles of 8" PVC C900 – Pressure Class 150 Piping material. The system will be installed beneath the current dirt roads that surround the development and in sections so as to leave service to the existing properties until such time that it is completed, tested and turned on. Materials will include 8" PVC C900 – Pressure Class150 as manufactured by PW Eagle or equal, Tees, Gate Valves, Air Vacs, Thrust Blocks, Tracer Wire and Valve Cans, service saddles and Fire Hydrant connections.Isolation valves will be installed at strategic locations so that only sections will be shut-down for a repair versus the entire development.	M	0	C	The original 1.6 mile waterline system was installed in the 1980's using an inexpensive and undersized 4 inch PVC header piping system tied to a 2 inch lateral system feeding (61) lots. This system has proven to be inadequate in providing sufficient water pressure to the homes and fire stand pipes, and has frequent line breaks. Due to the poor design and planning of this system, there is no way to isolate these line breaks and the entire water system must be shut down affecting 61 properties every time a repair is required.The original watersystem was installed with cheap 2 inch PVC pipe connecting 61 properties. About 15 years ago the system was upgraded by adding a second 4" PVC pipe to the system. The 4" pipe was connected in several spots to the 2" pipe. Some homes are hooked to the 4" pipe others to the 2" Pipe. Frequent line breaks are unable to be isolated due to the poor planning of the system upgrade therefore causing us to shut the entire system down.	160,000	61	213	13	San Bernardino	V	2011
2369	0510019	0510019-002	Wallace Community Services District	Multi-Well Activation with Code Compliance	For proper operation of the water system as a whole, the following tasks will be performed.a. Install a new water system controller that will control the three wells in normal and "backup" operation.b. Install flow control capability at each well to provide energy efficient flow control, that, in turn, allows operation that protects the aquifer. Variable Frequency Drive power systems will be installed, along with appropriate control and sensor lines.c. Install flow monitoring capability at each well, per CA DPH requirements.d. Refurbish and bring power to the third well (1,000 foot power run).e. Develop programming to operate the groundwater system in a safe and reliable way.f. Document all improvements, "as-built."	M	0	C	The District currently operates with only one qualified well. Qualification of a second well is in process. Once completed, the system controller will need to be replaced to properly operate both wells in an optimized way for safety, water quality and aquifer protection. A third well needs to be activated to provide needed capacity were the best producing well to fail (required by State Engineering Standards). This well is in place, but primary electrical power needs to be brought to the site, and the well needs to be re-furbished. We are under a DPH directive to complete qualification of the second well and to begin operations using both wells. The latter requires completion of this project.	225,000	75	220	10	Calaveras	III	2009

2373	4300575	4300575-002	Twin Valley, Inc.		Install new tank & piping.	M	0	C	Recurring TCR MCL violations. Rerank to M from F (9/17/01)	150,000	83	250	17	Santa Clara	II	2006

2374	4300575	4300575-004	Twin Valley, Inc.	Replace 100 year old wooden water storage tank	Project Outline:Acquire Fund resources $150,000Planning setup of new construction of new tank locationAcquire new tank location or use current locationDesign New Tank plansGet Premits and Approvals from County PlanningStart Construction: - excavate tank site for new tanks - Prepare and put new tanks on location - Remove Old tank and clear pad for new tank - Setup plumbing for all new tanks - Setup new tanks on all new pads - Plumb new tanks on all new pads - complete new tanks install and satitize new tanks - put new tanks in operations - check new tanks installation for any problems and fix as discovered - monitor new tanks and operation of new tanks - monitor new tanks and the feed of water to upper tank - review transfer of water to upper tanks from new tanks. - complete any remaining Construction on project	M	0	C	Currently there is a 33000 gallon 100 year old redwood storage tank that holds the water pumped from five different wells. This tank leaks, mice, rats, squels, bird and other animals and insect manage to find there way into the tank offen. They contaminate the water in this tank. In the last several years we have put new roof, screen over the sides tops to try to keep these varmits out, but no luck. We have a chlorinator to cholorinate the water because this tank get many creaters in it, in order to keep the water drinkable and sanitized we chlorinate.We need to replace this tank with storage of upto 70,000 to 120,000 gallon tanks of water storage. We currently climb to the top of this tank 3 time a week and collect any varmits floating on top of the water as well as chlorinate the water.All of our population is feed thru this tank. We need some funding help to replace it.Twin Valley has been instructed by the Department of Public Health to replace this tank by august 1, 2010. Our engineer inspector said "this is the worst tank he has ever seen". We need to replace it and the funds to do it. WE have one year to get this job done. Our Engineer of CDPH has given us the word.	150,000	83	250 17	Santa Clara	II	2009
2375	4900532	4900532-018	Sonoma County CSA 41-Jenner	Replacement of Water Mains - Jenner C S A # 41	The project consists of installing 1000 feet of 6 inch & 4 inch water mains in three locations within the Jenner water system CSA #41. The main 6" line on Hereford Drive and the 4" line on La Porte Road will be relocated to a stable location within the existing roadway/right of way. These pipe lines are currently valved off and are out of service. This portion of the relocation project consists of 200' of 6" main in Hereford Drive and 300' of 4" main in La Porte Road. The other two relocation projects are located in Rock Point Drive - 200' of 4" main and 300' of 6" main. Currently, the system relies upon the 4" line in Rock Point Drive to provide water to 20% of the services in this water district. With out the water mains in Herford and La Porte, a failure in the Rock Point line will effect these users. The repairs in Rock Point Drive are classified as preventive construction. The replacement in Hereford Drive and La Porte Road are critical replacements since these lines are currently inoperable.	M	0	C	The Jenner Water System serves 100 customers located at the confluence of the Russian River & the Pacific ocean and along highway 1. The geology is typically fragile, there are numerous earth slides within the community. Typically the movement of the soil causes failure to the water mains, especially those located on the side of the road toward the Russian River. Cal- Trans has stabilized numerous locations along hwy 1. The Water district has relocated pipe lines along hwy 1 in three locations and now the hwy is relatively stable. The main 6 inch main connecting the east side of the system with the west side is broken and cannot be repaired in the existing location. There are three locations where the water main must be relocated on the other side of the public roads. The District is currently completing a major upgrade to their surface water treatment plant and are using SRF loan funds to complete this task.	120,000	125	250 18	Sonoma	II	2009
2376	1500544	1500544-002	ENOS LANE PUBLIC UTILITY DISTRICT		Loop system	M	0	C	Dead end water lines	300,000	82	250 19	Kern	III	2006

2377	4300575	4300575-003	Twin Valley, Inc.	Wooden Water Storage Tank Replacement and expansion Storage Facility	EligibilityTwin Valley Inc. project is to replace and expand the current old Redwood Storage Tank (est. 95 years old) with Seven 20,000 gallon storage tanks at TWO DIFFERENT LOCATIONS on the TWIN VALLEY TERRITORY map. These seven 20,000 gallon tanks will be at 620 feet of elevation. These tanks will provide cleaner water without mice, bugs, and contamiants. Also will allow more water for highier demands when needed by users, because current storage limits the amount of water stored durring the pumping thoughout the night. With more storage more firer protection will be available, last summar we had 3 forest fires in our area and did not have enough water for even to fight one.Facilities to be constructed-First location construction--Replace Old Redwood (620 elevation) 33000 gallon storage tank with a 20000 intermediate pumping tank to pump to the 70000 steel tank at the current location, that is all that there is physical space for and is already plumb for with boster pump and 6"pipes to and from the tank. The 70000 Steel tank supplys a different set of customers in the system.Second location construction-Purchase a small lot of land from a Landowner on the Watsonville Road, actually a small hill top which is 610 to 640 feet of alittude for construtions of a base for water storage tank platform for six 20000 gallon water tanks.Notice all tanks will be at same elevation 620 -- balance water	M	0	C	Twin Valley, Inc. currently has two water storage tanks: One is a 33000 gallon Old Redwood wine tank (est. 95 years old) at 620 feet altitude and Two - a steel 70000 tank at 820 feet altitude. The Old Redwood wine tank need replacement and expansion with additional 6 other 20000 gallon tanks at a different location where there is more physical land space. The current Redwood tank pumps upto the 70000 gallon steel tank which feed another set of water users.Problem #1:Twin Valley, Inc. in the summar months pumps well #2 which has some Nitrates that is blended with Well#3 without nitrates. This blending of Well#2 and #3 together allows the nitrates level to be between 16ppm and 29ppm, which is acceptable standard of water. However the quanity of water bended out of these two wells plus another 3 wells offen fails to meet the quanity demands of the users at certain times of the day. because the limited storage of the size of the tanks vs the quanity of gallons able to pump from the wells over a given time period. Thus causing water outages usually after the morning spike in water demands. With more water tank storage the pumps can continue to pump thru the night, when now the current size of the storage would be full, but with the additional storage to hold the continuious pumping of water more water can be stored. Then when high demand is reached more water storage will be available to meet the highier	240,000	83	250 17	Santa Clara	II	2009
2378	5602117	5602117-003	STRICKLAND ACRES	Strickland Mutual Distribution Pipe and Lateral Replacement 2009	Upgrade 4” transite pipe to 8" PVC; estimated cost $660,000 based on 5280 linear feet at $125 per foot. Includes slurry pavement repair. - Replace Steel laterals with PVC; est. $150,000 based on 100 laterals at $1,500 ea. - Isolation valves; estimated $13,200 based on eight valves at $1,650 - Mobilization $35,000 - Traffic Control $25,000 - Trench Safety $25,000(Subtotal Construction: $908,200) - Water Company Administration / Permits $50,000 - Project Planning and Design (8%) $72,656 - Construction Administration & Inspection (8%) $72,656 - Contingency (15%) $136,230 ----------Total Estimated Project Cost $1,239,742	M	0	C	The distribution system contains 4" and 6" transite (asbestos cement) pipe, and a variety of steel black pipe and galvanized, and copper laterals. The steel laterals are old and restricted in flow due to corrosion deposits. This project would involve replacement of the 4" transite with 8" PVC, and replacement of the steel laterals with PVC. The objective is improvement of fire flow, and reduction and simplification of future maintenance. Notes: (1) This system serves 126 connections and at least six hundred individuals. The state database incorrectly indicates 256 individuals. (2) We can provide data that supports a disadvantaged community classification. The data are from a recent Ventura County sewer project covering Strickland Acres and El Rio, near Oxnard, CA. (3) In this application we are seeking grant monies, with only a nominal contribution from the area served.	1,227,000	130	252 06	Ventura	IV	2009

2379	3500006	3500006-002	CSA No. 31 Stonegate WS	Stonegate Groundwater Well and Delivery System	Design and construction of a groundwater well, connected by a 2,400 - 4,800 linear foot 6" pipeline from privately owned property to Stonegate's existing potable and non-potable water distribution system. It is estimated that this well capacity would need to produce 250 gpm to safely meet Stonegate's needs. The project also includes an inter-tie with Tres Pinos Water District, providing emergency water supply (fire protection) for Tres Pinos, and Stonegate an alternative potable water supply. As these two systems operate at different hydraulic elevations, requiring a a booster pump or a higher capacity well pump.The project also includes the replacement of meters, providing for the accurate recording of and billing by usage, encouraging water conservation. There are two meters/lot, or 148 meters. Finally, the new system will provide for the decommissioning of the existing water treatment plant.	M	0	C	The water system problem experienced by the residents of County Service Area (CSA) No. 31, Stonegate, is Category E: Water systems with water outages or significant water quantity problems caused by source water capacity or water delivery capability that is insufficient to supply current demand. The current water supply for Stonegate, County Service Area (CSA) No. 31, is provided through San Benito County Water District and is supplied by the Central Valley Pipeline. The water is piped in and treated for potable use by a water treatment plant owned and operated by San Benito County. This water supply is interruptible and its availability fluctuates. In 2008, Stonegate's water allotment was reduced to 75% of it annual usage. During the months of June, July, and August, its allotment was further reduced to only 30% of its annual supply. The water district has just informed the County that the water allotment for 2009-10 will be 45% of historical usage, or 92 acre feetThe severe water shortage in 2008 resulted in the adoption of Resolution No. 2008-86 by the San Benito County Board of Supervisors on August 5, 2008, declaring a water shortage emergency in CSA No. 31. The water shortage emergency has not been rescinded and is still in effect. There are 73 residents in the CSA and one common lot. Average day demand is estimated as 315 acre-feet/year, however, current water supply averages 220	1,470,000	74	252 05	San Benito	II	2009
2380	3500006	3500006-001	CSA No. 31 Stonegate WS		Re-coat tanks.	M	0	C	Interior coatings on the system's two storage tanks are failing and need to be restored.	100,000	74	252 05	San Benito	II	1998
2381	4900558	4900558-001	Belmont Terrace Mutual Water Company	Well Pump Upgrade Project	This project would abandon the 57-year old secondary well and replace our existing primary well pump and booster pumps to include: 1) New main well pump 2) VSD booster pumps 3) Replacement of electrical service/control panels. 4) New standby power generator 5) Automatic chlorine disinfection & alarm system. By upgrading our aging main well/pump motors, and capping the secondary well we can mitigate the potential risk of PCE contamination & nitrate levels. Replacing our main well pump we can eliminate using a lubricant that affects disinfection effectiveness. This project will improve production reliability to our distribution system and comply with State Waterworks Standards. The engineered pump and well design and materials will conform to applicable potable water well standards prescribed the the State of California Department of Water Resources, and the State Department of Public Health. This proposal is considered 'shovel ready'.	M	0	C	This project would upgrade and improve the efficiency of an aging mutual well pump delivery system which supplies drinking water for 85 homes. The Mutual Water Co. owns two groundwater wells and plans to abandon a secondary well that contains levels of nitrate exceeding the MCL and detectable levels of PCE. The well pump & twin booster pumps electrical service & system controls are currently in jeopordy of failing due to it's age. The well pump currently uses a lubricant that is released into the water. Lubricant accumulates in the storage tank and interferes with disinfection. The propane generator currently supplies back-up power to a stand-by well with problematic water quality.This generator is insufficient to run the main well pump and booster pumps.This community based delivery system has been properly maintained and operated by skilled and licensed homeowners for decades. In recent years water board has been carefully planning with professional engineers to perform the system upgrade to bring our system up to current Water Works Standards.	184,169	85	264 18	Sonoma	II	2009

2382	4900558	4900558-002	Belmont Terrace Mutual Water Company	Distribution System Replacement	This project would vastly improve the reliability of an aging distribution system in order to adequately supply drinking water and fire protection to this community.By increasing the size of AC mains to 8" it would increase pressure/volume to protect the 85 homes in the Terrace. New gate valves and hydrants are included in the upgrade.Also included would be a seismic upgrade of the cracked concrete storage tank to improve tank integrity and insure reliability and maintain health standards throughout the system.A delivery system redesign would also eliminate 'dead end' pockets, add needed blow off valves and include back flow devises to prevent cross-connections. These improvements would be necessary to complement the proposed well pumping portion of the overall system improvements. The improvements would insure the communities ability to independently, safely and reliably provide water to a community water system. The distribution system replacement will conform the all potable well water delivery standards prescribed by the State of California Department of Water Resources and the State Department of Public Health.	M	0	C	This project would replace an aging, undersized distribution system and bring it up to modern standards. The system was installed in 1952. It has undersized 4" asbestos concrete mains, ineffective wharf style hydrants, and leaky control valves. Concerns also include small cracks in a concrete storage tank(37K gals) due for replacement in this project. The tank needs a seismic upgrade to insure and provide reliability. The system has also experienced multiple copper service line leaks in recent years.The service lines are in need of individual meters at all 85 hookups for purposes of leak detection and as incentives for conservation efforts.The Water Co. has been digitally monitoring the static/dynamic groundwater well levels in recent years to build a data baseline. It appears this well sits on adequate groundwater supply for future delivery.A delivery system redesign would also eliminate 'dead end' pockets, add needed blow off valves and include backflow devises to prevent cross-connections. These improvements would be necessary to complement the proposed well pumping portion of the overall system improvements.Further aging and deterioration of the delivery system could result in undetected leaks and an inability to provide adequate fire protection to protect private property.	2,921,830	85	264	18	Sonoma	II	2009
2383	1900303	1900303-001	LLANO MUTUAL WATER COMPANY	Llano Mutual Water Company	The project is a community water system consisting of 80-99 connections and purchases water from Llano de Rio Water Co #1900849. The system is in need of an additional water source, upgrades to their treatment equipment and or water storage tank.	M	0	C	The Water System is in need of an additional water source to meet the demands of the community, i.e new ground well. All details can be provided by the LPA- LA County Water Quality Program.	500,000	80	264	16	Los Angeles	IV	2008
2384	2701364	2701364-001	PEDRAZZI MWC		Drill a new well and tie it into the existing system.	M	0	C	Water system needs to add a new well to improve supply reliability.	561,050	96	273	05	Monterey	II	1998
2385	4100503	4100503-001	BUTANO CANYON MUTUAL		Install new distribution system of high density polyethylene, with 96 metered connections and a new 40,000 gallon header tank at higher elevation.	M	0	C	Mains in poor condition, not in compliance with WW Standards., Low pressure.	450,000	92	276	17	San Mateo	II	1998
2386	4100503	4100503-003	BUTANO CANYON MUTUAL	Storage Tank Replacement	Project involves the purchase and delivery of two (2) new glass-fused-to-steel 60,000 gallon replacement tanks which will have to be down loaded from a 40ft flatbed to a smaller truck for delivery over 3 miles of a very narrow, winding road through a redwood forest. Erection of these two tanks will be completed on site after removal of exsisting steel bolt-up tanks which will need to be recycled. After in-depth study and research, we found this to be the most cost effective way to maintain our safe drinking water for the members of our mutual water company now and for generations to come. We also feel that these new tanks will allow us to continue to provide non-contaminated drinking water to our members.	M	0	C	After completeing a tank inspection and cleaning, it has been determined that our two (2ea) sixty thousand (60,000) gallon bolt-up drinking water storage tanks are in need of replacement due to old age, deterioration and interior rust. Tanks are located in a remote area which increases the cost of replacement due to additional circumstances involved in delivery and erection of these storage tanks. Our remote location has in the past caused us to not be reached by emergency response services in times of disaster. Therefore we feel it is important and necessary to have adequate drinking water storage contained in clean, rust-free, safe storage facilities. The physical state of the interior of these two tanks may also be the reason our Trihalomethanes test results are exceeding the MCL.	200,000	92	276	17	San Mateo	II	2007

2387	3200188	3200188-005	Greenhorn Creek Services District	Water Tank installation and well pump replacement	Greenhorn Creek Community Services DistrictProject DescriptionThe study completed by Shaw Engineering found that the existing water system does not have adequate storage facilities to meet the requirements for Operational and Emergency Storage.The Project includes installation of a 100,000 Gallon Storage Tank, 1,600 ft of 6" water main, a new well pump and controls at our existing well number 1.This project also includes the cost of the engineering master plan, and the preliminary engineering report. Project to provide a safe and reliable water supply to our community.	M	0	C	Greenhorn Creek Community Services DistrictProblem DescriptionThe Greenhorn Creek Community Services District is located approximately ten miles East of Quincy California. The CSD was formed in 1975 and provides water and fire protection to the community.The CSD contracted with Shaw Engineering in March 2005 to review the water system and make recommendations to correct the problems with our system. The Master Plan identified the need for additional Operational and Emergency Water Storage along with numerous repairs. This project would provide funding to correct the Water Shortage.The CSD contracted with Shaw Engineering in November 2005 to produce a Rate Survey and a Preliminary Engineering Report. The Preliminary Engineering Report, including environmental review, was completed and the CSD agreed to increase our water storage and bring our "Stand By" well into operation. The CSD completed the "218" process in June 2006. In July 2006 the CSD increased water rates to reflect the true cost of Operations and to provide money for Future Capital Improvement Debt Service. In February 2008 we obtained a loan from The USDA for $250,000 to provide partial funding for the estimated $265,000 project. I September 2008 Shaw Engineering reviewed the project and increased the Project Budget estimate from $265,000 to $400,000.In January 2009 A surveyor was	213,000	90	280 02	Plumas	I	2009
2388	3700859	3700859-001	RANCHO DEL CAMPO WATER SYSTEM	Well Improvement and Consolidation of Campo Water Maintenance District Systems	The Rancho Del Campo Water System requires urgent improvement of aging and worn wells, pumps, and associated equipment. The Campo Hills Water System faces serious water quality problems such as high concentrations of uranium, nitrate, iron, manganese, lead and copper resulting in high operational costs and health and safety concerns. The two systems currently have an emergency interconnection that relies on a booster pump and pressure reducing valves to allow supply to be conveyed between the systems. The deep-well Rancho Del Campo supply can be expanded to provide sufficient capacity to serve both of the water systems, resulting in a high quality, reliable water supply for the entire District service area.The Campo Water Maintenance District proposes construction of additional new drinking water wells. The water basin at Campo Hills area is shallower and contains higher concentration of uranium in comparison with Rancho del Campo. Proposed water wells shall be constructed within the Rancho Del Campo Water System to allow for consolidation of the Rancho Del Campo and Campo Hills Water Systems. The project includes construction of new wells, installation of submersible well pumps, installation of emergency generator, installation of one uranium treatment system, improvement of the system interconnection piping, fittings, and valves, and improvements to associated controls. Each well will	M	0	C	Campo is an unincorporated community located in southeastern San Diego County, California with a population close to 640. Water service for the community is provided by a County Water Maintenance District via two separate drinking water systems – Rancho Del Campo (RDC, ID: 3700859) and Campo Hills (CH, ID: 3710047). The RDC Water System serves 110 connections including residential, commercial, and public agency customers, including Border Patrol and Sheriff's Stations, Fire station, community purpose facilities, and health care facilities. The RDC Water System was originally constructed by the Federal Government in the early 1900's with ownership subsequently transferred to the County of San Diego in the 1940s. The system consists of two 110 ft and one 170 ft deep active wells with a total design capacity of 330 gpm, approximately 6 miles of distribution mains, and two storage tanks with a maximum capacity of 860,000 gallons. Groundwater from RDC Water System is treated for naturally occurring uranium contamination. The level of uranium and gross alpha monitored in the wells are 22-37 pCi/L and 27-32 pCi/L respectively exceeding MCL. A Boil Water Order for an E Coli present in sample and a Compliance Order for unauthorized release of uranium were issued for the water system in 2006 and 2008 respectively.Due to the age of the system, the existing well pumps are	2,500,000	110	290 14	San Diego	V	2009

2389	5800924	5800924-002	CAMPTONVILLE COMM. SERV. DIST	Camptonville Water Quantity Compliance & Upgrade	The preliminary budget and work plan submitted are based on an initial evaluation by Walters Engineering, Reno, NV. This project needs an engineered Scope of Work, then the Engineering Master Plan, a CEQA and California Department of Health permit. The Yuba County Water Agency will fund the cost of engineering this project this year.The water treatment plant's capacity will be expanded to provide up to 150,000 gallons of water a day. The expansion beyond the current 108,000 gallon a day is from one additional 22,000 gallon per day slow sand filter box as in the original plans - and installation of a green sand filter to remove the iron and manganese from the well water for another additional 20,000 gallons per day. Adequate space exists at the site for both of these units. The additional slow sand filter box will need to be enclosed and added on to the existing water plant structure. A space already exists for the green sand filter. Both the new filters will be plumbed into the existing distribution system. A new, reliable water source will be developed and connected to the treatment plant.Preliminary Work Plan and ScheduleMonth 1 (September-December, 2012)Task 1.Planning/Design/EngineeringSubtask 1.1 District water rights documentedSubtask 1.2 Groundwater capability documentedSubtask 1.3 Engineering/Design of new tank, additional filter boxes and plumbingSubtask 1.4 Determine new well site and	M	0	C	Camptonville has water quantity problems caused by periodic drought, insufficient water treatment and storage. Two year drought cycles have occurred five times in the last 20 years. In the late summer, Camptonville's water sources decrease substantially in volume. Climate change may increase periods of drought and low water source volume. The existing pipe from Camptonville's main water source, Campbell Gulch, can deliver up to 200,000 gallons of water a day to the treatment plant. Two stand-by wells are unreliable. For short periods, they can produce up to 20,000 gallons a day. These wells are not used except in extreme emergencies due to high iron and manganese levels.The water treatment plant and distribution system were built in 1990. The plant was originally designed for six sand filters but only five were installed. It has a chlorinator and a 64,000 gallon storage tank. The water distribution system has 72 connections, which includes a public school and three businesses. The bolted steel panel storage tank has been inspected and maintained. It is currently serviceable but will eventually need to be replaced. The treatment plant has a maximum output of 108,000 gallons a day. The three year average summer water use is 60,000 gallons a day. Peak usage on multiple summer days has been up to 120,000 gallons a day. The treatment plant at times is unable to supply the water demanded by users.	762,090	72	300 21	Yuba	I	2012
2390	3110042	3110042-006	Tahoe Swiss Village Utility	Tahoe Swiss Village Utility-Sierra Vista Ave. Water Storage Tank	Tahoe Swiss Village Utility (TS) would build a very much needed large diameter water storage tank. This 400,000 gallon bolted steel tank would allow the TS system have water for a full day of peak demands. There would be approximately 600 feet of 8" main installed to distribute water from this new storage facility. There would be valves and the telemetry system would be relocated to the proposed new tank. The exisiting 50,000 gallon tank could then be tanken out of service for a through rehabilitation and recoating. Then put back into service.	M	0	C	Tahoe Swiss Village Utility (TS) years ago, for a tank site, purchased a vacant lot for $12,000. This lot is adjacent to a very small 50,000 gallon water storage tank. This tank supplys storage for 95% of the TS system. Peak day demand is 400,000 gallons per day. When there is a source out of service water would not be available to serve its customers. American Waterworks Association standard practice recommend that a water systems have at least one day supply of water to serve its customers. Additionally, fire protection would be enhanced. The state and local fire protection laws require fireflows shall be available for two hours.	875,000	378	300 02	Placer	I	2009

2401	4300563	4300563-001	Mt. Pleasant Water Users Association	Old pipe replacement Mt. Pleasant Rd. toward Quimby Rd.	A water distribution line made up of war surplus pipe is in need of immediate replacement under approximately 1 mile of roadway. The pipe is rusting and has become very brittle. A major break in this line could drain the first level of storage tanks and leave much of the system dry until repairs are completed. This line has suffered increasing breaks recently and is highly susceptible to breakage due to minor earth movement and the heavier road traffic such as garbage trucks. The surplus pipe will be replaced with pvc and isolation valves will be added to provide a long-term, reliable delivery system.	M	0	C	Old surplus pipe from the 40's and 50's is in use to supply water users. This pipe was never intended to be used for as many years as it has. Breaks are becoming more frequent and more difficult to repair as it is extremely brittle. A large break could result in loss of water to most users and it would drain the first level of storage tanks.	250,000	70	300 17	Santa Clara	II	2008
2402	2910011	2910011-002	PlaVada Community Association	Water Well and Storage Tank Replacement Project	Specific proposed facilities included in this project are the following: Installation of a 130,000-gallon steel water storage tank on Assessor's Parcel 47-430-04. Construction of approximately 120 lineal feet of access road and about 200 lineal feet of 4-inch water pipeline to connect the new water storage tank to the existing Association water distribution system on Assessor's Parcel 47-430-04. Construction of pump station at the new well on Assessor's Parcel 47-180-000. Construction of approximately 1,900 lineal feet of 6-inch water pipeline on Assessor's Parcel 47-430-06 to connect the new well to the existing Association water distribution system. Installation of a pressure reducing station at the existing booster pump station. Construction of approximately 280 lineal feet of 4-inch water pipeline between Jeffrey Pine Drive and Manzanita Terrace on Assessor's Parcel 47-430-04. Construction of a small hydropneumatic pump station at the west end of Jeffrey Pine Drive on Assessor's Parcel 47-430-04 to provide ample water pressure for residents along Jeffrey Pine Drive.	M	0	C	The proposed project includes a new water well, a new water storage tank, water pipelines and appurtenant facilities for the Pla-Vada Community Association (Association) located in the County of Nevada, CA (County). The new well will replace a spring fed water supply that was previously taken out of service at the direction of the California Department of Public Health. The new water storage tank will replace an existing small redwood water storage tank that is substandard and unreliable. The new pipelines and other facilities noted below are required to connect the well and tank to the Association water distribution system and provide adequate pressures.	696,624	230	300 21	Nevada	I	2009
2403	1000056	1000056-001	MEADOW LAKES CLUB		Additional source and upgrade distribution system.	M	0	C	Water system currently has only 1 operating well for 132 connections. Distribution system is old.	2,500,000	129	300 23	Fresno	III	2004

2404	3110042	3110042-005	Tahoe Swiss Village Utility	TSVU Grand Ave. pipeline and highway 89 crossing	The proposed project is to replace 4" steel main ant to install approximately 1400 feet of 8" watermain, valves, fittings, three fire hydrants there is a bore or open trench dig across State Highway 89. The replacement of the old distribution main will enhance the public health and safety of the public, addtionally, fire protection will be enhanced. The rate payers will benefit with less energy used in the production water because the pumps will be much more efficient.	M	0	C	TSVU has two approved sources of supply and one unfiltered lake source that feed the entire service area. The two approved 250 GPM groundwater sources intersect at a four inch main. The hydraulics at that intersection create for inefficiencies of the two submersible pumps; therefore more electricity is used than necessary. Each pump increases its pressure, working against each other, which in turn means a loss of water production. The pumps are working outside of the recommended pump curve.	412,000	378	300 02	Placer	I	2009
2405	1500542	1500542-002	WILLOW SPRINGS MOBILE HOME PARK	DRILL A WELL FOR INCREASING SOURCE CAPACITY	FUNDS NEEDED TO DRILL A SECOND WELL FOR THIS WATER SYSTEM. 2408	1700526	1700526-003	Pine Grove Water System	PINE GROVE STORAGE TANK REPLACEMENT	The project entails meeting the surface water treatment rule, and must be thought of in those terms. The condition of these tanks goes beyond what might be deemed acceptable, and should be given the highest priority. The amount of the project may fluctuate due to the limited access for equipment, however the request is adequate to insure progress can be made.	M	0	C	The Pine Grove Water System is operated by the Cobb Area Coounty Water District under court ordered receivership.The system is considered "under the influence of surface water", and must meet the Surface Water Treatment Rule. Part of this requirement is to have adequate storage. Currently the four (4) redwood tanks that are in use are in very bad condition, leak excessivly and are structuraly unsound. Due to the terain the tanks are spotted in three different locations, and access to the tank sites is severely limited.The ability to continue to meet the Surface Water Treatment Rule is tenuous at best.	75,000	91	304 03	Lake	II	2009
2409	5500077	5500077-001	SLIDE INN SNOWBOWL WATER CO		Upgrade and replace existing pipelines and install new tank already purchased. OTHER-Refinance and Design	M	0	C	Water and pipelines 30 to 40 years old. Some existint pipe is not to PUC Standards. Waterlines running above surface-approx. 1000 ft.	125,000	100	315 11	Tuolumne	III	1998
2410	5500077	5500077-004	SLIDE INN SNOWBOWL WATER CO	Slide Inn Snowbowl Water Co Phase 2 - New Mains	Slide Inn Snowbowl Water Company Phase II – New Mains Project Scope. To be able to put in new water mains (20) (water infrastructure) this project will need an engineer consulted, the construction and manpower to remove old piping and replace 20 mains with new piping (valves, piping, modern fire hydrants, valve boxes, etc.), equipment rented for a length of time, other materials (sand, cement, asphalt, etc.), aqua testing when needed, and laborers. The project will require the participation of an engineer, equipment rental company, aqua testing company and laborers. Old piping would need to be removed and hauled away. The water district is located at 5,200 feet in the Sierra Nevada Mountains; we have a window of 9 months out of the year to work on this project. If funding can be made available, we would start this project at the end of March 2011 and work until the beginning of December 2011 and so on until it is completed. We have sent to the California Department of Health a map for your perusal to get an idea of area needing new mains. Having a new water infrastructure (20 new mains) would stop many of the water outages our customers have been experiencing for years and give our customers a reliable water source.	M	0	C	Slide Inn Snowbowl Water Company is requesting your assistance to complete our Phase II New Mains Project. Slide Inn Snowbowl Water Company is located in Long Barn, CA on Highway 108 in Tuolumne County. We provide water for 134 water connections (500 population) to individual property owners in the municipality of Long Barn. Documentation will show that we have more customers today 134 connections and the population of our area has increased as a result than what you have record for. 90% of the pipe that exists at the water company is antique 4” (Welded Steel Pipe - inadequate) and 40 to 50 years old; as a consequence, through the years has multiple breaks that have been patched everywhere. In more than half the area the piping is only 2”. The result is that customers consistently have water outages that last for sometimes hours or even days and the water pressure is low. There are a total of 20 mains in the Slide Inn Snowbowl Water Company and there is not a pipe that hasn’t been patched. The mains would consist of a total of 5 miles of pipe being replaced with 6 ” pipe giving customers adequate water pressure and allow every house to be readied for a meter. Much of the pipe is visible because of erosion through the years and as a result the piping is exposed and taking a beating. In recent times, we had a home burn to the ground and with that came the wake-up call of how crucial it is that	365,000	100	315 11	Tuolumne	III	2011

2411	4600017	4600017-001	R.R. Lewis Small WC		Replace 2300 feet of 2" and 3" pipe with 4" pipe. Install new storage reservoirs. Purchase emergency chlorination equipment.	M	0	C	Distribution system pressure and flow problems. Replace old concrete storage tanks.	230,100	124	324	02	Sierra	I	1998
2412	4600017	4600017-002	R.R. Lewis Small WC	Installation of permanent chlorination And storage facility replacement	Project is a B rated project. The primary purpose is to install a permanent chlorination facility and approximately 1200ft of piping to act as the contact tank prior to being inserted into the distribution system. The chlorinated water will be back fed into the the existing piping through connections to cover all services upstream of the new insertion point. All Anderson Spring Water will be chlorinated. In addition, an existing 5000 gallon spring storage tank will be removed and replaced with either two horizontal 10000 gallon or two vertical 15000 gallon steel tanks (Alternates A and B in the bid package). The water company has spent over 5 years finalizing a placement of the chlorinator facility and its design with the county planning and building department as well as securing the necessary permits to complete the project.	M	0	C	Currently operating under a Health Department Order to install permanent chlorination on the Anderson Spring since 2002. Have operated on a temporary system with the temporary permission of the forest service since 1999 in order to comply with health standards	286,500	124	324	02	Sierra	I	2009
2413	4600017	4600017-003	R.R. Lewis Small WC	Wixson and Unnamed Spring storage, piping and chlorination, plus system piping upgrades and deadend	1. Complete chlorination of both the Wixson and unnamed springs for the RR Lewis customers bringing all water used within its service area to chlorinated water as Anderson Spring is already being chlorinated. 2. An additional 30,000 gallons of storage available on a spring that collapsed three years ago leaving an entire area supported by minimum water for home use and trucked water for irrigation. Additional spring work will be done this fall to muck out the overburden in the tunnel area again. This storage will replace a 50 year old leaking concrete tank of 15000 gallon capacity which will be left on line for the mutual water companies.3. Replacement of 60 year old 2" pipe with a life of 40 years with 4" and 2" PVC piping eliminating a main area of leak repair for the water company and allowing service to the area from either spring as well as eliminating 2 dead end lines.4. Looping 4 other lines to eliminate dead ends and allow for continuous water flow.	M	0	C	Wixson Spring has been consistent in its violation of the bacterioligal standards. The unnamed spring, which is a part of this system, has not been able to be put on line for over 8 years as it will not meet coliform standards. Because this is a "shared" source with mutual water companies, they have refused to permanantly chlorinate, replace a 50 year old leaking concrete tank, or even to disinfect the system when required to do so in that they do not want chlorine in their systems. The State has not forced the issue of compliance with them but has put the issue of compliance at our door step. The proposal includes a complete separation of the system with our own tanks, lines, and chlorination for the benefit of our ratepayers so that we can have unlimited use of our water rights to these springs in order to serve safe water to our customers without having to incur the expense of maintaining the system unsupported. Our main spring, Anderson Spring, is already being chlorinated.The second portion of the project involves installing 2000' of piping to replace 2" orangeburg polypipe installed in the 1950's that is rapidly failing. In addition, there are 2 other dead end piping lines that must be looped (500') to eliminate their dead ends withing the existing distribution system. Our current Prop 50 project will eliminate 1 such situation.The project has a current application for engineering under Prop 218 that is still being	362,728	124	324	02	Sierra	I	2011

2421	4900570	4900570-003	Palomino Lakes Mutual Water Co.	Tank #2 replacement	Replace the existing 15,000 gallon redwood tank with a 25,000 gallon steel tank. Preliminary geo-technical work has been completed and shows the site suitable for the increased capacity. The redwood tank will be replaced with temporary storage (a tank or tanker) and dismantled. Following necessary base preparation, a bolt-together steel tank will be erected, filled and tested. Upon successful completion of testing, the tank will be brought on line and temporary storage disconnected and removed.	M	0	C	Tank #2, a thirty year old, 15,000 gallon redwood tank, is of insufficient capacity and is nearing the end of its useful life. This tank serves forty-five residential connections and is unable to support peak daily demand without repeated refilling during the day. The tank has minor leaks and seepage which contributes to algae growth on, and in the vicinity of, the tank. The tank has been damaged by woodpeckers and, since it has a large screened vent area, is subject to insect intrusion and to dust and dirt penetrating the screen.	45,000	110	340 18	Sonoma	II	2008
2422	3702354	3702354-002	WARNER SPRINGS ESTATES	Warner Springs Estates/Stone Ridge Well #8 Generator	Purchase and install a generator at Well #8. A concrete base, storage structure, propane and electrical connections, appropriate engineering consulatation, etc. will be needed. Propane lines run throughout the community and is the only fuel source; however, additional lines must be installed to this area and will require trenching, etc. for installation at Well 8. If it is not feasible to do this, a propane tank system will need to be installed at the generator site. This may involve a land environmetal study. Site preparation must be done. Engineers, surveyors and a project manager will be needed, plans drawn and approved, permits obtained, as well as interested professional companies contracted with to complete the work in accordance with all laws and ordinances. Due to Warner Springs Estates location, disposal of construction trash/ hazardous materials is costly, requiring the materials to be transported to approved disposal sites 40 or more miles away. Any damage to community streets will need to be repaired. The $200,000 is an estimate until professional engineers and other consultants can be funded to advise our homeowners associaton and management.	M	0	C	During power outages, water distribution/access is very limited and when outages are for long periods of time, without a generator to provide power to run the Well #8 pumping system, it is impossible to provide water to residents. Warner Springs Estates/Stone Ridge is located 8 miles north of Warner Springs and 30 miles south of Temecula is the 'San Diego Backcountry.' It is a 55+ incorporated condominium community pf 300 lots and approximately 400 residents--a 'mini city' with it's own wells, sewer treatment plant, electrical transformers, private streets, etc. which was established about 35 years ago. We are totally dependent on our well water with no access to other water sources in the area. During prolonged outages and until our 240,000 gallon water storage tank drains, limited water is available via gravity. Many of our older homeowners and those who are disabled are challenged without water and cannot relocate temporarily when these outages happen. In addition should a wildfire or other catastrophe occur, lack of water is a major concern, not only for our community but also for local, state and federal fire agencies who may access our fast-fill hose connection from Well #8 which pumps 150 gallons per minute. We are not a wealthy homeowners association and	200,000	227	340 14	San Diego	V	2007

2423	4900570	4900570-002	Palomino Lakes Mutual Water Co.	Tank #1a replacement	Remove the existing 15,000 gallon redwood tank and replace its capacity by adding to an existing adjacent 15,000 gallon bolt-together steel tank. The project involves the removal of the roof of the steel tank and adding an eight foot section to the tank. The additional section will increase the tank capacity to 25,000 gallons. The tank center support, overflow tube, ladder and gauge will be extended or replaced as necessary. The roof will be replaced and the tank filled and tested. Upon completion of testing, the steel tank will be brought on line, and the redwood tank dismantled. Preliminary engineering work has been completed and indicates that both the steel tank and its existing base are capable of supporting the capacity increase.	M	0	C	Tank #1a, a thirty year old, 15,000 gallon redwood tank, is nearing the end of its useful life. The surface of the tank is checked and deteriorated from weather damage and exposure. The tank has leaks and seepage which contribute to algae growth on, and in the vicinity of, the tank. The tank has been damaged by woodpeckers and, since it has a large screened vent area, is subject to insect intrusion and to dust and dirt penetrating the screen.	15,000	110	340 18	Sonoma	II	2008
2424	1510016	1510016-005	RAND COMMUNITIES CWD - RANDSBURG	Water Supply Pipeline Replacement	The proposed proejct is to replace the existing 7.4 miles of 4-inch pipeline with 6-inch C-900 PVC pipeline from the wells to the storage tanks. This will prevent critical water loss, especially in the current drought conditions, and reduce the potential for coliform bacteria contamination.	M	0	C	The existing water supply pipeline runs 7.4 miles from the wells up 1,470 feet of elevation via 3 booster stations to the storage tanks. The transmission pipeline from the wells is 4-inch Schedule 40 PVC and was not properly bedded in the mostly rocky area. RCWD has been experiencing very frequent pipeline leaks and repairs. As a result, the system suffers significant water quality and quantity problems and water supply outages because the water supply pipeline is unavailable or contaminated because of breaks and leaks.A citation for noncompliance was issued in May 2006 for exceedance of the total coliform maximum contaminant level (MCL) that most likely resulted from leaks in the pipelines.	3,900,000	295	344 19	Kern	III	2009

2427	4400571	4400571-015	DAVENPORT COUNTY SANITATION	Davenport Water Distribution Lines	Davenport Water Distribution Lines Replacement ProjectThe purpose of this project is to replace water distribution lines and service lines in the community of Davenport. Valves and blowoffs will be installed in appropriate locations. Minimum separation requirements will be established or maintained for water lines and sanitary sewer lines or septic systems. All work will occur within County road rights-of-way. Water line design and construction will conform to state standards and the requirements of CDPH. The project consists of the following components which are identified as the highest priority in the Capital Improvement Program: 1. Install blowoffs at the ends of Ocean, Davenport, Fair and Center streets2. Replace 2300' lf of undersized (less than 4" diameter) mains serving Old Coast Road (east of Fair Ave), western Marine View, and Third Ave., and other water mains in poor condition. Abandon all existing small diameter water mains3. Loop water mains. Construct a new water main along Highway One from Third Ave to First Ave and from Marine View to Fair Ave.4. Replace service lines from the water mains to the property line oredge of easement . 5. Replace main valves6. Install backflow preventers as required in accordance withTitle 17, Chapter V, Sections 7583-7622 of the California Administrative Code7. Identify illegal connections and add them to the system. 8. Keep the public informed	M	0	C	Davenport Water Distribution Lines ProjectSetting:The community of Davenport in coastal Santa Cruz County has a permanent population of about 400 residents. A 2008 income survey documents that the community has a median household income of $39,999 which classifies it as an economically Disadvantaged Community. The community is primarily residential. Davenport Sanitation District provides drinking water treatment and wastewater services to the community. Drinking water is supplied from San Vicente Creek . Citizens of Davenport have been under boil-water orders periodically since 2005, because the water treatment plant does not meet the California Surface Water Treatment Rule (Title 22, Sections 64650-64666). The water system does not meet state treatment standards for turbidity, Giardia or Cryptosporidium. Residents receive quarterly notifications warning them of potential health risks associated with the drinking water. The most recent notice was issued in February 2009. The treatment plant will be upgraded in 2009 with funding from: increased rates, assistance from a CDPH SDWSRF loan and grant, and a Prop 50 IRWM grant from the State Water Board. The District has also applied for Economic Stimulus funding for the treatment plant as a precaution, since repayments on Prop 50 grants are "frozen" indefinitely, .Problem to be Addressed With This Funding: The water distribution	530,000	130	350 05	Santa Cruz	II	2009

2428	4400539	4400539-001	MANANA WOODS MUTUAL WATER CO		Replace lines, and install shut-off valves, meters, and purification filters.	M	0	C	Pipes are aging and decaying.	50,000	109	350 05	Santa Cruz	II	1998
2429	3700924	3700924-004	LAKE MORENA VIEWS MW CO.	Consolidation of Lake Morena Views with Lake Morena Oak Shores	the initial desire was to replace the treatment system but that does not rank well and is expensive for O&M so consolidation is being considered. The other system, Lake Morena Oak Shores,is willing to discuss the concept and participate. Their system is only a block away from our system and should involve a simple tie in. Tie in sould include under 2000' of 8"-12" piping and associated valves.	M	0	C	Lake Morena Views water system consistantly exceeds the MCL for uranium and nitrates requiring continued treatement and blending. The treatment system is old and could need replacement at any time. Costs are such that treatment may not be affordable.	250,000	120	350 14	San Diego	V	2009
2430	3500509	3500509-002	Tres Pinos CWD	Tres Pinos Water District - Waterworks Improvement Project	The waterworks improvement project includes two new 250,000 gallon water tanks, land purchase for tank site, new 800 gpm well, 12" pipelines: (Southside to Quien Sabe along Bolado; Third St., F to Airline; First St., F to Airline; Airline to Fifth St, down Southside) totaling 7,370 lf. This project is needed to provide fire-flow to the residents of Tres Pinos and allow for new growth.	M	0	C	The waterworks improvement project will supply fire flow to a community that currently does not have adequate fire flow; it will lift the moratorium on new connections which has been in effect for over 10 years. It also includes pipeline improvements which will replace aging pipes to provide reliable water supplies.	1,666,350	113	350 05	San Benito	II	2007

2432	3301031	3301031-001	BANNING HTS. MUTUAL WATER CO.	System upgrades and storage improvements	Project will recoat/reline the 1 million gallon storage tank,and replace over 4000 feet of distribution and water main lines thus eliminating water loss and contaminations from line breaks.	M	0	C	System is old and failing. A new treatment system has been installed but now pipes need replacing and the water storage tank needs recoating to prevent water loss throughout the system and to minimize Bac T issues.	350,000	153	350 20	Riverside	V	2011
2433	5601105	5601105-001	FILLMORE IRRIGATION CO		Construct a new tank (125,000 gallons) at site that includes soil compaction, pad, erect new tank with earthquake anchors and signal devices for well pump.	M	0	C	Water storage capacity (125,000 gallons) does not meet title 22, water works standards requirements or the system size (150 service connections)	90,000	158	355 06	Ventura	IV	2002
2434	5601105	5601105-003	FILLMORE IRRIGATION CO	Well Replacement	The Board has elected to pursue the drilling of a new well in order to correct possible severe water shortage or outage problems caused by source watercapacity that is insufficient to supply current and/or unanticipated demand.Based on the previous development of Well #3, this is the preliminary estimate of activitis and costs needed to establish a new well: Permits, fees: $ 5,000Drill (200'): $150,000 Pump: $ 40,000 (based on 200HP motor, casing, pipe, bowls)VSD: $ 15,000 (does not include labor nor SoCalEdison incentive)Water works: $ 20,000 (gate valves, flow meter, check valve, surge tank)Infrastructure: $ 10,000 (slab, pump house)Electrical: $ 15,000 (parts & labor, elec panels, entrance)Misc Labor: $ 15,000 (welding, connection to existing distribution lines)Total to establish new well: $270,000Estimate does not include: survey costs for well placement and explorary drilling as well as purchase price for the land and any additional unanticipated labor and parts. This is estimated at approximately $50,000 in additional to the above amount.	M	0	C	In the spring of 2010, well #2 owned by Fillmore Irrigation Company (FIC) began to experience issues with the pump sucking air, causing reduced capacity and potential for extensive damage to our distribution system.Well #2 was drilled prior to 1950 and was re-lined approximately 10 years ago with a mild steel, wire-wrapped liner. There is no existing documentation on the re-lining due to the company which performed the work ceasing operations. Apparently, all documentation was either lost or destroyed resulting in no engineering information as to the reason the well was re-lined nor the condition of the original casing at that time of re-lining.Video logging shows about 95% reduction in capacity for this well. Due to the age of the well, the major contractors in this are feel that there is significant risk in re-establishing this well. Therefore, the FIC Board has taken the well off-line, leaving us with a single source (well #3) that is at or near capacity for FIC needs, especially during the summer months. There is no easy way to establish an interface with a neighboring water company to serve domestic water. The Sespe Creek is adjacent to our service area, not allowing us to interface with the largest supplier in the area -- the City of Fillmore -- and the other water company in the area does not serve domestic water.This leaves the Company in dire conditions if our primary well fails.	250,000	158	355 06	Ventura	IV	2011

2442	5400544	5400544-002	ALLENSWORTH C.S.D.	Allensworth Water Supply Reliability Project	Per the recommendations of the electrical engineer retained to assess the problem and recommend a solution, the proposed project solution is to install a radio telemetry system that will enable District personnel to read well and pump data from the District office, and control pump operation accordingly. This will end the system's dependence on the pressure system to control pump operation. Additionally, to address the water hammer problem, it is recommended that a 1,250 gallon hydro-pneumatic tank be installed at the well site. In addition, replacement and or bypassing of the electrical imbalance protector at Well #2 will be necessary.	M	0	C	The problem to be addressed by this project is twofold. The most urgent problem is that the newer and larger of Allensworth's two pumps, the 20 HP submersible, will not stay online (located at Well #2, west well), for reasons that have to do with an electrical imbalance and a "water hammer" effect caused by a pressure-based switch system and the long (3 mile) pipe length between the wells and the storage tank. The maintenance man is required to drive the 2-mile dirt road to the well sites to manually switch the pump back on, sometimes as often as 3 times per day. This road becomes impassable in the wet season, and is difficult to travel even in the dry season. Secondly, the well with the smaller pump (#1, east well, 7.5HP submersible) is borderline for arsenic contamination (with levels of 9-12ppb). To achieve proper blending of the water from both wells, as well as meet the community's demand for water, it is necessary that the pump on Well #2 be functioning correctly.	200,000	110	400	12	Tulare	III	2009
2443	1900146	1900146-002	SUNNYSIDE FARMS MUTUAL		DRILL NEW WELL.	M	0	C	WELL IS CURRENTLY UNDERPRODUCING.	15,000	139	405	16	Los Angeles	IV	1998

2445	1300616	1300616-004	PALO VERDE COUNTY WATER DIST.	Potable Water Pipeline	The project will tie two existing RV Parks into the PVCWD water system. The project will include approximately 2.5 miles of 8-inch C-900 PVC water pipeline from the southernmost termination of the existing PVCWD system. The pipeline will include required valves and other miscellaneous fittings to provide a system that will be able to provide healthy treated water to the RV Parks. A distribution pump station is not required as PVCWD has just installed a new one that is capable of delivering the additional flows for the proposed project, nor is any additional storage is required.	M	0	C	There are two mobile home parks approximately 2.5 miles southwest of the termination point of the existing water pipeline that belong to Palo Verde County Water District (PVCWD) - Two Palms and Coco Palm Mobile Home Parks. These parks do not have any water treatment facilities to provide healthy water to serve the residents of this park. These facilities are using well water from a local lagoon that has been found to contain outlawed pesticides and other deleterious contaminants. The proposed project would bring a potable water pipeline from PVCWD to serve the residents of these parks with potable water.	2,000,000	161	410 14	Imperial	V	2009
2446	1300616	1300616-005	PALO VERDE COUNTY WATER DIST.	storage tanks	Improve water quality by removing rust & iron content. Vehicle travel across the only access to the island property causes stress and breaks on the current pipeline.	M	0	C	Our two storage tanks (sizes 29' x 24' H) need major repairs. The metal covers are badly rusted and in need of replacement. The 8" inflow pipes are rusted and need replaced on the inside of the tanks. The bottom & sides need to be recoated. The inside ladder needs replaced due to rust. County Health Dept. requirement.Need to replace the 8" ductile distribution pipe under the 4th St. bridge, which currently ties beneath the bridge. Need a directional bore beneath the waterway, and replace with PE pipe.	450,000	161	410 14	Imperial	V	2011

2450	5301003	5301003-002	Lewiston Park MWC	Lewiston Park Mutual Storage Tank	Addding a second storage tank (<100,000 gallons) would allow the water system to manage their source capacity problems in the summer time. Additional storage would also greatly benefit Lewiston's ability to manage fires.Cost Basis:Replacement 100K gallon tank (materials, installation, painting)- $150KDesign $10KMob/demob and earthwork $20KFoundation $10KPermitting/easements $5KProject Management... $10K	M	0	C	Problems:1. Source Capacity. Lewiston Park Mutual is supplied by groundwater wells year-round. However, they are unable to meet demand in the summer, and must supplement with surface water. California's drought and declining water table elevations have increased their source capacity problems.2. Fire Flows. Lewiston does not have adequate fire flow capacity. The loss of homes during the Lewiston Fire was extensive, largely due to limited available storage.	205,000	162	450 01	Trinity	I	2009
2451	1900649	1900649-001	GOLDEN SANDS MOBILE HOME PARK	Golden Sands Mobile Home Park	The project is a community water system consisting of 152-199 connections and a treated ground water source. The system is in need of an additional water source, upgrades to their treatment equipment and or water storage tank.	M	0	C	The Water System is in need of an additional water source to meet the demands of the community, i.e. new ground well. All details can be provided by the LPA- LA County Water Quality Program.	500,000	152	450 16	Los Angeles	IV	2008

2452	4400598	4400598-005	PURESOURCE WATER, INC	SCADA Control System	Project would consist of installing sensors of appropriate types at each of two wells, a booster pumping station and at a storage tank. It would connect these stations via land-line data transmission which would be internet-available, so that monitoring could be done from any computer with on-line access.The system would include battery backup so that it would be operational even during power outages.	M	0	C	Present system requires physical on-site monitoring. There is no method of providing emergency notification. It is possible to have either over-pumping or under-pumping. Over-pumping wastes power and water. Under pumping can lead to system shortages and possible de-pressurizing of the mains, leading to the possibility of contamination.There is currently no practical way to monitor pump performance nor to warn of pump or power supply problems. Because of its mountainous terrain, the system is vulnerable to power outages. The power may be off for only a few minutes, but when restored it sometimes has a phase out or reversed phases. These can lead to pump damage.The proposed Supervisory Control and Data Acquisition (SCADA0 system would also offer supervisory viewing of the system components, permitting a supervisor to observe the system and provide guidance to an on-site worker in case of an emergency. A SCADA control system would provide a simple solution for these problems.	40,400	79	450 05	Santa Cruz	II	2009
2453	0105008	0105008-001	Castlewood Domestic Water System	Castlewood Storage Tank Replacement	The project would include demoltion of the existing redwood tanks, grading and earthwork, foundation construction, installation of 2 - 100,000 gallon bolted Steel Tanks included cathodic protection and exterior and interior coatings, replacement of the existing SCADA system and installation of a 10 inch drain pipe for overflow.	M	0	C	The County of Alameda maintains the domestic water supply for the Castlewood County Service Area through a contract with California Water Service. The system consists of two levels, the lower level supplied by a steel tank and the upper level supplied by two Redwood Tanks. Based on the 2008 Annual Inspection Report performed by the California Department of Public Health, the report observed evidences of leakage at the Redwood Tanks and recommended corrective actions be taken. California Water Service had prepared a redwood tank replacement feasibility study in 2007. The County of Alameda hired a consultant to provide an engineering assessment of the Redwood Tanks since the age of the structures were in question. The report recommended that "the structures be taken out of service, demolished and replaced. The redwood water tank structures have poor seismic detailing that could cause failure during a strong seismic event. The seismic capacity is estimated to be approximately 35% of the capacity required in accordance with current building code standards". Based on this the County is proposing replacement of the Redwood Tanks.	1,700,000	190	499 04	Alameda	II	2009

2454	3103836	3103836-003	HIDDEN VALLEY COMMUNITY ASSOCIATION	Hidden Valley Community Assoc Domestic Supply System Replacement	Hidden Valley Community Assoc. (HVCA) project is shovel-ready replacement of our 60-year-old domestic water supply lines, which run in our dual domestic/irrigation system. Public Water Supply Permit #3103836 issued Directives #2 and #3 under Citation #2008-35 to replace the existing distribution system.Phase 1 completed engineering, plans, specs, and pre-qualified bids. Engineering determined CIP alternative of incremental replacement of domestic lines would not be CWA compliant due to close proximity of the two distribution systems. This replacement Project will bring our supply system compliant with primary drinking water standards, and replacement of this aged infrastructure would enhance long term reliability, pursuant to SDWSRF goals in Intended Use Plan.This Project installs 16,201 lf of 8-in PVC class 900, and 368 lf of 4-in PVC. Project will have disinfection capabilities, backflushing, and gasketed bell joints. Placement of domestic lines would be at CWA standards of separation from existing deteriorated irrigation lines. Conservation of domestic water is achieved by irrigation water safely remaining for homeowner yards and livestock. HVCA D-1 operator finds this Project will reduce breakages, outages to all homes, susceptibility to contamination into domestic lines, and remove potential contamination from asbestos cement lines.32 new Steamer full-flush fire	M	0	C	Hidden Valley Community Assoc (HVCA) urgently requires complete replacement of 60-year-old Domestic Water Distribution Lines. HVCA owns a water plant supplying both irrigation lines of canal water, and domestic water supply to 163 full-time residence homes. Domestic Supply system has mixed pipe types: 4-in PVC glued bell, and 4-in asbestos cement pipe (AC), with some 6-in AC at meter. And 6-in and 4-in steel, badly rusted. All domestic water to 430 residents flow through rusted steel and AC sections. Many leaks are on glued bell 4-in pipes. There are no CWA standard gasketed bells. No water meters are on exiting system beyond delivery point, as raw water was initially purchased for treatment by HVCA.Irrigation lines to each residence conserve domestic treated water, but risk cross-connections. 164 Backflow Preventers (BFPs) were purchased in Phase 1, but installation deferred due to deterioration, age, type and sub-standard close proximity of existing domestic and irrigation pipes. BFPs are subject of Citation #2008-35 by Placer County Health and Human Services (HHS) and two Directives (#2 and #3) under Conditional Public Supply Permit PWS # 3103836.Purchase of treated water from Placer County Water Agency (PCWA) began 1991, but HVCA distribution lines remain badly leaking, incapable of disinfection, and CWA sub-standard. Frequent repair-in-place breaks allow mud, particulate from sawing, and	1,950,000	161	499 02	Placer	I	2012
2455	3103836	3103836-001C	HIDDEN VALLEY COMMUNITY ASSOCIATION	Hidden Valley Safe Drinking Water and Regulatory Compliance Project	Hidden Valley Community Association (HVCA) formed a Water Task Force in 2004 to address its water deficiencies. The Psomas Corporation, Roseville, was hired to do an analysis and make recommendations. Based on the Psomas work, and the Task Force's own knowledge of the water systems and study of potential solutions, HVCA decided to pursue building a complete new domestic water system as opposed to patching up a system inadequate for water safety, water conservation, and fire protection. Partitioning the three mile plus system into five or so smaller systems for engineering and construction was considered but dropped as impractical for a variety reasons. HVCA Water Task Force asked the Placer County Water Agency (PCWA) for assistance in 2007. PCWA submitted a concept for a new domestic system that HVCA determined to purse. In 2008 HVCA approved a special assessment of $118,000 to hire the engineering firm of Giuliani & Kull, Auburn to engineer a new domestic water system. HVCA was surveyed in the fall of 2008 and the engineering was completed in February of 2009. The new domestic system meets code requirements for pipe routing (sewer and irrigation), includes backflow preventers (preventing possible contamination from cross connections on residential lots), hydrants for fire safety and metering of individual lots to encourage water conservation.Before receipt of	M	0	C	HVCA water systems were originally constructed in the 1950s. Canal water from PG&E was diverted to a small water treatment plant for drinking water purposes. A separate irrigation water system had a pump also sourced by canal water. The piping for this dual system was a mixture of whatever materials were available and inexpensive. The pipes were side by side in shallow ditches to mitigate trenching in the abundant granite of this area. The lack of maps or any documentation is not surprising.In the 1960s, section by section, the drinking water system was reconstructed with 4" PVC with glued joints. The work was done by the community caretaker and volunteer residents. The lack of any engineering for maintenance and safety is evident as the domestic system does not contain any air release valves, hydrants for fire safety , or backflow preventers, and had only two blow off valves for the entire three plus miles of piping. The pipe for this system was placed in close proximity to the irrigation and older domestic pipes.Our 45 year old PVC system experiences numerous glue joint failures common to installations of that era. While there are some isolation valves, the lack of ARVR's and limited blow offs makes proper flushing and sanitation after one of our frequent breakages an immense and sometimes impossible task. In 1991 the water treatment plant was abandoned. The domestic system was connected to Placer County Water Agency	3,500,000	161	499 02	Placer	I	2009

2456	4910020	4910020-010	Sonoma County Water Agency	Water Transmission System Air Valve Replacement Project	Sonoma County Water AgencyWater Transmission System Air/Vacuum Relief Valve Replacement Project DescriptionSafe Drinking Water State Revolving Fund LoanThe objective of the Water Transmission System Air/Vacuum Relief Valve Replacement Project (Project) is to upgrade and standardize the combination air/vacuum relief valve (ARV) stations along the Santa Rosa, Cotati, Petaluma, Oakmont, Sonoma, North Marin, and Forestville aqueducts. ARV's are situated at high points along the pipeline and after long, flat sections (about one half mile) of pipe. ARV's are housed in valve vaults. The ARV's relieve air entrained in the water and relieve air from the pipeline during pump start-ups (i.e., line pressurization). The ARV's also allow air to enter the pipeline during pump shut downs (i.e., line depressurization). The aqueducts and their associated appurtenances were constructed in the fifties and sixties. Therefore many of the air valve stations are at the end of their useful lives. The aqueducts currently have several styles of air valves from different manufacturers, all of which require different parts and make maintenance difficult. In addition, the California Department of Health Services (DHS) requires air/vacuum relief valves for potable water transmission systems to be vented above grade. The vent piping at some of the ARV stations will need to be modified to meet this requirement.At each station,	M	0	C	Sonoma County Water AgencyWater Transmission System Air/Vacuum Relief Valve Replacement Project DescriptionSafe Drinking Water State Revolving Fund LoanThe objective of the Water Transmission System Air/Vacuum Relief Valve Replacement Project (Project) is to upgrade and standardize the combination air/vacuum relief valve (ARV) stations along the Santa Rosa, Cotati, Petaluma, Oakmont, Sonoma, North Marin, and Forestville aqueducts. 2457	4910020	4910020-014	Sonoma County Water Agency	SCADA System Security Enhancement	The EPA-approved Vulnerability Assessment (VA) recommended that SCWA implement water system security countermeasure improvements that have not as yet been implemented:o Disconnect the SCADA LAN from the SCWA business LAN and restrict access to only those operators who are responsible for SCADA operation. o Train SCADA staff on new SCADA system operationso Install secure password programming on the SCADA system requiring stricter password requirements and automatic password expirationo Reconfigure SCADA operator laptop computers for total dedication to the SCWA SCADA system, with no ability to connect to the SCWA network, non-SCADA dial-up services, or to the Internet. SCWA proposes to implement these measures because they would significantly reduce the risk of cyber terrorists accessing the SCADA system through SCWA's a) Internet, b) non-SCADA dial-up services, and c) business network with over 200 computer work stations that can be accessed by employees and other visitors to SCWA's offices.	M	0	C	The Sonoma County Water Agency (SCWA) is a wholesale potable water provider to 700,000 people (including transients and tourists) in two counties (Sonoma and Marin) through nine public water system contractors. SCWA operates a Supervisory Control and Data Acquisition (SCADA) system that serves as the computer-based machine interface that controls the related mechanical and electrical assets of the water system, based on real-time feedback and pre-programmed data.The SCWA EPA-approved Vulnerability Assessment (VA) identified the SCADA system as a significant critical asset vulnerable to cyber terrorism and recommended security countermeasure improvements. This project proposes to implement those improvements that have not yet been implemented.The VA documented numerous existing SCADA security measures but also identified the weaknesses that increase the cyber terrorism risk to water system operation:o A router connects the SCADA LAN to the SCWA business network and Internet used by more than 200 employeeso Use of short passwords and lack of password renewal systemo Remote computer equipment used to access SCADA may not always be secure The SCWA water system and SCADA system operate continuously. The SCADA system gathers data, monitors a multitude of process parameters, operations, and alarms, and maintains	100,000	136	500 18	Sonoma	II	2009
2458	3110015	3110015-001	Fulton Water Company	Pineywood Well Tank Replacement	we will replace two small water tanks dating form 1937 with a single larger tank. The current capacity of the two tanks is 22,000 gallons. The new tank will hold 110,000 gallons. We will also install a backup generator with automatic start controls, plus rebuild the existing pump house.	M	0	C	The Fulton Water company has limited storage for the entire water system. This project will increase our storage capacity at this well pumping station from 22,000 gallons to 110,000 gallons. Also we will have an automatic generator power back up system for when power goes off during winter storms, or we loose power from a fire. We installed a new well at this location two years ago, and now we have 320 gpm production from the new well. The next phase of improvements will be to increase water storage.	150,000	899	500 02	Placer	I	2011

2459	1500409	1500409-001	BROCK MUTUAL WATER COMPANY	Brock Mutual Water Company-Consolidation with Vaughn WC	This is for an emergency intertie project. Vaughn Water Company's pipeline is less than 1,000 feet from Brock Mutual WC. As part of the project new distrbution system, meters, and service lines will be installed.NOTE: This record was added by CDPH (Mark Bartson) in response to the email from the water system on September 22, 2008 which indicated that they had intended to submit two preapplications through their CDPH District office - Jesse Dhaliwal. - Mark Bartson 10/24/08	M	0	C	Brock Mutual Water Company's well produces water with nitrate above the MCL of 45 mg/L. The Water Company is in violation of the nitrate MCL.	65,000	155	500	19	Kern	III	2008
2460	2800526	2800526-004	Napa County Public Works-LBRID	LBRID Water Tank Replacement and Distribution System Upgrade Project	This project shall replace all three of the District's redwood water storage tanks with new pre-stressed concrete tanks. One of the 100,000 gallons tanks would be replaced with a 300,000 gallon, the other 100,000 gallon tank would be replaced with a tank of equal capacity, and the existing 200,000 gallon tank would be replaced with a 300,000 gallon tank. The increase in total storage capacity is to ensure adequate water supply for fire protection and residential uses.Additionally, all mechanical and electrical equipment associated with the two lift stations shall be replaced and a state of the art SCADA system shall be installed for remote monitoring purposes.The project shall also replace broken gate valves within the distirbution system, and repair/replace any compromised fire hydrant units.These improvements will ensure an adequate, continuous, and stable water supply for both residential and fire protection purposes in the future.	M	0	C	The LBRID distribution system was installed in the mid to late 1960's and consists of 28,000 feet of distribution pipe, two 100,000 gallon and one 200,000 gallon redwood water storage tanks, two lift stations, 96 gate valves, three pressure reducing stations, and 43 fire hydrants. The District is currently pursuing replacement of the water storage tanks and needs to replace the lift stations, install SCADA equipment for remote monitoring of the tanks, replace broken gate valves, and replace fire hydrant units where needed to meet fire demands.All three of the District's water tanks are at the end of their useful life. This is evidenced by the degradation of the redwood staves holding the tanks together, the listing of one of the 100,000 gallon tanks. Additionally, the results of a recent seismic evaluation of all tanks revealed that due to their proximity to several large regional faults (within 20 miles) and also to the Hunting Creek-Berryessa Fault (1.1 miles), at full capacity the structural integrity of the tanks would be compromised during an earthquake of magnitude 4.5 or greater. Failure of any of these tanks would cause an immediate and extended water service interruption for the community. Additionally, the water storage tanks are the only source of water for fire protection, should the tanks fail, or should capacity of the tanks need to be reduced to meet seismic regulations, the District will not have sufficient water for fire protection.In addition	3,000,000	180	500	03	Napa	II	2009
2461	4910020	4910020-012	Sonoma County Water Agency	Water System Isolation Valves	The Sonoma County Water Agency (SCWA) proposes to strategically locate isolation valves to reduce the vulnerability of its water systems to impacts from natural hazards including earthquakes, floods, mudslides, landslides and wildfires, and to minimize the potential for uncontrolled release of water.SCWA proposes to install 30 remote operated and seismic isolation valves, both of which require an emergency power supply, such as UPS or battery, to operate. These power supply systems will require regular maintenance. The remotely-operated valves in some of the proposed locations require a large vault and an above-ground cabinet. The size of the vault needed for a motor controlled valves is larger than that for a manual valve. Some of the components of these valves and the control system (such as SCADA antenna) will be installed above ground.	M	0	C	The Sonoma County Wataer Agency (SCWA) has prepared a Reliability Study, a Vulnerability Assessment, and a Local Hazard Mitigation Plan for its water systems. SCWA believes that the upgrades and safe operations of its systems require an ongoing program in which the most obvious vulnerabilities and those with the highest probability of occurrence are mitigated first followed systematically by vulnerabilities with lower probabilities, or newly identified vulnerabilities based on new information, with a continued improvement in the reliability of the system. The proposed project would implement recommendations in the plan to install isolation valves at strategic locations system-wide to reduce the overall system vulnerability by adding redundancy to the system and by enhancing SCWA's response through better monitoring of its system.	3,100,000	136	500	18	Sonoma	II	2009

2462	2800526	2800526-005	Napa County Public Works-LBRID	LBRID Water Tank Replacement and Distribution System Upgrade	This project shall replace all three of the District's redwood water storage tanks with bolted steel tanks. One of the 100,000 gallons tanks would be replaced with a 110,000 gallon tank, the two remaining tanks (100,000 and 200,000 gallons) would be replaced with tanks of equal capacity. The increase in total storage capacity is to ensure adequate water supply for fire protection and residential uses.Additionally, all mechanical and electrical equipment associated with the three pump stations shall be replaced and a new SCADA system shall be installed for remote monitoring and delivery purposes.The project shall also replace broken gate valves and pressure reducing stations within the distribution system, and repair/replace any compromised fire hydrant units.These improvements will ensure an adequate, continuous, and stable water supply for both residential and fire protection purposes in the future.	M	0	C	The LBRID distribution system was installed in the late 1960's and consists of 28,000 feet of distribution pipe, two 100,000 gallon and one 200,000 gallon redwood water storage tanks, three pump stations, 96 gate valves, three pressure reducing stations, and 43 fire hydrants. The District is pursuing funds for the replacement of the water storage tanks, upgrades to the three pump stations, installation of SCADA equipment for remote monitoring of the tanks, replacement of gate valves and pressure stations, and replacement of fire hydrant where needed to meet fire demands.All of the District's water tanks and pump stations are at the end of their useful life. This is evidenced by the degradation of the redwood staves providing structural support for the three tanks, and the listing of one of the two 100,000 gallon tanks. Additionally, the results of a recent seismic evaluation of all tanks revealed that due to their proximity to several large regional faults (within 20 miles) and also to the Hunting Creek-Berryessa Fault (1.1 miles), at full capacity the structural integrity of the tanks would be compromised during an earthquake of magnitude 4.5 or greater. Failure of any of these tanks would cause an immediate and extended water service interruption for the community.The water storage tanks are also the only source of water for fire protection. 2463	4910020	4910020-015	Sonoma County Water Agency	Water pipeline, storage tanks, booster pumps - Cotati to Kastania tanks	To ensure the reliable delivery of drinking water, the project will include construction of an additional pipeline, water storage tanks, booster pumps, and related facilities between the existing Cotati tanks and the Kastania tanks in southern Petaluma. The project would consist of 85,000 feet of 42-inch to 48-inch diameter pipe. Three steel water storage tanks, booster pumps, and appurtenances would be constructed to provide adequate water storage. Tank capacity would range form 4 to 17MG per tank. The project would also include an aggressive water conservation element.	M	0	C	Capacity of current aqueduct between Petaluma and Cotati is exceeded during summer months. The ability of the aqueduct to reliably deliver drinking water is compromised during this period. Customer demand exceeds the design capacity causing significant stress on portions of the transmission system infrastructure in addition to resulting in high energy use. The pipeline has been in continuous service since 1959. Redundant or parallel facilities are needed to be able to take the pipeline out of service for maintenance and to ensure that service will continue in the event of a failure. For the Petaluma aqueduct, in order to meet existing demand, water is currently pumped at a higher velocity than the designated operational velocity. This creates more wear on pumps and reduces the useful life of the pipeline. Even at excessive flow rates, demands at certain times of the year exceed the delivery capacity of the aqueduct.	80,000,000	136	500 18	Sonoma	II	2009

2464	4910020	4910020-017	Sonoma County Water Agency	Water Transmission Pipeline Hazard Mitigation - Russian River Creek Crossing	The goal of this activity is to mitigate the loss of an essential service to 600,000 residents and businesses that would result from a moderate or severe earthquake along the Rodger's Creek Fault causing a failure to the Russian River-Cotati Intertie. This goal will be attained by completing the following mitigation objective(s): 1. Modify the Russian River-Cotati Intertie to improve its ability to withstand the affects of an earthquake and minimize the liquefaction and lateral spread hazard resulting from an earthquake along the Rodger's Creek Fault at the Russian River crossing.Other objectives that will be achieved as a result of the proposed project include:- maintaining water service to the entire population served by the Sonoma County Water Agency (over 600,000 people and businesses) without significant rate increases due to emergency earthquake damage repairs- maintaining firefighting capability - maintaining water free from contamination- avoiding disruption of access to the road and emergency services as a result of pipeline failure - avoiding economic losses to local businesses as a result of pipeline ruptureSCWA's FEMA-approved Local Hazard Mitigation Plan states that the Cotati Intertie crossing under the Russian River is one of the highest risk natural hazards concerning Water Transmission System reliability due to earthquake liquefaction and lateral spread of the surrounding soil. According to the	M	0	C	In the Water Agency's Seismic Vulnerability Assessment, lateral spread hazard in fine-grained overbank deposits was determined to be very high. The geology at the Russian River crossing exhibits a very high liquefaction and lateral spread hazard with up to 17 feet of lateral spread displacement. Because of the importance of the pipeline and because the pipeline has welded joints at this location, which could withstand the lateral spread displacements, a non-linear finite element analysis was conducted to assess if the pipeline could withstand the imposed ground displacement. The analysis shows that the strains induced in the pipeline from the lateral spread displacements significantly exceed the allowable strain. Consequently, it is concluded that the pipeline has a high likelihood of failure at the Russian River crossing. Damage at this location will also have a very significant impact on system operations. The Russian River – Cotati Intertie at the Russian River crossing needs to be addressed as a high priority item.	4,000,000	136	500	18	Sonoma	II	2009
2465	4910020	4910020-016	Sonoma County Water Agency	Water Transmission System Seismic Hazard Mitigation Project	To avoid or minimize the harmful effects of an uncontrolled release of water, the Water Agency proposes to install isolation valves throughout the transmission pipeline system near sites that have a high likelihood of failure in an earthquake. The isolation valves will reduce the risk of adverse impacts of pipeline failure/rupture due to ground shaking, fault rupture, liquefaction, and lateral spread caused by seismic events.In the Water Agency's Local Hazard Mitigation Plan, the Water Agency identifies the proposed project as top tier, and the next highest vulnerability to be addressed. The proposed project will install isolation valves throughout more than 90 miles of the water transmission system to reduce the risk of adverse impacts of pipeline failure/rupture due to ground shaking, fault rupture, liquefaction, lateral spread caused by seismic events. Valves will be installed at locations that will increase the Agency's operational capability to restore a reliable water supply, minimize risk to life and property, maximize the number of residents who can remain in service, and prevent water quality impairment that could likely result from a transmission pipeline failure immediately following a major seismic event. Approximately 20 valves, ranging in size from approximately 16" to 48" in nominal diameter, will be installed at an average unit cost of $90,000 for a construction cost of $1.8M and $300,000	M	0	C	The Water Agency owns and maintains more than 90 miles of pipeline in the vicinity of and crossing the Rodger's Creek and Bennett Valley Faults. Buried pipelines, such as the Water Agency's aqueducts, are designed for internal pressure with limited capacity to withstand large relative displacements of ground along their length. Most buried pipelines cannot resist large lateral spread displacements and therefore fail. Pipelines typically also have a high failure rate in zones of liquefaction. Consequently, such pipelines are vulnerable to damage when subjected to ground failure resulting from an earthquake. As described in the Water Agency's April 18, 2008 Natural Hazard Reliability Assessment of the Transmission System, MMI Engineering (MMI) conducted an assessment of the hazards along the Agency's pipeline routes. The hazard assessment included a detailed review of available data in addition to targeted geotechnical investigations. Earthquake is the predominant hazard for the Agency's aqueduct including differential settlement caused by liquefaction, large lateral spread displacements associated with liquefaction, surface fault rupture associated with the Rodger's Creek and Bennett Valley faults, and strong ground shaking. Based on analyses that ranged from using simplified empirical studies and nonlinear finite element analysis, MMI estimated that 17 to 20 pipeline breaks are likely within the Water	2,100,000	136	500	18	Sonoma	II	2009

2466	2810013	2810013-003	Napa County Public Works-NBRID	NBRID Water Distribution System Improvements	This project consists of the construction of a new 1.0 million gallon pre-stressed concrete tank and associated plumbing to be built next to the water treatment facility. The increase in capacity of the tank is to ensure adequate water for fire protection, peak residential demand, and emergency supply should the water treatment plant become inoperable.Additionally a state of the art SCADA system shall be installed for remote monitoring of the new tank.The project shall also replace all of the pressure reducing stations, all broken gate valves within the distribution system, repair/replace any compromised fire hydrant units, and the 10,000 feet of transmission main that runs from the water treatment plant to the water storage tank.These improvements will ensure an adequate and continuous water supply for both residential, fire protection, and other emergency purposes in the future.	M	0	C	The District is currently pursuing an addition of a new water storage tank and associated SCADA remote monitoring equipment, replacement of the transmission main leading from the water treatment plant to the storage tank, replacement of all pressure reducing stations/valves, replacement of broken gate valves, and replacement of all fire hydrant units to meet fire flow water demands.The existing water storage tank has barely enough capacity to meet current residential and fire flow demands. During a prolonged water treatment plant shutdown, the storage is insufficient to meet demands. Depending on the time of year, the storage tank only has enough capacity to meet residential demands for one to two days.In 2003 the transmission main leading to the storage tank was damaged in a remote area of the District, causing the storage tank to drain. This led to an instantaneous water service interruption that lasted for 3 days. Should a transmission main break occur in the same location again, the District would have no way to replenish the storage tank with treated water. The water storage tank is the only source of water for fire protection, should the tank fail, or should the transmission main break, as in 2003, the District will not have sufficient water for fire protection if needed.As stated above, the transmission main that broke in 2003 was in a remote area of the District which is difficult to access. The main	6,400,000	237	500 03	Napa	II	2009

2468	3110019	3110019-008	Squaw Valley Mutual Water Comp	Navajo and Apache Water Pressure Improvement	The solution consists of moving these homes into the upper pressure zone by the addition of two pressure reducing valves in order to create a larger upper pressure zone. Currently the upper steel tank (300,000 gallons) only supplies the eight Squaw Summit homes with water and it has plenty of capacity to handle the additional homes. Adding a PRV at the intersections of Sandy Way and Navajo Way and a PRV at the south end of Apache Way, 29 homes can be added to the upper pressure zone. These homes then should have water pressure that meets water system standards. The distribution system from Navajo to Sandy can also be looped which in a fire flow situation is ideal because the water will be split through the loop essentially cutting in half the velocities and head loss through the pipes.Pressure reducing valve (PRV) a Sandy and Navajo 56,246PRV at south end of Apache 56,246Construct associated 8 inch waterline (690 LF) 65,977 Subtotal 178,469Construction contingency 44,600 Construction cost 223,069Engineering, admin, and legal costs 66,900Total Project Cost $289,969	M	0	C	The Squaw Valley Mutual Water Company (SVMWC) was built in the late 1950s and early 1960s in order to service a subdivision being developed on the northern side of Olympic Valley, CA. Pipes of varying sizes – from 1 inch to 10 inches – and of varying kinds - AC, steel, PVC and ductile iron were installed. Some fifty years later, these pipes are leaking and no longer provide the flow and water pressure needed for to meet modern public health and fire suppression standards. The 2007 California Fire Code requires a maximum distance of 500 feet between fire hydrants in residential areas. The current fire hydrant configuration is variable, up to more than 1,100 feet between fire hydrants. In December 2008, the SVMWC Board adopted a master plan for the water system developed by Auerbach Engineering. They computed the SVMWC average daily demand (ADD) at 431 gallons/day. The estimated Maximum Daily Demand (MDD) is 1,230 gallons/day. A computer model of the water flow and pressure identified a number of deficiencies in the system including extremely low or high pressures at junction nodes and high velocity or head loss in pipelines. Auerbach Engineering prioritized the projects needed to bring the system up to standard.In the Navajo and Apache area 29 homes are serviced with low water pressure. Some of the homes on the high side of the street have less than 20 psi, and the ones on the lower	150,000	263	500 02	Placer	I	2009

2469	3110019	3110019-006	Squaw Valley Mutual Water Comp	Sandy Way Pipe Replacement	The plan is to replace the line at the back of the houses with 1,605 feet of 8-inch AWWA PVC-C900 main in the street. Six new fire hydrants will be placed along this portion of Sandy Way. Homeowners will be required to move their service connections from behind the houses to the front. This new line will also service the homes on the south side of Sandy Way. There will be 34 new single service boxes equipped with yokes to handle the installation of water meters.We have hired Shaw Engineering to begin developing the design for this project. Surveying is underway to document the challenges of the terrain and to understand the complexities of moving the service laterals from the back of the houses to the front. Shaw Engineering is investigating horizontal drilling and other technologies to avoid digging through existing landscaping, having to cut mature trees, etc. When the design is completed, we will hold neighborhood meetings in order to discuss the impact of the improvements on each home/member. 2475	4910020	4910020-018	Sonoma County Water Agency	Collector Wells Retrofit Project	In order to mitigate the water system's vulnerability to earthquakes, the Agency proposes to develop and implement designs to retrofit four collector wells against liquefaction and lateral spread hazard.The collector wells to be retrofitted were built in 1958. The general construction of the collector wells includes a large diameter (ranging from 13 to 18 feet inside diameter and 18 to 33 inch thick walls) concrete caisson that extends from the ground surface into the aquifer. The caissons range in length from about 108 feet to 123 feet. At the bottom of each caisson, perforated pipes (known as laterals) extend radially into the aquifer. Each lateral is over a 100 feet long and ranges in size from 8 to 10 inch diameter for the older five collectors and 12 to 18 inches for the newest sixth collector. Each caisson supports a pump house with two pumps that draw water collected inside the caisson.The retrofit project proposes to install columns of rock or gravel around each of the caissons to a depth of approximately to stabilize the caissons against liquefaction and lateral spread hazard.	M	0	C	A vulnerability assessment of the Agency's water supply facilities was performed. Damage to water collection systems following a major disaster, especially an earthquake, can lead to significant disruption. Structural assessment of the Agency's collector wells shows that four of the six collector wells have a high likelihood of sustaining major damage in the event of an earthquake causing widespread water outage.	8,000,000	136	500 18	Sonoma	II	2009

2478	5610068	5610068-004	CLOVERDALE MUTUAL WATER Co.	Installation of New Service Lines, Meters, and Mainline Isolation Valves	The project includes:a) Installation of new service lines to each parcelb) Installation of isolation valves on mains that do not have themc) Installation of meters on all customer service linesd) Obtaining permits and approvalse) Engineering and project management	M	0	C	Cloverdale Mutual Water Company has been in existence since 1919. Until about 10 years ago, there was no appreciable attempt to replace and upgrade worn-out infrastructure.In 2003, a new tank was installed to replace a badly leaking unit. Additionally, since then, a portion of the mainline has also been replaced. A large problem remains, however, in that the service lines to each parcel are generally in poor condition, and frequently break, necessitating shuting down the system for repairs. Many of these services do not have shut off valves at the point of connection to the main. Aside from the inconvenience to the the customers, the break allows contaminants to enter the pipe. These which difficult to flush out and remove. Occasionally, a break will occur at the point of connection between the service line and main creating a situation where the main needs to be cut and a portion replaced, again allowing contaminants to enter, but to a much greater extent. During the periods while the system is being repaired, the customers are routinely notified that the water will be shut down for an extended period of time. Another item that makes each shutdown a major undertaking is the fact that there are very few isolation valves throughout the system so, in most cases, large portions of the service area are out of water if there is a break in a single service line. Another problem is that there are no	512,000	130	500 06	Ventura	IV	2009
2479	4910020	4910020-013	Sonoma County Water Agency	Emergency Mobile SCADA	The SCWA EPA-approved Vulnerability Assessment (VA) recommended establishing a back-up SCADA control in a mobile van independent of the administration building and operations center. This would consist of programmable logic controllers, a Remote Terminal Unit, radio equipment, and an antenna. Laptop computers would be used as the operator's station in the mobile van. The SCADA system allows an operator to remotely control operations and monitor system status. A mobile van would provide SCADA redundancy and a self-sustaining independent SCADA system in the event the operations center was burned down, destroyed, or made uninhabitable.The SCWA water system and SCADA system operate continuously. The SCADA system gathers data, monitors a multitude of process parameters, operations, and alarms, and maintains water reliability.	M	0	C	The Sonoma County Water Agency (SCWA) is a wholesale potable water provider to 700,000 people (including transients and tourists) in two counties (Sonoma and Marin) through nine public water system contractors. SCWA operates a Supervisory Control and Data Acquisition (SCADA) system that serves as the computer-based machine interface that controls the related mechanical and electrical assets of the water system, based on real-time feedback and pre-programmed data.The SCWA EPA-approved Vulnerability Assessment (VA) identified power and the SCADA system as the most significant critical assets to water system security. The VA found these assets vulnerable to terrorism and adversarial tactics and recommended security countermeasure improvements. This project proposes to implement one of the recommended improvements that has not yet been implemented.SCWA has the ability to operate its system from the operations center and main administration building. There are redundant power supplies (generators) and protections against power surges (uninterrupted power supplies). However, the VA indicated that in the event SCWA's operations center became nonfunctional, radio communications to its main administration building would not likely be maintained. Global processing, remote control, and monitoring of system activity would be compromised by	300,000	136	500 18	Sonoma	II	2009

2480	5400903	5400903-003	TRACT 92 C S D	Tract 92 CSD Safe Drinking Water Project	Safe Drinking Water Project Project Description: The proposed project would include the drilling of a water test well at a new site in the community. The results of the test well will be utilized to design and construct a new water production well. The well would be equipped with a new pump and storage facilities.	M	0	C	Safe Drinking Water Project Problem Description: Tract 92 Community Service District provides water to the unincorporated area known as Union Addition. This unincorporated community consists of approximately 135 households and one church and is located Southeast of the City of Visalia. This economically disadvantaged community is a mix of retired people, farm workers, and low-income families. The community's water system was established in the early 1960's. The water system as two wells drilled on one site. At least one of the wells is producing water that fails the total Coliform rule. Analysis is pending on the other well. Over the passed 4 months we have consistently failed the total Coliform rule. The two wells were tested and once they failed an additional 5 sites were tested and they failed as well. We have received the Notice of Violations from the Tulare County Environmental Health for the preceding 4 months for the bacterial contamination. We did deliver notices as required by Tulare County Health to the water system users.	1,000,000	91	500 12	Tulare	III	2007
2481	4500195	4500195-005	STARLITE PINES MUTUAL WATER CO INC	Storage for Starlite Pines Mutual Water Co, Inc. Shingletown,CA	The project will require six concrete pads for the storage tanks. Six (6) five thousand Gallon Storage TanksPlumbing materials for connecting the new tanks to the current systemsWinterizing materials for plumbingLaborThere will be not destruction of any old sources.	M	0	C	Our current water system has two wells and the Number 1 well has been ouronly source until this Spring and we recently put the Number 2 well into use. We have put 4 (5000) gallon storage tanks on the well #2 but it needs at least two additional storage tanks to store enough water for our sub-division current demands. Our original well, #1, water storage is an open reservoir and we need to store water without risk of contamination to our water supply. Four (5000) gallon storage tanks would protect our water system and store enough water for our current demands on the system. We have very dry summers with little or no rain. We use the water for culinary use as well yard watering and most important fire protection. At the present time there is an extremely high water demand and the storage is not adequate. This is important to meet the California Standards for drinking water.The system was designed over twenty years ago and the sub-division, at that time, had many vacant lots, but less than two years ago there was a boom in the real estate market here and there are very few vacant lots, homes were built and new families moved in and there is a need for more water storage for our systemto meet the increased demand. We have no additional funds to update oursystem.	70,000	170	510 02	Shasta	I	2008

2482	0310006	0310006-002	River Pines PUD	Water Distribution System and Storage Improvements	Some new water lines and fire hydarnts were installed but the services were not moved to the new lines. New water lines would be installed where needed to provide adequate service and fire protection. Valves would be installed to provde reasonable operation and maintenance of the water system. New service laterals and meters would be installed and connected to the larger lines. The old system of small waterlines would be abandoned. The project would also provide a new steel water storage tank and refurbish the existing one to meet system standards and relaible fire protection.	M	0	C	Much of the River Pines PUD water sytems dates back to the origion of the town in 1930s. Most of the services are on 2-inch and smaller distributiioon lines. System doesn't have enough valves and many of the existing ones don't work. There are dead ends without blowoffs. The system is experiencing many leaks that are difficult to fix and water losses up to 34%.A high chlorine dosage is required because of the condition of the distribution system. The condition of the old system, many leaks, and water losses is a health risk from contamination. The water system lacks adequate storage to meet standard requirements. RPPUD has an old buried concrete tank that is at the end of its useful life. The system also has steel tank but it is corroding and needs work and recoating.	550,000	210	510 10	Amador	III	2011
2483	2000521	2000521-004	Broadview Terrace Mutual Water Company	Infrastructure Replacement Project	Approx 10,000 ' of 2" galvanized main will be abandoned and the same length 6" c-900 will be laid in the same easement or road right-of-way. Trenching will be labor intensive due to many granite outcropings and the roots of huge trees near but outside the easements. 90 service connections will be moved from the old main to the new.	M	0	C	We have small (1 1/2 " and 2") galvanized mains that are so corroded that water pressure drops to near zero in sections when several users are drawing water at the same time. Pressure less than 20 psi occurs frequently. These are mostly single family residences with no backflow prevention.	500,000	202	510 11	Madera	III	2007
2484	0310006	0310006-003	River Pines PUD	Water Supply Project	The project objective would be to first obtain a new source of water. Test wells would be drilled and a productuion well completed, and backup power provided. If a reliable well with good water quality is not able to be found, then a second phase of providing water treatment would be needed. The slow sand filter could be replaced with a more efficient modern surface water plant that could be started up in less time than a slow sand filter, and could utilize low and intermittent flows. The surface water flows could be supplemented with shallow wells near the stream GUDI wells that could keep the plant going to meet the system needs.	M	0	C	RPPUD has several water supply issues and lacks a reliable water supply. The designated primary water source is a slow sand treatment plant that has been nonoperational for three years because the source water stream is dried up in the summer and technical issues with the plant. Well No 2 is only 20 gpm capacity and has recently dried up because of the summer season. Well 6R is the only current water supply and has bag filter plant on it because of coliform contamination from surface water influnce. Well 6R does not have a generator and the water system is without water during power outages, which have extended up to three days in the past. Well 6R is in an area of water contamination, probably from septic tanks, and the bag filter plant is relatively expensive to operate.	800,000	210	510 10	Amador	III	2011

2485	4500195	4500195-006	STARLITE PINES MUTUAL WATER CO INC	Updating Current Water distribution and Storage	Starlite Pines Mutual Water Company provides domestic water service for approximately 160 connections within the service area located in Shasta County near Shingletown, California. The Starlite Pines subdivision may be classified as a disadvantaged community based on the guidance provided by CDPH (Map of Service Area mailed to address provided by CDPH). The distributiion system is approximately 40 years old and many segments of pipeline are suffering frequent failure. These failures have caused periodic system outages resulting in widespread loss of system pressure. Each of these outage events open up the system to possible microbial contaimination. These continuing pipeline failures have been a major factor in exhausting our reserve fund. The system currently has only 50,000 gallons of storage capacity. Our limited storage capacity causes frequent cycling of pumps and has led to frequent failure of our pumping systems, further eroding our reserve funds. Well #l storage is the original gunite reservoir and itis eroding. The system is not metered. Our customers are currently paying a flat rate of $30.00 per month. The systems current back up source of power is a diesel generator whichis in need of replacement and is necessary to continue to provide waterduring a power failure. 2486	4810010	4810010-003	SID - Gibson Canyon	Serenity Hills Tank Replacement (E.3.1.b)	An outside engineering firm will analyze the demand on the current system to determine the proper size of the replacement tank. The existing area of the tank should be large enough to support a tank that has twice the diameter of the current tank. Once the existing tank is removed, the sub-grade would be compacted and a new steel tank would be constructed. Cathodic protection will be installed to protect the tank from future corrosion.	M	0	C	The 10,000 gallon storage tank is undersized for the system. The pumps that fill the tank must run numerous time throughout the day in order to maintain the system. This tank is vital to the operation of this system.	200,000	159	518 04	Solano	II	2009
2487	1909006	1909006-006	WEST VALLEY COUNTY WATER DISTRICT	West Valley CWD Storage Tank Replacement	The proposed project is to remove the existing storage tank and replace it with a 286,000 gallon steel storage tank. The new tank will meet Title 22 and seismic requirements.	M	0	C	Storage Tank # 2 is in dilapidated condition and needs replacement.	250,000	274	530 22	Los Angeles	IV	2012
2488	3600260	3600260-002	Smiley Park Country Club	Smiley Park Well	We have proposed in a separate application to conduct a Hydrology Study to identify appropriate sites of groundwater in which to drill a new vertical well. This proposal is a request to drill one vertical well. We expect a qualified drilling contractor to provide the following: 1) Provide and operate well drilling equipment sufficient to drill in the geological conditions in Smiley Park; 2) Drill to a depth recommended by the Hydrology Study; 3) Install the well liner; 4) Install the well head and cap; 5) Install the well pump and decontaminate well. Connections from the well into holding tanks and pumps sufficient to pump the water into Smiley Park's storage tank will be the responsibility of Smiley Park.	M	0	C	Smiley Park Country Club is a private community in the San Bernardino Mountains near Running Springs. This is a community of 165 building sites (125 currently have water connections) in an area of 265 acres. Smiley Park maintains a private water system which is monitored by the county. We maintain our own wells, a 100,000 storage tank, distribution system, and water quality program. Smiley Park Water System currently has only one well to serve its customers (125 connections, 300 residents). Three former wells stopped producing and were abandoned. In 2006, a new well was drilled that currently produces 19 gallons per minute. This is insufficient to meet the full needs of the community. To supplement our water, we are connected to Running Springs Water System and purchase water from the Crestline Lake Arrowhead Water Agency (CLAWA) through the Running Springs System. We need to drill additional wells.	35,000	106	530 13	San Bernardino	V	2007

2489	3600260	3600260-001	Smiley Park Country Club	Smiley Park Hydrology Study	In order to properly plan for additional wells to meet both our current and future needs, we first need to conduct a Hydrology Study by a qualified engineer/geologist. This study will investigate potential groundwater sources and recommend the optimal locations for drilling new wells. We expect the hydrologist to provide the following: 1) Groundwater resource inventory and documentation; 2) Hydrological data analysis; 3) Preliminary water resource and geological features map; 4) Preliminary analysis for development; 5) Potential water well development strategy; 6) Preliminary description of development requirements. After a site is selected, the hydrologist will provide the following services: 1) Preparation of vertical well construction specifications; 2) Preparation of well bid documents; 3) Review of well driller's bids and recommendation; 4) Owner's representative during well drilling.	M	0	C	Smiley Park Country Club is a private community in the San Bernardino mountains near Running Springs. This is a community of 165 building sites (125 currently have water connections) in an area of 265 acres. Smiley Park maintains a private water system which is monitored by the county. We maintain our own wells, distribution system, and water quality program. Smiley Park Water System currently has only one well to serve its customers (125 connections, 300 residents). Three former wells stopped producing and were abandoned. In 2006, a new well was drilled that currently produces 19 gallons per minute. This is insufficient to meet the full needs of the community. To supplement our water, we are connected to Running Springs Water System and purchase water from Crestline Lake Arrowhead Water Agency through the Running Springs System. We need to locate appropriate sources of groundwater and to drill new wells.	35,000	106	530	13	San Bernardino	V	2007
2490	1900102	1900102-004	WEST SIDE PARK MUTUAL	Distribution System Infrastructure Rehabilitation	The system proposes to perform a water audit; hire leak detection services; and replace leaking portions of the distribution system including meters, valves, service connections, and pipelines as required to prevent further water losses. Water from Palmdale and AVEK is not available to us. We need to rehabilitate the distribution system to ensure water conservation methods are implemented.	M	0	C	The distribution system is dilapidated and failing. The system has many water leaks resulting in excessive water losses. The instability of the pipelines, valves, service connections, and meters is negatively impacting our water delivery capability.We do not have a reliable backup water supply. We are not connected to AVEK or Palmdale. Drought conditions have made it critical for us to make extensive repairs to the distribution system and meters to prevent increasing water losses from our failing infrastructure	200,000	144	550	16	Los Angeles	IV	2008
2491	1900102	1900102-006	WEST SIDE PARK MUTUAL	Backflow prevention	We propose to purchase and install backflow preventers at each service connection. We need this to protect our drinking water from potential contamination from agricultural and animal enclosures, corrals, and animal waste within close proximity of the water supply. This adequate degree of protection will bring us into compliance with waterworks standards.	M	0	C	This water distribution system does not meet current waterworks standards. The system does not have any backflow preventers. The Distribution pipelines and sole source wells are in close proximity to animal waste storage areas, corrals and other animal enclosures. Properties have individual septic systems; are zoned for agriculture and animals; are in the vicinity of the wells and other distribution components; and have animal enclosures and an animal rescue business onsite. The entire system needs backflow preventers.	80,000	144	550	16	Los Angeles	IV	2008
2492	5010026	5010026-011	City of Modesto, DE Hickman	New Tank & Pump Station - Hickman	Approximately 0.40 MG of tank storage is required in the existing Hickman water system to meet existing City storage criteria. This volume was calculated using a Reliable Pumping Capacity scenario with a well out of service. This project includes a 0.40 MG storage tank and associated 1.2 MGD pump station including all control valves and piping, electrical and communication equipment, backup emergency generator, disinfection and treatment of water, and piping to tie-in the existing distribution.	M	0	C	Criteria has been determined by the City of Modesto for treated water storage and system peaking capacity needs to meet diurnal operational peaks, fire flows, and emergency conditions. Total storage and system peaking capacity requirements can be evaluated based on the following three components: (1) Operational Storage is 25 percent of maximum day demand; (2) Fire Storage is the required fire flow times the fire flow duration period, as required by the City's Fire Marshall; and (3) Emergency Storage is 1 x average day demand.The Hickman system currently does not have any tanks or storage reservoirs; therefore, all of its available storage capacity and ability to meet peak operational demands is based on groundwater basin storage and pumping capacity. This dependence on the groundwater basin for storage presents a reliability issue; there is no allowance for possible contamination or other scenario that renders a portion of the basin unavailable.	2,000,000	192	565	10	Stanislaus	III	2011

2493	5010026	5010026-010	City of Modesto, DE Hickman	New Well - Hickman	This project will consist of drilling a new well, installing a new 600 gpm well pump, all related electrical and communication equipment, chlorine disinfection system, a backup emergency generator with transfer switch and all onsite and minimal offsite piping to tie-in the new well with the existing system.	M	0	C	The main issue is the City of Modesto is not capable of providing reliable pumping capacity during peak and maximum day demands.The Hickman servicearea is supplied exclusively by groundwater that is pumped from two existing production wells. The total existing supply capacity is 620 gpm. However, for water supply purposes, this groundwater pumping capacity must be reduced to account for well or wells out of service at any given time due to mechanical breakdown, maintenance or other operational issues. This reduced pumping capacity is defined as the Reliable Pumping Capacity and assumes the largest well is out of service.Under this scenario, the reliable pumping capacity is 190 gpm and is NOT sufficient to meet the existing Maximum Day or Peak Hour demands of 380 gpm and 635 gpm, respectively. Even with both wells on the existing supply capacity (620 gpm) does not meet the Peak Hour demand.	1,333,000	192	565 10	Stanislaus	III	2011
2494	1710011	1710011-002	Buckingham Park Water District	Clearwell Expansion, Treatment & Distribution site backup power generation	Construction of a 170,000 gallon +/- clearwell/storage tank and backup/standby power generators at both the District's treatment facility and it's distribution pump station, which will help alleviate both the District's insufficient treatment and storage capacities.	M	0	C	Compliance order 02-03-04C0-001 dated July 21, 2004 cited the District's insufficient treatment and storage capacity to adequately, dependably and safely serve it's 425 customers pursuant to Section 64562, Chapter 16, Title 22 of the California Code of Regulations. Said compliance order was issued after it was determined that from 7/4/04 through 7/9/04 the District's pressure zone 2 and 3 dewatered leaving it's customers without water and resulting in a boil water notice which was issued to all District customers on 7/6/2004.	763,000	450	580 03	Lake	II	2009
2495	4400502	4400502-010	TROUT GULCH MWC	Replace 2" Main to Emergency Intertie	The initial scope of this project was to bring a SqCWD main to the closest TGW main, install valves, meter, vault and street crossing. Detail design of this project has been completed, a contractor has been selected and work will start as soon as weather permits (expected in the first week of March).Last week, in the process of inspecting the project site, we discovered that 450 feet TGW water main documented as four inch by the Water System Engineer we hired as part of our Water Permit Transfer / TMF Capacity evaluation, in fact is only two inch PVC. This section of main must be replaced with a six inch line to provide adequate flow to meet demand and keep the storage tanks sufficiently full and provide the desired additional fire protection.Thus, this project being submitted for this Pre-Application is just to address this new requirement of replacing the undersized main. This work must be completed before the advantages of the emergency interconnect can be realized.	M	0	C	The Trout Gulch Mutual Water Company (TGW) is supplied by two wells. Each must be removed from service for major improvement or replacement. Neither well is reliable enough to serve the system alone. An emergency connection to a reliable water supply is required during the period each well is off line. This connection should remain in place as an emergency response / disaster preparedness measure and fire protection.The first well, drilled in 1934, continues to produce adequately, but has manganese content substantially above allowable limits (currently at 19 times ACL), and is an unacceptable source except in an extreme emergency. It must be taken off-line for some period to install a manganese removal system. The second well, drilled in 1961 and put into service in 1987, has been a sand producer and its production capacity has dropped from 150 gpm in its early years to 41 gpm now. Forced conservation was required to keep consumption within available supply this last summer.Many engineers and well contractors have been consulted and their consensus is that the well will continue to lose production capacity without major improvement or replacement. Current total water production capacity (80,000 gallons per day) is close to current summer demand and the system storage capacity (120,000 gallons) provides only 1.5 days of average demand. In addition, fire protection reserve	45,000	171	584 05	Santa Cruz	II	2009

2496	4400502	4400502-003	TROUT GULCH MWC	Replace 3" Water Main on Lower Trout Gulch Road with 6"	Replace existing 3" main with a 6" or 8" main.Total Project Cost of $72,000 is based on the approximate length of 900' and recent, local, similar, water main replacement costs.	M	0	C	Portions of Trout Gulch Mutual Water Company (TGW) infrastructure date back to the 1930's. Almost all of the mains from these older portions were upgraded per the design of the engineering firm of Washington & Jensen in 1980.One section of water main that was not upgraded is the lower section of Trout Gulch Road. This section along Trout Gulch is the only remaining 3" section. This undersized main supplies water to 22 customers (13 on Trout Gulch and 9 on Valencia).Determine if the size upgrade is needed - since it can be fed directly from Meadow Ranch via 6".It does not meet current standards for distribution mains.One of the Santa Cruz County DEH's requirements for approval of the transfer of Domestic Water Supply Permit from MVWC to TGW on April 1, 2008, is "Review the adequacy of the 3" line along Trout Gulch Road".	72,000	171	584 05	Santa Cruz	II	2008
2497	4400502	4400502-008	TROUT GULCH MWC	Add 100,000 Gallon Storage Tank	Install 100,000 gallon tank at the top of Skyward Drive.This would solve 3 problems: Meet California Water Works Standard. Double firefighting capacity. Water pressure via gravity would be adequate for all but 3 residences. These residences currently have private storage tanks and booster pumps).Project Cost Includes: Alternative site evaluations Site selection Site preparation and easements (if necessary) Tank, delivery, erection and outfitting. Install water main from Meadow Ranch Tank to new tank site = 2,600 feet.	M	0	C	Current water storage capacity of this system (120,000 gallons) does not meet the American Water Works Association Standard, using average California Residential Customer Consumption. This method of analysis had to be used since the former owner of our water system never measured actual water production or consumption by 2/3 of all customers. Note: This system currently provides water to 183 residences (the DWP database still says 171). We have received applications for 4 more Memberships (connections). We will approve these applications as soon as we can determine a fair Membership fee. Beyond these 4 new connections, we expect only 1 to 2 addtional connections per year, up to our maximum authorization of 199.Now that we have measured actual water production for one year, storage requirements also have been measured using the AWWA Standard based on this actual production. Using this single year as a basis, we may have enough storage capacity. AWWA recommends that a number of years of recent production be used in determining storage capacity. Thus, having only one year of history, storage capacity should still be based on average California consumption.Water Pressure is not adequate for about 23 customers. Firefighting water storage would provide a maximum of 12 minutes of flow at 1,000 GPM if both storage tanks were full. This last summer we did not	130,000	171	584 05	Santa Cruz	II	2009
2498	3810001	3810001-041	San Francisco Regional Water System		Build a pump station to pump water either from or to SCVWD.	M	0	C	Need emergency connections to Santa Clara Valley Water District.	7,900,000	200	600 04	San Francisco	II	1998
2499	3810001	3810001-012	San Francisco Regional Water System		MAKE PREPARATION OF PLANS AND SPECIFICATIONS FOLLOWED BY CONSTRUCTION WORK.	M	0	C	Calaveras pipeline subject to slope failures.	439,000	200	600 04	San Francisco	II	1998

2511	3810001	3810001-172	San Francisco Regional Water System	Sunol Valley WTP Expansion & Treated Water Reservoir	The CDPH's 1995 Cryptosporidium Action Plan (CAP) requires water systems using a surface water source adopt a philosophy of awlays optimizing their surface water treatment plant operations in a manner designed to achieve the maximum turbidity removal...to minimize the risk to exposure of pahtogens, including Cryptosporidium, in the drinking water delivered to their customers. The CAP indicates that a treatment plant to provide optimum removal treatment under all conditions and at all times depend, among others, on the reliability of the system equipment, availability of on-line back-up equipment.The SVWTP Expansion and Treated Water Reservoir Project includes the addition of 40 mgd of process capacity which is needed to meet the plant's 2030 Level of Service (LOS) of 160 mgd sustainable production for 60 days. Sustainable for the purposes of this project mean that the plant can produce 160 mgd within 24 hours of a major earthquake or loss of the Hetch Hetchy Aqueduct supply and sustain that production for the full 60 days even if one of each major process unit (e.g., flocculation/sedimentation basin) is out of service for maintenance or repair. Based on treatment process alternative evaluations in the Alternatives Analysis Report (AAR), Conceptual Engineering Report (CER), and subsequent technical memoranda (TMs), Alternative 1D was recommended to provide the additional 40-mgd	M	0	C	Although the San Francisco Regional Water System has about 600 retail customers, it is a wholesale water system that serves a total of 2.4 million customers in the counties of Alameda, San Mateo, Santa Clara, and San Francisco.This project is intended to meet the requirement 7(d) of CDPH Compliance Order #02-04-96C-001 that requires the SFPUC to provide treated water storage to serve as a balancing reservoir and the design criteria shall be subject to CDPH review and approval. Additionally, this project will allow SFPUC to meet level-of-service goals in the Water Supply Improvement Program that require sustainable treatment capacity. This project is crrently ranked as M Category in the existing SRF Project Priority List.The SFPUC is requesting a grant of $20 million for this project.	20,000,000	200	600	04	San Francisco	II	2009
2512	3810001	3810001-006	San Francisco Regional Water System		Perform study and analysis of existing timer trestles to determine their ability to withstand future earthquakes. Develop alternatives to achieve this goal followed by design and construction of necessary work.	M	0	C	BD pipeline timber trestles need seismic upgrade.	24,610,000	200	600	04	San Francisco	II	1998
2513	3600262	3600262-001	Snowcrest Hts. Imp. Assoc		Construct source, storage, and distribution facilities	M	0	C	Inadequate storage, undersized mainline, insufficient source capacity	500,000	120	600	13	San Bernardino	V	1998
2514	3810001	3810001-036	San Francisco Regional Water System		Slip-line existing pipelines (put a pipe side), where possible, and to replace it where this is not feasible.	M	0	C	Prestressed concrete pipe has had major failures.	90,200,000	200	600	04	San Francisco	II	1998
2515	3810001	3810001-042	San Francisco Regional Water System		Plan, design. And install diesel generators and buildings at critical water pumping stations.	M	0	C	Need diesel generators at pump stations.	9,040,000	200	600	04	San Francisco	II	1998

2516	3810001	3810001-171	San Francisco Regional Water System	Lawrence Livermore Water Quality Improvement	This project involves the design and construction of a ultraviolet (UV) light disinfection system consisting of two, 150 gallon-per-minute (gpm) parallel UV light units and ancillary facilities. These facilities will be installed within the existing Thomas Shaft Chlorination Building and will provide the needed, one additional log of Giardia inactivation to meet the State surface water treatment regulation requirement. The project will include the design and installation of two, new, deep-well submersible-type pumps rated at 150 gpm each at 600 feet of head to supply water from the SFPUC's Coast Range Tunnel (CRT) to the new disinfection system. On completion, the project will allow delivery of potable water when flows in CRT exceed 240 milion gallons per day.	M	0	C	Although the San Francisco Regional Water System has about 600 retail customers, it is a wholesale water system that serves a total of 2.4 million customers in the counties of Alameda, San Mateo, Santa Clara, and San Francisco.Under the Long Term 2 Enhanced Surface Water Treatment Rule (LT2ESWTR), the SFPUC must construct new advanced disinfection facilities for its unfiltered Hetch Hetchy supply in order to inactivate Cryptosporidium. The project is intended to ensure the SFPUC is in compliance with the LT2ESWTR Cryptospodidium inactivation requirements in its supply of water to Lawrence Livermore National Laboratory's Site 300 facility. The SFPUC is requesting a grant of $4,320,000 for this project.	4,320,000	200	600 04	San Francisco	II	2009
2517	3810001	3810001-014	San Francisco Regional Water System		Replace three sections of pipeline.	M	0	C	Crystal Springs pipeline deteriorated beyond repair.	12,600,000	200	600 04	San Francisco	II	1998
2518	3810001	3810001-048	San Francisco Regional Water System		Provide seismic anchorage for these water tanks. Provide flexible connections between the tanks, the inlet and outlet piping.	M	0	C	Storage tanks need seismic rehabilitation.	3,200,000	200	600 04	San Francisco	II	1998
2519	3810001	3810001-003	San Francisco Regional Water System		Replace trestles above low water where required. Replace walkways and guardrails where required. Raise elevation of support where required.	M	0	C	BD pipeline trestle deteriorated from weather.	6,650,000	200	600 04	San Francisco	II	1998
2520	4500210	4500210-001	LASSEN PINES MUTUAL WATER CO		Construct water storage tank.	M	0	C	Inadequate storage capacity.	300,000	155	600 02	Shasta	I	2002
2521	1010051	1010051-001	FRESNO CO WATER WORKS DIST 18		Install new filter, modify clearwell, and add new storage tank.	M	0	C	Lack adequate treatment and storage capacity.	461,870	236	620 11	Fresno	III	1999
2522	2710023	2710023-003	TASCO Spreckels Water Company	Install 22 Cross-connection devices - Spreckels WS	The Spreckels Water Company has standard detail drawings, specifications for procurement, and preliminary quotations to perform the installation of all 22 backflow devices. Installation and testing will be prepared by March 30, 2009. No environmental documentation is required for this work. Specifications by March 1, 2009. Procurement, installation, and testing to be completed by August 1, 2009. The following is a cost breakdown:Engineering & Administration - $2,500.00Procurement & Installation - $175,000.00Testing, Certification & Closeout - $5,000.00Contingency at 15% - $27,375.00Total Cost - $209,875.00	M	0	C	A recent cross-connection survey of the Spreckels Water System has determined that 22 potential cross connections exist within the entire system. Typical of the cross connections found are services utilized for irrigation and connections to commercial properties with interior building sprinkler systems and connections to food processing plants. With the potential of contamination to the drinking water system from back-siphonage at all of these locations, the immediate installation of approved back flow devices is required. The devices range from 1/2 inch to 6 inches in diameter.	209,875	212	660 05	Monterey	II	2009
2523	2710023	2710023-001	TASCO Spreckels Water Company	Water Main Replacement - Spreckels WS	Plans and specifications for the replacement of mainlines in the Spreckels Water system are in process and will be completed by May 31, 2009. As these are all replacements of existing mainlines, and all mainlines are under 12 inches in diameter, no CEQA review is required. Procurement, installation, and testing of the replaced mainlines can be completed by December 2009. Project cost estimates are listed below:Engineering & Administration - $75,000.00Procurement & Installation - $540,000.00Testing, Certification, & Closeout - $10,000.00Contingency at 15% - $94,000.00Total Cost $719,000.00	M	0	C	The Spreckels water system was installed in the early 1900's and many parts are more than 100 years old. Many of the water mains are thin-walled steel pipe and are aged well beyond their intended service life. Sections are seriously degraded and a slight increase in operating pressure or a fire flow event results in several broken lines. As leaking and/or broken mainlines can pose a water quality hazard to the system, our engineers recommend that the severely degraded mainlines be replaced. There is approximately 6000 lineal feet of mainline requiring replacement. In addition conservation efforts for the groundwater in the Salinas Valley adjacent to Spreckels are very important due to declining water quality and quantity. This project would allow Spreckels to significanly improve its conservation efforts.	719,000	212	660 05	Monterey	II	2009

2524	2210002	2210002-001	PONDEROSA BASIN MUTUAL WTR CO	Pipeline replacement	Remove and replace 2600 feet of substandard piping underneath a main road (Parmabel Street). Current pipe is 2" irrigation pipe and it not up to code with County and State regulations. Install 6" main with 6 fire hydrants and 1 1/2" service laterals to homes. Install 12 valves. Maiposa County Public Works will be paving the road that this project is on in Jun/July 2009 because the road does not meet current County compaction code.	M	0	C	Remove and replace 2600 feet of substandard piping underneath a main road (Parmabel Street). Current pipe is 2" irrigation pipe and it not up to code with County and State regulations. 2530	3110011	3110011-003	Tahoe City PUD - McKinney/Quail	McKinney Secondary Source	This Pre-Application is for potential SRF funding for Phase 2 of this project, which is the design and construction of an approved permanent surface water treatment plant. Based on the success of the Interim Faciltiy, the concept of surface water treatment has been proven to be a viable solution to the long-term reliability issue with the Crystal Way Well. However, the Interim Water Treatmetn Facility is not a viable long-term option, and was never planned to be permanent, due the following factors:1. The facility is located directly adjacent to a Sanitary Sewer Pumping Station.2. The facility is located directly adjacent to McKinney Creek, which typically flows year round. The creek has flooded and submerged the area in 1997 and partially in 2005. 3. The facility is installed outdoors and must be decommissioned in the fall due to freeze and snow considerations.4. The decommissioning of the plant in the fall only provides the water system with one approved source during the months of October through June.5. The facility is located in direct contact with a public use recreation area and a residential condominium complex, and provides significant visual impacts.The project will involve siting, design, and construction of a permanent water treatment facility. The current preliminary design report indicates that a microfiltration plant using UV and chlorination is the peferred treatment method based on local water	M	0	C	The Tahoe City Public Utility District is under directive from CDPH to provide a permanent secondary source. The directive is summarized in Water Supply Permit No. 01-09-01-PER-003 and as amended in Permit Amendment No. 01-09-05-PER-002.In late July of 2003, the Tahoe City Public Utility District's (TCPUD) Crystal Way Well, which serves the McKinney/Chamberlands area of the west shore of Lake Tahoe, experienced a sudden loss of pumping capacity. The sudden loss of pumping capacity was due to a sharp and sudden drop in the pumping level of the well. This indicated that the aquifer in the area was depleted, limiting production capabilities. The pumping output of the well was restricted and the customers in the area were put on a strict rationing. During this period, the TCPUD evaluated options for correcting the situation. A two-phase approach was established, in which an interim water supply alternative was to be pursued as the first phase, and a permanent supply alternative as the second phase.Phase one of the project was handled by TCPUD in conjunction with Gilmore Engineering. Phase one consisted of a State Department of Health Services (DOHS) approved interim water supply to be used until a permanent solution is constructed and in service. During early 2004, the TCPUD conducted pumping and water quality testing of two existing groundwater wells in the area, the McKinney Well No.1 and the McKinney	4,615,375	453	750 02	Placer	I	2009

2531	4110012	4110012-004	Cuesta La Honda Guild, Inc.	Cuesta La Honda Guild pipeline replacement	The funding requested in this pre-application would be used to replace substandard pipes in drinking water distribution system. The Guild has identified 14 separate projects that together represent about 30% of entire distribution system conveying treated water. In its entirety, the project would replace 13,000 feet of old 2 inch water mains (galvanized and PVC) with 6 and 8 inch pipe, install 23 fire hydrants, 2 PRVs, and re-connect service to 83 residences. Installation of the new mains would be designed to eliminate dead-ends that are currently present in the system. This portion of the project represents approximately 58% ($1,922,000) of the total requested funding. Additionally, we are requesting funding to replace approximately 11,000 feet of 2-4 inch pipeline conveying source water to reservoirs and the water treatment plant with a more efficient system that is better protected. The major pipeline supplying water from a remote reservoir to the treatment plant would be re-routed along an existing service road and installed below ground. Besides replacement pipe, we estimate 11 hydrants, 5 gate valves, and 6 air vents will be installed.	M	0	C	Cuesta La Honda Guild is a home-owners association formed in the 1930s that currently comprises 285 single-family homes in a rural area of San Mateo County. The association owns and operates the drinking water system. In addition to supplying water to it members, the Guild is the purveyor to several outside users including the local volunteer fire department and public elementary school. The distribution system conveying treated water was originally installed in the 1930's, much of it with substandard materials. Large sections of the system are serviced by 2 inch pipes of varying material (galvanized pipe, PVC, and electrical conduit) that require frequent repair for leaks and occassional issuance of boil orders. Wharf hydrants installed along these sections do not meet current fire fighting requirements. Furthermore, the system contains many dead-ends that complicate the management of the system. The Guild is committed to replacing the original, failing distribution system. The highest priority projects have been funded by expenditures from the Guild's modest capital reserve fund supported by membership assessments. Recently, however, the Guild has needed to use capital reserve funds to implement additional treatment of its source water (local streams) to meet drinking water standards for disinfection by-products. The Guild has been working with DPH regulators to bring chloramine treatment on-line in 2009. Costs	3,329,000	300	750	17	San Mateo	II	2009
2532	3110018	3110018-002	Tahoe Park Water Company		Install a storage tank and pipeline. Involves design and construction.	M	0	C	Inadequate storage for proper operation of distribution system.	200,000	436	750	02	Placer	I	2006

2535	2400172	2400172-004	Sandy Mush Detention Center	Merced County Correctional Complex Arsenic Treatment Project	The project will replace temporary piping systems connected to an existing treatment plant with permanent infrastructure improvements, a buffer bank for blending various concentrations of well water exceeding the Federal MCL, an additional treatment vessel to assure continual supply of domestic water to the facility, and Direct Digital Controls (DDC) for remote monitoring of the system. These improvements will reduce the arsenic concentrations in the water to acceptable levels, in compliance with the Federal and/or State MCL, whichever is more stringent. A significant amount of reconfiguration of the existing water distribution system will be required to combine the water from all three wells into a single point of confluence for the most cost effective treatment system. The County of Merced has already obtained plans and specs for the reconfiguration of the water supply system utilizing adsorptive processes. Merced County is ready to move forward with this project and commencement of construction activities for the improvements can occur as early as October 1, 2010.	M	0	C	Arsenic levels in all three ground water wells that serve the County's correctional facilities currently range from 15 ppb to 49 ppb. These levels exceed the Federal Maximum Contaminant Level (MCL) for arsenic, which is 10 ppb. This water system serves both the juvenile justice complex and the adult correctional facilities for the entire County of Merced. No other source of water exists in this isolated vicinity. The ground water in this area of Merced County contains naturally high levels of arsenic. The site of the two correctional facilities is served by a total of three wells and three 100,000 gallon storage tanks. All three wells produce water with elevated levels of arsenic. Two looped 8 inch (8") water mains provide both domestic and fire suppression water to each facility. No irrigation water is associated with this system.[An arsenic treatment plant is currently in place.]	500,000	157	800	11	Merced	III	2011

2538	0310005	0310005-003	Pine Grove Comm Serv Dist	12" Water Line - Irish Town Road to State Highway 88 Bore	This distribution infrastructure project, Phase 2 Construction, will consist of installing 2,600 feet of 12" water line from the County road to the bore under State Highway 88. The bore is in place, awaiting connection.	M	0	C	This is Phase 2 of a two-phase distribution and infrastructure project to bring increased water volumes to existing developed residential and commercial areas. Current water lines do not provide the volume of water needed for proper water flows and pressure.This new water line would also upgrade our ability to provide required fire flows to these existing neighborhoods, which we currently cannot provide. Pine Grove C.S.D. is located in the foothills, where there is a lot of timber and brush creating high fire hazards.	212,000	358	900	10	Amador	III	2009
2539	0310005	0310005-002	Pine Grove Comm Serv Dist	12" Water Line - Tank to Irish Town Road	This project, Phase 1 Construction, will consist of installing 1,357 feet of 12" water line from the District's storage tanks to a County road.	M	0	C	This is Phase 1 of a two-phase distribution infrastructure project to bring increased water volumes to existing, developed residential and commercial areas. Current water lines do not provide the volume of water needed for proper water flows and pressure. This new water line would also upgrade our ability to provide required fire flows to these existing neighborhoods, which we currently cannot provide.Pine Grove C.S.D. is located in the foothills, where there is a lot of timber and brush creating high fire hazards.	114,000	358	900	10	Amador	III	2009
2540	0310005	0310005-001	Pine Grove Comm Serv Dist	New water storage tank.	The old water storage tank would be removed and replaced with the new tank on C.S.D. property. Site preparation should be minimal, as we are simply exchanging tanks.	M	0	C	These funds would be used for replacing a water tank that is at least 25 years old. This tank was a used tank when installed and is showing strong signs of deterioration and should be replaced to protect the integrity of this public, potable water storage tank.	250,000	358	900	10	Amador	III	2009
2541	3110020	3110020-013	Squaw Valley Public Service District	Well 3R Replacement Project	Well #3, located on the valley floor and belonging to the Squaw Valley Public Services District (SVPSD), was completed in 1958 by the State of California as a source of water supply for the 1960 Winter Olympics. It was constructed prior to most of the existing commercial development in the valley. Since the well was completed, the facilities at the ski area, including the paved parking lots, have encroached on the well. The various facilities are perceived by the SVPSD as potential threats to the chemical quality of the groundwater resources exploited by them. Well #3 was constructed without a sanitary seal. At an age of over 48 years old, the well has exceeded its expected life span and the SVPSD has determined it necessary to redrill Well #3R per CDPH standards to provide a continued reliable and safe drinking water supply for the valley.	M	0	C	Well #3 was drilled in 1958 by the State of California as a source of water for the 1960 Winter Olympics. The existing Well #3 was constructed without a sanitary seal which does not meet the requirements in California Department of Water Resources Bulletins 74-81 and 74-90. Well #3 is located within the Squaw Valley Ski Corporation Parking lot and a sanitary seal is vital to the protection of water quality.	750,000	745	926	02	Placer	I	2009

2558	1910244	1910244-004	GREEN VALLEY CWD	Refurbish Pressure Reducing Valves	All three valves would be inspected by a trained technician and the pressure reducing pilot replaced and adjusted if necessary and a back pressure pilot installed and adjusted to the proper pressure.	M	0	C	The District has three Pressure Reducing Valves (PRVs) in the system. They are located between pressure zones and were designed to allow water to flow from a higher zone to a lower zone in case of a loss of pressure in the lower zone(s). They have been inoperable for some time and need to be refurbished and modified so they will function properly. They should have two features; one to allow flow from the higher zone to the lower zone in case the pressure in the lower zone drops to a value lower than normal and two; to provide back pressure control that would close the valve if the upper zone pressure dropped below a pre set value so that the upper zone would not be depleted of water. This would happen if the lower zone had a water main break or some other emergency condition. The existing valves do not have the back pressure feature. The main valves have small pilot valves that control the valve functions automatically by pre set pressure values.	10,000	485	1,000	15	Los Angeles	IV	2007
2559	1910244	1910244-001	GREEN VALLEY CWD		Expose, remove and replace old lines; refurbish and modify three pressure reducing valves adding pressure sustaining features and low flow bypass; install additional water storage tanks next to existing tanks ...	M	0	C	WW standards defects. Aging distribution system creates the potential for contamination caused by leaks of breaks. Insufficient storage.	201,250	485	1,000	15	Los Angeles	IV	1998

2560	1710018	1710018-006	Lake County CSA 2 - Spring Valley	Spring Valley Water Distribution System Upgrades	The distribution improvement project includes:Installing a new pipe to create a loop between Quail Trail and Spring Valley Road;Installing a pipe on New Long Valley Road to create a loop between Pawnee Trail and Spring Valley Road;Increase pipe diameter along Wolf Creek Road; andInstall pressure regulating valves at three locations along Spring Valley Road.	M	0	C	In 2006, the Lake County Special Districts Administration investigated the Spring Valley Water System's distribution system. This project implements recommended improvements outlined in the Hydraulic Analysis Report. Improvements include looping areas of distribution system, increasing pipe size in other areas, and installing pressure regulating valves in areas of high pressure.HEALTH BENEFITS include a more reliable source of water throughout the distribution system.ECONOMIC BENEFITS include construction of the improvements including materials and labor.COMPLIANCE BENEFITS include a more reliable distribution system with significantly fewer dead ends and stable pressure zones.	2,000,000	420	1,018	03	Lake	II	2009
2561	1710018	1710018-005	Lake County CSA 2 - Spring Valley	Improve Storage and Distribution Facilities	Increase storage and distribution facilities to improve delivery during high demand periods.	M	0	C	Quantity of water supply is inadequate during peak demand periods.	1,500,000	420	1,018	03	Lake	II	2007
2562	2110005	2110005-008	Bolinas Community PUD	Arroyo Hondo Transmission Line Replacement	A replacement section of 6-inch PVC pipe of approximately one-half mile in length will be installed within the district's utility road easement between the upper and lower catchments at the Arroyo Hondo Creek.	M	0	C	In 1982, the district's then-existing raw water transmission line from its source (the Arroyo Hondo Creek) to the water treatment plant was largely destroyed during federal disaster storm events. The entirety of the line was replaced, with the exception of approximately one-half mile of 6-inch steel line between the district's upper and lower catchments. This section of line is now exposed in multiple places adjacent to the creek and is vulnerable to falling trees and severe storm events. A loss of this line would severely jeapordize the district's access to its raw surface water supply.	300,000	587	1,200	18	Marin	II	2009
2563	2110005	2110005-011	Bolinas Community PUD	Horseshoe Hill Road Water Main Replacement	The existing water line will be abandoned in place and a new line of approximately 4700 linear feet will be installed within the County right-of-way.	M	0	C	The existing water line serving the customers in this area was installed 100 years ago under what is now private property; our district's access to this line is limited and our ability to service and maintain it is compromised. In addition, the existing line does not meet current AWWA requirements.	175,000	587	1,200	18	Marin	II	2009
2564	2110005	2110005-009	Bolinas Community PUD	Wharf and Brighton Road Customer Service and Saddle Replacement	Replace approximately 100 existing customer service lines and saddles that are failing due to corrosion caused by sea/ground water intrusion to ensure reliable water service to these customers and reduce water losses in the distribution system.	M	0	C	Approximately 100 district customers are located in the downtown area, along Wharf and Brighton Roads, at sea level in this coastal community. The existing service lines and saddles for these customers are badly corroded due to sea/ground water intrusion and currently are failing, resulting in significant water losses and requiring the district to conduct frequent emergency repairs. In addition, the County of Marin plans to repave Wharf Road within the next year or two, so our district needs to replace these corroded service lines and saddles prior to this repaving project. The project is necessary to ensure reliable water service to these 100 customers and reduce water losses in our distribution system.	250,000	587	1,200	18	Marin	II	2009

2565	2110005	2110005-012	Bolinas Community PUD	Olema-Bolinas Road Water Main Replacement/Upgrade	Approximately 1600 linear feet of existing 4-inch water main will be abandoned in place and a new, 6-inch water main will be installed. Thirteen customer services and saddles also will be replaced as part of this project.	M	0	C	The existing water main in this section of our distribution system is a 4-inch diameter line, which provides inadequate flow for fire suppression purposes. Our engineers have recommended that this approximately 1600 linear feet of water main be abandoned and replaced with a 6-inch diameter line. The local fire protection district strongly endorses this application; at present, due to the inadequate flow, fire response protocol requires that water be tendered in to this area and/or emergency water storage is required of adjacent property owners. The local K-8 public school and thirteen residences are located in this area. This project is urgent due to the fact that the County of Marin is scheduled to install a federally-funded bike path during late July and August 2009 in this same location: it would be much more expensive and disruptive to our customers to replace this water main after the bike path has been installed. Accordingly, we seek funding to replace this water main during July 2009.	300,000	587	1,200	18	Marin	II	2009
2566	2110005	2110005-010	Bolinas Community PUD	Install Additional Filtration Unit at Water Treatment Plant	Purchase and install new fifth microfiltration unit at existing water treatment plant to increase water treatment plant's treated water production capability.	M	0	C	Our water treatment plant is equipped with four microfiltration units which are capable of producing a combined maximum output of approximately 160 gallons per minute of treated water. During summer and fall months, this output capability typically falls when we supplement our surface water source with reservoir water -- the reservoir water quality is inferior due to algae bloom and other source conditions. At the same time, we typically experience an increase in customer demand during these months. Due to the combination of decreased production ability and increased demand, the district frequently cannot meet demand and necessarily issues requests for voluntary water conservation. Note: this is not a raw water supply availability problem, but rather a production capability problem.	250,000	587	1,200	18	Marin	II	2009
2567	5010023	5010023-001	City of Modesto, DE #6, So. Turlock	Turlock Replacement Well	This project will include drilling a deeper well with a larger casing and pump motor to provide reliable pumping capacity for this area. Related site improvements include chlorine disinfection system, upgrading electrical as required by code for the new pump, install a backup emergency generator with transfer switch and any onsite piping to tie-in the new well to the existing system for distribution.	M	0	C	The main issue is the City of Modesto is unable to provide reliable pumping capacity during peak and maximum day demands. There are currently two wells available for the southern area of Turlock in which the City of Modesto provides water. In the event of an emergency, any one well can NOT provide reliable pumping capacity. The existing maximum day demand for this area is 355 gpm. Assuming one well offline due to no backup power at either site, the maximum reliable pumping capacity is currently deficient by providing only 240 gpm.	1,000,000	342	1,279	10	Stanislaus	III	2011

2568	4710006	4710006-014	McCloud C.S.D.	McCloud - Replacement of Upper Elk Spring Pipeline	Full replacement of the existing pipeline with ductile iron pipe within the existing footprint is the presumed most cost-effective and environmentally friendly project.	M	0	C	The community of McCloud is blessed with pristine water but currently cursed with an antiquated water supply system installed from our springs and springhouses sometime between 1927 and 1937 when the community was a company-owned town. In a 1998 McCloud Water Supply Infrastructure Improvement Requirements report, the community's Upper Elk Spring pipeline was identified as having an additional 10 years of life remaining. In 2006, an engineering study identified the 6,300 lineal foot pipeline as a 10", thin walled steel pipe that connects the Upper Elk Springhouse to the Lower Elk Springhouse. Most of this pipeline was very shallowly installed below ground. Some sections sit on the ground surface with soil mounded over it providing minimal, inadequate protection. Two sections of the pipeline are suspended above waterway crossings; one is supported by a rotting wooden truss system and the other exhibits extensive cable wear which has caused sectional pipe sagging. The 1998 report recommended replacement of noted multiple unscreened air valves in disrepair and one of the aerial pipeline crossings for more immediate replacement than the then-10 year anticipated lifespan. These concerns have not been addressed to date, presumably due to the economic fragility of the community. McCloud's population of 1300 cannot solely sustain the enormous financial impacts of this	3,500,000	641	1,300	01	Siskiyou	I	2012
2569	4710006	4710006-005	McCloud C.S.D.	Replacement of Lower Elk Spring Pipeline	Full replacement of the existing pipeline with ductile iron pipe within the existing footprint is the presumed most cost-effective and environmentally friendly project.	M	0	C	McCloud's Lower Elk Spring pipeline was installed sometime between 1927 and 1937 when the community of McCloud was a company-owned town. The approximately 14,000 lineal feet of 14", thin walled steel pipe connects the Lower Elk Springhouse to the Water Storage Tank. In 2003, a water meter and 10" pressure relief valve were installed on the pipeline approximately 220' upstreamof the Water Storage Tank. No other major improvements have been made to the pipeline. Most of the pipeline is seated in a very shallow trench or on the surface with soil or corrugated metal sheeting mounded over the pipe providing minimal and inadequate protection. Aerial pipeline sections cross seasonal drainage ditches with cable suspension support systems. Deterioration of the pipeline is a constant source of maintenance issues for the McCloud Community Services District requiring significant funding and staff time, throwing "good money after bad" rather than addressing replacement. The pipeline is susceptible to leaks, holes and failures due to lack of protection provided by minimal coverage in some areas and none in others. These circumstances create a serious issue of vulnerability. Damage to the pipeline caused by tree roots, rocks, falling timber, heavy equipment, all-terrain vehicles, large mammals, age and high pressures is frequent. The pipeline does not meet the State's requirements for a reliable and	5,250,000	641	1,300	01	Siskiyou	I	2008

2570	4710006	4710006-015	McCloud C.S.D.	Planning/Technical Assistance for Phased Water Distribution System Replacement	Planning/Technical Assistance for Phased Water Distribution System Replacement	M	0	C	McCloud's company-owned mill town legacy includes deeded inheritance of approximately 63,000 lineal feet of an antiquated water distribution system installed in the 1940s without benefit of design planning or engineering. The existing helter-skelter pipelines include mains running through now private properties since the company divested itself of ownership. Homes and businesses exist atop infrastructure. Valves are located on private properties and frequently under residential and commercial structures. Infrastructure was deeded to McCloud with minimal documentation to facilitate accurate location of water main, service lines and appurtenances. Although the McCloud Community Services District (MCSD) employees have developed a map book based on the limited documentation provided and additional field observations, it is difficult and sometimes impossible to accurately establish the location of mains, service lines and appurtenances. An inordinate amount of staff time must be spent performing open trench investigations of infrastructure prior to performing what should be minor repairs or replacements since unknown factors often cause significant, negative consequences. One area of town requires the closure of 24 valves to shut the water off for a single repair. MCSD is currently "throwing good money after bad" as budgeted capital replacement funds are used to repair and replace infrastructure	35,000	641	1,300 01	Siskiyou	I	2012
2571	4710006	4710006-013	McCloud C.S.D.	McCloud - Replacement of Lower Elk Spring Pipeline	Full replacement of the existing pipeline with ductile iron pipe within the existing footprint is the presumed most cost-effective and environmentally friendly project.	M	0	C	McCloud's Lower Elk Spring pipeline was installed sometime between 1927 and 1937 when the community of McCloud was a company-owned town. The approximately 14,000 lineal feet of 14", thin walled steel pipe connects the Lower Elk Springhouse to the Water Storage Tank. 2583	2110004	2110004-017	Stinson Beach County Wtr Dist	Calles & Patios Pipeline Replacement Project	The District replaces approximately 300 feet of old and undersized potable water pipeline (1 to 2-inch diameter) annually with 2 to 4-inch pipe using its own staff forces and equipment. Staffing, time, and budget limitations only allow the District to replace approximately 300 feet of pipe annually and there are approximately 4,200 feet of pipeline needing replacement. The funding requested for this project ($126,000) would allow for relocating approximately 4,200 feet of potable water pipeline using a contractor to perform the work.This project addresses water system and water conservation improvements, and reliability issues.	M	0	C	The homes in the Calles and Patios area of Stinson Beach are situated on the sand spit beach. The water mains and laterals in the Calles and Patios area are over 50 years old, undersized, and deteriorating. The deteriorating condition of the pipelines causes problems with backflow prevention devices and causes flow restrictions that result in non-compliance with fire flow requirements. Additionally, the old pipelines were not originally installed at proper depth and often leak. Because the pipelines are installed in sand, the leaks can go undetected for long periods of time.	126,000	721	1,500	18	Marin	II	2009

2590	1210008	1210008-010	Garberville Sanitary District	Bear Canyon Aerial Replacement Project	The proposed project would consist of replacing the old aerial line supplying the north side of Bear Canyon. The project elements will include preliminary engineering, environmental, design, and construction of a new mainline and storage tank. The existing aerial line would be decommissioned in place as part of the project. The new route for the waterline would consist of constructing a new water main in Redwood Drive from Maple Lane to Alderpoint Road, over Highway 101, bypass the Arthur Road pump station, and continue along Alderpoint Road to Wallen Road, and up Wallen Road to the Wallen Road tank site. The length of waterline necessary would be 14,060 lineal feet. Approximately 1,330 LF of this waterline would be within bridge structures. The project will also replace the existing storage tank at the Wallen Road Tank site. The existing tank is a 20,000 gallon redwood tank. The tank was erected in the 1970s when the Wallen and Johnson Subdivision was constructed. The tank is filled by the Wallen Road booster station which pulls water from the Alderpoint Road tank. The site is at 1,150 feet above MSL. The Wallen Road booster station was also constructed in the 1970s and will need minor rehabilitation as part of the project. The Arthur Pump Station will be decommissioned as part of the project. This will decrease the O&M costs for the district. This project is intended to be attached to the new mainline	M	0	C	On March 4 2010 and again on December 28, 2010 the district experienced a catastrophic six inch transmission main line failure. the failure was caused by a 10 acre landslide in a remote canyon that divides southern Garberville from northern Garberville services. The failure left many state and county essential services with out water. Cal Trans, Cal Fire, the Pacific Gas and Electric area service center, and the Humboldt County Roads Operations Center were with out water along with 101 residential services. A Boil Water Order was issued by the district. The failure was mitigated by installing a temporary three inch pipe that is laid above ground. The 6 mainline feeds an aerial line from downtown to the northerly bank of Bear Canyon near the CDF fire station. This aerial line was constructed prior to 1936. David N. Lindberg, Certified Engineering Geologist evaluated the slide on March 8th and December 29, 2010 and recommended that the waterline be relocated to the east as far as possible as a temporary solution. Mr. Lindberg further recommended that the long term solution was to relocate the waterline crossing of Bear Canyon to a more stable and accessible location. CDPH District Office staff has observed the slide area and has concerns that the system will see failure of the slide during the winter of 2011, which will result in approximately one quarter of the system customers	3,030,000	409	1,500	01	Humboldt	I	2012
2591	2110004	2110004-014	Stinson Beach County Wtr Dist	Fitzhenry Creek #2 Pipeline Crossing	The project consists of installing approximately 60 feet of new 8-inch diameter potable water pipeline and fittings and 60 feet of new 4-inch diameter raw water pipeline and fittings. The new pipeline and fittings shall be cement-lined ductile iron with asphaltic coating. The pipelines shall be constructed on cast-in-place reinforced concrete piers to form a long span across the creek. The new water pipelines shall tie into the District's existing buried pipelines on each end and new gate valves shall also be installed to allow the new sections of above-ground pipeline to be isolated in the event of emergency or repairs. Custom-fabricated steel saddles are required to accept the new pipe on piers.The plans and specifications for the project are approximately 90% complete as of February 2009.	M	0	C	One of the District's critical facilities is an 8-inch potable water pipeline that crosses a small creek, sometimes referred to as Fitzhenry Creek #2. The 8-inch potable water pipeline crosses Fitzhenry Creek #2 in an alignment that follows a foot trail. The creek passes under the foot trail (and the 8-inch potable water line) in two small corrugated metal culverts. In addition to the 8-inch potable water pipeline, the District also has a 4-inch raw water pipeline in the same alignment and parallel to the 8-inch potable pipeline.In recent years, Fitzhenry Creek #2 has overtopped the small corrugated metal culverts and the foot trail, subjecting the potable and raw water pipelines to potential damages and threatening the ability of the District to provide a reliable supply of water to a large portion of its customers.	40,000	721	1,500	18	Marin	II	2009

2592	2110004	2110004-020	Stinson Beach County Wtr Dist	Black Rock Raw Water Tanks Replacement Project	The project involves replacing the District's aged 30,000 gallon redwood storage tanks (two tanks totaling 60,000 gallons). The redwood tanks will be replaced with a series of smaller, plastic storage tanks having lesser total capacity than the existing redwood tanks. The redwood tanks will be dismantled on site and disposed of properly. Some minor grading of the existing tank site will be required as part of the project. The new tanks will require a concrete pad foundation and proper seismic anchoring. The tank replacement project will also require replacing and realigning small sections of the existing raw water pipelines that serve as the inlets and outlets to/from the tanks. The project addresses water conservation, efficiency, and reliability improvements. This Project is currently on the CDPH's Proposition 50 Project Priority List.The plans and specifications for the project are approximately 75% complete as of February 2009.	M	0	C	The raw water storage facilities of the Stinson Beach County Water District (District) include two (2) large redwood storage tanks, each having a capacity of 30,000 gallons. The redwood storage tanks (referred to as the Black Rock raw water storage tanks) were originally constructed around the turn of the century and need to be replaced. The Black Rock raw water storage tanks need to be replaced because they exceed their useful lives, they leak water, are uncovered, and are vulnerable to a seismic event.Surface water from two of the District's four surface water supplies is stored in the Black Rock raw water storage tanks prior to delivery to the District's water treatment plant. The water tanks are situated together on a small District-owned easement. The existing tanks do not have seismic anchoring. The water tank site is on a hillside, not easily accessible for construction equipment, and is in close proximity to local residents. Previous conceptual designs for replacing the tanks have met opposition from local neighbors. To address the aesthetic issues raised by its neighbors, the District plans to replace the 2 large redwood tanks with a series of smaller, plastic water tanks of lesser total capacity.	114,800	721	1,500	18	Marin	II	2009
2593	2110004	2110004-016	Stinson Beach County Wtr Dist	Ranch Raw Water Tank Replacement Project	The project involves the design and construction costs associated with replacing the District's aged 410,000 gallon bolted steel raw water tank with a new steel tank having equal capacity as the existing tank. The bolted steel tank will be dismantled on site and properly disposed of. Some minor grading of the tank site will be required as part of the project. The new tank will require a concrete foundation and proper seismic anchoring. The tank replacement project will also require replacement and realignment of the pipeline systems that deliver water to and from the tank. The project addresses water system and reliability improvements.This Project is currently on the CDPH's Proposition 50 Project Priority List.	M	0	C	The raw water storage facilities of the Stinson Beach County Water District (District) include one (1) large bolted steel raw water storage tank, having a capacity of 410,000 gallons. The storage tank (referred to as the Ranch raw water storage tank) was originally constructed around 1956 and needs to be replaced. The Ranch raw water storage tank needs to be replaced because it has exceeded its useful life and is vulnerable to a seismic event.Surface water (and occasionally groundwater) from one of the District's four surface water supplies is stored in the Ranch raw water storage tank prior to delivery to the District's water treatment plant. The Ranch water tank is the District's primary source of storage for raw water and is situated on a small parcel of land owned by the District. The water tank site is in a ravine that is subject to slides and not easily accessible for construction equipment. The District plans to replace the bolted steel raw water tank with a new steel tank.	490,000	721	1,500	18	Marin	II	2009

2598	4710002	4710002-003	City of Dunsmuir	Dunsmuir Water	Water mains will be replaced at a 6 inch, 8 inch, 10 inch Diameter and in some cases relocated to a more accessible location. To increase safety of drinking water, longevity of system and fire safety.	M	0	C	Replace aged distribution system (nearing end of useful life), some water mains are failing continually. Existing lines have a 6 inch Outer Diameter thin wall with approximately 140 pounds PSI. Water main is located within 3 feet of an existing sewer main. Due to terrain and utilities location of existing water main does not allow construction of new main in same area.One region has a 2 inch water line with no fire fighting capabilities.Our elementary school has very limited fire fighting water resources.	2,547,000	1,285	1,923	01	Siskiyou	I	2011
2599	5410014	5410014-005	Tipton Community Services Dist	New Municipal Water Well - Tipton CSD	The Tipton Community Services District (District) has identified the need for a new groundwater well for domestic water supply purposes. The District's proposed project consists of designing and constructing a new groundwater well. At this time, a well site has not been identified. The project cost estimate includes the cost to install a 10-inch transmission pipeline (1,320 lineal feet) to connect the proposed well to the existing water system. The cost estimate also includes a test well and abandonment of one existing well. The well site will include a 600-foot deep municipal well, pump and electric motor, an 8,000 gallon hydropneumatic tank, chlorination and associated safety equipment, piping, valving, flow measurement, site work, fencing and a fire hydrant.The proposed Project will include the preliminary engineering necessary to complete the well including: technical design, reports, California Environmental Quality Act procedures, surveying and permits. The preliminary engineering will culminate with the preparation of final plans and specifications for bidding purposes. As part of the Project, the District will select a general contractor through a public bidding process.	M	0	C	The Tipton Community Services District (District) provides domestic water to the residents of the unincorporated community of Tipton. The District's water system serves approximately 2,400 people. The District utilizes two (2) groundwater wells to supply its water system. The wells produced 193.9 million gallons in 2008.The revisions to the Title 22 Water Works Standards (effective March 9, 2008) requires that the public water system has the capacity to meet the system's maximum day demand (MDD) and peak hour demand (PHD) (see Section 64554(a)). The standards also require that the system shall be capable of meeting MDD with the highest capacity source off-line (see Section 64554(c)). Based on the Year 2008 water production records (the District does not have water usage records) and the Year 2007 pump tests, the existing water system cannot meet the title 22 Water Works Standard discussed above.The two (2) wells were drilled in 1959 (Well No. 2) and 1986 (Well No. 4) and are 50 and 23 years old, respectively. The District needs a new groundwater well to meet current title 22 Water Works Standards. A new well is also necessary to relieve the District's dependency on its older wells.	1,017,000	587	1,992	12	Tulare	III	2009

2602	4910019	4910019-002	Forestville County Water District	Forestville Water District Young Tank Replacement	Dismantle existing redwood storage tank and construct a new welded steel tank with a storage capacity of approximately 300,000 gallons. Reconstruct tie-in pipeline and appurtenances.	M	0	C	An existing 100,000 gallon redwood water storage tank has been in service for over 40 years. It has developed leaks which are no longer repairable. The tank also sustained slight exterior damage when it was struck by a nearby tree felled during a recent storm. Although the longer term effects on the structural integrity of the tank due to this event are unknown, the on-going risk to the District is high. This tank represents 50% of the water storage capacity directly serving the high pressure zone on the west side of the service area. The District is also in need of additional overall storage capacity to offset seasonal water delivery limitations form the Sonoma County water Agency.	500,000	909	2,000	18	Sonoma	II	2009

2603	4910019	4910019-001	Forestville County Water District	Forestville Water District Kay Lane Water Main Replacement	Install approximately 2,300 feet of 8" diameter water pipe, three (3) 8-inch isolation valves, one (1) blow-off and four (4) fire hydrants.	M	0	C	Two existing small diameter private water mains provide water service to District customers whose properties are up to 2,300 feet from the nearest point of the District's distribution network. These private mains were installed over 30 years ago and run beneath a street that borders the District's service area. The length and age of these private mains continually expose the customers to an elevated risk of substandard water quality and service reliability. One of the mains crosses over Jones Creek, which is therefore at-risk to the effects of direct discharge of chlorinated water that would result from any leakage. Other property owners in the service area also front the same street in which the private mains are located but are unable to afford a water service connection due to regulations that establish limits on the distances that separate distribution system, customer meter and customer property. This portion of the District's service area also lacks suitable water supply for fire fighting purposes. The District would like to replace the private mains with a pipe that meets District standards, providing not only improved service to existing customers, but also enabling other property owners in the service area to acquire water service. This new pipe would eventually be extended back to another main in the distribution network, creating a service loop that would provide increased reliability to a larger portion of	362,000	909	2,000	18	Sonoma	II	2009
2604	1710010	1710010-008	Lower Lake County Water District	Distribtution System Replacement	Replace with new pipe sized to meet current system demands.	M	0	C	Eight miles of old, undersized pipe in poor condition.	4,000,000	886	2,025	03	Lake	II	2002
2605	5610003	5610003-002	VENTURA CWWD NO. 17 - Bell Canyon	Ventura County Waterworks District No. 17 - Reservoir Safety Upgrades	This project will include:1. Installation of a flexible connection (EBBA Iron "Flextend") for the reservoirs inlet-outlet piping.2. Installation of secured, enclosed ladders at the reservoirs.3. Installation of SolarBee circulation equipment. Completion of the Project will help:1. Protect the integrity of the reservoir in earthquakes.2. Provide safe access to the reservoirs3. Maintain chlorine residuals, provide for dispersing/mixing of chemicals, and control nitrification.4. Protect the health and and safety of customers and employees.	M	0	C	Ventura County Waterworks District No. 17 (District) provides domestic water and fire protection to the community of Bell Canyon, a high fire hazard area. There are three inherent problems with the District's reservoirs1. The reservoirs do not have a flexible connection to the water system to protect them from damage.2. The reservoirs do not have a secured access ladder to provide safe access. 3. Stratificaiton and stagnant zones are causing loss of disinfectant residuals.	171,000	711	2,154	06	Ventura	IV	2009
2606	5610003	5610003-003	VENTURA CWWD NO. 17 - Bell Canyon	Ventura County Waterworks District No. 17 - Waterline Replacement	This project will include the construction of approximaely 10,000 linear feet line in segments at various locations throughout the District's water system. The work consists of installation of water lines, gate valves, air and vacuum relief valves, fire hydrants, reconnecting water service lines and appurtenances; and removal and construction of a pressure reducing station. The work also includes, but is not limited to replacement of fittings, disinfecting and testing, potholing, sheeting and shoring, insertion of temporary shut-off valves, temporary by-pass of testing supply line, removal and reconstruction of existing improvements, traffic control, disposal of all excess excavated or removed materials, and construction of temporary and permanent pavement resurfacing.Completion of the project would ensure a reliable system, thereby protecting the health and safety of our customers.	M	0	C	Ventura County Waterworks District No. 17 (District) provides domestic water and fire protection to the community of Bell Canyon.The system was constructed in 1977. Certain reaches of the system is composed of cement mortar coated and lined pipe traversing deep canyons. Some of the areas which were accessible in the 1970's have been developed and access to our lines by road is impossible.Failure in any of these crossings would cause water outages to several of our customers, and repairs would be extremely challenging and prohibitively expensive.	2,000,000	711	2,154	06	Ventura	IV	2009

2607	3310047	3310047-005	Cabazon Water District	Northwest (2156) Pressure Zone I-10 / Railroad Crossing	The project proposed is simply to add a parallel 16" bore and jacked waterline next to the existing 8" waterline. This will ensure that a sufficient quantity of water can be moved to and from the Northwest Pressure Zone. The total length of the bore and jack is estimated at 600 lineal feet to cross both Interstate 10 and the railroad. The area is known to contain extremely rocky material. Appropriate permits will need to be obtained from both CalTrans and the railroad company. The total estimated construction costs consist of material costs, equipment costs, labor costs, bonds and insurance costs, and construction contingencies. The total estimated project costs consist of construction costs, engineering costs, administrative costs, environmental costs, and legal costs.	M	0	C	The District has a total of approximately 1,050 service connections. Of these, nearly all are located in the three pressure zones located below the Northwest (2156) Pressure Zone, which is the District's highest pressure zone. However, one-half of the District's water production and supply is from the Northwest Pressure Zone. The District's existing Well Pumping Plant #2 is located adjacent to the Robertson's Ready Mix gravel operation on the southerly side of Interstate 10, south of the easterly portion of Cabazon Factory Stores. Well Pumping Plant #2 pumps to the District's existing Reservoir #2, which is located on Millard Pass Road on the northerly side of Interstate 10, east of the Cabazon Factory Stores. Currently, the only path for water to travel from Well #2 to Reservoir #2, and the three, lower pressure zones, is through an old, 8" pipeline that travels underneath Interstate 10 and the railroad located immediately south of Interstate 10. The condition of the old, 8" pipeline traveling underneath Interstate 10 and the railroad is not known; however, due to its age and the limited flow of water that can be conveyed through the pipeline, its condition is suspected to be poor. There is no backup or alternative means for the water to travel between the	907,000	875	2,229	20	Riverside	V	2007
2608	5610015	5610015-013	VENTURA CWWD NO. 19 - SOMIS	Ventura County Waterworks District #19 - 860 Reservoir Replacement	This project is to construct a 200,000 gallon bolted steel water tank on a concrete foundation per AWWA D103-89 standards. The tank shall have a nominal diameter of 38' and a height of 24 feet. A cone roof, sloped to drain toward the shell shall be provided. The reservoir shall be built completed with all pipe connections, access openings, nozzles, taps, drains, ladders, vent, liquid level indicatators, and other accessories and appurtenances as shown on the plans.When completed this project will provide for additional storage capacity in the 860 zone. When completed, this project will reduce energy costs and conserve the water supply and the dependance on imported State water.	M	0	C	Ventura County Waterworks District #19 (District) was estabilised in 1981 when it assumed ownership of the Rancho Las Posas Mutual Water Company. When the District acquired ownership, the existing water system was deficient in several areas: inadequte sizing, deterioting pipeplines about 80 years old, and lack of supply and storage. Since its formation, the District has been making improvements in various parts of the system to bring it into compliance with the Title 22 requirments.The proposed reservoir will replace an existing one which was built in 1975. The bolted steel reservoir has served its useful life. It is badly corroded, has leaks and could be out of commision at any moment. Loss of the reservoir in this system would impair the storage capacity of the zone, compromising the storage requirements, and thus endangering the health and safety of those who receive water from the current reservoir.	250,000	775	2,266	06	Ventura	IV	2009

2609	5610015	5610015-010	VENTURA CWWD NO. 19 - SOMIS	Ventura County Waterworks District No. 19 - Pipelines Replacement	This project will include the replacement of approximately 72,000 linear feet of aged water distribution line in segments at various locations throughout the District's water system. The work consists of installation of water lines, gate valves, air and vacuum relief valves, fire hydrants, reconnecting water service lines and appurtenances; and removal and construction of a pressure reducing station. The work also includes, but is not limited to replacement of fittings, disinfecting and testing, potholing, sheeting and shoring, insertion of temporary shut-off valves, temporary by-pass or supply line, removal and reconstruction of existing improvements, traffic control, disposal of all excess excavated or removed materials, and construction of temporary and permanent pavement resurfacingCompletion of this project will ensure a reliable water supply, meeting all Health Department requirements.	M	0	C	The Ventura County Waterworks District No. 19 (District) provides water services to the community of Somis. The District is a small water system serving approximately 1000 customers. All costs for the repacement of the waterlines must be borne by these customers.The District's water system is deteriorating because of aging and tuberculation. Certain segments of the lines were installed 80 years ago; consequently, valves, blow-offs and fire hydrants are malfunctioning. Operations and Maintenance cost have been on the rise. As is typical of an aging system, the District is experiencing pressure problems, water quality and capacity issues, and frequent water line breaks. The main reason the replacement project has been delayed is the cost of the project and the financial impact on the District's customers.	10,000,000	775	2,266	06	Ventura	IV	2009
2610	5610015	5610015-002	VENTURA CWWD NO. 19 - SOMIS		Construct 900 LF of 8 inch water line to replace existing 2-inch line on East St.	M	0	C	Distribution system needs upgrades to comply with the W.W.S.	54,000	775	2,266	06	Ventura	IV	1998
2611	5610015	5610015-005	VENTURA CWWD NO. 19 - SOMIS		Construct 1.0 MG reservoir and 7,200 LF of 14 inch transmission line	M	0	C	Needs additional storage capacity to meet Water Works standards.	1,223,000	775	2,266	06	Ventura	IV	1998
2612	1510007	1510007-001	FRAZIER PARK PUD		REPLACE WATER MAINS WITHIN OUR DISTRICT - REPAIR/REPLACE WATER STORAGE TANKS ADD FIRE HYDRANTS. OTHER - DESIGN AND CONSTRUCTION	M	0	C	OLD WATER MAINS MADE OUT OF 10 GAUGE STEEL SOME AS SMALL AS 2"; INADEQUATE FIRE PROTECTION, WATER STORAGE TANKS DETERIORATING	800,000	1,362	2,348	19	Kern	III	1998
2613	0310021	0310021-004	Amador County Service Area #3/Unit 6	Camanche Low Pressure Zone Project	The proposed project includes the addition of approximately 10,600 lineal feet of 12 inch water main which connects one of the best well production areas with a central portion of the overall water system. This will allow the water tanks to be filled and meet system demands. System pressures are expected to be greater than 40 PSI with this pipeline in place. The estimated cost for the new water main is $850,000. No additional montoring, treatment, or booster pump stations are proposed with application. A seperate application seeks funding for this system to add treated water storage. If that storage is added in conjunction with this project, then storage can be consolidated and existing tanks (leaking and in poor condition) can be eliminated.	M	0	C	The Camanche Water System will experience water pressures below 20 PSI at times when filling tanks within the system. The system was originally designed to serve multiple pressure zones through muliple wells, tanks, and hydropneumatic stations. Since its installation, wells are not being utilized due to water quality concern or lack of capacity. Currently the water system relys on water transfers from new, better quality, or higher producing wells. The pipe system connecting these different systems is not adequate to meet existing demands and fill tanks at certain times of the year. This problem can be resolved through an additional pipeline: 10,300 lineal feet, 12"diameter.	750,000	723	2,386	10	Amador	III	2008

2614	0310021	0310021-005	Amador County Service Area #3/Unit 6	Consolidate and Replace Leaking Redwood Tanks	Construction of a two million gallon bolted steel storage tank. The new tank would consolidate storage from several existing tanks. This proposed tank would provide adequate to provide domestic pressures and fire flows currently unavailable with the current tanks. The existing tanks leak nearly 2,000,000 gallons monthly which will eliminated with the installation of this proposed tank.	M	0	C	Currently the total system tank storage capacity in Lake Camanche is 677,000 gallons. There are six storage tanks which are mostly unlined, ventilated, 40 year old redwood tanks. The tank staves have begun to rot, and to separate due to the tanks not remaining full at all times. Peak day demands are 774,000gpd. Currently the existing tanks leak an estimated 2,000,000 gallons monthly. Some tanks are not located near system wells and water must be transferred via pipelines. Filling existing tanks and meeting domestic demands can result in pressures below 20 PSI. The existing storage is insufficient and would require two million gallons of storage if it were constructed to Agency standards. A single two million gallon storage tank could be placed in the system such that storage could be consolidated in this one area and eliminate all of the existing tanks. The elimination of the existing storage tanks is possible if a pipeline is added which is proposed under a seperate application.	1,750,000	723	2,386	10	Amador	III	2008
2615	3610051	3610051-001	VALLEY OF ENCHANTMENT MWC	Abandon 2 inch galvanized water line Highway 138, abandon 2 inch galvanized main between Tetley and	Pipeline replacement and installation, service line connections, install 10 new fire hydrants, 15 service lines will need to be jacked underneath a main state highway which requires a contractor to complete, upgrade undersize mains for necessary fire flow, repave, lay asphalt.	M	0	C	Upgrade extremely old 2 inch mains which were installed in the 1940's. Replace them with 6-8inch mains to improve potable water distribution to customers and to be able to adequately provide fire flow requirements to a community located in a catestrophic high fire danger area. Other improvements will be to connect the project water mains to a loop system to greatly improve water quality and more efficient distribution to customers by eliminating dead end mains. Our system is very old and outdated, these projects will greatly improve the water distribution and service to our customers.The scope of the projects are greater than what our staff of 2 field personnel can complete. All of these projects require us to contract out these projects.	350,000	885	2,400	13	San Bernardino	V	2008
2616	3310004	3310004-006	Box Springs Mutual WC	Box Springs Mutual Water Company - Facility Improvements	This project will aid in the modernization of a deteriorating distribution system. If funded, this project would replace the current pump station with an entirely new system that meets all applicable codes and requirements of this type of installation and provides adequate fire flow. A separate project to replace aging distribution infrastructure is also being submitted for funding. The new system will consist of a new 800 gpm pump, as well as a 3,650 gpm pump for emergency conditions, all with new motor control centers, instrumentation, and other modernized control equipment. A 200 KW backup generator would also be included in this design; in the event of an emergency, the facility would have the ability to continue to deliver an adequate level of service to meet local requirements. These systems would be housed in a new pumping structure to protect this valuable equipment and provide a safe working environment for the employees of the BSMWC. In addition to a new pump station, this project will also replace assorted yard piping, and other appurtenances to transform the pump station that is not to current codes into a modern facility. The necessary replacements will allow the water	M	0	C	The Box Springs Mutual Water Company (BSMWC) serves the severely disadvantaged community of Moreno Valley, near Riverside, California. The current service area is 430 acres, with approximately 600 service connections. BSMWC has an existing well and Western MWD imported water connection that pump into 2 -400,000 gallon water storage tanks. The booster pump station that currently delivers water from the tanks into the distribution system needs replacement. During the most recent pump station evaluation, the BSMWC Pump Station was evaluated as being in very poor condition for the following reasons: • Piping is corroded and inaccessible for repair. • Auxiliary mechanical equipment is aged and corroded. • Valves are corroded, worn, leak, and do not operate effectively; it is not known if some valves operate at all. • The electrical system and controls do not meet current electrical codes • The housing structure is a corroded, corrugated metal building with aged wood framing. The structure is deemed inadequate to protect valuable equipment, does not meet current building codes, does not provide adequate spacing between electrical panels and other obstacles; and does not provide adequate ventilation.	2,270,000	602	2,477	20	Riverside	V	2007

2617	3310004	3310004-004	Box Springs Mutual WC	Box Springs Mutual Water Company - Nitrate Removal	This project would fund the installation of a nitrate treatment system on well #17 to reduce the nitrate contamination level of the water prior to disinfection and distribution. This system will likely consist of a skid mounted selective contaminant well head ion exchange system to significantly reduce the level of nitrates in the source water. In addition to the treatment system, a new building enclosure, concrete, and other associated appurtenances would be funded through this project to construct a complete operational system that operates efficiently and effectively. In order to economically produce high quality water, only a fraction of the total flow pumped from well #17 must be treated. Approximately 300 gpm of treated water would be blended with raw water to provide a potable water supply of 800 gpm that will meet all necessary regulations. This treatment process would allow the BSMWC to directly distribute water generated entirely from local sources without blending with water obtained from WMWD. Although this would eliminate the need to obtain water supplies from outside sources, the connection to WMWD would remain available for emergency uses.	M	0	C	The Box Springs Mutual Water Company (BSMWC) serves the severely disadvantaged community of Moreno Valley, near Riverside, California. The current service area covers 430 acres and supplies water to approximately 600 service connections. BSMWC currently obtains water from 2 sources. The primary source of water is obtained from a local ground water source, pumped through Well #17. However, Well #17 has nitrate concentrations ranging from 9 to 10 mg/l of nitrate as N. It is believed that historical agricultural sources are the primary cause of nitrate contamination. Located in the northern portion of the service area, this well can provide a continuous water supply to meet the demands of the service area of over 800 GPM. BSMWC also purchases imported water from the Western Municipal Water District (WMWD) through a 6" interconnection at the eastern edge of the service area. The primary purpose for purchasing water from the WMWD is for blending the two water supplies to reduce the nitrate concentration of the delivered water prior to distribution to customers. As set by the United States Environmental Protection Agency, a Maximum Contaminant Level (MCL) of 10 mg/l of nitrate as N has been set, however the California Department of Heath Services permit held by	1,960,000	602	2,477	20	Riverside	V	2007
2618	3310004	3310004-005	Box Springs Mutual WC	Box Sprigns Mutual Water Company - Distribution System Improvements	This project will modernize an aging distribution system that is significantly passed its useful life by replacing a significant fraction of the corroded and deteriorated pipes that are currently in service. These infrastructure improvements will reduce water losses, water outages, and potential water contamination issues related to the extremely fragile state of the existing distribution system. This project would fund infrastructure improvements that consist of failing pipelines, valves, fire hydrants, and other related equipment. A separate project to replace an aging pump station is also being submitted for funding. The necessary replacements will allow the water distribution system to operate more efficiently by significantly reducing water losses and pumping costs using modern corrosion resistant materials and appropriately sized distribution pipes. Approximately 36,700 feet of 8" and 12" PVC pipe will be used to replace existing failed 4" and 6" lines. These improvements will increase emergency fire flows within the systems service area by reducing friction losses in the system. This would be a vast improvement from the current conditions and contribute significantly to the improvement of this disadvantaged area.	M	0	C	The Box Springs Mutual Water Company (BSMWC) serves the severely disadvantaged community of Moreno Valley, near Riverside California. The current service area covers 430 acres and supplies water to approximately 600 customers. The industry standard for the useful life of a distribution pipeline is generally accepted as 40 years; a significant portion of the 51,953 linear feet of the BSMWC distribution system is composed of pipe that is 40 to 60 years old, and has out lived its useful life. From 1998 to 2001, there have been 81 distribution or service line breaks for the 430 acre service area and in the past 4 years, nearly 200 acre-feet (up to 13% of total annual usage) of water have been lost. Most of the pipes in the system are made of unlined-steel and have developed internal tuberculation. The tuberculation has caused continued deterioration and a reduction of as much as 50 percent of inside pipe diameter in some pipes. The reduction in internal pipe diameter increases pumping and maintenance costs and reduces service pressures and available flow rates to customers. The external surfaces of the steel pipe are also uncoated, and due to the corrosive nature of the native soil, is subject to corrosion which has also contributed to pipe failure.	7,350,000	602	2,477	20	Riverside	V	2007

2619	4510002	4510002-006	Mountain Gate C.S.D.	Mountain Gate - drought preparedness project	proposed project ; replacement of 2200ft. 12 in ductal iron pipeline .replace 30+yr old booster station with new, in alignment with new pipeline routing.remove all exposed pipe and demolish old pump station	M	0	C	drought conditions at primary intake at shasta lake has eroded transmission main support . this pipeline is in iminent danger of failing. loss of this transmissiom main will stop all raw water reaching the treatment plant .this pipeline is exposed on what is normally lake botton, but now is in a drainage chanell. relocation of this main to higher ground out of the drainage is required.pipe relocation will also require replacement of a booster station . in jan.09 board of directors declaired this project an emergency condition that would compromise public health and safety should the pipeline fail	934,000	664	2,500	02	Shasta	I	2009

2621	4410008	4410008-004	Mt. Hermon Association, Inc.	Replace Tanks	Replace 2 deteriorated tanks with one new 500,000 gal tank.	M	0	C	System has 2 old bolted steel tanks (250,000 gal ea.) that are 50 years old and failing.	475,000	590	2,500	05	Santa Cruz	II	2006
2622	4510002	4510002-010	Mountain Gate C.S.D.	Copper Canyon Distribution Upgrade	The Project would include upgrading the existing 4-inch distribution lines to 8 inches. This Project would also allow the District to then upgrade Fire Prevention and Fire Suppression flows to the Copper Canyon area of the District: which would be included in the overall Project.	M	0	C	A pump station in the Copper Canyon area of the District was upgraded in 2005, but has not solved the problem of low, domestic flows: which include the needed pressure for fire protection. The existing pipes in the area are only four inches in diameter, and need to be enlarged to 8 inches in order to comply with state requirements and provide a minimum of 20 psi.	675,000	664	2,500	02	Shasta	I	2011
2623	3710036	3710036-004	Borrego WD	Conduct a feasibility study to investigate alternative imported water routes	The two major water districts mentioned earlier have been contacted and appear willing to assist in 'wheeling' water through their system to a pipeline to Borrego Valley. The objectives of this planning/feasibility study include: (1) the identification of a water source for Borrego, such as from Indian Tribes located on the Colorado River, State Water Contractors, etc.; (2) the evaluation and selection of the most appropriate pipeline routing from the either district to Borrego (three have been preliminary identified); and (3) the preparation of a preliminary design of the best routing alternative.	M	0	C	The community is totally reliant on a sole source aquifer for drinking water. This aquifer is being depleted by agricultural, recreational and domestic pumping, 70%, 20% & 10% usage, respectively. The groundwater levels are dropping by 3-5 feet per year. The annual overdraft is estimated to be from 12,000 to 14,000 acre feet per year and it is possible that there may be as little as 35 years of usable water left in the aquifer. While both the BWD and the County of San Diego have adopted groundwater mitigation requirements for new development in the area, the County's requiring new development's water use to be off-set by fallowing farm land on a one-to-one basis and BWD's requires the payment of a fee, there is a significant new demand from previously approved dwelling units that are not subject to the County mitigation. This potential new demand will increase the current overdraft by about 3,500 afy. BWD studies have shown that with the recently adopted water conservation program for domestic water use, there are no solutions to the overdraft problem, except the importation of water from one of the two major water districts, a distance of 40 to 50 miles from the Borrego area. This conclusion has been confirmed by the Department of Water Resources.	250,000	2,017	2,535	14	San Diego	V	2008
2624	5510005	5510005-004	TWAIN HARTE COMMUNITY SERVICES DISTR	Water Line Replacement	Install new 6-inch PVC water lines. (Goodell)	M	0	C	Low pressure and water supply problems caused by old and deteriorated 2-inch steel lines.	30,000	1,530	2,568	11	Tuolumne	III	2003
2625	2310007	2310007-013	North Gualala Water Company	Anchor Bay Tanks	Construct two(2) new 141,000 gallon bolted steel storage tanks including piping, automated controls, alarms, and monitoring systems.	M	0	C	Existing storage capacity will not meet domestic and fire flow requirements. Per CDPH Compliance Order #02-03-08CO-002 section 64554 and section 116555 (a)(c) CCR Title 22.	575,280	1,033	2,595	03	Mendocino	II	2009

2626	2310007	2310007-010	North Gualala Water Company	Enchanted Meadows Storage Tank Upgrade and Watermain Replacement	Demolish and construct a new surge tank meeting earthquake standards including automated controls, alarms, and a monitoring system. Replace a substandard connecting water transmission main to meet CPUC fire flow requirements.	M	0	C	The existing 30,000 gallon surge tank with booster pump is of questionable structural integrity and needs replacement. Existing tank can not be earthquake retrofitted. Existing tank is constructed of redwood with varying decay problems. Tank leans beyond perpendicular. Because a temporary plastic liner has been placed inside the tank, total tank decay is imminent. Two booster pumps, which transport water to a 141,000 gallon storage tank at higher elevation, are required to be upgraded to pump an adequate flow through the connecting main between another surge tank, the surge tank to be replaced, and the upper tank of adequate volume. An existing 4 inch water transmission main is substandard in size for a distance of approximately 3,000 feet between the decaying wood tank and the larger 141,000 gallon steel bolt-up tank which could supply adequate fire flow and domestic service flow if the main were large enough to transmit the necessary volumes for public health and safety. This project will replace the four inch diameter transmission main with an eight inch diameter transmission main.Insufficent storage and water transmission capacity to meet AWWA & CDPH standards per CDPH Compliance Order #02-03-08CO-002 section 64554 CCR Title 22.	548,000	1,033	2,595 03	Mendocino	II	2009
2627	2310007	2310007-014	North Gualala Water Company	Water Main Replacements - Compliance Order	Replace exisiting under sized water mains with new water mains with sufficent capacity. This project is to only provide adequate service to existing customers and bring the system into compliance with the State Office of Drinking Water Standards and California Public Utility Commission Standards.	M	0	C	This project is to replace aging under sized water mains that can not meet domestic demands while under minimum fire flows, or which cannot even meet minimum pressure standards for domestic service during times of peak domestic demand. These deficient water mains violate Calif. Department Public Health and Safety Code Title 22 CCR sections 64554 chapter 16, section 116555(a)(3) and have been ordered to be brought into compliance per Compliance Order #02-03-08CO-002. These projects are all in or adjacent to paved roadways where botanical impacts are not likely but must be reviewed by a qualified botanist and impacts must be fully disclosed. They are to serve existing populations where build-out is substantially complete and generally will have no growth inducing impacts. They are solely for improvement of health and safety to meet minimum State Office of Drinking Water and California Public Utility Commission Standards. They will not require any new source of water. Therefore they will be eligible for a Categorical Exemption from CEQA,unless botanical resources are found. No Federal cross-cutting requirements will be triggered unless botanical resources are found.	2,982,808	1,033	2,595 03	Mendocino	II	2009

2628	3510004	3510004-007	Aromas Water District	Rea Tank Replacement Project	Replacing old redwood tank with new steel tank:The project consists of setting up disinfected temporary distribution reservoir and switching controls for complete operation without the existing redwood tank. Construction project would include clearing, grubbing, demolition of existing redwood tank, connecting to existing underground piping, new outlet piping, site grading and re-compaction, road construction and pavement, relocate existing electrical, controls, telemetry, erection of steel bolt-up 214,000 gallon tank, complete site work and install vinyl coated chain link fencing for security. This project: 1) New 214,000 gallon steel tank meets AWWA Standards D 100-05, whereas the existing redwood tank does not. 2) Steel tank reduces possibility of increased coliform levels caused by bacteria in redwood. 3) Secures System reliability for this pressure zone, as the existing tank leaks badly and is deteriorating. 4) Loss of the redwood tank in this pressure zone would have a direct effect on nearly 20% of the District service area population. 5) A steel tank will mitigate the danger of capacity loss due to earthquake and fire loss. 6) Loss of the existing redwood tank would cause flooding damage to surrounding homes. 7) Improve security by placing a fence around reservoir site. 8) Reduced costs for long-term maintenance of steel vs. redwood tank. 9) The District has experience purchasing, erecting and	M	0	C	This project replaces an old (1970) leaking redwood 60,000-gallon storage tank with a new bolted steel 214,000-gallon tank serving potable water for domestic use. This project: 1) Provides compliance with Title 22 CCR, Section 64585,Article 6. Distribution Reservoirs, Design and Construction 2) The new steel tank meets the AWWA D-103 standard and requirement, while the existing redwood tank does not. 3) The new tank will secure system reliability for this pressure zone, as the existing tank leaks badly and is deteriorating. Recent soils tests show leaking water penetrated the surrounding soil to a depth of 4'. 4) This pressure zone serves nearly 20% of the District service area population, emergency failure is significant. 5) A steel tank will mitigate the danger of capacity loss due to earthquake and fire loss. 6) Emergency failure of the existing redwood tank would cause flooding damage to surrounding homes. 7) Security will be improved by placing a fence around reservoir site where none exists now. 8) While no violations have occurred, a new steel tank reduces the risk of potential contamination from the redwood tank.	298,000	884	2,700	05	San Benito	II	2009
2629	3610063	3610063-002	GOLDEN STATE WATER CO - MORONGO DEL SUR		Replace mainline	M	0	C	Old, undersized mainline	570,000	823	2,716	13	San Bernardino	V	1998
2630	1510046	1510046-006	Lost Hills Utility District	Reliable Capacity Well No. 3	The LHUD will be completing a Water System Master Plan through a Prop 84 Grant. This study will include a component on Firm Water supply which will confirm the need for an additional water well. Other water system improvements will also be identified.The Firm Capacity Well No. 3 will require environmental documentation. Since the LHUD is pursuing State and Federal funding, the CEQA plus documentation is anticipated. Coordination with the Semitropic Water District will be required for drilling a new well in its district. A Kern County Well drilling Permit will be required and modifications to the Arsenic WTP permit will be addressed once the well is drilled and put into service.Design of a new well will take approximately 6 months. Construction of the well can be completed in approximately 5 months after the contractor receives a notice to proceed. Total time for planning, design and construction is a minimum of 18 months.	M	0	C	The Lost Hills Utility District (LHUD) provides domestic water to the town of Lost Hills, I-5/Highway 46 commercial users, and users along the Highway 46 corridor from 10 miles east of I-5 to approximately 10 miles west of I-5. Water is pumped from two wells, located on 160 acres, 10 miles east of I-5/Highway 46 interchange. This site is located in the northeast corner of Gun Club Road and McCombs Avenue in the Semitropic Water Storage District Service Area.The two existing wells are rated at 500 gpm. LHUD is in need of a 3rd well in order to maintain firm supply. Industry standard defines firm supply for a water system comprising of wells, as the total pumping capacity minus the largest well. Therefore, the LHUD has a firm supply of 500 gpm with one well operating. Based on monthly water production data and projections to the Maximum Day Demand, the LHUD water demand periodically exceeds the existing firm capacity of 500 gpm.Based on CDPH Revised Water Works Standards, Maximum Day Demand (MDD) to Maximum Month Demand (MMD) peaking factor of at least 1.5 is recommended. LHUD monthly production data indicates several maximum month demands greater than 15 million gallons per month (mgm). These demands occurred in 5 months between 2003 and 2007 in July or August. A 15 mgm equates to maximum month average day demand (MMD) of approximately	800,000	360	2,772	12	Kern	III	2012

2636	5410009	5410009-011	Pixley Public Util Dist	Water Main Replacement	Correction of the problem includes looping of dead ends and replacement of waterlines 4-inches and smaller. Wharf hydrants will also be replaced.	M	0	C	The existing water system was constructed in the late 1940's and early 1950's. The lines range from 2-inch steel to 12-inch pipelines, however, most are 4-inch and 6-inch pipelines. The small pipelines and multiple dead ends impose a large pressure loss to the water system. These pipelines are not sufficient for fire flow deliveries. The old steel lines may also be a source of water leaks and potentially a source of contamination throughout the District. Many of the hydrants are wharf hydrants that are insufficient for fire flow demands.	2,070,000	801	2,793	12	Tulare	III	2009
2637	2010003	2010003-002	BASS LAKE WATER COMPANY		Construct a new 8-inch diameter raw water pipeline.	M	0	C	Intake pipeline to the surface water treatment plant is old, undersized, and has numerous leaks throughout its length.	800,000	989	2,800	11	Madera	III	2001

2639	2110006	2110006-015	North Marin WD - Pt. Reyes	Water Treatment Plant - emergency power hookup	Install connection for emergency generator to speed restoration of service.	M	0	C	No emergency power at treatment plant.	10,000	762	3,000	18	Marin	II	1998
2640	2110006	2110006-026	North Marin WD - Pt. Reyes	Pt Reyes Pump Station Upgrades	This project proposes to replace the motor control centers at the Pt Reyes Pump Station. This replacement will enable the pumps to restart when the power is restored after an outage, restoring water service to the 750 customers who would otherwise have to wait until the pumps could be manually fixed, a task made more difficult due to the remote location of the town of Pt Reyes.	M	0	C	The Pt Reyes Pump Station is the sole pump station that provides water to 750 services in the distribution system. Due to the age and condition of the electrical distribution equipment at this pump station, if a power outage were to occur catastrophic failure of electrical equipment would interrupt water service to all of these customers. The Pt Reyes Pump Station needs to be upgraded to continuously provide enough water delivery capacity to supply current demands.	72,000	762	3,000	18	Marin	II	2009
2641	2110006	2110006-016	North Marin WD - Pt. Reyes	dedicated emergency generator for Pt Reyes	Purhcase power generator dedicated to West Marin.	M	0	C	No emergency power at treatment plant.	35,000	762	3,000	18	Marin	II	1998
2642	2110006	2110006-029	North Marin WD - Pt. Reyes	Upsize 2" Mains	This project proposes to replace the 6,640 feet (1.25 miles) of aging 2" main with new 6" main. This upsizing will enable enough flow capacity to serve the current demand. The upsizing will also bring the distribution system into compliance with Water Works Standards of a minimum main size of 6" diameter.	M	0	C	There currently exists over 6,640 feet (1.25 miles) of circa 1950's 2" galvanized steel water main in the distribution system. These mains are undersized and severely corroded, causing significant water supply and reliability problems. It is very difficult to meet current demands.	300,000	762	3,000	18	Marin	II	2009
2643	2910002	2910002-001	City of Nevada City	The Nevada City Drinking Water Plant Upgrade	The City of Nevada City's water treatment plant was totally rebuilt in the mid 1970's. The plant is designed to produce 2MGD; because the plant is essentially manually operated.In recent years, the City has been considering a complete rebuild of the water treatment plant system. The following upgrades need to be corrected:1. The plant has a 53 acre feet storage pond and during winter months, algae blooms and causes taste and odor problems.2. Three storage tanks of approximately 1.5 MG each, are mechanically controlled with frequent spillage results in wasted water.3. The filter system is in need of replacement requiring frequent back-washes during the day.4. The water system has mechanical transmission problems to the far sides of town because of the old pipe system.These corrections to the entire plant need to be completed to help make the City's water supply of higher quality and to insure adequate water supply for the next generations.	M	0	C	To increase the capacity of the plant to produce sufficient amount of water during the summer peak demand and to increase our storage facilities and to refurbish and automate the thirty-five (35) year old plant.	3,625,000	1,205	3,001	21	Nevada	I	2008

2645	4010012	4010012-002	HERITAGE RANCH CSD	0.42 MG Storage Tank Replacement	Heritage Ranch Community Services District is requesting funds to replace the existing 0.42 mg bolted steel tank with a new 0.5 mg welded steel tank. The following would be included in the project:• Decommission existing bolted steel tank.• Construct new 0.5 mg welded steel tank with new foundation, coating, cathodic protection, separate inlet and outlet, mixing system, SCADA, and other appurtenances.• Once new tank is constructed, take existing 2 mg tank out of service for inspection, cleaning, coating, and minor repair work including separate inlet and outlet and mixing system.• Construct a fence around perimeter of facility.	M	0	C	Heritage Ranch Community Services District (District) provides water service to a population of approximately 3,500 persons with an average annual water demand of 618.5 AFY. Their average day demand and peak hour demand are 0.56 mgd (388 gpm) and 1.96 mgd (1,361 gpm). The District operates a 2 mg storage reservoir that supplies gravity pressure to the entire distribution system. Adjacent to the 2 mg tank is a 0.42 mg bolted steel tank that has been taken out of service due to substantial rust and leaks. At this time, the District does not have a permanent secondary source of water storage to allow the District to take the primary tank out of service for maintenance and cleaning. It has been 9 years since the tank has been taken out of service and cleaned. To maintain the integrity of their primary water storage facility, a full inspection, cleaning, and minor repair work is required in the near future as identified in the District's Water Master Plan, prepared in September 2008 as a first priority project. Additional upgrades that should be completed on the 2 mg tank include expansion joints for protection against earthquakes, separate inlet/outlets to meet current Water Works Standards, and an internal mixing system to help improve water quality during the low demand season. In order for the District to properly maintain the existing tank and bring the tank up to current Water Works Standards, the District needs a secondary water	1,448,775	1,695	3,100	06	San Luis Obispo	IV	2009

2656	4710008	4710008-002	City of Mt. Shasta	Big Lakes Well and Pressure Zone Project	The project will include the installation of a new municipal well, 1000 gpm pump with 150 hp motor, 800 lineal feet of 12 inch pvc water line and necessary appurtenances.	M	0	C	The Mt. Shasta water system has an area that is subject to periodic low pressure due to it's elevation and location in the end of the distribution system, as well as significantly deteriorated pipes. This project is intended to correct system deficiencies that lead to inadequate water supply and pressure, and possible contamination and other serious health and safety issues that could result from backflow or backsiphon conditions that could occur.	728,250	1,675	3,642	01	Siskiyou	I	2009
2657	4710008	4710008-004	City of Mt. Shasta	Kingston Road System Improvements	This project includes the installation of approximately 5650 lineal feet of 10 and 12 inch pvc water line and related appurtanences. This project is part of a multi phased approach to solving system deficiencies that have the potential to cause significant health and safety issues. Other project phases include the Kingston Rd. System Improvement Project, the North Mt. Shasta Balancing Reservoir Project and the Big Lakes Well and Pressure Zone Project.	M	0	C	This project will correct inadequate pressure, fire flow, and supply issues in a deteriorated section of the distribution system that has the potential to cause serious public health and safety issues.	996,000	1,675	3,642	01	Siskiyou	I	2009
2658	4710008	4710008-003	City of Mt. Shasta	North Mt. Shasta Balancing Reservoir Project	This project includes the installation of a 1.0 Million Gallon storage reservoir, tank site improvements, and the necessary tank supply line.	M	0	C	This reservoir will provide adequate storage, fire, flow, and emergency storage for an area of the distribution system that potentially could adversely affect public health and safety. This project would also benefit, enhance, and be an integral part of the Big Lakes Well and Pressure Zone Project.	1,345,000	1,675	3,642	01	Siskiyou	I	2009
2659	2310005	2310005-001	Willow County Water District	Willow County Water District Water Tank Replacement Project	The Willow C.W.D. proposes to demolish the existing 100,000 gallon storage tank, and replace it with a new 350,000 gallon water storage tank.	M	0	C	The Willow County Water District existing 100,000 gallon water storage tank built in 1950, no longer meets tank safety standards. This tank has the potential of being a threat to neighboring property owners.	375,000	1,051	3,797	03	Mendocino	II	2009
2660	1010034	1010034-002	San Joaquin, City of	Well No. 4 Replacement	The proposed project would drill a new well within the City of San Joaquin. As much of the mechanical and electrical equipment from the existing well will be used at the new well as possible.	M	0	C	The city's existing Well No. 4 has a history of sporadic detections of total coliform and pseudominas bacteria. E.coli was detected in a sample taken in September 2010. The well was drilled in 1978, and over the last 20 years the city has patched holes in the casing to prevent intrusion of groundwater in areas above the perforations.The City is currently under Compliance Order 03-23-10O-009 to correct the microbiological contamination in Well No. 4, and the well is currently off-line. The city has 2 other wells that can meet demand if both wells are operational. However, if one well is out of service, then Maximum Day Demand with fire flow can not be meet, as required by California Waterworks Standards. The city does not have any storage facilities.Due to the expenditures to repair the existing casing, the city is not willing to spend additional funds to address the contamination on this well.	750,000	927	3,870	23	Fresno	III	2012

2661	1010034	1010034-001	San Joaquin, City of	San Joaquin Well No. 6	The proposed project will provide an additional source of water for the City of San Joaquin. This project will drill and develop a new water well approximately 500 feet in depth. The anticipated production is 1,200 gpm. The standing water level is about 175 feet and the anticipated pumping level will be about 260 feet below surface.Final design of the pump and motor will be determined after the development of the well. However, it is anticipated that a 150-hp electric motor will be needed for the vertical tubine pump. the pump will be set about 330 feet below surface. Electrical controls will include a variable-speed drive to maintain constant pressure and conserve energy.Site improvements will include grading and fencing.	M	0	C	California Water Works Standard Sec. 64554(c) requires that a community system be capable of meeting Maximum Day Demand with the highest producing well not in service. Currently the water system is not capable of meeting the Maximum Day Demand with fire flow if one of the exisiting wells is off-line. The Maximum Day demand with fire flow is 3,000 gpm. The system can deliver 3,500 gpm with all three wells operating and 2,400 gpm if one of the wells is off-line. With this project an additional 1,200 gpm supply will be provided. In June 2004 Well No. 4 was off-line for unscheduled maintenance, and had just been reassembled but not in service, when a fire occured at a fuel distributorship in the city. Public Works personnel were required to drive to the well site and manually engage the well to provide water to fight the fire. In addition, the oldest well in the system was drilled in 1968 and has been in continuous use since then. Although the well is producing good quality water, it is approaching the limits of the typical useful life for a well. The City is concerned that this well may fail.	750,000	927	3,870 23	Fresno	III	2009
2662	3110010	3110010-001	Tahoe City PUD - Main	Bunker Water Tank Replacement	The Tahoe City Public Utility District (District) plans to construct a new 1.2M gallon welded steel water tank to replace an existing redwood water tank (Bunker Tank). The existing tank has been evaluated to be severely undersized for today's Fire Protection Standards and highly vulnerable to seismic and forest fire events. The new tank construction will include: 1.2 MG Welded Steel Water Tank, approximately 300 linear feet of new water main piping, engineered structural foundation, fence protection, new paving of the existing dirt access road, and a graded site clear of the surrounding forest fuels, all of which will be applicable to current code requirements.	M	0	C	The Bunker Tank, originally constructed in the early 1950's, is a major component of the Tahoe City (sub-regional) water system and contributes to the potable and fire flow storage water needs for approximately 2,500 residential and commercial connections. It is the only redwood tank and the oldest tank maintained by the District, and has reached the limits of its reliable use. The existing 500k gallon tank's capacity is roughly half of the capacity necessary to meet current Operational, Fire, and Emergency Storage requirements. To meet storage requirements the new tank will require a nominal capacity of approximately 1.2M gallons. According to the "Seismic Analysis for Rocky Ridge, Tahoe Tavern, Four Seasons and Bunker Water Tanks" dated January 2006, by Nolte Associates, Inc., the existing tank does not meet current seismic code requirements and is highly vulnerable to design level seismic events. The report recommends replacement instead of retrofit due to the age of the facility, interior corrosion, structural capacity, and deteriorating site conditions. To meet current seismic regulations the proposed tank will be constructed of welded steel and situated on a site that has been engineered and structurally prepared. Based on the current Water Works Standards, the tank does not meet current AWWA design criteria for seismic structural standards based on AWWA D100-96.	2,173,450	2,663	3,997 02	Placer	I	2009

2663	5610005	5610005-005	MEINERS OAKS CWD	Storage tank Replacement project	The proposed project is to replace 2 of the 500,000 gal storage tanks, and the 80,000 gal tank, including valves and required monitoring components, and demolish the old leaky leaning tanks. The construction will take place on the same site as the existing tanks. By constructing sufficient storage, the water system will ensure reliable water supply for consumers demand, without the added financial burden of purchasing water from another source. Other sources for purchase are not reliable during the current extreme drought conditions. The replacement tanks would greatly reduce the risk of Coliform exposure due to holes in the existing storage tanks.	M	0	C	The system storage consists of 3-500,000 gal, 1-250,000, and 1-80,000 gallon ground storage tanks. All are interconnected with the distribution system. All are in dilapidated condition to the point of near failure. The condition of the tanks is critical and causes significant water quantity problems during summer demand. Due to lack of sufficient, reliable storage, the system suffered significant water shortages, was required to purchase ~54 ac/ft of water in 2006, and anticipates needing doing so again this year just to meet minimum demand.Two of the 500,000 gal storage tanks are next to each other and leaking. Both have significant structural defects indicated by leaning, sides bowing, and leaking bolts. The third of the 500,000 tanks had to be taken offline due to it's critical condition of leaning more than 7 degrees.The 80,000 gallon tank is extremely dilapidated and has several large holes in its side and is susceptible to Coliform contamination. All four remaining online tanks are used to capacity on a daily basis. Loss of service from any of the tanks will result in critical water outages to the community. Chlorine residual levels must be kept high to prevent coliform violations from contamination.	1,500,000	1,283	4,000	06	Ventura	IV	2009
2664	1310011	1310011-007	Coachella VWD: I.D. NO. 11	Haven Drive, Riviera Circle and Grand Avenue Main Replacements	The Haven Drive, Riviera Circle and Grand Avenue Main Replacements project includes installing approximately 300 feet of 6-inch and 2,300 feet of 8-inch ductile iron water main including valves, services, hydrants and related appurtenances. This project is categorically exempt under Article 18, Section 15282 of the CEQA Guidelines as a pipeline installation less than a mile in length. A Notice of Exemption will be prepared per CEQA guidelines and filed with Riverside County prior to construction.	M	0	C	The Improvement District No. 11 (ID 11) water system consists of three wells, 16-inch and 18-inch transmission main, distribution piping and one 1.0 MG storage reservoir. ID 11 serves approximately 4,000 customers currently isolated from CVWD's main domestic water system. ID 11 domestic water infractructure is more than 50 years old and consists of 4-inch and 6-inch asbestos concrete pipe that has exceeded its useful life and is in very poor condition. New pipelines are needed to replace this failing infrastructure.	250,000	2,624	4,198	20	Imperial	V	2009

2675	2410008	2410008-001	MEADOWBROOK WC	Main Extensions	The new area is very rural with pockets of homes on large lots/acreage. It is difficult to ascertain the best way to reach the largest numbers of homes at the lowest practical cost and in a timely manner. We need to have a comprehensive plan done to examine the feasibility of going under Highway 99 with a main extension; examine how to reach the most homes most effectively; evaluate any alternatives such as a "system within a system" (new well(s) to serve new homes.). Ideally, the study would lead to a preliminary project design enabling us to take the next step toward financing the actual work.	M	0	C	In April 2008 Meadowbrook Water was granted a greatly increased service area. The purpose of the request for funding is to examine the most feasible and cost effective way to extend our services to our new areas. Much of the area is rural; identifying the most densely populated areas and serving them first would be optimal. Many of the private wells in the area are drying up and with water at a premium, it is safer and more cost effective to be able to provide a hook up to our system. Another benefit is the ability to monitor the water table more closely, as typically, most private well owners do not do so.	50,000	1,539	4,400 11	Merced	III	2008
2676	3410007	3410007-002	Del Paso Manor County Water Di	Water Reliability Project	This project will install upgraded electrical control system and install a standby power temporary connection for water supply to existing critical ATT telecommunications facilities cooling equipment.	M	0	C	Existing well equipment is approximately 60 years old and at the end of useful service. Failure of this facility will adversely impact a regional communication center.	201,600	1,795	4,458 09	Sacramento	I	2009
2677	3710004	3710004-002	Del Mar - City of		Please see attached	M	0	C	Add seismic actuated valves to increase system reliability. Please see attached.	260,000	1,846	4,580 14	San Diego	V	1998
2678	2010010	2010010-002	MADERA VALLEY WATER COMPANY	New Construction Well #7	We are planning to construct a new well site. The new well would replace the two wells which have become unsable. The new well would include a variable frequency drive and standby back up diesel generator. There would also be installation of pipeline to incorporate the well into our existing system.	M	0	C	We have two wells in our system that have become unusable. These two wells are over 30 years old. If we try to use these wells the drawdown is so great that they pump a lot of air into our system. We have lowered the bowls as far as we can. These are closed bottom wells so we can not drill them any deeper. The perforations in one of the wells are so worn out that if we do try to use the well we have to dump water on the ground for about an hour before the well clears up and we can put it into our system. Over the past several years we have seen the water table drop and with the present drought we do not forsee any significant recharge to these wells in the near future.	1,000,000	1,884	4,625 11	Madera	III	2008

2679	1910185	1910185-001	LOS ANGELES CO WW DIST 36-VAL VERDE		RECOAT INTERIOR OF 0.50 MG CUYAMA TANK TO PROTECT WATER QUALITY AND PUBLIC HEALTH.	M	0	C	CUYAMA TANK. 2680	1910185	1910185-004	LOS ANGELES CO WW DIST 36-VAL VERDE		CONSTRUCT A 500,000 GALLON TANK AT AN INTERMEDIATE PRESSURE ZONE FOR THE HASLEY AREA.	M	0	C	INTERMEDIATE ZONE DISTRIBUTION TANK NEEDED. THE EXISTING SYSTEM HAS TWO PRESSURE ZONES WITH A 310' DIFFERENCE IN ELEVATION. MANY OF OUR CUSTOMERS ARE SERVED OFF THE HIGH PRESSURE ZONE. THIS REQUIRES CONSTANT PUMPING AND REGULATING OF PRESSURES.	5,015,000	1,320	4,660	16	Los Angeles	IV	1998
2681	1910185	1910185-002	LOS ANGELES CO WW DIST 36-VAL VERDE		CONSTRUCT NEW WELL WITH CHLORINATION STATION, FOREBAY TANK, AND BOOSTER PUMPING STATION TO MEET CUSTOMER WATER REQUIREMENTS.	M	0	C	NO WELLS. THIS DISTRICT HAS ONLY ONE SOURCE OF WATER, THE CASTAIC WATER AGENCY. WHEN THIS CONNECTION IS DOWN, AS OCCURRED AFTER THE 1994 EARTHQUAKE, WE MUST RELY ON STORAGE VOLUME FROM OUR TANKS WHICH WILL LAST LESS THAN ONE DAY.	1,705,000	1,320	4,660	16	Los Angeles	IV	1998
2682	1910185	1910185-005	LOS ANGELES CO WW DIST 36-VAL VERDE		RETROFIT TWO WATER TANKS WITH FLEXIBLE CONNECTIONS AND MOVE DRAIN/OVERFLOW TO SIDES OF TANKS.	M	0	C	SEISMICALLY UNSOUND TANK CONNECTIONS. IN THE EVENT OF A SEVERE EARTHQUAKE, THE EXISTING RIGID CONNECTION AND DRAIN COULD RUPTURE LEAVING AFFECTED RESIDENTS WITHOUT WATER SERVICE.	112,500	1,320	4,660	16	Los Angeles	IV	1998
2683	1710006	1710006-004	Konocti County Water District	Replace Clearwell Tank	This project would replace a 100,000 gallon clearwell storage tank used for CT with a 200,000 gallon storage tank. The current pump station would be replaced with a properly sized lift station to match the current capacity of the water treatment plant.Tank and pump station engineering and construction: $188,000Replace clearwell storage: $450,000Relocate and replace pump station: $180,00010% continguences: $82,000	M	0	C	The clearwell tank is in poor condition. The vent screen on the roof of the tank has corroded completely. While there are no risks of contamination due to the vent screen and support missing, leaving a cap to act as a barrier to contaminants, inadequate venting may lead to the tank collapsing under pressure. Also, the support at the center of the tank is heavily corroded. The lift station does not have adequate capacity to match treatment plant capacity. To improve capacity delivered to the distribution system, it is imperative the lift station is relocated to allocate space for the clearwell and pumps are replaced.	900,000	1,744	4,986	03	Lake	II	2009
2684	5510010	5510010-002	TUD - Crystal Falls Water System	Rancho Poquitos Pipeline replacement	CONSTRUCT A PIPELINE TO REPLACE THE OLD STEEL PIPE AND CONSTRUCT AN INTERCONNECTION WITH THE OAK GARDEN SYSTEM.	M	0	C	THE RANCHO POQUITOS MAIN SUPPLY PIPELINE IS STEEL PIPE REQUIRING FREQUENT REPAIR. THE RANCHOS POQUITOS SYSTEM NEEDS TO BE LOOPED FOR RELIABILITY.	38,000	2,232	5,301	11	Tuolumne	III	1998
2685	5810006	5810006-001	North Yuba Water District	North Yuba Water District Water Transmission Main	The project would consist of a 2.7 mile extention of an existing dead end water main to loop the distribution system. This would enable the District to maintain acceptable levels in storge tanks during critical times.	M	0	C	The District has an existing eight inch water main that delivers water from the water treatment plant to the distribution system. This water main is undersized and cannot convey enough water during summer months for domestic use and fire protection. Customers are periodically asked to cut back on water use as storage tanks (also undersized) become dangerously low. The possibility of creating a negitive head situation exists. Additionally, the District cannot provide adaquate fire protection during these times and fire fighting would definitely cause a negitive head situation. The community is in a heavily forested area and the danger of fire is extream.	680,000	695	5,303	21	Yuba	I	2007
2686	4210013	4210013-002	SOLVANG WATER DEPARTMENT		Construction of 2.3 million gallon reservoir	M	0	C	Needs additional water storage facilities to comply with Water Works standards.	3,638,000	1,916	5,383	06	Santa Barbara	IV	1998

2687	4110010	4110010-056	Montara Water and Sanitary District	New Alamo Booster Pump Station	This project will convert an existing Alamo Pressure Regulating Valve Station into an underground booster pump station by adding a booster pump. This existing Alamo PRV station connects the higher Portola Zone with the lower Alta Vista Zone. The new booster station would allow pumping from Alta Vista Zone to Portola Zone and would increase the fire safety in the forested area significantly.	M	0	C	Montara Water and Sanitary District owns and operates an existing Alamo Pressure Regulating Valve Station (PRV). This project includes making modifications to the existing PRV station to allow the District to transfer water from its Alta Vista pressure zone to the Portola pressure zone thus significantly increasing fire fighting capabilities, which are especially important within the urban-rural interface in the forested area. This project will contribute to improving public health and safety by improving the District's distribution system fire fighting capabilities.	215,000	1,640	5,412 17	San Mateo	II	2009
2688	4110010	4110010-009	Montara Water and Sanitary District		Replace school house tank ,rehab Alta Vista tank, repair or replace Potola tank.	M	0	C	Reservoir rehabilitation.	1,550,000	1,640	5,412 17	San Mateo	II	1998
2689	4110010	4110010-041	Montara Water and Sanitary District	Emergency Connection with Coastside County Water District	This project will install two above-grade quick connection points each equipped with 1,000 feet of 4-inch-diameter flexible piping to be deployed in case of emergency. One connection facility will be installed at each of the water district's closest distribution system location. The project will include the following elements:1. For Montara Water and Sanitary District (MWSD): one above-grade connection equipped with a 1,000-foot roll of 4-inch-diameter flexible piping; located in the most southern portion of the distribution system. The facility will be enclosed in a pre-fabricated building. MWSD owns a portable booster pump should pumping be deemed necessary.2. For Coastside County Water District (CCWD): one above-grade connection equipped with a 1,000-foot roll of 4-inch-diameter flexible piping; located in the most northern portion of the distribution system. The facility will be enclosed in a pre-fabricated building.	M	0	C	This project will provide facilities for a quick connection between Montara Water and Sanitary District (MWSD) and neighboring Coastside County Water District (CCWD) to be operated in case of emergency such as multiple fire events, earthquake, any other natural and man-made disasters that effect one of the water districts and allows the unaffected district to provide mutual aid type assistance in case of dire need. No permanent connection will be established by this project due to previous supply agreements, water rights, and restrictions imposed by the California Coastal Commission.This project is critical for public health and safety protection for over 25,000 people residing in the Mid-Coast Region served by the two water district and recorded over 150,000 visitors to the coastside annually.	200,000	1,640	5,412 17	San Mateo	II	2009
2690	4110010	4110010-057	Montara Water and Sanitary District	Water Distribution System Rehabilitation and Improvement Project	This project will replace the next several mains that have demonstrated the highest number of leaks in the past 5 year, as follows:1. Fourth Street Main Replacement, 1,500 ft, 6-inch-diameter2. Airport Main Replacement, 2,400 ft, 8-inch-diameter3. Corona Street Main Replacement, 200 ft, 6-inch diameter4. Replace 4” steel water main on Elm St. between George and Franklin St.5. Replace 4” AC water main on Elm between Franklin and Drake St.6. Replace 8” gate valve after PRV station at Marine and Cabrillo Hwy.7. Add 6” gate valve at Edison and Tamarind St.8. Add 2 ½” valve station at 4th St. and Le Conte Ave.9. Add 6” gate valve on 5th St. at East Ave.10. Add 6” gate valve at 5th St. and Le Conte Ave.11. Add 8” gate valve at 8th St. and Le Conte Ave.12. Add 8” gate valve 8th St. and Farallone Ave.13. Add two 6” gate valves on Cypress, both sides of Cabrillo Hwy.14. Replace non-op 6” and 8” gate valves at Edison and Birch St. 15. Replace main on Harte Street between Fir and Ivy 16. Replace main on 12th street17. Replace PRV Station at 5th street	M	0	C	The District has acquired the water system ownership in 2003 from a private water company. The customers voted overwhelmingly to take over the system due to poor water quality, water leaks, lack of emergency and fire storage and other deferred maintenance issues. The District has instituted an aggressive main replacement program and implemented many distribution system improvements since 2003. The implemented improvements resulted in a significant reduction of leaks and subsequent water losses. However, the program was put on hold in 2006 due to lack of funding. This project will contribute to further improvement of public health and safety by reducing leaks, improving distribution system efficiency, and reducing pressures in the distribution system. In addition, this project will help improve the distribution system water quality.	2,800,000	1,640	5,412 17	San Mateo	II	2009
2691	4110010	4110010-040	Montara Water and Sanitary District	New Valve and Pipe Installation at South Airport Well	This project will install a new out to waste valve and waste pipe at the South Airport Well to avoid contaminating the system with dirty water on well startup.	M	0	C	South Airport Well needs a new out to waste valve and waste pipe to avoid contaminating the system with dirty water upon startup for water quality protection and public health and safety protection.	23,000	1,640	5,412 17	San Mateo	II	2009

2692	4110010	4110010-039	Montara Water and Sanitary District	Air Relief Valves for Distribution System	This project will install up to 20 air relief valves throughout the distribution system to ensure water quality protection during repairs, on-going maintenance, and pressure fluctuations during routine operations of the water system.	M	0	C	This project will place air relief valves throughout the distribution system to ensure water quality protection during repairs, on-going maintenance, and pressure fluctuations during routine operations of the water system. The system currently contains no air relief valves.	58,000	1,640	5,412	17	San Mateo	II	2009
2693	4110010	4110010-058	Montara Water and Sanitary District	South Airport Well Rehabilitation	This project will chemically rehabilitate the existing South Airport Well to restore its production to rate capacity and extend its service life.	M	0	C	This project will rehabilitate existing South Airport Well to restore its rated production capacity and improve water quality. The well if one of the highest producing groundwater sources in the District, however, its production has significantly deteriorated due to deposits on the screens resulting in loss of capacity.	75,000	1,640	5,412	17	San Mateo	II	2009
2694	1910163	1910163-001	VALENCIA HEIGHTS WATER CO.		Design and construct replacement wells.	M	0	C	Four wells produce water with nitrates and VOC's. Three out of four wells have exceeded the MCL for nitrate of 45 ppm.	700,000	1,600	5,500	16	Los Angeles	IV	1998
2695	1010006	1010006-002	FOWLER, CITY OF		Construct a new well to increase the water supply capacity for both sides of the water system.	M	0	C	The water system is separately by Freeway 99 and the three water lines that connect the two sides of the water system do not have adequate capacity to provide desired water pressures and fire flows.	650,000	1,528	5,572	11	Fresno	III	2001
2696	3310800	3310800-001	California Rehabilitation Center - Norco		Add air stripping unit for benzene treatment.	M	0	C	Well #1 contains Benzene at a level above the MCL. The well was taken out of service in early 1989. In 3/97 an inspection of CRC's water system by DHS indicated that we need more water to reliably meet demands. Well #1 needs to be reactivated.	250,000	1,600	5,730	20	Riverside	V	1998
2697	3310026	3310026-001	Nuevo Water Company		Construct new 1000 gpm capacity well and new 12" pipeline (see attached Plate 1).	M	0	C	Degradation of ground water quality due to intrusion of plume of high TDS water into ground water basin (see attached May 31, 1995 report prepared by Albert A. Webb Associates).	1,020,000	1,787	6,000	20	Riverside	V	1998
2698	4910027	4910027-011	Sonoma State University	Domestic Water tank #3	This project includes construction of a new 350,000 gallon welded steel tank for water storage, including tank foundation, subgrade preparation, anchorage, and tank accessories including internal and external pipe and pipe connections, inlet, outlet, overflow, drain, access manways, vents, ladders, guardrails, and miscellaneous equipment, together with associated site preparation, removal of trees, site grading, construction of new access roads to and around the tank, fencing, water systems piping, electrical work, instrumentation, protective coatings, disinfection, testing and demolition. Project earthwork is unbalanced and requires disposal of unsuitable material and importation of suitable material for engineered fill.The Univeristy is proposing to construct a new 350,000 gallon welded steel tank to facilitate the domolition and reconstruction of two new 300,000 gallon tanks. Since the University is operational 24/7, 365 days a year, the ideal solution is to bring Tank #3 online first to ensure that the campus would have ample water supply during the reconstruction of tanks #1&2 which would have to be done separately so that sufficient water storage remained.	M	0	C	The University intends to construct a new 350,000 gallon welded steel tank for potable water storage northeast of the existing two 200,000 gallon concrete tanks in the Facilities Services Area on the northeast side of the Sonoma State University campus. The purpose of this project is to increase the reliability and the capacity of the University's potable water storage. The University has an existing potable water storage capacity of 400,000 gallons in two concrete tanks originally constructed in the mid 1960's. Both reservoirs have damage, which has led to continuous leakage of water from the reservoirs. In addition, the age of the reservoirs and their proximity to the active Rodgers Creek fault, less than 3.5 km from the site, which is capable of producing strong ground shaking means that the reservoirs are susceptible to failure in an earthquake.Continued operation of the reservoirs places the University's water supply at an unacceptable risk. Recommendatioins for potable water storage for the University have been documented in the Water System Analysis and Report prepared for Sonoma State University by Winzler and Kelly Ingineers, in October 2007. This project includes the construction of a new 350,000 gallon tank located northeast of the existing two 200,000 gallon tanks. This would provide the University with approximately 750,000 gallons in water storage capacity including an immediate 350,000	1,200,000	1,100	6,000	18	Sonoma	II	2009

2699	4910027	4910027-009	Sonoma State University	Well 3 and 4 Rehabilitation	The University is proposing to drill a well in close proximity to the existing well to reduce the amount of additional infrastructure needed. The project would go out to bid with the following requirements for contractors to meet.Installation of electrical service for well system, pouring of concrete slab around well casing, install and connect water piping from the well location to the pump house on campus. The well specifications would be as follows: Drill and case an 8' x420' domestic water well, provide fluid tank for storage of drilling fluid and development water throughout drilling process and vacuum truck to remove fluids off site, install a 230S250-8B 25hp Grundfos submersible pump (or equivalent) set in 350' deep, install wellhead and plumbing items, install Siemens (or equivalent) pumping plant panel with motor protection, install check valve, chlorinate well and begin monitoring of water quality through lab testing.	M	0	C	The life cycle of Wells No. 3 and No. 4 are approaching the end of their useful life. These are the only two operating wells that the University has and due to the age and detioration of well casing, they are approaching the end of their useful life. The casings in wells No. 3 and No. 4 is compromised due to sand encroachment and the overall age of the casing which are detioriated. The wells are over 20 years old and they are the only reliable water source for the campus. If one of the wells should fail due to age, the campus would have only one well to supply all water for the campus. The wells intertie with the campus system, but not to any outside (external) system that could provide backup.The monitoring systems that would be included in rehabilitation of wells no. 3 and no. 4 would include PLC communication and automated alarm to University Police and Plant Operations to allow for a fast response for repair or implementing alternate measures.	200,000	1,100	6,000	18	Sonoma	II	2009
2700	4910027	4910027-010	Sonoma State University	Drinking water raw water line replacement	The project involves connecting into the existing tanks and wells at either end and abandoning the existing transite line in place. The existing pathway is several hundred yards of pavement that will need to be removed and replaced. This installation would also be designed as described above to allow for minimal disruption of water to the campus by allowing the connections to be made at both ends at the very last moment.	M	0	C	Main drinking water raw water line is old frail transite piping. The piping fails frequently and requires repairs to be performed regularly. When a failure occurs it impacts the campus' ability to provide the necessary potable water to the population of on-campus residents, commuter students, visitors and employees. In the event of an earthquake which is very likely, this system is extremely likely to fail completely which would isolate the raw water wells from the campus treatment and distribution system. This would force the campus to close until the line was repaired.	1,500,000	1,100	6,000	18	Sonoma	II	2009
2701	4910027	4910027-008	Sonoma State University	Domestic water Chlorination System	Removal of the existing T2 Chlorinator (approx. 10 years in age) from the potable water control building located within the Corporation Yard including HAZMAT disposal. Install 50 feet of new 1" CPVC piping and fittings for new system requirements, upgrade electrical power supply from 110VAC to 220VAC, install new sensors to existing Allen-Bradley monitoring system which will allow monitoring of water condition including chorlination and total dissolved solids and alarm reporting to University Police and Plant Operations with automatic shutdown in the event of chlorination system failure.	M	0	C	The Unviersity relies on a self- operated, owned and maintained well water system for the campus. The existing chlorination system is no longer supported by the manufacturer and replacement parts are not available. If the system was to fail, the University would shut down and the on-campus residents would have to be relocated. Violations would be not providing proper water disinfection and most likely violation of California Code of Regulations Title 22 Sections 66-4421-64426.5.	100,000	1,100	6,000	18	Sonoma	II	2009
2702	4910027	4910027-007	Sonoma State University	Domestic Pumphouse Emergency Supply	Winzler and Kelly Consulting Engineers completed and evaluation of the Water System. The recommended evaluation outlines a strategy of three phases. The university had implemented two of three phases and needs to complete the final phase. This final phase is a straight forward design build that involves removal of the existing natural gas motor, replacement with an electric motor which will be operated by campus power or by a diesel generator that has been specified to provide power to the new electric motor, and PLC controllers for the system. This project combined with an existing project underway at one of the well locations would provide the necessary backup power to enable the campus to provide the domestic water needs during power failure and also provide the desired redundancy in the daily pumping operations.	M	0	C	The problem is the backup power for the booster pump that pressurizes the residential water supply is provided by a natural gas powered motor that is at the end of its life expectancy. It is approximately 40 years old. Not only is this motor old, but since the only fuel source is natural gas, it is susceptible to failure in the event that natural gas service is interupted. Additionlayy, this motor is not well suited for control by the currentl PLC controls and does further expose the motor to failure by overheating or other mechanical problems not monitored by the PLC.	300,000	1,100	6,000	18	Sonoma	II	2009

2703	3410005	3410005-004	Rancho Murieta Community Servi	Drought Augmentation Supply - New Well: West Ranch site	This project entails construction of a new well capable of producing approximately 500 gpm. A new 15-18 inch pipeline, approximately 12,000 feet long, is necessary to intertie with the existing distribution system.	M	0	C	In a 1977 drought, 1:200 year event, the District's primary water source, the Cosumnes River, is essentially dry, causing a 1500 AF shortfall. The District will not be able to divert surface water to storage reservoirs for consumptive uses for nearly 10-12 months and must rely on storage from previous years. Even with 50% conservation, at full buildout there is a 1500 AF shortfall.This well will aslo provide an emergency back-up water supply in case one or all of the surface water reservoirs are contaminated or the water treatment plant is out of service for extended periods, as a result of fire, vandalism, or other catastrophic failures.	2,000,000	2,525	6,060	09	Sacramento	I	2011
2704	3410005	3410005-005	Rancho Murieta Community Servi	Drought Augmentation Supply - New Well: South Ranch site	The project entails construction of a new well capable of producing 500-1000 gpm. This well is located outside District boundaries. A new 15-18 inch pipeline, approximately 3 miles long, is necessary to intertie with the existing distribution system.	M	0	C	In a 1977 drought, 1:200 year event, the District's primary water source, the Cosumnes River, is essentially dry, causing a 1500 AF shortfall. The District will not be able to divert surface water to storage reservoirs for nearly 10-12 months and must rely on storage from previous years. Even with 50% conservation, at full buildout there is a 1500 AF shortfall.This well will also provide an emergency back-up water supply in case one or all the surface water supply reservoirs are contaminated or the treatment plant is out of service for extended periods as a result of fire, vandalism, or other catastrophic failures.	2,300,000	2,525	6,060	09	Sacramento	I	2011
2705	3410005	3410005-006	Rancho Murieta Community Servi	Drought Augmentaion Supply - New Well: Airport site	The project entails construction of a new well approximately 500 feet deep, capable of producing approximately 500 gpm. This well is located within the Disrict boundaries. A new 15-18 inch pipeline is necessary to intertie with the existing distribution system. The project also includes acquisition of right of way easements and a dedicated well site.	M	0	C	In a 1977 drought, 1:200 year event, the District's primary water source, the Cosumnes RIver is essentially dry, causing a 1500AF shortfall. The District will not be able to divert surface water to storage reservoirs for consumptive uses for nearly 10-12 months and must rely on storage from previous years. Even with 50% conservation, at full build-out there is a 1500 AF shortfall.The new well will supply approximately 500 gpm. A new pipeline extension is needed to tie into the existing distribution system.This well will also provide an emergency back-up in case one or all of the surface water supply reservoirs are contaminated or the water treatment plant is out of service for extended periods, as aresult of fire, vandalism or other catastrophic failure.	1,100,000	2,525	6,060	09	Sacramento	I	2011
2706	4010025	4010025-003	SLO CWD NO. 10 - CAYUCOS	Distribution lines	Replace existing 4 inch lines with new pipes.	M	0	C	Two, 4inch distribution lines inadequate for providing fire flows & pressure	850,000	736	6,076	06	San Luis Obispo	IV	2006
2707	3310036	3310036-003	Western MWD - Murrieta Division	Replace old water mains	Replace main & lateral water lines in older parts of town. Many areas are in lower income areas. Some are also in historical parts of town.	M	0	C	Aging leaking water distribution lines within older portions of town requiring high maintenance costs & possible water outages.	750,000	2,446	6,305	20	Riverside	V	2001

2708	1910247	1910247-003	NEWHALL CWD-CASTAIC	CASTAIC FOREBAY TANK AND PUMP REPLACEMENT	Newhall County Water District plans to disassemble the current Forebay reservoir and booster pumps. A contracted tank removal company will do this. Once the site is clear of obstacles construction can begin on the new Forebay Tank. We will use an engineered design, from a tank construction company. After the new tank is in place, work can begin on the Forebay Booster Pumps. As I mentioned earlier, three out of four boosters have design flaws. In addition, the current pump configuration does not lend itself to efficiency. Because of these reasons, we will replace three of the oldest pumps with one high efficiency pump and new motor control centers. We will also incorporate a booster pump, installed in 2007, into the new facility design. Following this, are above ground piping improvements and a full tank coating (inside and out). To top off the construction, a company will re-asphalt to improve access to the site.	M	0	C	Newhall County Water District constructed the Castaic Forebay Tank in 1966. This welded steel tank has a capacity of 300,000-gallons and receives water from both wells and the State Water Project. Water mixes within the tank and booster pumps distribute the water to the rest of the Castaic Distribution System. Since the Forebay tank is the entry point to the entire Castaic System, it plays an important role. Newhall County Water District, as a part of our normal monitoring and maintenance, hires a diver to do scheduled inspections on tanks. During the inspections, the diver makes minor repairs when needed. We have now arrived at a point where minor repairs cannot fix the problems with the tank. Problems include deterioration of the steel walls, the tank floor, rust tubercles, coating blisters, deep pitting, and severe metal loss in support beams. Since the problems are extensive, and its age being 44 years, we have arrived at the conclusion: The Forebay Tank has reached the end of its useful life and we must replace it. In addition to the problems with the tank, the booster pumps that receive Forebay's water have an antiquated design. Three out of the four booster pumps are installed partially below ground. This design flaw leads to the pump vaults filling with water. Sump pumps must evacuate the collection of the water in the vaults periodically in order to ensure proper sanitation.	625,000	1,931	6,392	15	Los Angeles	IV	2011
2709	1010005	1010005-005	Firebaugh City	Well No. 7 Replacement	This project will replace City Well No. 7 with a new well. This includes site exploration, drilling test well, drilling of a new production water well, installing a pump, motor, controls, site improvements, and connection to the existing water treatment plant.	M	0	C	Well No. 7 is offline and will be abandoned due to steady arsenic concentrations that exceed the maximum contaminant level permitted. This seriously impacts the City's ability to meet peak water demands. A new well to replace Well No. 7 is needed as soon as possible to enable Plant No. 2 to meet the City's demand if Plant No. 1 is not in operation.	658,350	1,347	6,500	23	Fresno	III	2012
2710	1010005	1010005-006	Firebaugh City	Valve and Fire Hydrant Replacement	This project will work to maintain a high standard of fire safety readiness by replacing several aging water valves and fire hydrants in various locations throughout the City.	M	0	C	Many of the fire hydrants and valves around the City are reaching the end of useful life and need replacement. Rust build-up and aging have the potential to cause substandard operation or failure during a fire emergency. The failure of any hydrant or valve during an emergency has the potential to cause additional unwanted damage.	250,800	1,347	6,500	23	Fresno	III	2012
2711	1010005	1010005-004	Firebaugh City	HUD Tank, Booster Pump Station, Piping Replacement	This project will replace the aging HUD tank with a 0.75 million gallon tank, booster pump system, and the associated distribution piping and valving.	M	0	C	The current tank was built in 1971 and is reaching end of its useful life. An inspection completed in 2008 and 2011 revealed the tank to have interior lining degradation including corrosion pits, checking, cracking, and blistering. Some patching of the more advanced rust areas has occurred at time of each inspection. The tank has no anchoring system or grade band and rests on grade. It also lacks any internal or external cathodic protection, an interior ladder and a roof railing system. The tank was found to have minor movement of the roof support structure however a structural analysis was not completed as part of the either inspection. The failure of this tank would cause a significant problem for Firebaugh's industrial users and the Las Deltas Water District. The project is needed in order to maintain adequate storage capacity and sustained fire flows in the south west portion of the City.	794,200	1,347	6,500	23	Fresno	III	2012

2712	1010005	1010005-003	Firebaugh City	6" Water Line Replacement	This project will replace the existing 6 inch water line with a 12 inch water line from the HUD tank to the industrial area on Washoe Avenue and also connect to the recently installed 12 inch water line from the Tomatek plant.	M	0	C	The City of Firebaugh serves water to its industrial users and the Los Deltas Water District at the present time via a 6" main from the HUD tank. The 6" main severely restricts supply to the south west portion of the City due to its length and size. A new 12" replacement is required to maintain adequate sustained fire flows to this area of the City. This replacement line would connect to a 12" main previously constructed by the industrial users in this area and would provide a looped system for a more dependable water supply.	611,325	1,347	6,500	23	Fresno	III	2012
2713	4010019	4010019-004	Templeton CSD	Westside Water Storage Tank and Pressure Zone	Due to the high health and safety concerns resulting from substandard pressures, the 2005 District Water System Master Plan Update identified correcting the pressure deficiency as a first tier priority project. To increase the water pressure in the distribution system to acceptable levels and in conformance with California Waterworks Standards (Section 64602), the District proposes to construct a new 1M gallon water storage tank as part of a new pressure zone in the Southwest area of the District.The proposed Project includes a new water storage tank located 44 feet higher than the existing water tanks in the system. This tank will be the primary water supply the new pressure zone. The increased hydraulic grade line will eliminate the low pressure areas and help provide fire flow to the Southwest corner of the District. The tank will be sized to meet the storage requirements of the zone as recommended by the District's Water Master Plan. This project will also include 1500 lf of new 16-inch transmission line and a booster station designed to supply water to the tank from the main zone. The booster station will be equipped with two 560 gpm pumps to feed the new tank. The booster pump station will be housed in a small block wall building and include a chlorine treatment facility. The new pressure zone will be isolated from the main system by installing check valves and pressure reducing stations at strategic	M	0	C	The Westside area of the Templeton Community Services District (District) has low water service pressures (25 to 39 psi) and marginal fire flows (less than 1500 gpm) during average day demand conditions. The low fire flows are a serious safety concern and the lowest water service meter in this area measures an average service pressure of only 22 psi. The area affected by the low pressure includes the Vineyard Elementary School, serving 487 students & faculty, and approximately 576 residential service connections. Correcting this pressure deficiency is identified as a first tier priority project in the 2005 District Water System Master Plan Update due to the high health and safety concerns resulting from substandard pressures and fire flows needed to serve the existing customers in the District. It is critical that the District take steps to correct the water pressure deficiency in order to insure compliance with the minimum pressure requirements of the California Waterworks Standards (Section 64602). The District currently operates a single pressure zone with water tanks providing water pressure through a gravity system. In a gravity fed system, adequate storage is critical to ensure positive water pressure necessary to prevent contamination. During the hot summer months when water use is high, tank levels drop to minimum levels on a daily basis. As the tank levels drop, water pressures in the system decrease and	3,800,000	2,563	6,500	06	San Luis Obispo	IV	2009
2714	1910085	1910085-003	MAYWOOD MUTUAL WATER CO. #2	Water Mainlines Rehabilitation 2008	The project consists of cleaning and lining with cement mortar approved by NSF. This improvement will bring to all customers better quality of water, will bring an efficient PSI and will reduce the use of electricity needed on the boosters and pumps.	M	0	C	Water mainlines are full of tuberculation caused by minerals, and need a rehabilitation of approximately thirteen miles. Main valves need to be replaced, a total of 175, and approximately forty-five fire hydrants that are currently under the standards of Los Angeles County Fire Department. This water system has no history of rehabilitation for the past sixty-five years, and the appearance of water is often brownish-yellow caused by minerals.	4,500,000	1,908	6,700	16	Los Angeles	IV	2008

2715	3610062	3610062-014	RUNNING SPRINGS WATER DISTRICT	Valley View/Hwy. 18 Water Main Replacement Project	The project would entail installing three sections of new water mains. Two of these would be on Valley View Drive and the third would run parallel with Highway 18. Approximately 1,100 feet of 12" PVC pipe would be installed from the Luring Pines Tank on Valley View Drive to Highway 18. This would substantially increase fire flow throughout the Luring Pressure Zone. A parallel 8" PVC water main would need to be installed on Valley View Drive which would be a part of the ROWCO Pressure Zone. This would facilitate the back-lot main abandonment program. The third water main would be installed along Highway 18 from Wagon Wheel Drive to the other end of Wagon Wheel Drive. This portion of the project would consist of approximately 2,725 feet of 12" PVC pipe. Once these mains are installed, the District can begin to switch the water meters over to the new mains and abandon the old mains.	M	0	C	The Running Springs Water District has undertaken a program to eliminate a series of substandard sized back-lot water mains that were installed in the 1940's & 50's. These lines are old galvanized steel and range in size from 1" to 2". These water lines are a constant source of high water loss, rusty water customer complaints and the tuberculation in the pipes make it very challenging to maintain adequate working pressures. Before we can abandon these old steel mains, new water mains must be installed in the streets fronting these properties. These new mains will also have the added benefit of increasing the fire flow throughout the District, protecting the community in case of a wildfire.	820,000	3,160	6,713	13	San Bernardino	V	2009
2716	0510017	0510017-002	CCWD Copper Cove	Copper Cove C Tank and Main	The project will construct a new booster pumping station and transmission main to directly feed the C tank. The booster station will provide a capacity of 5,000 gpm with two pumps, and a space for a third for future demands. 13,000 LF of 20-inch main will be installed. A portion of the pipeline alignment is routed through wetlands and the project has received all necessary permits for construction.The design and environmental documentation and permits are complete. The project has been placed on hold due to current economic status and impact on District's finances. Project is ready to bid for construction pending notice of funding availability.	M	0	C	The Copper Cove water system consists of three main pressure zones. The C pressure zone storage tank is fed from the B pressure zone storage and distribution system. During high demands, pressure in the B system is reduced and insufficient flow and pressure are available to serve the C system. As a result, the C tank has been depleted and insufficient pressure is available to meet C system demands. While this has impacted existing customers up to now with reduced pressure and possible water quality impacts, the system would be unable to provide fire flow protection, which could prove disastrous. Another benefit of the project will be improved capacity and reliability to provide fire flow requirements and supply for new economic development in the project area.	7,000,000	2,449	6,735	10	Calaveras	III	2009
2717	1910147	1910147-004	SATIVA-L.A. CWD F	Sativa new well project # 4B	Sativa Los Angeles County Water District # 1910147, desperately needs improvements to its water system.Develop a new well with a production of 900 gpm or more.Build a small on site reservoir with booster pumps to maintain positive pressure on the system (preferred).Hydro-pneumatic tank at well site if not a reservoir and booster pump.Abandon and destroy the old well # 4 site or build a treatment system for VOC removal and re-develop well # 4 and repair well # 4.Drill and develop a new well to supply the district. Add a reservoir for storage and fire protection. Add a booster pump station to provide positive pressure.Currently there are only 2 hydro-pneumatic tanks providing storage and pressure for the system.The system uses all "Groundwater" no surface water or MWD connection.	M	0	C	Sativa Los Angeles County Water District is a very small water system with approximately 6,880 customers with limited water production capabilities. The District needs to locate, drill and develop a new well to meet system demands. The current wells barely reach 50 psi and we have a need to maintain positive pressure in the system to eliminate potential backflow and cross-connection and contamination. Our older well # 4 has been contaminated with VOC's and we need to develop a new well to replace well # 4 due to the VOC problem. Well # 4 will soon be abandonded and a new well is urgently needed. The water system is barely maintained with wells 2 & 5. Our other well, well # 3 has sanded and is under going repairs. It is very likely that when well # 3 is repaired that the production will be reduced and it will continue to pump sand. The water system has no other water sources for the community. The current wells are old and need another well to supplement our water system (well 3 site was first developed in the 1950's).The last Sanitary Survey noted the risk of potential cross connection due to low water system pressures and Well # 4 was discovered to be contaminated with VOC's. The water system is over 60 years old and in dire need to be brought up to CDPH Standards to provide safe drinking water to our community. The district recently hired a "Certified Operator" and was operating without a certified	2,000,000	1,488	6,813	22	Los Angeles	IV	2008

2718	2310001	2310001-004	Fort Bragg, City of	EFBPZ Willow St Pump Station Rehab	Phase 1 is pump station improvements consisting of two low flow (300 gpm), two medium flow(450 gpm) and one fire flow (1500 gpm) pump. The low and medium flow pumps would be powered by variable frequency drives and the fire pump would be a fixed speed drive. A surge control, pressure relief valve is proposed on the common pump station discharge piping. Flow would be metered on the low and medium flow discharges only. A standby power set is proposed in an outdoor, weather proof and noise attenuating enclosure. A SCADA antennae is also proposed on the roof and confirmation of line of site SCADA transmission will be evaluated.Phase 2 of this project consists of installation of 10" water main along the west side of Dana Street from the Willow Street extension to tie in near Chestnut Street; installation of 10 inch water main from the new line on Dana Street across school property to tie into existing water main at the south end of Hocker Lane and installation of new water main around the back side of the High School to complete the loop with the two new proposed pipes.	M	0	C	The East Fort Bragg Pressure Zone (EFBPZ) pump station was constructed in 1985 to boost pressure within the southeasterly portion of the City of Fort Bragg. After some 25 years in operation and numerous modifications to the pump station city staff determined that available water supply and pressures within the EFBPZ are, at times, insufficient. The equipment at the pump station is outdated; the pumps have been re-built numerous times; pump controls and alarms are deficient and a total upgrade of the pump station is required. Installation of an emergency generator is also an additional component being considered. The pressure zone and pump station have been evaluated and several necessary phased projects identified and proposed to increase water availability for domestic use and fire suppression.	555,000	2,791	6,963	03	Mendocino	II	2011
2719	1710015	1710015-002	Hidden Valley Lake CSD	Well Protection, Chlorination and Emergency Power	The project consists of the following:Well #2 Site:Construction of a building (well protection), installation of backup emergency power (250 KW generator), motor control center, flow meter and low level switch.Well #3 Site:Construction of a building (well protection), installation of chlorination facilities, motor control center, flow meter and low level switch.Well #4 Site:Installation of a building (well protection), booster station with tank, booster pump and controls, motor control center, flow meter and low level switch.	M	0	C	This project is to add well protection, chlorination facilities and emergency power.	1,350,000	2,433	6,971	03	Lake	II	2009
2720	1710015	1710015-003	Hidden Valley Lake CSD	Raven Hill Water Storage Tank	The project consists of installing a new 500,000 gallon storage tank at the same elevation as the existing Tank 9, and isolating the Ravenhill Road area from Zone 9 and boosting pressures within by connecting it to Eagle Rock Zone and installing a PRV, gate valve, and check valves. Acquisition of right-of-way for the pipeline connecting the two zones outside of District boundaries will be required as well as purchasing property for the new tank site. The low pressure problem in the Ravenhill Road area will be addressed by isolating this area from Zone 9 and a new pressure zone will be created, Ravenhill Zone, by connecting it to Eagle Rock Zone, which is fed from Little Peak Tank.The peak elevation in Eagle Rock Zone is approximately 1,795 feet. The existing PRV at this location is set at 50 psi on the downhill side. The new PRV separating Eagle Rock Zone from Ravenhill Zone will be located at 1,525 feet. The upstream pressure on the PRV will be 167 psi. By setting the downstream setting on the PRV to 62 psi, the resulting pressure at the peak of Ravenhill Road, 1,575 feet, will be approximately 40 psi. The lowest elevation in Ravenhill Zone, 1,465 feet, will have a pressure of approximately 88 psi.	M	0	C	This project is intended to address and resolve pressure and storage concerns within Zone 9 of the Hidden Valley Lake Community Services District's current water system.	1,590,000	2,433	6,971	03	Lake	II	2009
2721	1710015	1710015-001	Hidden Valley Lake CSD	Water Service Lateral Replacement	The project would replace the old leaking water service laterals and as a result, greatly enhance the District's water conservation efforts.	M	0	C	The problem is that there are approximately 2200 water service laterals that are 35-40 years old and have significant leakage.	8,000,000	2,433	6,971	03	Lake	II	2009

2722	2910023	2910023-009	Nevada ID - Lake Wildwood	Connection to NID	Connection to NID treated water service.	M	0	C	Lack of adequate well water/reliance on NID Ditch water for housefold use	1,310,000	3,137	7,090	21	Nevada	I	2004
2723	3910003	3910003-001	Escalon, City of	Municipal Well No. 11	The Municipal Well No. 11 project is comprised of planning, designing, permitting, and construction of a new municipal water well within the City of Escalon. The developed well generally consists of drilling and installing a new municipal water well approximately 700 feet below the surface. The City has already conducted test well procedures and verified the site will produce viable water in terms of quality and quantity. Plans and specifications are currently being finalized. The well will be equiped with all necessary mechanical, electrical, SCADA, backup power, chlorination, and associated appurtenances. More Specifically, the items to be installed/constructed include, but not limited to: Well installation/development, perforated casing, pump, associated onsite piping and valving, electrical equipment to include backup power, variable speed drive, chlorination equipment, and all necessary site equipment including site development and security.	M	0	C	The City of Escalon currently operates four (4) active municipal wells in the City's water system. Currently, in the event of a well being taken out of service the water system would not be able to adequately meet peak water demand and pressure requirements in all areas of the City. The system essentially does not have redundancy in the event a well fails or is taken offline for maintenance. The City's system, more specifically, is at capacity during peak hour demand during summer months. In the event of a well going offline, the system would not only not meet municipal water demands and pressure requirements, but would be at risk in terms of meeting fire flow requirments. Municipal Well No. 11 provides the City with much-needed redundancy to the water system. The proposed new Municipal Well No. 11 will also stabilize the western portion of the City. Currently, the City does not have any municipal wells located on the western portion of the City.	1,500,000	2,363	7,137	10	San Joaquin	III	2009
2724	5410008	5410008-008	Orosi Public Utility District	Eastside Water Pipeline Rehabilitation - Orosi PUD	It is proposed to install 3,530 lineal feet of 8 inch ductile iron pipeline, including fire hydrants and valves to replace about 3,100 lineal footage of aging and leaky pipeline of which over one-half of the footage is 3-inch steel pipe. The balance of the pipeline to be replaced is 4-inch and 6-inch asbestos concrete pipe. The proposed project will replace pipeline that has exceeded its useful life and will include additional fire hydrants at a spacing that meets current standards. The project will also improve hydraulic capacity in the eastside portion of the District. The health and safety benefit identified is the reduced potential of water contamination occurring with higher water system pressures. Further, the project will improve hydraulic capacity for customer use and for fire protection. With regards to the reduction in system repairs, a health and safety benefit is also realized by the reduction in occurrences of residents being without water during the leak repair effort. Further, any time a repair is made to an existing water system, there is an opportunity for contamination of the water system. This is especially a concern in systems operating at low pressures. A public meeting was held on February 13, 2007. The proposed project was discussed. One member of the public spoke in favor of the project, and there was no expression of opposition to the proposed project. On April 10, 2007, a public hearing was held on the proposed Negative Declaration	M	0	C	System Description:The District was formed in 1922 and currently provides water, sewer and lighting services to approximately 1,722 single-family residential equivalents (SFRUE). According to the 2000 census for the Orosi Census Designated Place (CDP), the population was 7,318 people and the median household income was $30,400.The District's water source is from pumping of groundwater wells. The water distribution system consists of a 750,000 gallon ground level storage tank, booster pumps and pipelines that ranging in size from 2 inches to 16 inches in diameter. The single-family residential monthly rate is comprised of fixed ($7.68) and a consumption ($0.76 per 1,000 gallons) components. The typical single-family monthly water rate is about $20.20. From 2001 to 2005, pressure data loggers were installed in areas of concern. The low and high system pressures generally ranged from 27 to 51 psi. Given the formation of the District in 1922. Some portions of the distribution system have seen over 80 years of service.Problem:About 90 percent of the pipeline recommended to be replaced is located in easements behind residential lots. The pipe is not located in either an alley or public road. Access to the pipeline has been compromised with the building of fences making access to the water pipeline difficult. About 60 percent of the pipeline is three (3)-inch steel pipe. The pipe material indicates that the pipe is old	741,000	1,870	7,318	12	Tulare	III	2009

2725	5110001	5110001-021	City of Live Oak	City of Live Oak New Well with Arsenic Treatment System	The New Well with Arsenic Treatment System project will be all inclusive. It will start from selecting a suitable site for the well and water treatment system, through environmental studies and permit processing, through construction and connection to the City Municipal water system.The City will first hire an engineering firm experienced with City Municipal water systems to design the project. Their work will include selecting a suitable site based upon soil, aquifer, and water testing, as well as the best fit for our existing water system. If a current City owned site is not identified for this project, we will have to purchase a suitable site. The engineer will continue with environmental review, as well as permitting for the well. The project will be designed to meet the current requirements and needs of our residents as well as any anticipated future regulations and development needs. A contractor experienced in Municipal water systems will be selected to construct the project. The contractor will be responsible for new construction as well as connection to the City's existing water system. Training for City employees will be a critical step, adequate training of all employees on the newly installed equipment will be a mandatory requirement. Once the system is constructed and put into service, the contractor will be available for technical assistance as necessary to ensure proper operation of the equipment. A maintenance schedule	M	0	C	The City currently has 2,210 service connections and a service population of 8,392. The City of Live Oak's Well #5 has been repeatedly tested and shown elevated Arsenic and Nitrate levels. The well is very old, and because of its age it is not able to be economically repaired and upgraded in order to facilitate arsenic and nitrate treatment and removal systems. In 2009 we were awarded funding to install an Arsenic and Nitrate Removal system at Well #5, but due to the age and level of repair of the well itself, the costs necessary to fully complete the project were not feasible and we were forced to abandon that upgrade and remove the well from service. Without the use of Well #5, the City is left with a supply deficiency on the east side of town. On peak demand days and times, a diminished supply results in diminished flows and pressures that are noticeable to our residents. Not only are these levels of service noticeable to our residents during normal use, the Sutter County Fire Department has voiced repeated concerns for the safety of residents in a fire emergency due to the lack of adequate fire flows. The fire flow concern is so great, that part of the fire emergency plan includes a possible emergency shutdown of State Route 99 in order to lay a hose line across the highway from the water storage tank on the west side of town to supply fire water to the east side of town. This is an extremely drastic measure, however with the missing	2,700,000	2,186	7,475	21	Sutter	I	2012
2726	5110001	5110001-019	City of Live Oak	City of Live Oak Kola Street Water Main Replacement	The Kola Street water main project will replace aging, leaking and undersized water mains beginning at the O Street water treatment facility heading north on O Street to Kola Street, and then east on Kola Street, with a short jog on N Street before picking up Kola Street again to State Route 99. The project will replace aging and deteriorated 6" water mains with 10" water mains, and install new 10" mains where none previously existed. This project will directly increase water flow and supply pressures on State Route 99 where we have diminished pressures and fire flows due to the undersized mains. This project will consist of replacing the 6" predominantly cast iron mains with 10" C-900 PVC or ductile iron mains, as well as adding a section to O Street where no main currently exists. This small addition of O Street main will allow for a direct water supply to Kola Street and State Route 99, bypassing the current mains that loop through Luther Elementary School and a nearly 200 unit residential subdivision before making their way to Kola Street and State Route 99. Where Kola Street crosses the Union Pacific Railroad, boring will be required to replace the 6" main with a 10" main. All required permits and approvals will be obtained from the Railroad prior to any work taking place in their right of way. With the mains, new fittings, hydrants, valves, and all other associated equipment that is required to safely and efficiently distribute water	M	0	C	The City currently has 2,210 service connections, and a service population of 8,392.The existing City of Live Oak water distribution system is aging and in need of replacement. The majority of the existing water distribution system in the City was installed between 1947 and 1965, and consists of mainly 6" cast iron water lines. The entire system is degraded and undersized and cannot meet the demands of Live Oak's growing population. Population changes have affected Live Oaks water requirements and the capability to provide the water needed for its residents. The Kola Street water main project begins at the O Street water treatment facility, and replaces 6" mains that are currently too small to adequately supply water to the north side of town. Especially of concern is the State Route 99 corridor. The 6" mains are unable to supply enough water to the commercial sites along the highway, and are unable to meet the fire flow demands required by the fire department in an emergency situation. The City completed its Water Master Plan in late 2009, which identified a maximum day deficiency in our supply capacity, as well as hydraulic restrictions within the distribution system that limit the flow and pressure. The undersized 6" mains are the main culprit behind the hydraulic restrictions in the system.The existing mains in this project consist of cast iron, plastic, and transite/asbestos pipe. Replacement is needed not only	300,000	2,186	7,475	21	Sutter	I	2012

2727	5110001	5110001-020	City of Live Oak	City of Live Oak Pennington Road Water Main Replacement	The Pennington Road water main project will replace aging, leaking, and undersized water mains beginning at the Pennington Road and O Street intersection, and will continue east down Pennington Road under the railroad crossing, and under State Route 99, ending at the Larkin Road intersection. The project will replace aging and deteriorated 6" water mains with 12" water mains. This project will greatly improve the supply of water to the east side of town, as well as the central portion of the City located along State Route 99. This project will consist of replacing the 6" cast iron mains with 12" C-900 PVC or ductile iron mains. The project includes boring under the railroad as well as under State Route 99 for the new main installation. All required permits will be obtained from the railroad as well as CalTrans for the Highway crossing. The Highway crossing will include survey of existing sewer, storm drain, gas, and electric utilities to insure safe and proper installation of the new main. Included with the installation of the actual water main, all fittings, hydrants, valves and other associated equipment required to safely and efficiently distribute water to our customers will be included. Paving and patching the roadways will also be required to complete the project.	M	0	C	The City currently has 2,210 service connections and a service population of 8,392.The existing water distribution system is aging and needs to be rehabilitated. The majority of the existing water distribution system in the City of Live Oak was installed between 1947 and 1965. This particular section of main on Pennington Road is 6" cast iron and is some of the first water mains installed in Live Oak. With the average life expectancy of these cast iron water mains estimated at 75 years, we are fast approaching the end of the expected life of these mains.Because of the age of the mains, as well as the installation methods that were used during early days of Live Oak, we are experiencing notable leakage in our oldest mains. This leakage is becoming quite taxing on our water systems, which is already struggling to meet our maximum day demands. These 6" mains are not only nearing the end of their useful life, they are also undersized and not meeting all of our current and anticipated future demands. With one of our City wells out of service on the east side of town, the supply mains on the west side of town are taxed with supplying water to east side of town via Pennington Road. With only a 6" main, we are unable to supply enough water to fully meet peak demands, as well as fire flow requirements.	550,000	2,186	7,475	21	Sutter	I	2012
2728	1910060	1910060-003	LA PUENTE VALLEY CWD		Replacement of line with 12" ductile iron pipe. Project involves: Design to solve problem, and Construction	M	0	C	WW standards defect. Reliability. Numerous leaks on 12" steel (circa 1951) transmission/distribution line on Stimson St. causing water outages during maintenance.	150,000	2,567	7,500	16	Los Angeles	IV	2006
2729	5410020	5410020-005	Woodlake, City of		Add additional storage tank and associated piping.	M	0	C	Inadequate storage capacity.	750,000	1,784	7,524	12	Tulare	III	2003
2730	4910016	4910016-001	Cotati, City of	Cypress Water Storage Tank Replacement Project	This project includes demolition of the existing 0.1 MG tank, and construction of a new 0.4 MG steel tank in the same location, including an upgraded intertie with the distribution system, related site work, telemetry, and landscaping to mitigate visual impacts.The existing 0.1 MG tank is no longer serviceable, and has been out of service since 1997. The purpose of the new tank is to increase storage (as identified in the City's Water Master Plan), provide operational flexibility for maintenance of the City's in-service 1.0 MG tank, provide equalization volume for peak hour demands in an area that currently has relatively low pressures, and to provide storage during emergencies, including failure of the long intertie with the 1.0 MG tank.	M	0	C	Cotati previously had a 100,000 gallon storage tank at the proposed tank location. However, this was taken out of service in 1997, as it was no longer servicable. This project will increase the City's storage from 1.0 to 1.4 million gallons for normal operations and provide redundancy for maintenance and emergencies.Cotati's Water Master Plan identifies the need for this tank due to increased storage needs in 2010 and to mitigate the potential for low-pressure (under 20 psi) during periods of peak hour demand. This portion of the City already experiences relatively low pressures due to the elevation, so the proposed tank will mitigate the potential for peak hour pressure drops.The tank will also provide redundancy and backup for maintenance and emergencies. The other 1.0 million gallon (MG) tank is located in a different portion of the City and is on the end of a long pipeline. In the event that this pipeline fails, the 0.4 MG tank provides emergency operational storage until the 1.0 MG tank is brought back on-line. The new 0.4 MG tank will allow the City to take the 1.0 MG tank out of service for routine maintenance and also provide additional storage for normal operations (as identified in the Master Plan for 2010).	1,600,000	2,560	7,532	18	Sonoma	II	2009

2737	4210020	4210020-011	Santa Ynez River Water Cons. Dist. ID#1	2" PVC Replacement Project	The project is to replace the undersized (2") water mains with 6" Class 900 PVC to increase flow and pressure during periods of high demand. Five segments have been identified that would require replacement, ranging in lenght from 297 feet to 1,050 feet, for a total of 3,245 feet.	M	0	C	In various locations throughout the District's water distribution system, undersized (substandard) 2" PVC water mains need to be replaced. These lines are not compliant with the California Water Works Standards for new water main installation and cause restricted flow and pressure problems.	405,630	2,327	8,298	06	Santa Barbara	IV	2009
2738	4210020	4210020-010	Santa Ynez River Water Cons. Dist. ID#1	Still Meadows Pressure Improvement Project	The project would serve to increase pressure and reduce flow velocities in an area of the ID1 distribution system showing greatest negative affects during periods of high demand. Piping from ID1's highest pressure zone would be extended into an isolated area of a lower pressure zone. System improvements would include the installation of 660 feet of 12-inch PVC piping and four isolation valves.	M	0	C	Computer flow modeling of the Santa Ynez River Water Conservation District, Improvement District No.1 (ID1) distibution system, with field verification and calibration, has revealed areas of inadequate pressure within the distribution network during periods of high demand. Pressure thresholds used for system evaluation include CAC Title 22, American Water Works Association standards, ID1 Water Works Standards and Construction Specifications, and Santa Barbara County fire flow requirements for rural/residential service. Additionally, modeling results revealed flow velocities that exceed the ID1 engineering design threshold of 4 fps during periods of high demand.	250,000	2,327	8,298	06	Santa Barbara	IV	2009
2739	4210020	4210020-009	Santa Ynez River Water Cons. Dist. ID#1	2" GIP Replacement Project	The project is to replace the GIP sections of the District's aging distribution system to reduce water losses, reduce expenditure of District resources for multiple repairs, and alleviate potential impacts to system water quality. Improvements to flow and pressure will also be realized in isolated sections of the system. Six GIP pipeline sections have been identified that require replacement, ranging in length from 148 feet to 420 feet, totaling 1350 feet. GIP piping would be replaced with 6-inch Class 900 PVC in compliance with AWWA and California Waterworks Standards.	M	0	C	In various locations throughout the District's water distribution system, undersized (substandard) 2" galvanized iron piping (GIP) that was installed in the early sixties needs to be replaced. Due to the material and age of the piping, frequent leaks occur resulting in water quality concerns, loss of water, and expenditure of District resources. In some areas, the undersized piping restricts flow causing a reduction in system pressure during high use periods.	184,750	2,327	8,298	06	Santa Barbara	IV	2009
2740	4210020	4210020-012	Santa Ynez River Water Cons. Dist. ID#1	Still Meadows 4" Lateral Replacement Project	Replacement of the 4" lateral with 6" Class 900 PVC would provide for more reliable service, prevent water loss and alleviate potential impacts to system water quality from continued breaks. The length of the 4" line requiring replacement is approximately 945 linear feet.	M	0	C	A 4" lateral to the 8" distribution main on Still Meadows Road, installed in the mid-70's, is constructed of substandard (Schedule 40) piping material. Numerous repairs have been made on the line, which provides water to four domestic service meters, resulting in water loss and potential contamination of the distribution system.	85,050	2,327	8,298	06	Santa Barbara	IV	2009
2741	4210020	4210020-002	Santa Ynez River Water Cons. Dist. ID#1		Construct a 3.2 MG reservoir to provide adequate storage in one pressure zone.	M	0	C	Inadequate storage to comply with Water Works standards.	3,300,000	2,327	8,298	06	Santa Barbara	IV	1998

2743	1010026	1010026-002	PINEDALE COUNTY WATER DISTRICT	Pinedale Water Well	Design: Issue a Request for Proposal (RFP) and Statement of Qualifications to local engineering firms and select an engineering consultant for the design. Construction: Drill a well pilot hole and test water quality in various water bearing strata. Construct and develop a new water well. Construct a well pump and associated piping, valves, and tie-in to existing water distribution facilities. Construct appurtenant facilities including a pressure tank and backup generator. Develop the site, including access road street improvements and security fencing.Construction Administration: Generally performed by District staff, but the engineering consultant would be retained to review submittals and address any issues that might come up during construction.	M	0	C	The primary need for the project is to provide the water district with sufficient system capacity to meet fire flow demands prescribed by local codes and ordinances. The addition of a standby power source to the new well would help to ensure that adequate pressure is maintained in the District's water system during power outages.There are typically two principal water production criteria that should be met in the operation of a public water system. These criteria include peak hour demand flow rate and average daily demand plus fire flow rate.Since the District does not have any telemetry system or metering equipment to monitor usage on an hourly basis, peak hour usage is estimated by utilizing accepted textbook factors. In one accepted textbook method, the peak month is used to calculate the peak hour flow rate in the District for comparison to pumping capacity. Using a factor of 1.2 to estimate the peak day flow during the month of maximum use, and applying a factor of 1.5 to estimate the peak hour flow during this period of high use, the estimated peak hour demand for the District is calculated as 5,580 gpm.Another accepted practice for estimating peak hour demand involves applying a factor of 1.8 to the average daily demand and utilizing a 1.5 factor for peak hour demand. Using this method the peak hour demand is calculated as 5,600 gpm. This number compares favorably with the previous method of estimating peak	900,000	3,370	8,495	11	Fresno	III	2012

2747	4010016	4010016-004	Los Osos Community Services District	LOCSD and GSWC Inter-tie Project	The Inter-tie project will include two separate inter-tie connections between the LOCSD and GSWC water distribution systems. The inter-ties will be located in the street. They will include a valve vault, valves, and two-way meters. The project will also include approximately 1,400 feet of 8-inch water main to connect the two water systems together.	M	0	C	The Los Osos Community is currently served by three water purveyors, Los Osos Community Services District (LOCSD), Golden State Water Company (GSWC), and S&T Mutual Water Company (S&T). They serve a total population of just over 14,000 persons. The community's sole source of water supply is the groundwater basin. The lower aquifer of the groundwater basin is currently in overdraft and experiencing sea water intrusion at a rate of 50 to 60 feet per year with the current operations. The upper aquifer is currently high in nitrates and is a non-potable water supply source without blending or other treatment. The three water purveyors are currently working together to optimize the use of the groundwater basin and determine projects that will not only reduce water consumption, but also reduce the use of lower aquifer wells that are closer to the bay and intensifying the rate of sea water intrusion. GSWC will be installing a nitrate removal unit at one of their well sites that will allow them to extract water from the upper aquifer and reduce the pumping from the lower aquifer. LOCSD recently installed an upper aquifer well, which is blending with a lower aquifer well. The water purveyors are pursuing water education programs to help bring awareness to water conservation and will be developing a groundwater basin management plan in the near future.Another project identified is an inter-tie	240,000	2,738	9,000	06	San Luis Obispo	IV	2009

2753	1910203	1910203-007	LOS ANGELES CWWD 40, R24, 27,33-PEARBL	Nitrate Treatment in Well 27-5	This project is for the removal of nitrate from the groundwater pumped from Well No. 27-5 to ensure compliance with the nitrate standard. To accomplish this goal, the District proposes using one of the commercially available ion exchange systems for nitrate treatment. Ion exchange is designated as the Best Available Technology by the USEPA for the removal of nitrate from drinking water sources and some ion exchange treatment systems have already been permitted by the California Department of Public Health and are in operation in the State. Also, a typical ion exchange treatment process is simple, robust, compact, easy to automate, and can be operated on demand. The treatment goal is to remove the nitrate in the effluent (treated) water to less than 4 ppm, meeting the nitrate standard of 45 ppm.The proposed packaged wellhead nitrate removal system includes a treatment module, pre-filter assembly, salt/saturator tank, brine processing unit, and brine wastewater storage tank(s). Details of each component that is sized to treat the flow rate from Well No. 27-5 at 500 GPM are as follows. The treatment module (i.e., ion exchange system) uses multiple columns of ion exchange resin operating in parallel to remove the nitrate from the well water. The columns are installed in a 10'W x 35'L x 9'H mobile container, eliminating the need for a building or other housing structures. The ion exchange resin is	M	0	C	Nitrate is an inorganic compound that often appears in the environment, both naturally and unnaturally. Most commonly the nitrate in groundwater originates from fertilizers, septic systems, and manure storage or spreading operations. The nitrate from these sources seeps into the groundwater if it is not absorbed by vegetation, turned into vapor, or taken away by runoff. If water with high nitrate levels is consumed by humans or animals, it will inhibit the ability of the red blood cells to carry oxygen throughout the body, a condition called Methemoglobinemia. This is most dangerous in infants who can die from the effects of the nitrates. High nitrate levels may also affect the oxygen-carrying ability of the blood of pregnant women. Nitrate regulation was established in 1992 and it requires all water suppliers to test samples of their water every year to monitor the contamination levels. When these water samples are tested, they should have a nitrate level of less than 50% of their MCL of 45 parts per million (ppm) Nitrate as NO3. If a sample is found to be higher than 50% of its MCL, contamination level must be checked every three months. The water supplier will be forced to take action if the level of nitrates found in the samples is consistently in violation. The Los Angeles County Waterworks District 40, Antelope Valley, Regions 24, 27, and 33, Pearblossom, Littlerock, & Sun Village, serves approximately 9,800 people through	499,000	2,754	9,777	16	Los Angeles	IV	2009

2757	4110017	4110017-001	City of Menlo Park	Water Main Replacement Project	The City has a consultant working on plans and specifications to address each of the problems listed. Their services will also include permit, bid and construction support. 1. Menlo Business Park – This project will reconfigure the pipes and valves to allow Menlo Business Park customers to receive water from turnouts controlled by the City of Menlo Park. Approximately 930 feet of pipe will be installed along an easement and connections to three SFPUC turnouts will be reconfigured. Emergency connections will remain with the neighboring city via normally closed valves.2. Bayfront Expressway at Marsh Road – To improve maintenance accessibility to the water main and valves, approximately 400 feet of pipe will be installed along Bayfront Expressway. Pipes and valves in the middle of the busy intersection will be abandoned.3. Haven Avenue at Atherton Channel – To eliminate these dead ends, this project will install 100 feet of 8-inch pipe to be bored under Atherton Channel. Access points will be well away from the bank and creek habitat. 4. Sharon Oaks Residential Complex –This project will involve the installation of two new water service lines; one to the residential complex swimming pool and the other to three townhouses. About 60' of one-inch diameter copper service line will be installed along with new meters. Existing meters and service connections will be abandoned.5. O'Keefe and Willow Road – To	M	0	C	Seven problems in the City's water distribution will be addressed by this project.First, approximately 100 customers in the commercial/industrial Menlo Business Park receive water from San Francisco Public Utility Commission (SFPUC) turnouts controlled by a neighboring city. The area became part of the City of Menlo Park Municipal Water District (MPMWD) in 2001 when an old County water district was dissolved. The piping remained connected to the neighboring City's system. MPMWD pays a 5% surcharge for the water it must purchase from that city to serve these customers. The affected water customers have asked that the piping be reconfigured so that they would be served from City-controlled turnouts.Second, several valves, old ductile iron pipe (DIP) and asbestos cement pipe (ACP) are located in the middle of a busy, Caltrans-controlled intersection at Marsh Road and Bayfront Expressway. Maintenance personnel are required to exercise valves and repair main leaks at this location in high-traffic conditions or accessibility is limited to rare hours of low traffic times at night and on weekends. Third, MPMWD severed a water main located under Atherton Channel just downstream of the Haven Avenue vehicle bridge due to leakage. Because it was an emergency fix and permits could not be obtained quickly, the dead ends were not reconnected. To eliminate the two dead ends that were created, these	1,440,000	3,901	10,200	17	San Mateo	II	2009

2760	1910148	1910148-004	SIERRA MADRE-CITY, WATER DEPT.	Water System Rehabilitation	This project will provide for the design of the replacement of undersized water transmission and distribution pipelines to provide adequate water supplies in the event of a major seismic event as identified in the 1997 Corps of Engineers Seismic Reliability Study. Replacement of aged undersized pipelines will increase the volume of water flow needed to provide fire flow protection to the City's residential, commercial and industrial communities following a major seismic event as well as improve water quality. The project will also provide for the replacement of system control valves and the installation and upsizing of fire hydrants.	M	0	C	The quality and reliability of drinking water supplies for the City of Sierra Madre is at risk due to the deterioration of their water infrastructure due to age and from the potential impact from a major seismic event in the region. The design and construction of the purposed projects is imperative in order to safeguard the quality and quantity of the drinking water supplies in their communities. Improvements to water storage reservoirs, pump stations, and well supply sources are needed to lower the risk of contaminating the drinking water supply and ensure sustainable water supplies due to the failure of water infrastructure systems.	3,000,000	3,867	10,800	07	Los Angeles	IV	2009
2761	1910148	1910148-002	SIERRA MADRE-CITY, WATER DEPT.		Design and construct one domestric well and a water system inter-tie between the Cities of Sierra Madre and Arcadia.	M	0	C	Reliability of local sources limited. Additional sources of supply needed.	1,660,000	3,867	10,800	07	Los Angeles	IV	2006
2762	4910012	4910012-005	Sonoma, City of	Napa Road Water Line Extension Project	The project will extend the City's existing 10-inch water line in Napa Road from Larkin Drive to Broadway. Service line laterals would be constructed to service parcels on the south side of Napa Road. The work will include street resurfacing as necessary for the installation of the water line trench on Napa Road.	M	0	C	The City's existing water line alignment follows southerly on Broadway and extends to the intersection with Napa Road. The Vintage Senior Living and Assisted Care Facility on Napa Road is serviced via the existing connection to the water main which veers north and east through private property at the Friedman's Home Improvement Store located at 1360 Broadway Avenue. After crossing the Friedman's property, the line connects to the 14-inch main in Broadway. Another 10-inch City water line is located in Napa Road east of Larkin that services residential homes in the Larkin Drive area. Installation of the Napa Road Water Line Extension Project would circumvent the City's water line that is located within the private property of Friedman's Home Improvement Store, and place it in City right-of-way in Napa Road. Ruptures and leaks on the City water line within the Friedman's property are difficult to maintain and repair quickly because of their location on private property. Delayed repairs cause water loss and potential interruption of service to Vintage Senior Living and Assisted Care Facility. The project would also create a redundant loop system to provide greater system reliability, particularly to the Vintage Senior Living and Assisted Care facility.	700,000	4,214	10,807	18	Sonoma	II	2009

2763	4910012	4910012-003	Sonoma, City of	Citywide Water Services Replacement Project	The project includes the residential water service replacement projects that are part of the 2007 Connection Charge and Rate Study. The water service lines are located within the following streets: Junipero Serra (West Spain to Merritt Court), Este Madera Drive, Este Madera Lane and Este Madera Court, France Street (5th Street East to Broadway), and Chase Street (East of 5th Street East). It is anticipated that the replacement elements will include water service laterals, service saddles, corporation stops, meter boxes, and related improvements such as curb/gutter/sidewalk/driveway/and ADA ramp replacement where necessary, trench pavement repair, pavement striping and markings where necessary and related improvements. There will be two sections of water main replacement: on the eastern side of Este Madera Drive and off of 340 Patten Street. Approximately 55 linear feet of 6-inch pipe will require installation in order to connect two 6-inch water mains on Este Madera Drive, providing a looped system which increases service reliability and improves water quality in that area. The second section of water main replacement at 340 Patten Street is an existing 2-inch main (approximately 220 lineal feet) that would be increased to a 6-inch water main to provide sufficient fire flows.	M	0	C	The identified water service lines are currently leaking due to the type and age of the service lines. In addition, the fittings for the lines are leaking and may be structurally inadequate. Failures to those connections would be catastrophic in nature and would impact water services and traffic safety on the roadways where the lines are located. Replacing the service lines would save water and increase the reliability of the water system since the service lines are the weak links in the system.	2,420,000	4,214	10,807	18	Sonoma	II	2009
2764	4910012	4910012-004	Sonoma, City of	Fano Lane Area & Bettencourt Water Improvements Project	The proposed limits of the work includes Bettencourt Street between Fifth Street West and Second Street West and Fano Lane between Robinson Road and Fifth Street West, Junipero Serra Drive between Verano Avenue and West Spain, Merritt Court, Palou Street and Hayes Street. The project includes water service replacements in the project area. It also includes the necessary street resurfacing for addressing the impacts to the roads resulting from the trenching and other related work.	M	0	C	The identified water service lines are currently leaking due to the type and age of the service lines. In addition, the fittings for the lines are leaking and may be structurally inadequate. Failures to those connections would be catastrophic in nature and would impact water services and traffic safety on the roadways where the lines are located. Replacing the service lines would save water and increase the reliability of the water system since the service lines are the weak links in the system.	1,314,000	4,214	10,807	18	Sonoma	II	2009
2765	1805004	1805004-001	High Desert State Prison	Security Perimeter and Lighting for Water Tanks	The planning, implementing and control of a secured perimeter fence and security lighting around the water tanks for High Desert State Prison and California Correctional Center. Project would include the layout of the lighting and fencing, excavation of the electrical trench, installation of lighting poles,running of electrical conductors and conduit, installation of lighting timers and hardware, excavation of holes for vertical poles for fencing,installation of 3 wire(barbed) on top of poles,installation of 1,100.00 linear feet of fencing, 2 bags of concrete for approximately 110 holes for vertical poles. Fabrication of two (2) each Gates for the entrance into the fence in two (2) separate locations. Fabrication of signs for "authorized personnel only". Fence will be 8 feet tall by 1,100. feet in total length with two gates. Fence will have security ties and welded at all connections to prevent tamper.	M	0	C	The water tanks currently have no security perimeter surrounding them. There is a potential to tampering with the water tanks. These tanks are next to theperimeter road, where a vehicle could impact the tanks. In keeping with the security standards of public utilities since september 2011 these tanks should be behind a secured perimeter to prevent unauthorized access and protected from potential terrorist attack to the drinking supply.	83,000	2,023	10,950	02	Lassen	I	2012

2766	4410013	4410013-001	Scotts Valley Water District	Automated water meter conversion	The project is to replace SVWD's existing touch-read water meter system with state-of-the-art AMR/AMI technology. The conversion would be a turnkey installation provided by a qualified firm identified through a competitive selection process. The new AMR/AMI system would incorporate and utilize existing SVWD meters, but would provide for electronic communication of data on a minimum daily time-step. The system would provide functionality with SVWD's existing billing system and would include programmable features for identifying leaks and successfully implementing water conservation best management practices.	M	0	C	Scotts Valley Water District (SVWD) relies on a sole source aquifer for its drinking water supply. Over the past three decades, groundwater extractions by SVWD, neighboring water districts, small systems, and private pumpers have caused groundwater levels to decline by up to 200 feet. Water recycling and water conservation have been identified as key programs to reduce overall pumping to a sustainable level. A successful water recycling project has been implemented, and wide-ranging water conservation measures have been put in place.Further strides in water conservation savings are hampered by limited customer water use data. SVWD currently reads and bills customers once every two months. More frequent meter reading with the existing touch-read technology is not feasible due to staffing constraints. Replacement of the current system with automated meter reading (AMR) and advanced metering infrastructure (AMI) technology would allow for early leak detection, implementation and documentation of water conservation best management practices, reduced vehicle use, and overall improved customer service.	950,000	3,852	11,301 05	Santa Cruz	II	2009
2767	4410013	4410013-002	Scotts Valley Water District	Booster pump station improvement	The project consists of improvements to Sandhill and El Pueblo booster pump stations.The Sandhill booster pump station would be improved to replace the existing aging pump with a new high efficiency pump and add a second new high efficiency pump along with associated valves and piping. The two new pumps would operate in a lead-lag mode. The normal operating capacity of the facility would not change. The purpose would be to provide assured water service for customers in the Mt. Roberta pressure zone. The planned improvements would require acquiring approximately 200 square feet of rural property adjacent to the existing booster station footprint. Preliminary discussions with the property owner regarding this potential acquisition have been completed.The two existing, aging pumps at Bethany booster pump station would be replaced with new high efficiency pumps. Existing valves and piping would remain unchanged. The three existing, aging pumps at El Pueblo booster pump station would be replaced with new high efficiency pumps. Existing valves and piping would remain unchanged. The pump replacements at Sandhill, Bethany, and El Pueblo would generate an overall estimated 25% energy savings. The greatest total energy savings would be achieved at El Pueblo due to the large volume of water pumped at this station.	M	0	C	Three Scotts Valley Water District (SVWD) booster pump stations -- Sandhill, Bethany, and El Pueblo -- are in need of immediate improvement. Sandhill booster pump station consists of a single, aging 30+ year old booster pump. This booster pump station is SVWD's sole means of filling of Mt. Roberta water storage tank, which can provide a maximum of one day's supply within the Mt. Roberta pressure zone at peak season customer demand.Bethany booster pump station consists of two aging 30+ year old booster pumps. This booster pump station is SVWD's sole means of filling of Bethany water storage tank, which can provide a maximum of two days' supply within the Bethany pressure zone at peak season customer demand.El Pueblo booster pump station controls delivery from El Pueblo Water Treatment Plant, which processes approximately 30% of SVWD's total supply. The pump station consists of three parallel 28 year old booster pumps capable of operating in tandem. Loss of this pump station to pump failure in a peak use period would seriously compromise SVWD's ability to meet customer demand throughout the entire SVWD system. Pump tests show signficant potential energy savings from replacing the El Pueblo pumps with new efficient models. Energy savings would also result from replacing the Sandhill and Bethany pumps, but in lesser amounts due to the lower volume of water pumped at	650,000	3,852	11,301 05	Santa Cruz	II	2009

2768	4110016	4110016-004	Hillsborough Water Dept.	Water Main Replacement	1. 2445 to 2400 Summit Dr & Oak Tree Place Install 815' of 8" cement lined DIP. Move zone boundaries at 2445 Summit Dr to 2400 Summit; install 6" PRV to supply Forestview tank zone (exist #40 psi) with the Darrell zone (exist #113 psi); eliminate dead-end on Summit and assist Forestview tank zone when needed. Install 200' of 6" DIP on Oak Tree Pl and 3/4" pressure regulators at all residents. Install two 6" PRV's on Summit Dr and Bella Vista to feed this area from the Darrel tank zone for the future elimination of old Oaks Drive pump station and old Forestview tanks. Mains will be installed in roadway.2. Robinwood Lane & Denise Drive Install 930" of 6" DIP on Denise Dr from Alberta Way to Robinwood Ln and 1700' of new 6" DIP on Robinwood from Denise to Hayne Rd. Both of these dead end mains will be connected together to create a circulation line and improve reliability, water quality and fire flows. New hydrants will be spaced approx. every 300' and include a main run isolation valve approx every 500' - 600'. Mains will be installed in roadway.3. 101 Robin Rd to 2755 Ralston Ave- Install approx 1270' of 6" DIP main in roadway on Ralston and space hydrants every 300'. Existing main will be abandoned in place. New long water services will now be connected from Ralston, requiring reverse plumbing of existing residents to the street.4. Chateau Pumping Line - The Town will install approx 1900' of 10" DIP in the roadway	M	0	C	Hillsborough provides service to 4,200 service connections via 97 miles of water main lines. A 2004 Water Main Infrastructure Inventory identified ages of mains:Age Linear Feet0-10yrs 541510-20yrs 020-30yrs 5562230-40yrs 6096340-50yrs 75698Older 314633Many miles of pipe remain to be upgraded. Following are the most problematic due to deterioration, breaks, inadequate supply, hydrant spacing, placement and material:2445 to 2400 Summit Dr & Oak Tree Place:Summit has failing 6" Cast Iron (CI) and Transite (TI) mains. Hydrants are dry-barrel type supplied by a 6"x 4" reducer. Oak-Tree is served by 4" CI main fed from 2400 block of Summit, which is lower pressure. 10 Oak Tree Place has #37 psi. Other properties on Oak Tree and Summit are served by 2',' plastic-to-galvanized, higher pressure line fed from the 2500 block of Summit through the easement into the back of Oak Tree. Existing mains crisscross the roadway from behind the curb.Robinwood Lane & Denise Drive:6" CI main on Robinwood, from Hayne to Denise, has had several breaks over past few years. 6" CI main on Denise needs replacement. Existing mains are behind the curb.101 Robin Rd to 2755 Ralston Ave 6" CI main needs replacement. Runs behind back yards of properties on Barroilhet Rd, Ralston Ave and Robin Rd. Existing water services run from main to homes. Area is difficult to access for main repairs, emergency water turn offs,	3,000,000	4,296	11,328	17	San Mateo	II	2009
2769	4110016	4110016-005	Hillsborough Water Dept.	SCADA System Upgrade	The Town of Hillsborough's water system consists of 8.3 million gallons of storage, 14 pump stations and approximately 100 miles of water distribution piping. Town plans on using the upgraded Supervisory Control and Data Acquisition (SCADA) monitoring system to improve the operation and control of the drinking water storage and distribution systems. The new SCADA monitoring system will include development, installation and commissioning of a Central Computer System (CCS) with a state-of-the-art Human Machine Interface (HMI), 19 new Remote Terminal Units (RTUs), a retrofit of 2 existing Remote Terminal Units (RTUs) and a spread spectrum based radio telemetry network. Additionally, the system shall have the capability to incorporate an Emergency Operations Center (E.O.C.). The system shall be installed in a coordinated manner in order to assure valid and accurate monitoring and control capabilities are maintained at all times on the existing system or the new system. The new project will also include effort to install and connect certain new instruments at each site. The new SCADA monitoring project will incorporate up to 50 facilities and a minimum of 2000 mixed physical and 5000 pseudo I/O points.The data obtained from SCADA monitoring system will be used to improve the daily water system operation, increase the efficiency of pump stations during off peak hours, and maintain optimum water	M	0	C	The Town of Hillsborough provides drinking water to approximately 4,200 residents and businesses. The Town's water supply system includes 14 pump stations, 17 tanks, and 9 water-metering stations. Water levels in these facilities is monitored and controlled by a Supervisory Control and Data Acquisition system (SCADA). The system consists of a Master Transmitting Unit (MTU), located in the Public works department and a Remote Transmitting Unit (RTU), which monitors equipment located at every tank and pump station. The Town's SCADA system was installed in 1999, is outdated and is no longer supported by the manufacturer. A 2006 SCADA System Evaluation identified numerous system issues:1. The RTU uses the actual reservoir level information while simultaneously controlling pumps to bring the reservoir to a desired water level. In one instance, the MTU went offline for a prolonged period of time due to power failure. During this time no new water level information was transmitted to the RTU at each pump station. This led to the pump running continuously on the last transmitted value of the reservoir level. This is a major flaw in programming and an upgrade in the safety check of pump control logic is required. 2. The wiring installation did not adhere to standard engineering practices. For example, wires are not labeled with wire numbers and there is no indication of wire numbers on the terminal block.	1,340,000	4,296	11,328	17	San Mateo	II	2009
2770	4110016	4110016-001	Hillsborough Water Dept.	Replace Water Mains, Tanks and Booster Stations	Replace existing undersized water mains with minimum 8" ductile iron pipe. Seismically upgrade or replace water tanks and booster station and other improvements and water services.	M	0	C	Delapitated and aged watermains, water tanks and booster stations.	15,000,000	4,296	11,328	17	San Mateo	II	2006

2771	4110016	4110016-003	Hillsborough Water Dept.	New Vista Water Tank	The Town is at 50% design of a 600,000 gallon concrete storage tank and anticipates completing 100% design by June 2009. The tank will be built above ground using pre-stressed concrete. The pre-stressed concrete tank will be secure and virtually maintenance free. The north side of the tank will be built on the footprint of the existing tank. The south side of tank will be built into a hillside which will act as a retaining wall. This will save expenses on excavation, retaining walls and paving costs necessary if a conventional steel tank were built. The tank design provides better inlet/outlet piping design along with a mixing system to improve the water quality. It is designed to meet current American Water Works Association (AWWA) standards for seismic design and will include an earth quake shut off system. The new tank design also saves on exterior and interior coatings costs which are an on-going maintenance expense.The increased water storage capacity will give the Town more water reserve to service the residential and other areas during peak water demand due to emergency water shortage, wildfire or earthquake. The new pump station for Vista water tank would be relocated for easier access and drainage away from the building. It would also meet seismic design standards for this area. It would have a new Motor Control Center panel (MCC) and standby generator within the new building. The pumps would be able to alternate	M	0	C	The Town of Hillsborough is a residential community located in San Mateo County, California. It lies west of Highway 101 and east of Highway 280 and is within very close proximity to the San Andreas Fault line. Fully two thirds of the Town is in a CalFire State Fire Hazard Zone and nearly half is in a state-designated Very High Fire Hazard Zone. The ABAG Multi−Jurisdictional Local Hazard Mitigation Plan identifies 3,458 acres or 89% of the Town as being at risk from wild land-urban interface fires. The Town's water system includes 8.2 million gallons of water storage facilities, 14 pump stations and 17 tanks and 100 miles of water piping to 4,200 service connections. Much of the system was originally installed in the early-mid 1900s. A number of the water tanks and pump station have been upgraded in order to bring them into compliance with current construction standards, harden them against seismic events and to increase storage capacity in case of wildfire. However the Town's 350,000 gallon Vista Road Water Storage Tank, built in 1947, and associated pump station, built in 1960, have not yet been upgraded. They have surpassed their long term durability and normal longevity.It is a free-floating steel tank on 6 inch sandbed foundation. The tank has significant corrosion at the bottom wall shell connection to the floor plates. It has bitumastic tar coating interior lining which has corroded. The tank is in major need of seismic retro fit to bring it up to current	2,500,000	4,296	11,328	17	San Mateo	II	2009
2772	5410006	5410006-001	Lindsay, City of		CANAL SUPPLY LINE, 2.5 MG STORAGE TANKS, TWO NEW WELLS, INFRASTRUCTURE IMPROVEMENTS, PRESSURE SYSTEM LOOPS, RAW WATER TREATMENT PLANT IMPROVEMENTS. OTHER - DESIGN AND CONSTRUCTION	M	0	C	DISTRIBUTION PROBLEMS	12,842,000	2,335	11,450	12	Tulare	III	1998
2773	4910005	4910005-007	Healdsburg, City of	City of Healdsburg College Avenue Water Main Replacement	The project would entail; development of water supply by-pass plans to ensure all customers maintain domestic water service; systematic removal of old water mains on College Avenue between Piper Street and Sherman Avenue; placement pipe bedding; installation of 1,855 lineal feet of 8" C-900 PVC water main; trench compaction; installation of 36 new 1" residential water services; installation of 4 new fire hydrant assemblies; and appetent valves and piping; flush new lines; pressure test new lines; flush and disinfect new lines; perform bacteriological testing; and return completed lines to service; and perform street trench repairs. Estimated time to complete 90 days.	M	0	C	College Avenue is currently served by a 4" cast iron water main that was installed in 1936. This main serves 36 residential customers and has experienced several failures over the past several years. Failures have been attributed to age of pipe, seismic activities and corrosion. The failures typically occur after hours requiring prolonged shut-downs and significant expense due to overtime work. Public health is potentially compromised due to lack of water for domestic consumption and sanitary purposes while emergency repairs are performed. Uncontrolled discharges of chlorinated water due to the water main failures has resulted in the Regional Water Control Board staff advising the City that as a minimum, the discharged water needs to be de-chlorinated prior to discharge into the storm drain system, and that greater preventive measures should be taken to minimum water main failures. In addition the substandard water main sizes are not be able to meet current minimum fire flow requirements. No public notification conditions currently exist.	415,000	4,272	11,706	18	Sonoma	II	2009

2774	4910005	4910005-008	Healdsburg, City of	City of Healdsburg Brown Avenue Water Main Replacement	The project would entail; development of water supply by-pass plans to ensure all customers maintain domestic water service; systematic removal of old water mains on Brown Avenue between Piper Street and Powell Avenue; placement pipe bedding; installation of 2,394 lineal feet of 8" C-900 PVC water main; trench compaction; installation of 42 new 1" residential water services; installation of 6 new fire hydrant assemblies; and appetent valves and piping; flush new lines; pressure test new lines; flush and disinfect new lines; perform bacteriological testing; and return completed lines to service; and perform street trench repairs. Estimated time to complete 90 days.	M	0	C	Brown Avenue is currently served by a 2" and 4" cast iron water main that was installed in phase beginning in 1936 and completed in the early 1940's. These mains serve 42 residential customers and have experienced several failures over the past several years. Failures have been attributed to age of pipe, seismic activities and corrosion. The failures typically occur after hours requiring prolonged shut-downs and significant expense due to overtime work. Public health is potentially compromised due to lack of water for domestic consumption and sanitary purposes while emergency repairs are performed. Uncontrolled discharges of chlorinated water due to the water main failures has resulted in the Regional Water Control Board staff advising the City that as a minimum, the discharged water needs to be de-chlorinated prior to discharge into the storm drain system, and that greater preventive measures should be taken to minimum water main failures. In addition the substandard water main sizes are not be able to meet current minimum fire flow requirements. No public notification conditions currently exist.	534,900	4,272	11,706	18	Sonoma	II	2009
2775	4910005	4910005-006	Healdsburg, City of	City of Healdsburg Cadoul Reservoir Rehabilitation II	The project would entail: installing by-pass pumping to maintain domestic water supply from other storage and supply sources; draining the tank; removing and disposing of the existing roof structure and covering at a permitted landfill or demolition recycling facility; mobilize air blowers and monitoring equipment to ensure safe and adequate air supply during work; perform repairs to the tank interior and piping as necessary; clean tank; installing 7 oz geo-textile underlayment; installing 45 mil Hypalon liner with batten bars and appurtenant attachments to piping and tank inlets and outlets; test all seams for leaks via air lance method; repair or install new access ladder; install new roof support structure; install new roof covering; clean and disinfect new installations; fill tank with domestic water and check for leaks; disinfect refilled water; perform bacteriological testing; disconnect by-pass pumping; and return reservoir to service. Estimated time to complete 45 days.	M	0	C	The Cadoul Reservoir is a 60,000 gallon poured in place concrete reservoir, partially below grade, that provides domestic and fire suppression water to approximately 116 connections. The reservoir was constructed in 1920. The reservoir has developed significant cracks allowing root intrusion, and is leaking – thereby wasting potable water and possibly creating unsafe saturated subsurface conditions. In addition, the existing roof structure has deteriorated to a point where it could fail. The roof has been temporarily repaired but there are concerns related to contamination from precipitation and other vectors. No public notification conditions currently exist.	150,000	4,272	11,706	18	Sonoma	II	2009
2776	4910005	4910005-009	Healdsburg, City of	City of Healdsburg Fitch Well Field Rehabilitation	The project entails a systematic rehabilitation of Wells #1 - #4. Rehabilitation for each well would include: removal of pump motor; removal of pump assembly and water column; scrubbing of the well casing; video inspection of well casing; installation of new well screens/liner as necessary; well surging and development; installation of new pump/bowl assembly, bearings, "spider" supports, foot check valve, and water column; installation of new energy efficient pump motor with anti-ratcheting device; perform check of electrical supply and motor control center and perform necessary repairs/upgrades; disinfect and flush well; perform bacteriological testing; and return well to service. Estimated time to complete 120 days.	M	0	C	The Fitch Well Field consists of four public supply wells adjacent to the Russian River. The well motors are mounted on elevated support structures and are above Russian River flood stage. The wells were constructed in the early 1970's and have an average depth of 80 feet, with an average production of approximately 700 gpm each. The wells are classified by DPH as being under the influence of surface water from the Russian River and the City is prohibited from using them for public consumption from November to May. Due to the surface water influence, the well screens and bowls have become "fouled". We have recently experienced pump and motor failure on our other well field (the Gauntlett Well Field) and are concerned that similar failures will occur on these wells. These well augment the City peak summer demand and are critical to meet public health and safety supply demands. No public notification conditions currently exist.	500,000	4,272	11,706	18	Sonoma	II	2009

2777	4910005	4910005-004	Healdsburg, City of	City of Healdsburg Gauntlett Reservoir Rehabilitation	The project would entail: installing by-pass pumping to maintain raw water supply to the water treatment plant; draining the tank; removing and disposing of the existing roof structure and covering at a permitted landfill or demolition recycling facility; mobilize air blowers and monitoring equipment to ensure safe and adequate air supply during work; perform repairs to the reservoir interior and piping as necessary; clean tank; install 7 oz geo-textile underlayment; install 45 mil Hypalon liner with batten bars and appurtenant attachments to piping and tank inlets and outlets; test all seams for leaks via air lance method; repair or install new access ladders; install new roof support structure; install new roof covering; clean and disinfect new installations; fill tank and check for leaks; disinfect refilled water; perform bacteriological testing; disconnect by-pass pumping; and return reservoir to service. Estimated time to complete 120 days.	M	0	C	The Gauntlett Reservoir was constructed in 1957 and is a 720,000 gallon gunite lined, below grade reservoir that serves as the raw water fore-bay tank for the City's Panorama Water Treatment Plant. Water is supplied from four public supply wells that are adjacent to the Russian River. Prior to the DPH requirement to construct the water treatment plant - due to surface water influence of the public supply wells - the Gauntlett Reservoir served as the primary potable water storage facility for the City. However, with the construction of the water treatment facility in 2005, the Gauntlett Reservoir was "reused" as the fore-bay tank, providing gravity feed to the water treatment facility. Recent inspections have determined that the roof structure is in significant distress (dry rot and failed joint connections) and the roof covering is leaking, allowing precipitation and other vectors to enter. The City recently spent $30,000 to perform emergency – temporary repairs. The gunite liner has also been observed to be leaking in several locations and may be creating unsafe saturated subsurface conditions. No public notification conditions currently exist.	750,000	4,272	11,706	18	Sonoma	II	2009
2778	4910005	4910005-005	Healdsburg, City of	City of Healdsburg Water Main Replacement Terrace Avenue	The project would entail; development of water supply by-pass plans to ensure all customers maintain domestic water service; systematic removal of old water mains at various locations on Terrace Avenue between Healdsburg Avenue and University Street; placement of pipe bedding; installation of 2,566 lineal feet of 8" C-900 PVC water main; trench compaction; installation of 55 new 1" residential water services; installation of 6 new fire hydrant assemblies; and appetent valves and piping; flush new lines; pressure test new lines; flush and disinfect new lines; perform bacteriological testing; and return completed lines to service; and perform street trench repairs. Estimated time to complete 90 days.	M	0	C	Terrace Avenue is currently served by 2" and 4" cast iron water mains that were installed in phases starting in the early 1930's and completed in 1963. These mains serve 55 residential customers and have experienced several failures over the past several years. Failures have been attributed to age of pipe, seismic activities and corrosion. The failures typically occur after hours requiring prolonged shut-downs and significant expense due to overtime work. Public health is potentially compromised due to lack of water for domestic consumption and sanitary purposes while emergency repairs are performed. Uncontrolled discharges of chlorinated water due to the water main failures has resulted in the Regional Water Control Board staff advising the City that as a minimum, the discharged water needs to be de-chlorinated prior to discharge into the storm drain system, and that greater preventive measures should be taken to minimum water main failures. In addition the substandard water main sizes are not be able to meet current minimum fire flow requirements. No public notification conditions currently exist.	575,600	4,272	11,706	18	Sonoma	II	2009

2779	4910005	4910005-002	Healdsburg, City of	City of Healdsburg Gauntlett Well Field Rehabilitation	The project entails a systematic rehabilitation of Wells #1, #2 and #3. Rehabilitation for each well would include: removal of pump motor; removal of pump assembly and water column; scrubbing of the well casing; video inspection of well casing; installation of new well screens/liner as necessary; well surging and development; installation of new pump/bowl assembly, bearings, "spider" supports, foot check valve, and water column; installation of new energy efficient pump motor with anti-ratcheting device; perform check of electrical supply and motor control center and perform necessary repairs/upgrades; disinfect and flush well; perform bacteriological testing; and return well to service. Estimated time to complete 120 days.	M	0	C	The Gauntlett Well Field consists of four public supply wells adjacent to the Russian River. The well motors are mounted on elevated support structures and are above Russian River flood stage. The wells were constructed in 1957 and have an average depth of 80 feet, with an average production of approximately 650 gpm each. The wells are classified by DPH as being under the influence of surface water from the Russian River. As directed by the DPH the City constructed a surface water treatment plant which was completed in 2005 and is supplied raw water exclusively from the four Gauntlett wells. Due to the surface water influence, the well screens and bowls have become "fouled". Last year Well #4 went down and had to be rehabilitated. Well # 3 went down on February 18th of this year and is currently undergoing emergency repairs and will ultimately need to be completely rehabilitated. Recognizing that Wells #2 and #1 are most likely in a similar condition and "ready to fail", and that this well field is the only raw water supply to the water treatment facility for the City of Healdsburg, it is imperative that Wells #1, #2 and #3 be rehabilitated to maintain adequate water supply to protect public health and safety. No public notification conditions currently exist.	375,000	4,272	11,706	18	Sonoma	II	2009
2780	4310019	4310019-003	City of San Jose - NSJ/Alviso	Nortech Parkway East Loop Main	Microtunnel under a state highway to provide an additional connection between the two areas.	M	0	C	Service area is split into two geographical portions, connected only by two distribution mains. During a seismic, or other catastrophic event, the two portions may become separated, resulting in loss of water supply to residents and possible depressurization of the system.	750,000	2,267	11,742	17	Santa Clara	II	2009
2781	1510013	1510013-001	City of McFarland		A) Eliminate low volumes and possible bacteriological problems. B) Portable electric generator to restore water service during power outages.	M	0	C	A) Large diameter system main line extensions to eliminate small diameter customer lines, extending long distances. B) Lack of water/power to emergency situations	211,000	2,792	12,138	12	Kern	III	1998
2782	1510013	1510013-004	City of McFarland	Browning Rd Storage Tank and Booster Pumping Plant	The project is to construct a new water supply well, storage tank, and booster pumping plant on the east side of Hwy 99 along Browning Road in Kern County, California. A one-acre (1 ac) well site has already been acquired and a casing hammer test well drilled. The casing hammer method of drilling allowed for frequent water quality sampling down to a depth of 900-ft. The test well indicated that a new well can be completed that will provide 1,500 gpm to 2,000 gpm and meet all Title 22 water quality requirements without treatment. The new well will supply a 1,000,000 gallon welded steel storage tank. A booster pumping plant with an initial capacity of 3,500 gpm and the ability to expand in the future will convey water to the distribution system. This storage tank and pumping plant will provide the system a sufficient water supply in the event of a PG&E power outage on the west side of Hwy 99. Furthermore, the City will be able to fill the storage tank in off-peak hours and use the tank and pumping plant in peak hour periods to take advantage of time of use pumping and reduce operational costs to continue to provide inexpensive water to the community.	M	0	C	The City of McFarland currently has three active water supply wells. One of the wells is above the chemical MCL for arsenic at 16 ppb and the other two wells are right at or just below the MCL for arsenic at approximately 9 ppb. Changing groundwater levels could negatively impact these two wells and increase the arsenic concentrations above the MCL. The City's inability to absorb the high operation and maintenance costs associated with well head arsenic treatment are a great concern due to the economic disadvantage of their community. An alternative to installing treatment for these wells must be pursued. Furthermore, the City water system is bisected by Highway 99. The west half of the City is served power by PG&E. The east half of the City is served power by Southern California Edison. The three existing water supply wells are all on the west half of the City. When power by PG&E is interrupted or lost, the City is unable to supply water for domestic use or fire protection. A new well and storage tank is proposed on the east side of Hwy 99 to remedy the system problems noted above.	3,500,000	2,792	12,138	12	Kern	III	2009

2783	3910015	3910015-004	CITY OF LATHROP	3.8 Million Gal Water Tank and Booster Pump Station	Project includes construction of a 3.6 million gallon water tank with a booster station and a SCADA tower in order for the city to be able to communicate between water facilities within the City.	M	0	C	The 3.8 million gallon water tank is needed to provide addition storage and fire protection for the City. The tank and booster station will be tied into the water system and will provide a more consistent water pressure. The water tank will also aid in allowing the City to utilize their surface water supply more efficiently and reduce our depeandancy on groundwater. Our current ground water requires additional treatment for arsenic removal and reducing the amount of water needed to be treated for arsenic will aid in providing lower water rates to our citizens than it would be without the tank. In addition this tank is needed to support developoment of approximately 5 million square feet of retail space. The project was put on hold due to the difficulties experienced in the recent credit crunch and down turn it the economy. The project has CEQA clearance as well as improvement plans that are ready for bidding. If this project is funded, it will provide the oppurtunity for new businesses to develop and provide nearly 2000 jobs to the area.	6,000,000	3,675	12,427	10	San Joaquin	III	2009
2784	3610121	3610121-006	SBDNO COUNTY SERVICE AREA 64	Spring Valley Lake CSA 64 Water System Improvement	The project includes the drilling and equipping of a new water production well. The site location identified for the well indicates that a production of between 2,500 and 3,000 gallons per minute can be anticipated. The well would utilize an 18-inch diameter steel casing with full depth perforations to maximize the output. The well would be equipped with a water lubricated vertical turbine pump and motor arrangement. Well construction would be performed on property already owned by the District and when complete would bring the District into compliance with the DHS requirements for water supply to public water systems.The project also includes the fabrication and erection of two 3.0 million gallon water storage reservoirs. The reservoirs would be constructed of steel panels utilizing welded connections. The reservoirs would be designed and constructed to the American Water Works Association's (AWWA) standards on property previously purchased by the District.Finally the project includes the construction of approximately 1.3 mile of 16-inch diameter pipeline to connect the new well and reservoirs into the existing District water system. This pipeline would be constructed using polyvinyl chloride material meeting the AWWA and industry standards. The pipeline routing would be exclusively on District property or within County maintained road rights-of-way.	M	0	C	CSA 64 (District) provides water for domestic service and fire protection to approximately 3,782 equivalent single family residences in the community of Spring Valley Lake. The District falls under the regulating authority of the California Department of Health Services (DHS). The DHS requires public water systems to provide water at a rate of the maximum day demand to the customers with the Districts largest production well out of service. The District does not meet this requirement and additional well capacity is required to bring the District into compliance.Further, the District does not meet the DHS requirement for water storage capacity. Based on the population served and the maximum day water demand, the District is deficient by 5.0 million gallons of storage. Additional reservoir capacity is required to bring the District into compliance.The system deficiencies are noted on the annual inspection and reports performed and submitted by the DHS.	3,200,000	3,782	12,481	13	San Bernardino	V	2009

2787	1910096	1910096-006	Newhall CWD-Newhall	Newhall Reservior 4A Replacement	The first step of the project would involve engaging engineering firms to bid on the design of the new distribution reservoir. Once the bid has been awarded staff will work closely with the engineers to make sure all specifications are met. After a design is completed NCWD will go out to bid for the dismantling of the existing reservoir and the construction of the new 2.75 MG reservoir. Grading of the area surrounding the existing Reservoir 4A is the first portion of the construction process. Then, during winter months, Reservoir 4A can be dismantled, recycling as much material as possible. When this is completed the existing footing must be removed and final grading can take place. A new footing can then be poured and the construction of a coated steel reservoir can begin. Some features that have become Newhall County Water District Standards are: non common inlet/outlets, spiral flex tend staircase to the top of the tank, and earthquake valves on inlet and outlet of the reservoir. Our standardized specifications for new reservoirs will be fully implemented into the design and construction of the new reservoir to assure that the highest level of safety and functionality are utilized. In addition Title 22 standards for distribution reservoir construction (section 64585) will be strictly adhered to ensuring regulatory compliance. Rather than retrofitting the existing reservoir and building an additional	M	0	C	Newhall County Water District (Newhall Division) Reservoir 4A was built in 1975. This 1.5MG tank is hydraulically connected with Reservoir 4 and together both feed Zone 4 of the Newhall Division. Reservoir 4 is in need of major rehabilitation that includes earthquake retrofits, structural improvements, and correcting its common inlet/outlet flaw. The Newhall Division Master Plan, prepared by Brockmeyer Engineering, expresses the need for increased storage in this zone for a total of 3.39 MG. Taking this into consideration, the most sensible solution to the problem is to demolish the current Reservoir 4A and build a much larger 2.75 MG Reservoir in its place. Increased storage, along with design improvements, yields many benefits for the water system. The first improvement is increased available storage for peak flows. Currently Pressure Zone 4 is deficient when it comes to peak demand in hot weather, extreme fire flow conditions, and in the event of a disaster. Another improvement is increased water quality. Having a larger tank allows operators to cycle the water levels in the tank so that older water is turned over more often. At this time the reservoir is kept relatively full and tank levels are not allowed to drop enough for fear of a demand surge. A full reservoir with minimal turnover puts the reservoir at risk of nitrification (due to the chloramines disinfectant used). Water quality is also improved by eliminating	1,240,000	3,846	12,566	15	Los Angeles	IV	2008
2788	1910096	1910096-007	Newhall CWD-Newhall	Newhall Reservoir 1 Replacement	The first step of the project would involve engaging engineering firms to bid on the design of the new distribution reservoir. Once the bid has been awarded staff will work closely with the engineers to make sure all specifications are met. After a design is completed NCWD will go out to bid for the dismantling of the existing reservoir and the construction of the new 4.5 MG reservoir. Grading of the area surrounding the existing Reservoir 1 is the first portion of the construction process. Then, during winter months, Reservoir 1 can be dismantled, recycling as much material as possible. When this is completed the existing footing must be removed and final grading can take place. A new footing can then be poured and the construction of a coated steel reservoir can begin. Some features that have become Newhall County Water District Standards are: non common inlet/outlets, spiral flex tends staircase to the top of the tank, and earthquake valves on inlet and outlet of the reservoir. Our standardized specifications for new reservoirs will be fully implemented into the design and construction of the new reservoir to assure that the highest level of safety and functionality are utilized. In addition Title 22 standards for distribution reservoir construction (section 64585) will be strictly adhered to ensuring regulatory compliance. Rather than retrofitting the existing reservoir and building an additional	M	0	C	Newhall County Water District (Newhall Division) Reservoir 1 was built in 1962. This .75MG tank is hydraulically connected with Reservoir 1A and together both feed Zone 1 and the rest of the Newhall Division. Reservoir 1 is at the heart of the Newhall distribution system and is in need of major rehabilitation that includes earthquake retrofits, structural improvements, and correcting its common inlet/outlet flaw. The Newhall Division Master Plan, prepared by Brockmeyer Engineering, expresses the need for increased storage in this zone for a total of 7.5 MG. Taking this into consideration, the most sensible solution to the problem is to demolish the current Reservoir 1 and build a much larger 4.5 MG Reservoir in its place. Increased storage, along with design improvements, yields many benefits for the water system. The first improvement is increased available storage for peak flows. Currently Pressure Zone 1 is deficient when it comes to peak demand in hot weather, extreme fire flow conditions, and in the event of a disaster. All of Newhall is dependent on Reservoirs 1 and 1A and they are grossly undersized. Another improvement is increased water quality. Having a larger tank allows operators to cycle the water levels in the tank so that older water is turned over more often. At this time the reservoir is kept relatively full and tank levels are not allowed to drop enough for fear of a demand surge. A	2,200,000	3,846	12,566	15	Los Angeles	IV	2008

2789	1910096	1910096-009	Newhall CWD-Newhall	Newhall Booster No. 4 Replacement	The replacement of Booster Station No. 4 is an item that is recommended in the Newhall County Water District (NCWD) Newhall Master Plan prepared by Brockmeier Consulting Engineers Inc. The suggested location of relocation is a piece of property the District already owns. Furthermore, a second parcel to the west of the property is needed and will be acquired from the City of Santa Clarita. Once this has been completed NCWD will entertain bids for engineering design of the pump station and intertie into the distribution system. During the design process, staff will work closely with engineers to ensure that Title 22 Regulations and NCWD specifications are integrated into the project. After the design has been established NCWD will receive bids to build the new pump station. All piping work will be done in-house utilizing the NCWD Construction Crew. According to the Newhall Master Plan, the new booster station should house two vertical turbine pumps that produce 1,300gpm. Two pumps are essential for system redundancy. Also, another advantage of two pumps is the ability to switch off lead and lag pumps. This will lengthen the life of the pumps and motors installed at the site. By moving the location and installing new pumps and motors all issues for Booster 4 are resolved; the pumps are housed in a building and are away from customers, pumping efficiency and pumping rates are increased, and reliability is	M	0	C	Newhall County Water District Booster Pump Station No. 4 was built in 1966 and consists of three centrifugal pumps. Located in the Newhall Division, Booster No. 4 receives water from Zone 1 and pumps the water to Reservoirs 4 and 4A. The combination effluent from all three pumps is approximately 1200gpm. The pumping rate is slightly deficient, but the major problem with Booster No. 4 is the type, and location of pumps. This booster station is located in a residential neighborhood on a lot between 2 houses and customers have complained of noise issues on several occasions. Also, centrifugal pumps are not the most efficient selection for this application. They are not dependable and are constantly being changed out and rebuilt (we estimate the life of each motor at a year and a half). Furthermore, centrifugal pumps are inefficient in terms of electricity consumption. The last Edison pump tests conducted on March 28, 2008 showed 55.9%, 55.9%, and 49.0% efficient for pumps one, two, and three respectively. A combination of these problematic elements suggests Newhall County Water District should replace the booster station to resolve all issues.	530,000	3,846	12,566	15	Los Angeles	IV	2008

2792	3310074	3310074-001	Lee Lake Water District		A water surface treatment facility needs to be constructed to allow the District to use its wells for potable use. Also, a water transmission pipeline must be constructed to connect the wells to the District's existing potable transmission main.	M	0	C	In 1996, the Distirct acuired 3 water wells for the purpose of providing an alternate source of potable water to the District's system to increase system reliability. It was determined by DHS that the wells are under the influence of surface water.	1,000,000	4,440	13,168	20	Riverside	V	1998
2793	3310074	3310074-002	Lee Lake Water District	Wild Rose Reservoir II	The proposed project is the construction of a 3 million gallon tank adjacent to the existing tank site to provide storage for operation and emergencies. The District has a continuious western border with the Cleveland National Forest that has the potential to threaten multiple communities within the District. There are no other water sources in the area for fire fighting and CalFire uses our system to fill basins within the forest. We believe that more storage capacity will safe gaurd the community in the event of fire or earthquaake if the District's single water source is or unavailable or ruptured.	M	0	C	The District is needs to expand its storage capacity for emergency and fire flow.	3,000,000	4,440	13,168	20	Riverside	V	2009
2794	4210007	4210007-006	MONTECITO WATER DIST	Dalton Tunnel Storage Tank/Treatment Plant Expansion	Replace existing 250,000 gallon tank with 2,000,000 gallon tank and increase treatment flow to 1.4 MGD.	M	0	C	Dependency on South Coast Conduit during high flows.	3,200,000	4,529	13,500	06	Santa Barbara	IV	2003

2795	3310032	3310032-003	San Jacinto, City of	San Jacinto Elevated Storage Tank & Supply Pipeline	The proposed project includes construction of an elevated water storage tank and the appurtenant pipelines to connect the tank to the city's water distribution system. The tank would be located on a hillside on the edge of the city's water service area. It would have a storage capacity of at least 2 million gallons.The project work would entail purchasing an easement for the tank location; grading and paving of an access road and the tank site; construction of the tank foundation; installation of the tank; and installation of an underground pipeline (likely 15" diameter) between the tank and the city's water distribution system, a distance of a few thousand feet.	M	0	C	The City of San Jacinto's water system currently has two significant deficiencies. First, it does not have adequate storage capacity to serve emergency needs. As a result, the public are at risk in the event of a large fire or series of fires.Second, the entire system relies on at-grade storage tanks with booster pumps to provide a pressurized system. This requires that the pumps run 24 hours a day, which leads to high power usage. It also requires that the pumps operate across a range of flow rates while maintaining the same pressure - as a result, the pumps rarely operate at their best efficiency point. Finally, it leaves the system at risk of failure in the event of a power outage. While emergency generators are available at each of the pumping stations, they have only finite capabilities.The proposed project addresses these deficiencies. With respect to the first issue, a recent update to the City's master plan identified an immediate need for approximately 2 million gallons of additional storage. Thus, a tank with a 2 million gallon size is proposed.With respect to the second issue, the proposed tank would be built at an elevated location on a hillside along the edge of the City's water service area. By elevating the tank, the City can achieve more efficient operations by pumping the tank full at night, and using gravity during the day to serve users. During times of peak demand, the existing booster pumps could be used to supplement the gravity flow from the	4,000,000	4,030	14,098	20	Riverside	V	2011
2796	2910003	2910003-008	Truckee-Donner PUD, Main	Prosser Dam Road Pipeline Extension	The proposed project entails the extension of a municipal water pipeline into an area currently served by private wells.	M	0	C	The proposed project entails the extension of a municipal water pipeline into an area currently served by private wells.A number of properties in this area have experienced problems and/or well failures due to a locally declining groundwater table.Fire hydrants would be installed at intervals of about 500 feet along the pipeline, making water available for fire suppression in an area without such a water supply thereby protection this area and the urban/wildland interface along the northern area of Truckee.	1,200,000	12,271	14,300	21	Nevada	I	2009
2797	0510016	0510016-001	CCWD Ebbetts Pass Improvement District	Hunters WTP Surge Tank	The project will construct a surge tank at the Hunters WTP to reduce pressure impacts on the plant's mechanical equipment. Control halving will be added to equalize the pressure surges. Other ancillary equipment and electrical equipment will also be installed to support the surge tank operations. Hydraulic studies have been performed, plans and specifications are complete, The project consists of a 15-ft diameter, 64 feet high steel tank, a 12-in electronic control valve, and piping. The estimated cost is $500,000. The project has been exempted from CEQA, and the District has scheduled the project to go out to bid in April 2009. Construction is anticipated to be complete by September 2009.	M	0	C	CCWD owns and operates the Hunters Water Treatment Plant located near the community of Avery in Calaveras County. The permitted capacity is 4.0 mgd. The service area of the plant incorporates the Highway 4 corridor from Forest Meadows, Avery, Arnold, and Big Trees Village. The raw water feed to the plant is a connection to the District's Collierville Tunnel which operates the Collierville Powerhouse. The Powerhouse is operated by the NCPA. The operations of the Powerhouse have changed over the years resulting in daily hydraulic surges that propagate back to the Hunters WTP. The surges are such that control valving at the Plant can not react in a manner to prevent damage to plant piping and the upsetting of the filters. This District has worked with the operator of the tunnel to alter operations, but the negative impact to hydropower generation could not be reduced. Installing a surge tank at the end of the tunnel at the WTP is the recommended alternative.	500,000	5,736	14,340	10	Calaveras	III	2009

2798	3910007	3910007-001	RIPON, CITY OF	City of Ripon WBA Exchange Nitrate Treatment Pilot Investigation	Given the residuals disposal challenges associated with strong base anion exchange and reverse osmosis, the City of Ripon is proposing to evaluate weak base anion (WBA) exchange as an emerging nitrate treatment technology that may offer a feasible alternative to the current technologies. This project will complement current and anticipated Proposition 50-funded research efforts on other emerging nitrate treatment technologies including the City of Ripon's Integrated Nitrate and Arsenic Treatment Pilot Investigation (#P50-3910007-055) evaluating chemical reduction by SMI-III® granular media and other projects investigating biological reduction of nitrate (City of Fresno). The City of Ripon WBA Exchange Nitrate Treatment Pilot Investigation will be conducted cooperatively by the City and Damon S. Williams Associates (DSWA). DSWA is a water and wastewater engineering consulting firm whose primary focus is providing services to the water utility market in the areas of water quality and water treatment. DSWA's goal is to help utilities produce safe drinking water. DSWA has significant experience in the treatment of nitrate and arsenic in California water supplies, and has led the current Prop 50 funded pilot study (#P50-3910007-055), to test the effectiveness of SMI-III® granular media at removing nitrate. DSWA also brings the unique	M	0	C	Rising concentrations of nitrate in the City of Ripon's groundwater supply have forced the City to take critical wells out of its drinking water supply. One of the City's potable wells, Well 12 with a design flow of 2,000 gpm, is currently offline due to nitrate concentrations exceeding the MCL, while two other wells (Wells 3 and 14) are closely monitored and controlled to maintain nitrate compliance. In addition, five of the City's seven drinking water wells contain arsenic concentrations above the new arsenic MCL of 10 µg/L or within 20% of the MCL. The City also operates two municipal wells (Well 5 and Well 11) as supply for the non-potable water system. These wells have been converted from drinking water wells to non-potable use because of high nitrate concentrations. Currently the total pumping capacity is 1,750 gpm from these non-potable wells. Nitrate, with an acute health risk-based MCL of 45 mg/L as nitrate, has been detected in the City's wells at concentrations as high as 67 mg/L. Arsenic, which poses a chronic health risk and has a new MCL of 10 µg/L, has also been detected in the City's wells at concentrations as high as 14 µg/L. All of the City wells with water quality monitoring data have at sometime contained nitrate and/or arsenic within 20% of the respective MCLs or in excess of those limits. Other inorganic contaminants of concern have also been	500,000	4,524	14,915	10	San Joaquin	III	2007
2799	3910007	3910007-003	RIPON, CITY OF	Ripon Surface Water Supply Project	The infrastructure required to connect Ripon to the South San Joaquin Irrigation District (SSJID) surface water supply includes the construction of a 6-mile long pipeline, storage tank, and pump station. The pipeline will extend from the existing SSJID transmission pipeline where a tap will be made, directly south along rural Jack Tone Road, to the Ripon city limits. The pipeline will cross a number of facilities, the largest being Highway 120 and various irrigation canals.The pipeline is designed to convey the ultimate flow via dual 18-inch pipelines. The pipeline infrastructure will also include the necessary appurtenances such as air release valves, gate valves, and flow control equipment. A 2 million gallon storage tank and 3 million gallons per day pump station will be located on a single parcel at the terminus of the pipeline.	M	0	C	The City of Ripon, located in the Central Valley of California, serves water to 15,000 residents. The current source of water is solely supplied from groundwater wells. As with many other jurisdictions located in the Central Valley, the reliability of Ripon's water supply is threatened by nitrate levels in the groundwater exceeding State maximum contaminant levels.Ripon's request for $10 million in funding assistance would be used to install a 6-mile pipeline connecting Ripon's water distribution system to the South San Joaquin Irrigation District (SSJID) Nick DeGroot Water Treatment Plant. This source of surface water would supplement 25-35% of the City water demand and improve the reliability by which Ripon serves water.In addition to improving the reliability of Ripon's water system by the diversification of the water supply, this project would also provide regional benefits. San Joaquin County has relied heavily on groundwater to supply both its agricultural and urban needs. This reliance on groundwater has resulted in significant over drafting of the groundwater basin and a decline in groundwater levels, which in turn (1) causes the inflow of poorer quality groundwater from the west, and also (2) results in a net reduction of aquifer storage. The proposed Ripon Surface Water Supply Project would allow the City of Ripon to make use of surface water in-lieu of groundwater to supplement a portion of	10,000,000	4,524	14,915	10	San Joaquin	III	2009

2800	2810005	2810005-004	American Canyon, City of	American Canyon Potable Water Storage Reservoirs	This project involves the construction of two potable water reservoirs, East Tank #1 and East Tank #2. The two tanks will complement each other and are therefore submitted as one project. East Tank #1 will supply and pump water to East Tank #2, which is set at a higher elevation. East Tank #1 is a 2.0 MG above-ground, steel potable water storage tank. Construction involves a pump station and an 18-inch diameter inlet/outlet potable water pipeline, approximately 1,800 feet in length. The tank will connect to an existing 18-inch water line on the East Tank #1 project site. Work also includes storm water detention and overflow dechlorination vaults and construction of a 10 to 12--foot wide access road approximately 2,500 feet in length. A six-foot high chain link security fence, with three-strand barbed wire top, to encompass the tank site, will also be installed. East Tank #2 is a 2.5 MG above-ground, steel potable water storage tank. Construction involves two 18-inch diameter inlet/outlet potable water pipelines, approximately 3,100 feet in length. The tank will connect to an existing 18-inch water line on the East Tank #2 project site. Work also includes storm water detention and overflow dechlorination vaults, construction of a concrete pad, and improvements to a 10-foot wide access road approximately 3,100 feet in length. A six-foot high chain link security fence, with three-strand barbed wire	M	0	C	The main problem this project is attempting to address is a potable water storage deficiency to meet current demands in American Canyon. Storing water is critical to the efficient operation of American Canyon's water distribution system for two purposes: to allow for constant flow and to provide pressure to the distribution system. In1997 the California Department of Health Services (DHS), conducted a Water System Inspection Report stating that potable water storage was deficient. Since 2000, the City has witnessed an unprecedented 75 percent growth in population; growing from slightly over 9,800 residents to 17,000. Unfortunately, no storage facilities have been constructed as recommended by DHS, due to financial constraints thereby increasing stress on the current system. Industry standards recommend a minimum of 3-5 days of storage. The current storage capability within the City is approximately one day. In addition, in 2003, the City of American Canyon Water System Master Plan identified the need for additional potable water storage capacity to meet current water storage capacity goals. The Plan identifies a city wide storage deficiency of 7.1 MG at build-out, with 5.1 MG in the main pressure zone. One critical element of this project is the construction of the American Canyon High School (anticipated enrollment of 2,200 students), which commenced in 2008. The high school is set above the	11,000,000	6,750	15,300	03	Napa	II	2009
2801	2810005	2810005-005	American Canyon, City of	American Canyon Watermain Replacement Project	To eliminate chronic water outages and leaks, the City of American Canyon proposes to replace approximately 2,300 linear feet of asbestos cement water main piping with PVC C-900 at Patricia Drive, Stenson Drive, Marla Drive, and Danrose Drive. The project also includes installing 61 new one-inch service laterals (copper piping) and installing a cathodic protection system to protect the new copper piping from the corrosive soil. In order to achieve this goal, the City will utilize its standard procurement process to obtain bids and select the best purveyor to provide for the replacement of the water main and service laterals, and installation of a cathodic protection system. A final implementation schedule will be prepared and environmental clearance will be obtained by March 2009. The project is categorically exempt from NEPA and CEQA, because in all cases the water main will be replaced at previously disturbed sites. The total project cost estimate is $500,000. This includes demolition, abandonment, and removal activities, installation of 2,300 linear feet of PVC C-900 pipes, purchase and installation of a cathodic protection water service system, and installation of 61, one-inch copper service laterals. This is a shovel ready project that is estimated to create up to 20 jobs. Final plans and specifications are 95 percent complete and will be final in March 2009. Work can begin immediately upon grant award.	M	0	C	The City of American Canyon provides potable water service to approximately 6,000 active accounts utilizing over 4,100 acre-feet of water annually. The City has witnessed a 75 percent growth in population since 2000; growing from slightly over 9,800 residents to 17,000. Almost 50 years ago (in the 1960's), asbestos cement and cast iron water mains were installed in the southwest area of American Canyon; which contains corrosive or "hot" soil. Because of the corrosive conditions, the soil is penetrating or "eating" through the cast iron water mains and the cast iron water service saddles are separating. The net result is that within a neighborhood of roughly 75 homes, there have been 23 documented leaks and outages since 2007. Water outages range from one hour for small leaks (with a loss of 10 gallons per minute) to five hours for large leaks (with a loss of 150 gallons per minute). The water outages are chronic and unacceptable to residents and city leadership. Mitigation of the water delivery problem is a priority for the City. This project meets the definition of Category E on the Safe Drinking Water State Revolving Fund Project Ranking Criteria (Brief), which states, "Water systems with water outages or significant water problems caused by source water capacity or water delivery capability that is insufficient to supply current demand."	500,000	6,750	15,300	03	Napa	II	2009

2805	4010001	4010001-002	ARROYO GRANDE, WATER DEPARTMENT	Fair Oaks Avenue - Halcyon Road Waterline Replacement	The project scope includes the replacement of 7,130 LF of existing 8" cast iron pipe to 8" and 12" PVC pipe. Replacement of the existing pipe will begin at the City water wells, then east on Fair Oaks Avenue, then north on Halcyon Road, east on Cornwall and under Highway 101 to the City reservoir. The project will include a boring under Highway 101 and the installation of a 18" pipe sleeve for the replacement pipe to be installed within.	M	0	C	The City of Arroyo Grande is requesting partial funding to replace and upgrade an existing 1929 8" cast iron water distribution waterline. The existing water distribution waterline has documented water quality, reliability, and safety issues associated with it. Due to the age of the pipe the existing pipe it is known to cause taste, odor, and elevated level of bacteria into the water supply. The waterline is documented hazard to the community. In the late 1990's the pipe failed under the under Fair Oaks Avenue between Walnut Avenue and Elm Street causing a sink hole and damage to private property. The existing pipe was installed in 1929 to distribute water from the city water wells to city's primary reservoir - Reservoir No.1, which was recently replaced in 2003 with a 2 million gallon post-tensioned concrete water tank. The tank serves at the City of Arroyo Grande's primary reservoir, approximately 1.5 miles away. The pipe was installed prior to the construction of Highway 101. When Highway 101 was built, it was constructed over the existing water waterline without the installation of a pipe sleeve. It is the fear of the City that the pipe will fail underneath Highway 101 in the near future. Being that the pipe is the mainline to the city reservoir; the city is concerned that the pipe may crack in the event of seismic event. The project was originally identified in the City of Arroyo Grande Water Master Plan in 1999 as	600,000	6,223	16,682	06	San Luis Obispo	IV	2011
2806	3510003	3510003-002	Sunnyslope County Water Dist	Sunnyslope/Hollister SCADA Water Distribution Water Intertie Solar Retrofit	The project will consist of a solar retrofit and enhancement of 2 water tank sites, 4 well sites, and 6 distribution and interties to accurately measure the transfer of water quantity and quality between the Sunnyslope County Water District, the City of Hollister, and LESSALT.	M	0	C	Sunnyslope County Water District, the City of Hollister, and LESSALT have several shared interties between their respective potable water distribution systems. These interties monitor water quality and water quantity transfers between the systems through a Supervisory Control And Data Acquisition (SCADA) system. However, the SCADA system suffers from frequent power failures which causes data losses and SCADA failures. This frequent failure of the SCADA system which monitors the interties results in erronous data for water transfers and water losses in each subsystem. As a result of these erronous data readings and data lapses, it is impossible to accurately monitor water transfer between the systems and calculate system leakage or system water losses with the required accuracy. Due to erronous data anamolies from the SCADA system, the distribution systems have reported erroneous water leakage (or system losses) in excess of State of California standards for system leakage. The installation of a solar powered SCADA system to accurately monitor the water transfer between the Sunnyslope County Water District, the City of Hollister, and LESSALT during power failures will enable Sunnyslope and the City of Hollister to comply with the reporting requirements to accurately measure and report system losses from their respective distribution sytems.	287,400	5,241	16,713	05	San Benito	II	2009

2807	3510003	3510003-005	Sunnyslope County Water Dist	Ridgemark Tank Seismic Upgrade, Paint Recoating, and Cathodic Protection	The existing 0.5 and 1.0 million gallon steel tanks will be seismically retrofitted, repainted, and protected with cathodic protection to bring the two tanks up to the current seismic code for important structures which need to withstand seismic events. The seismic retrofit of the tank will bring the tanks up to the current seismic standard, and the repainting and cathodic protection of the tanks will ensure the proper structural protection of the structural steel elements. This project eliminates the structural seismic deficiencies of the existing tanks.	M	0	C	The existing two Ridgemark potable water tanks have a capacity of 0.5 and 1.0 million gallons of storage. Both tanks need to have their interior and exterior coatings repainted and need to have minor changes to the exterior valving to allow for top fill and bottom outlet of the tanks. The two tanks currently have no cathodic protection which futher adds to the continuing corrosion of the interior of the tank. The repainting and installation of cathodic protection on these tanks is necessary to preserve the structural integrity of these tanks. Finally, the existing tanks do not meet the current seismic requirements for the area and will need a seismic retrofit of the two tanks to meet the current seismic code for important publilc facilities.	490,000	5,241	16,713 05	San Benito	II	2009
2808	5610043	5610043-002	OAK PARK WATER SERVICE	Conifer Zone Outage Avoidance Project	The existing steel Conifer Zone Tank will be replaced with a new 2.1-million gallon reinforced/prestressed concrete reservoir at the nearest possible location without landslide issues. Oak Park names tanks for nearby features and the replacement reservoir will be named Oak Canyon Reservoir (OCR). The OCR site is at the edge of the Oak Canyon Community Park, one mile from the existing tank. The OCR will have flow-through (simultaneous fill and draw) via 1,600 feet each of 20-inch inlet and outlet pipes. The Conifer Zone Outage Avoidance Project will also eliminate a dead-end on 3,000 feet of 10-inch pipeline. The old Conifer Zone Tank filled via pressure reduction and gravity via pipe through the Conifer Zone causing poor control of tank turnover and wide variations in water pressure. The OCR will make constant the “full tank” pressure situation. The Conifer Zone Outage Avoidance Project will not result in any dead-end pipelines and will comply with CDPH requirements.Other Conifer Zone Outage Avoidance Projects include: a) replacing 1,700 feet of existing 10-inch ACP with 1,900 feet of 12-inch and 8-inch pipe; b) OCR inlet control with a motor operated valve; c) one replacement and one new pressure reduction station (the new station eliminates a dead-end situation); d) replacement of three Calleguas meter turnouts with one metered turnout for the entire Oak Park service area; d) demolition of the existing Conifer	M	0	C	Oak Park Water Service’s (Oak Park) 1-million gallon Conifer Zone Tank threatens a long-term water system outage and the likelihood of dropping system pressure below 20 psi for the 6,000 people living in the Conifer Zone. There is often groundwater around the water pipelines and there are about 10,000 feet of recycled water pipelines in the Conifer Zone. The steel tank was built on a landslide by a private developer in 1966 prior to the District’s involvement. In December 2005, during the environmental and geologic review process for the Conifer Zone Outage Avoidance Project, a 24-inch bucket-auger drill-hole investigation confirmed a landslide shear plain 33 feet below the tank and indications of five other shear plains. Geomorphology and topography suggest the landslide may be deeper than 70 feet. The landslide area is estimated at 50 acres.Even if it were not on a landslide, the Conifer Zone Tank would not structurally meet Waterworks Standards for seismic loads.Oak Park’s Conifer Zone is at the end of the line for water delivered by Metropolitan Water District of Southern California via Calleguas Municipal Water District (Calleguas). Both Oak Park and Calleguas have no local water supply. Should the Conifer Zone Tank fail due to ground movement caused by slippage, zone failure (which does occur in the area), or seismic induced sliding, catastrophic loss of water service would result. 2810	4210001	4210001-007	CARPINTERIA VALLEY WATER DISTRICT	West Side Well Project	CVWD is proposing to construct a new well located on the West end of the District. This project is to improve water quality and water reliability. This project will be shovel- ready by December 2009. The project consists of drilling a well on the west end of the District adjacent to the Main Transmission line (South Coast Conduit), installation of new pump equipment, installation of treatment equipment and installation of piping and valves.This project will enable CVWD to more effectively blend in the west portions of the distribution system.	M	0	C	The Carpinteria Valley Water District relies on surface water sources and groundwater sources to supply its customers with potable water. The local surface water source is treated at a conventional water treatment plant and then conveyed to Carpinteria Valley some 18 miles to a terminal reservoir. Historically the surface water from this source is high in total organic carbon. Combined with the long transit time to the terminal reservoir after treatment, up to 5 days, disinfection by product formation has been a problem. The District has had 2 violations for TTHMs under the Stage 1 DDBP Rule in the last 3 years. Operational changes including flushing, lowering chlorine residuals, covering open reservoirs, improving TOC removal at the treatment plant have all been implemented to reduce the potential formation of TTHMs. In spite of these efforts the District violated in third quarter of 2008 again. It is likely to continue to have problems when Stage 2 Rule becomes effective. One effective way to lower the formation has been to blend low TOC groundwater with the surface water entering the District. This approach has worked in the past several years. However the District's well field has been plagued with problems and well production reliability has been a problem. The District operates five well facilities of which three are no longer productive and have been put into an inactive status. The remaining two wells consist of a high	3,000,000	4,065	18,700 06	Santa Barbara	IV	2009
2811	4210001	4210001-006	CARPINTERIA VALLEY WATER DISTRICT	Lyons Well Rehabilitation Project	CVWD is proposing to rehabilitate the Lyons Well, which is currently inactive due to high manganese and production problems. This project is to improve water quality and water reliability. This project will be shovel-ready by December 2009. The Project consists of re-drilling the well at the Lyons Well facility, replacing old pumping equipment, installing new treatment facilities. The completion this project will enable the District to produce more groundwater for blending and improve water supply reliability.	M	0	C	The Carpinteria Valley Water District relies on surface water sources and groundwater sources to supply its customers with potable water. The local surface water source is treated at a conventional water treatment plant and then conveyed to Carpinteria Valley some 18 miles to a terminal reservoir. 2812	4210001	4210001-004	CARPINTERIA VALLEY WATER DISTRICT	Critical Valves and Intertie Project	This project will involve installation of 26 valves in strategic places within the distribution system and two intertie projects to Montecito Water District's distribution system. The valves will range from 6 inch to 15 inch. Some or all valves will need to be installed while the pipeline remains in service. This project is to improve water system reliability. This project will be shovel- ready by December 2009.	M	0	C	CVWD Distribution system has nearly 90 miles of pipeline serving 4000 individual meters over 10 square miles. The original distribution system was constructed as an agricultural system by the U.S. Bureau of Reclamation in 1954. The system was setup as many turnouts (30 turnouts) on a trunk line. This system was designed for agriculture and therefore water outages for several days were not seen as a problem because irrigation could be scheduled around outages. This same system today serves residential, commercial, industrial, public authority and fire safety customers. Certainly, a multiday water outage is not acceptable to today's water customer. Fortunately some of the system has been further developed and looping of the turnouts has occurred along with better valving within the system. However, even with the improvements the system lacks sufficient valves to isolate smaller sections of the distribution in the event an emergency. In many cases if the transmission system needs to be taken out of service hundreds of and even thousands of customers may be out of water due to a lack of critical valves.	700,000	4,065	18,700 06	Santa Barbara	IV	2009
2813	4210001	4210001-005	CARPINTERIA VALLEY WATER DISTRICT	High School Well	CVWD is proposing to rehabilitate the High School Well, which is currently inactive due to a collapsed well casing. This project is to improve water quality and water reliability. This project will be shovel- ready by September 2009. The Project consists of re-drilling the well at the High School well facility, replacing old pumping equipment, rehabilitating existing treatment facilities. The completion this project will enable the District to produce more groundwater for blending and improve water supply reliability.	M	0	C	The Carpinteria Valley Water District relies on surface water sources and groundwater sources to supply its customers with potable water. The local surface water source is treated at a conventional water treatment plant and then conveyed to Carpinteria Valley some 18 miles to a terminal reservoir. Historically the surface water from this source is high in total organic carbon. M	0	C	Installation of a 40kw solar electrical system at the water system's Lyon storage reservior to provide sustainable electrical supply and reduction of the ageny's carbon footprint pursuant to AB32.	250,000	5,949	19,000	05	Santa Cruz	II	2009
2818	1910073	1910073-005	LOMITA-CITY, WATER DEPT.	Harbor Hills Elevated Storage Tank	50,000 gallon elevated riveted steel storage tank constructed in 1940, 35' LWL/85' top of roof. Exterior coating Aluminum oxide with lead based prime coat(strip and recoat). Interior coating of coal tar and epoxy(strip and recoat). Repair or replace Ladders, balcony railing and catwalks to meet all current Federal and State safety standards. Remove and install new roof hatch to meet current DPHS standards. Bring tank vents up to current DPHS standards. Remove and replace exsiting spider rods on interior due to corrsion.	M	0	C	The Harbor Hills tank provides pressure and surge regulation for Zone 3 of the City's water system. The work needed to be done will provide for optimal safety, operations and storage of this elevated tank. Bring into Federal and State compliance. The tank is in need of repairs and upgrades including: internal and external coatings; structural member repairs, room repairs, catwalk repairs and hatch repairs.	160,000	4,212	20,181	07	Los Angeles	IV	2011
2819	3010055	3010055-001	South Coast WD - Capistrano Beach		The District proposes to construct a new 2 million gallon reservoir at the current reservoir's site.	M	0	C	Water storage capacity is inadequate to handle the anticipated storage needs for District as well as to handle the storage needs of the proposed District groundwater recovery facility.	2,000,000	5,575	20,500	08	Orange	V	1998
2820	3610120	3610120-002	Phelan Pinon Hills CSD	new master plan	Develop a new master plan	M	0	C	Master plan does not provide for reliable water system operation	100,000	6,267	20,681	13	San Bernardino	V	2000
2821	3610120	3610120-006	Phelan Pinon Hills CSD	booster station upgrade	Upgrade and replace booster pumps	M	0	C	Booster stations need to be upgraded to be able to supply additional water throughout the distribution system	150,000	6,267	20,681	13	San Bernardino	V	2000
2822	3610120	3610120-005	Phelan Pinon Hills CSD	distribution system upgrade	Upgrade distribution system	M	0	C	Distribution system is not large enough to adequately supply water throughout the system to meet peak demand	2,229,000	6,267	20,681	13	San Bernardino	V	2000

2823	3710023	3710023-004	Santa Fe I.D.	R.E. Badger Water Filtration Plant Chemical Tanks and Improved Disinfection	• Remove and replace existing ammonia storage tank with ASME certified vessel, including associated piping, appurtenances, and telemetry• Construct new spill containment area at chemical delivery site, with enhanced alarms, lighting, and communication in order to provide additional safety measures in the case of an emergency chemical spill.• Install baffles to improve the volume available for disinfection from 1.3 MG to 8.6 MG. Baffles would create a serpentine flow in the clearwell, improving disinfection contact time by increasing the distance the water will have to travel. This would lead to increased control of the detention time and a more efficient and effective disinfection approach.	M	0	C	The R.E. Badger Water Filtration Plant (REB) is one of the few facilities treating a local water source (Lake Hodges) in San Diego County. REB provides potable water to 58,900 people in the Santa Fe Irrigation District and San Dieguito Water District. SFID is submitting on behalf of both agencies. The existing ammonia storage tanks are out of compliance with current ASME standards and must be replaced. In addition the Chemical loading requires containment enhancements for mitigating potential spills during the delivery of hazardous chemicals.The current 13 million gallon (MG) clearwell provides disinfection contact time as well as storage. The project would provide baffling in the clearwell to enhance its efficiency and improve its ability to achieve Safe Drinking Water Act requirements using less chemicals.	1,800,000	7,121	21,081	14	San Diego	V	2009
2824	3710023	3710023-005	Santa Fe I.D.	Lago Lindo Water Main Replacement	• This is an infrastructure replacement project that will improve the reliability of an aging pipeline and reduce risk to public health and safety by relocating the pipeline to a more accessible easement. • Replacement of 5,000LF of 10" ACP waterline.• Installation of 6,300 LF of 10" PVC waterline in public right-of-way.• Install new fire hydrants, increasing fire flow reliability• Relocate water services to front of parcels, near public right-of-way for easier meter access and fewer easements.	M	0	C	Due to the cross-country nature and age of the existing water main, the easement is not accessible in multiple areas for emergency repair or maintenance. The project would relocate this aging pipeline to a more accessible route to enhance reliability and reduce public health and safety risks. Water main is in near proximity to numerous homes; water main break could potentially damage property in addition to disrupting service. Timing for relocation in the preferred route is becoming critical. The existing utilities in proposed public right-of-way are extremely crowded the proposed alignment would occupy the last available slot.	2,800,000	7,121	21,081	14	San Diego	V	2009
2825	5010017	5010017-005	PATTERSON, CITY OF	Groundwater Blending Program	The City of Patterson is 100% dependent upon local groundwater for its municipal and industrial water supply. The supply is provided through seven wells that are spaced throughout the City. Other water supply sources are either cost prohibitive or unavailable. The City is surrounded by agricultural lands that apply nitrogen as fertilizer. Some of the nitrogen percolates into the groundwater when crops are irrigated. In addition, the percolating water collects salts as it moves downward through the soil.Recently, nitrates in the groundwater have contaminated one of the City's wells causing the well to be removed from the water system. Nitrate is a primary standard according to the U.S. EPA, and can have acute health impacts on the community, especially young children and infants. The City was forced to shut down the well without warning. Prior testing of the well did not provide data to suggest nitrates would exceed drinking water standards in the immediate future. This action caused the City to lose approximately 15% of its water supply virtually overnight. Groundwater hydrology studies show that nitrates and salinity migrate, and may cause other wells to also become contaminated and lost. The migration and concentration of nitrates is often unpredictable. Treating the water at the wellhead (well site) for nitrates and salinity is cost prohibitive and often infeasible due to space constrictions. If additional wells	M	0	C	The City of Patterson is 100% dependent upon local groundwater for its municipal and industrial water supply. 2826	5010017	5010017-001	PATTERSON, CITY OF	Increased Security for Well #5	One of the City's drinking water wells is located adjacent to a City park, and surrounded by a residential area. The well is enclosed by four inadequate walls and a chain link gate. The walls are easily damaged and difficult to repair. Water operators observe indications that Well #5's Security is compromised on a daily basis. Without the added security of a roof the well is susceptable to sabotage and vandalism. The City proposes removing the existing styrofoam/stucco walls and replacing them with a concrete block structure that fully encloses the well and its components. This will add much needed security to this facility, and protect this highly productive well.	M	0	C	Security Project	250,000	5,680	21,229	10	Stanislaus	III	2007
2827	4110018	4110018-003	City of Millbrae		Seismically upgrade storage tanks and recoat interior and exterior surfaces	M	0	C	Need to improve storage reliability and recoat storage tanks.	2,000,000	6,397	21,500	17	San Mateo	II	1998

2832	1910038	1910038-003	EL MONTE-CITY, WATER DEPT.	Peck Road Water Main Improvements	To solve the pressure deficiencies in the City's current system, a CIP program has been put in place. The Peck Road Water Main Improvement Projects is part of the first phase of improvements to solve these low pressure deficiencies. The project consists of the construction and installation of approximately 7,600 lineal feet of new 12 inch ductile iron pipe, appurtenances, valves, and fire hydrants. Once construction of the new pipeline is complete, the City of El Monte will be able to improve a majority of system deficiencies.	M	0	C	The City of El Monte's current water distribution system consist of many aged and unlined pipes. Results of a hydraulic analysis of the City of El Monte's Water Distribution System indicate that the system could not adequately deliver the required fireflows while maintain a minimum residual pressure of 20 psi as specified by the department of health. Approximately 90 percent of the City's fire hydrants do not meet the fireflow requirements. In addition, the system experiences pressure deficiencies under a peak hour day condition.	2,100,000	3,524	22,828	16	Los Angeles	IV	2009

2833	3410011	3410011-008	Galt, City of	Galt - East Side Connectivity Improvement	The intersection of Carillion Boulevard and Simmerhorn Avenue is located about 2,600 feet east of the City Limits (along Simmerhorn Avenue). The City limits along Carillion Boulevard end approximately 1,800 feet north of the intersection of Carillion Boulevard and Simmerhorn Avenue. A 12" main ends at the southerly City Limits on Carillion Boulevard. A well and water treatment plant is located on the east side of Carillion Boulevard about 0.5 mile from the southerly City Limits along Carillion Boulevard. This water treatment plant is capable of producing approximately 3,000 gallons per minute of drinking water. The Industrial Park Water Treatment Plant is capable of producing similar flows in the immeidate vicinity.In order to solve the problem, a looped system would need to be constructed. This looped system would be constructed in portions of two roads that fall within Sacramento County jurisdiction - Carillion Boulevard and Simmerhorn Avenue. a 12" main would be constructed from the dead-end at Carillion Boulevard to the dead-end at Simmhorn Avenue. The total length of 12" water main is estimated at 4,400 linear feet. Fire hydrants would be installed every five-hundred feet and isolation valves would be located every 1,000 feet and on every leg of a tee. A total of six valves would be constructed.This looped system would allow the Simmerhorn Commerical area to be served by two water treatment facilities, allowing the City Water	M	0	C	Simmerhorn Avenue is located partially within the City of Galt and partially within the County of Sacramento. A 12" main extends easterly from Lincoln Way along Simmerhorn Avenue to the City Limits on Simmerhorn Avenue. The 12" main ends at the City Limits. There are six commercial businesses that are served off this 12" main. Fire District commercial fire flow requirements are 3,000 gallons per minute for three hours. Typically, dead-end 12" mains cannot accomodate this lengthy demand. This problem is exascerbated when the nearest well, reservoir, and pump station facility (Industrial Park Water Treatment Plant) is off-line, as there is no other supply source in the area, due to the lack of a looped system. In addition, the Industrial Park Water Treatment Plant provides domestic water and fire protection for existing commerical and industrial facilities in the immediate vicinity (due south and southeast). The Simmerhorn Commercial area is at the end of the water system.	1,400,000	7,872	22,982 09	Sacramento	I	2012
2834	3410011	3410011-009	Galt, City of	Galt - Old Town Undersized Main Upsizing	In order to upgrade the distribution system, the project consists of replacing undersized water mains in several areas (D Street from Fourth Street to Lincoln Way, E Street from Fourth Street to Lincoln Way, Church Street from F Street to G Street) with 10" mains, extending 10" water mains (Fourth Street from E Street to F Street), and completing interconnections (C Street at Union Pacific Railroad crossing and F Street at Lincoln Way). These improvements, identified in the City's recently completed Water System Master Plan, will provide for a looped system that meets the Fire District fire flow requirements for the Old Town area. In addition, fire hydrants would be installed every five-hundred feet and isolation valves would be located every 1,000 feet and on every leg of a tee.Costs for this application cover both design and construction of the improvements, including construction inspection and construction project management.	M	0	C	The Old Town area of Galt is a mixture of older residential homes, commercial businesses, and churches. This area is plagued by undersized (typically 4") and unconnected mains, thereby not creating a completed, adequately sized grid system. The water system is susceptible to low pressures and inadequate fire flows. There have been low pressure complaints and recent tests indicate fire flows of approximately 1,600 gallons per minute in these areas of the undersized mains. The current Fire District commercial fire flow standard is 3,000 gallons per minute for 3 hours. Covered in this application are the following locations for replacement of undersized mains: D Street from Fourth Street to Lincoln Way, E Street from Fourth Street to Lincoln Way, Church Street from F Street to G Street; extension of 10" water mains (Fourth Street from E Street to F Street); and completion of interconnections (C Street at Union Pacific Railroad crossing and F Street at Lincoln Way.	1,520,000	7,872	22,982 09	Sacramento	I	2012
2835	3510001	3510001-011	Hollister, City of	pipeline replacement	Identify a more stable pipeline route and construct a new pipeline with adequate restraints and supports.	M	0	C	City has 50-year old pipeline that needs to be replaced. Pipelines are located on unstable hillsides, not properly supported; have failed frequently, resulting in water outages. Repairing leaks requires depressurizing large portions of system.	1,366,000	6,119	23,110 05	San Benito	II	1999
2836	3510001	3510001-007	Hollister, City of	seismic retrofit	All deficiencies should be carefully evaluated and corrected.	M	0	C	Seismic retrofits of well facilities.	150,000	6,119	23,110 05	San Benito	II	1998
2837	3510001	3510001-005	Hollister, City of	replace Cienega Hills storage reservoir	Design and construct a modern reservoir to replace the existing one.	M	0	C	Concrete storage reservoir in Cienega Hills needs to be replaced.	265,000	6,119	23,110 05	San Benito	II	1998

2838	1910022	1910022-003	CALIF STATE POLYTECHNICAL UNIV - POMONA	Cistern Repipe and Valve	The University Water System as discussed has a "Blending Point" which is an In ground Concrete Cistern , This structure is approximatly 85 years old and is in need of repair and may eventually be a risk in an earthquake At present it is the only structure which allows for Nitrate and Perchlorate Blending Compliance . The University is constructing a second reservoir on the campus which could allow for the Cistern to be taken out of service as part of the water System and preseved as an historical building . In order to By Pass and take out the Cistern ,new Water Mains, Valves and Booster Pumps would have to be installed . The Nitrate Monitoring system would also have to be removed and replaced .	M	0	C	The University Water System has an antiquated inground Concrete Cistern as its Water Blending and Entry Point to the Distribution System . This Cistern which was constructed in 1922 has had problems with deterioration and seepage and potential for rodents and bird intrusion. The University is currently constructing a new second Reservoir which could allow for this Cistern building to be taken out of service ,however new Water Mains , Valves and Booster Pumps must be installed which would allow the Cistern to be bypassed .	195,000	7,575	23,500	22	Los Angeles	IV	2009
2839	4910013	4910013-009	Valley of the Moon Water District	Water Main Replacement	This project involves the replacement of approximately 3,000 feet of small diameter steel water mains with 6" and 8" PVC water mains, 75 water service laterals, and 6 fire hydrants. These mains are located in Boyes Hot Springs area of Sonoma County, as specified below:1. Mulford Avenue – approximately 300' of 2" water main2. Academy Lane – approximately 790' of 1-1-1/2' and 4" water main3. Manzanita Road – approximately 950' of 4" water main4. Fairview Lane – approximately 910' of 2" water mainCompletion of this project will address the problem of the existing old steel water mains that have deteriorated and are undersized. This will also address the issues of lost water due to water leaks, and provide reliable fire protection for this densely populated area.	M	0	C	The District's existing steel water mains located in the Boyes Hot Springs area were installed in the late 1950s and early 1960s. These steel water mains have deteriorated and are undersized. Due to the undersized nature of these mains, there is no reliable fire protection for the area residents. Additionally, because of the deteriorated nature of these mains, leaks are not uncommon. Between the time a leak is called in and the District's staff fixes the leak, a certain amount of potable water is lost. Given the drought conditions prevailing in our service area, it is of paramount importance to replace these mains to save potable water and to provide reliable drinking water to the District's customers. Properly sized water mains will provide the much needed water for fire protection for this densely populated area.	550,000	6,783	23,858	18	Sonoma	II	2009
2840	4910013	4910013-010	Valley of the Moon Water District	Trinity Oaks Glen Ellen Interconnection	This project involves the construction of approximately 3,600 feet of 8" PVC water main from Bonnie Way, Trinity Oaks to Arnold Drive, Glen Ellen. This pipeline will provide a connection from the Trinity Oaks to the District's water distribution system in Glen Ellen and the two water storage tanks in the Glen Ellen area that have a total capacity of 650,000 gallons. In the event of a disruption to the supply from the Sonoma Aqueduct, this interconnection will provide an alternate source of water supply to the residents of Trinity Oaks and improve the overall reliability of the water system to this area. This alternte source of water supply will also provide additional fire protection in the event of a disruption to the supply from the Sonoma Aqueduct.	M	0	C	The Trinity Oaks area near Glen Ellen is isolated from the rest of the Valley of the Moon Water District's (District) service area and it has currently no auxiliary source of water supply. The only source of water is from a single turnout on the Sonoma County Water Agency's (wholesale water provider) Sonoma Aqueduct. Currently there is no connection between this isolated area and the rest of the District's water distribution system, essentially creating an island of sorts. The closest point of connection to the District's water system is located in Glen Ellen at a distance of approximately 3,600 feet.	450,000	6,783	23,858	18	Sonoma	II	2009
2841	1910212	1910212-001	GSWC-SOUTH ARCADIA		REPLACE UNDERSIZED MAINS	M	0	C	700' OF WATER MAINS LESS THAN 4" IN DIAMETER. THESE MAINS DO NOT COMPLY WITH TITLE 22, SECTION 64628 (a).	70,000	7,362	24,413	07	Los Angeles	IV	1998
2842	1010029	1010029-002	CITY OF SANGER	Backup Power	Install backup power generators at 8 well sites to provide system reliability.	M	0	C	Lack of adequate backup power facilities at the well sites.	1,200,000	5,989	25,404	11	Fresno	III	2006

2843	1010029	1010029-003	CITY OF SANGER	City of Sanger Water Storage Tank	Given the critical water storage issues facing the City of Sanger, through the proposed project, the city will construct a new water storage tank in the eastern portion of the city. The project will include the acquisition of 0.3 acres of land, the construction of a 0.75 million-gallon, ground level, welded steel water storage tank with booster pumps and emergency generator. Electrical controls will provide telemetry and SCADA equipment to match the current city systems. Booster pumps will be sized to operate individually during low-demand periods, and in parallel for peak flow. Once the project is near completion, site improvements will be necessary. Site improvements will include landscaping, lighting and fencing so the tank will blend with the neighborhood.	M	0	C	The City of Sanger is a growing community in eastern Fresno County. As the city expands and the population grows, water supply has become an increasingly critical issue. Over the last two years, the city has regularly experienced water pressures as low as 22 psi, particularly during the hot summer months when there is maximum water usage. The low pressure problem is more pronounced in the expanding section of the community on eastern side of the city. The storage tank proposed in this project will be located in the eastern part of the city; addressing the specific needs of that community while also alleviating the pressure on the other water storage tanks throughout the city. Sanger obtains all of its water from wells pumping from the underground aquifer. The city has a history of old industry causing DBCP contamination in the groundwater that makes the drilling of additional wells not only costly to construct, but also costly to maintain. Currently, the wells are adequate to meet the Maximum Day Demand over a 24-hour period, but have difficulty meeting the Peak Hour Demand.The proposed tank will not only help meet the peak hour demand, but will also provide enhanced fire protection.	1,330,000	5,989	25,404	11	Fresno	III	2012
2844	1010027	1010027-001	REEDLEY, CITY OF	Elevated Water Storage Towers	The project will allow for two 1.5 million gallon elevated Hydro-towers to be located at the north end of the City and the east end to stabilize pressures and provide the City with more than 24 hours of water storage capacity. These towers will be design build similar to the ones built in Ripon and Dinuba. The projects are located such that a minimum amount of piping will be required to connect to the City's distribution system. A (supervisory control and data aquisition) S.C.A.D.A. system will be installed to monitor levels and pressures. The project will also include installation of a chlorine residual monitoring unit that will interface with the S.C.A.D.A. system to provide disinfection status of the towers. A future unit to provide conductivity and HPC readings is being discussed. The City will also utilize both towers in a multiple capacity to include storage and uses for equipment within the bottom portions of the towers. One of the towers will have more of a regional use in that it will be located at a proposed regional sports complex. The City currently owns property in which to place the towers and will therefore not need to purchase property. The City will do an RFQ process followed by and RFP to build the project. The City wishes to do its part to reduce emissions and peak energy consumption by being able to pump during off peak hours and allowing the water system to float off the two hydro towers during the day.	M	0	C	The City of Reedley's water system currently has storage capacity for 100,000 gallons to serve a population of 24,000 + with over 5,000 service connections. This is inadequate storage for fire protection and for an extended City wide power outage, this would not provide sufficient water storage for potable use. The City pressures are currently dependent upon wells operating and the two small water towers that are currently located in the central downtown district. Pressures vary widely and are dependant upon amount of use as to whether pressures are reduced to near unuable pressures or safe pressures. Pressure ranges during peak usages have been as low as 22 to 23 psi in the North end of the City. As far as adequate storage goes, the City if it were to have a major power outage and was unable to use its wells, would only have roughly 17 to 22 minutes of water storage available. To date no violations have occurred. Therefore, the City would like to be proactive in not allowing its water system to reach a point where violations are occurring or where frequent boil water orders are being issued.	9,000,000	6,619	25,584	11	Fresno	III	2007

2845	1910154	1910154-010	City of South Pasadena	Wilson Reservoir Replacement	The proposed project will demolish the existing 1 million gallon reservoir and pump station and construct one 1-million gallon reservoir in its place along with a pump station, drainage, electrical/control system, on-site chlorine generation, seismic protection and cathodic protection (steel tank). Current monitoring equipment will be removed and re-installed to save on costs. The city is in the process of finalizing the plans and will be ready to go out for construction bids in October of this year. The city has contributed significantly to this project with $1.75 million budgeted including $1 million reserved for construction costs. Wilson Reservoir is the most critical water storage facility in the City's water system, due to the fact that the majority of the City's water supply is blended and chlorinated at this site. The construction of a new Wilson Reservoir is imperative for the future of South Pasadena's drinking water.	M	0	C	The 1.0mg Wilson Reservoir was purchased in 1920 by the City of South Pasadena. The reservoir is predominately buried. The base of the reservoir is constructed of concrete and the roof is wood. This reservoir is used to blend water from 3 wells, 2 that are on-site and one that is about one-half of a block away. There are three booster motors and pumps at this site, and there is also a gaseous chlorine injection room.An inspection of the of the reservoir was performed in February 2008 after a portion of the wood roof appeared to be sagging. The inspection report noted that "severe roof collapse may occur at any time" and "plans should be put in place immediately to replace this tank." The reservoir does not currently meet earthquake resistance standards and has a number of other vulnerable features. The reservoir also needs regular maintenance because of its advanced age. This requires the reservoir to be shut down. However, should an emergency occur, shutting down the reservoir for proper maintenance could cause major system failures and substantial added cost to purchase water. The projected cost of the purchased water is estimated to nearly deplete the City's financial reserves.	10,350,000	6,264	25,824	16	Los Angeles	IV	2009
2846	4910017	4910017-034	Windsor, Town of	Water System SCADA Improvements Project	The Water System SCADA Improvements Project ("Project") is an opportunity for the Town to update its aging supervisory and control system with a modern SCADA system that can be easily expanded to meet the Town's future needs. The Project include design and construction of a new SCADA system including each of the remotes water sites (wells, tanks, pumps, etc) and a new master SCADA control station at the Town's Corporation Yard. The system, as initially installed, will completely replace the aging equipment with modern equipment, including programmable logic controllers (PLCs), remote terminal units (RTUs), panels and other miscellaneous hardware, communication equipment and new operating software. The system will initially be configured to accommodate all existing signals and equipment, with the capability to accept new functionality in the future. This expandability will allow the Town to further adapt and optimize system operation, allowing the new system to serve the Town's need for many years to come. All equipment and software will be of a type widely used in the municipal market, allowing for greater flexibility in obtaining service or maintenance from outside sources as compared to the existing system. The contract will be administered as a design-build agreement by which the Town will contract with a single firm for final design, installation, programming, testing, startup and	M	0	C	The Town of Windsor, California is a community of approximately 26,000 situated in Northern California, north of Santa Rosa just off of Highway 101. The Town's potable water system is operated and maintained by the Town of Windsor Public Works Department. The Public Works Department also is responsible for planning, designing and constructing projects for water system improvements. The system consists of water supply, treatment, distribution, booster pumping and storage facilities. A key component of this system is the Supervisory Control and Data Acquisition (SCADA) system, which monitors system status and reports system alarms to operators, allowing the Town to adapt system operation to meet the changing demands on the system. However, the existing equipment comprising the SCADA system is relatively old and has reached the end of its useful life. In addition, the current system uses outdated technology and affords the Town only limited ability to control the distribution system remotely. As such, it is difficult for the Town to optimize operation of the system with respect to energy efficiency, water quality and system reliability. Support services and documentation for the existing SCADA system are also limited. Despite a tremendous effort by Town staff, this proprietary equipment has become unreliable and difficult to maintain.	900,000	8,697	26,432	18	Sonoma	II	2009
2847	3710027	3710027-004	Vista Irrigation District	Avocado and Hanalei Drive Water Main Replacements	Installation of approximately 5,300 feet of 8 and 10-inch PVC water main and reconnection of water meters and fire hydrants in Avocado Drive and Hanalei Drive.	M	0	C	This project will replace approximately 5,300 feet of 6 & 10-inch aging steel water mains built in 1949. These mains are nearing the end of their useful lives and are beginning to experience leaks that make them a maintenance liability.	1,000,000	27,715	26,708	14	San Diego	V	2009

2848	3710027	3710027-001	Vista Irrigation District	Vista Flume Replacement	Permanent replacement of Vista Flume with pressure pipeline. See Attachement 2 and 3.	M	0	C	Public health and safety concerns associated with age and deterioration of the low head Vista Flume (potable water conveyance system). See Attachemt 1 and 3.The Escondido-Vista Water Filtration Plant (EVWFP) supplied 55 percent of VID's potable water over the last 10 years. The Vista flume is the sole facility that conveys water from the EVWFP to the VID service area. VID owns and operates the Vista flume and siphon conveyance system. The 11.25 miles of total length includes 6.25 miles of above-ground, gravity fed gunite bench flume, a quarter-mile long hard rock tunnel and 5 miles of steel and/or concrete inverted siphons.The flume was built in 1926 and is in great need of replacement to assure system integrity, reduce vulnerability from malicious behavior, provide better structural safety, prevent leakage, and protect public health. Repairs and/or upgrades to the flumes and siphons over the last 80 years have consisted of: cement motor lining and installation of cathodic protection systems on steel siphons; addition of a cover system; installation of an HDPE liner system which was completed in 2002; and continual repairs to cracks in the gunite and tears in the HDPE liner system. Low pressures and leaks in the existing flume increase the potential for contamination.	16,400,000	27,715	26,708	14	San Diego	V	1998

2855	1910204	1910204-007	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Emergency Power	INSTALL PERMANENT EMERGENCY BACK-UP GENERATORS TO KEEP OUR TWO MAJOR PUMP STATIONS OPERATIONAL DURING POWER OUTAGES.	M	0	C	EMERGENCY GENERATOR. DURING POWER OUTAGES, THE MAJORITY OF THE DISTRICT WILL BE CUT OFF FROM WATER SERVICE UNTIL POWER IS RESTORED.	600,000	7,733	27,807	16	Los Angeles	IV	1998
2856	1910204	1910204-024	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Pepperdine Bypass Water Circulation Project	The District is seeking matching funds for a capital improvement project aimed at decreasing water age by increasing turnover rates in the 5 MG Pepperdine storage, and installation of new water quality monitoring equipment. The project consists of installing approximately 4,100 linear feet of 16-inch parallel pipeline along Pacific Coast Highway and upgrading Marie Canyon pump station adjacent to John Tyler Drive at the entrance to Pepperdine University. The proposed pipeline would improve interconnectivity between pressure zones, and thereby, allowing the District to introduce additional demands to the Pepperdine system. The additional demand would increase the turnover rate in the storage reservoirs, circumventing potential water quality problems. Additionally, the 16-inch pipeline will by pass an existing 18-inch undersized high pressure pipeline and improve water supply to the west side of the City of Malibu. The proposed project would also increase system reliability benefiting the Pepperdine system and the rest of the District.	M	0	C	Metropolitan Water District of Southern California (MWD) provides the single source of water that supplies Los Angeles County Waterworks District No. 29 (District) through a connection with West Basin Municipal Water District (WBMWD). The water supply is delivered to the City of Malibu and the Topanga Canyon area through a 30-inch high-pressure transmission main from the District's interconnection approximately 15 miles away. The water then travels another 20 miles through the transmission main in Pacific Coast Highway (PCH) to the westerly boundary of the District. The water is pumped from transmission main on PCH into the District's storage tanks located in each of the canyons along this reach. In July 2005, MWD switched its primary disinfectant for the Joseph Jensen Filtration Plant that serves the District from chlorine to ozone. The ozone disinfection process improves the taste and odor of the treated water and reduces potential health concerns associated with chlorine disinfection. The treated water is disinfected by using chloramines, a combination of chlorine and ammonia, to maintain water quality in the distribution system. While chloramine can provide a more stable and lasting disinfection, the use of chloramine can potentially introduce water quality problems such as nitrification and corrosion. Nitrification causes depletion of	2,400,000	7,733	27,807	16	Los Angeles	IV	2007

2857	1910204	1910204-051	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Improving Water Quality in the Trancas Tank	The purpose of the proposed project is to thoroughly mix the water in the tank to eliminate temperature stratification, short-circuiting and stagnant water conditions, which will provide a uniform, short water age. 2858	1910204	1910204-025	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Water Security Improvement Project	In compliance with the Public Health Security and Bioterrorism Preparedness and Response Act of 2002, the Los Angeles County Waterworks Districts (Districts) completed three vulnerability assessments. These vulnerability assessments evaluated susceptibility of existing water facilities to potential threats and identified corrective actions to reduce or mitigate the risk of serious consequences from unauthorized entries and malevolent acts (e.g., vandalism, insider sabotage, terrorist attack, etc.). These assessments analyzed the vulnerability of the water supply (both ground and surface water), treatment and distribution systems along with risks posed to the surrounding community related to attacks on the water system. The Districts are utilizing these vulnerability assessments as a guide for prioritizing plans for security upgrades, modifying operational procedures, and changing policies to mitigate the risks to our critical assets. These assessments also provide a framework for developing risk reduction options and associated costs. The proposed project includes upgrading 10 critical sites in Los Angeles County Waterworks District 29, Malibu and Marina del Rey – System 1910204. The purpose of the proposed project is to implement vulnerability	M	0	C	Security Project	4,025,600	7,733	27,807	16	Los Angeles	IV	2007

2859	1910204	1910204-055	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Improving Water Quality in the Latigo Tanks	The purpose of the proposed project is to thoroughly mix the water in each tank to eliminate temperature stratification, short-circuiting and stagnant water conditions, which will provide a uniform, short water age. To accomplish this goal, the District proposes using one of the commercially available active tank mixing devices. 2860	1910204	1910204-045	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Marina del Rey Waterline Replacement - Phase III	The project consists of installing approximately 9,800 feet of 18-inch diameter steel pipeline to replace the existing, aging and undersized 10- and 14-inch diameter steel water main. The water main will be constructed along Bora Bora Way, Via Marina and Fiji Way. This purpose of the project is to improve the Marina del Rey Water System to meet domestic and fire protection water demands. The project represents Phase III of a Water System Improvement Master Plan for the Marina del Rey Water System.	M	0	C	The existing water main that serves the Marina del Rey customers is aged and undersized. It currently does not meet domestic and fire protection water demands.	5,700,000	7,733	27,807	16	Los Angeles	IV	2009
2861	1910204	1910204-004	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Carbon Mesa Water tank	ERECT A TEMPORARY 0.1 MG TANK, REMOVE THE EXISTING RESERVOIR, AND CONSTRUCT A NEW 0.250 MG RESERVOIR.	M	0	C	CARBON MESA WATER TANK. THE EXISTING 0.1 MG TANK IS AGED AND OF INSUFFICIENT SIZE TO STORE WATER FOR DOMESTIC WATER SUPPLY.	800,000	7,733	27,807	16	Los Angeles	IV	1998
2862	1910204	1910204-054	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Replacement and Retrofit of Four Feeder Valves	The goal of this project is to minimize the amount of water depleted in this area that can be used for both drinking and fire-fighting purposes, and to maintain the integrity of the roadway. The project consists of the replacement and retrofit of four existing water transmission system valves with new electrically controlled valves that can be operated remotely to isolate a highly leak-prone portion of the water system. Shutting down the water main remotely will allow the District to respond promptly and will reduce the damage and erosion caused by leaks. Retrofitting the valves will also reduce the amount of water lost through leakage. Another reason to operate these valves remotely is to reduce and eliminate traffic congestion due to the current need to close lanes of traffic in order to safely access the vaults that house these critical valves. Completing these retrofits will potentially save five to six hours that it typically takes to manually shut down the valves.	M	0	C	There is an active landslide at 19560 Pacific Coast Highway (PCH). This landslide is referred to as the Big Rock Slide and La Grande Bulge. Since 1996 approximately 55 percent of the water main breaks on the District's 30-inch transmission water main, which brings the only source of water supply for nearly 14,000 residents, delivering 10,000 gallons per minute, have occurred in the project area. During each event, we had to manually shut off the existing valves to isolate and repair the break, which is very tedious and time consuming, given the normally heavy traffic along PCH. For example, during the last leak in December 2006 a large sinkhole resulted in the closure of two lanes of PCH for approximately one week, disrupting businesses, restricting the movement of Malibu residents, and costing the District approximately $500,000 for repair. In addition, when leaks of this nature occur, the District's water storage is depleted, which limits the amount of water available for drinking and fire-fighting.	250,000	7,733	27,807	16	Los Angeles	IV	2009

2863	1910204	1910204-053	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Improving Water Quality in the Nicholas Beach Tanks	The purpose of the proposed project is to thoroughly mix the water in each tank to eliminate temperature stratification, short-circuiting and stagnant water conditions, which will provide a uniform, short water age. To accomplish this goal, the District proposes using one of the commercially available active tank mixing devices. The mixing device has little to no energy cost and requires virtually no maintenance, since it is powered by a solar panel placed on the top of the tank. This system efficiently mixes the entire reservoir by creating a near-laminar flow pattern, which will reach and eliminate all the dead spots. The device will also be equipped with Supervisory Control And Data Acquisition (SCADA) output signals that allow for real time monitoring of the tank; and a chlorine injection system that helps maintain appropriate disinfectant levels in the tank.This mixing device, which consists of three floats in triangular pattern with total float buoyancy of 600 pounds, floats on the water surface with a down Intake hose to draw water. The variable length hose automatically adjusts for the peak performance at any water depth. The intake remains stationary just above and in contact with reservoir bottom, preventing the machine from moving out of place or rotating. The proposed system is capable of pumping about 10,000 gallons per minute for mixing.The estimated total capital cost of the mixing devices is $80,000.	M	0	C	The Los Angeles County Waterworks District No. 29 receives its water supply from West Basin Municipal Water District that, in turn, purchases imported water from the Metropolitan Water District of Southern California (MWD). The water supplied by MWD is chloraminated for disinfection. Within the District, the Nicholas Beach tanks located at 34065 Pacific Coast Highway have a total capacity of 2,000,000 gallons, two tanks of 1,000,000 gallons each, storing the water delivered to the District through a 33" connection at Venice Boulevard and Sawtelle Avenue in Culver City. The freshest water added to the tanks is the first to be drawn off. This short-circuiting process leads to thermal stratification within the tanks where fresh cold water stays near the base of the tanks and older, warmer water stagnates near the top.Such long residence times and uneven or total lack of mixing of water in distribution system storage facilities often promote formation of disinfection byproducts that may cause liver, kidney, or central nervous system problems along with increasing the risk of getting cancer. The situation also fosters nitrification that occurs when the chloraminated water has excess ammonia present in the distribution system. Nitrification can have various adverse effects on water quality, including a loss of total chlorine, an increase in heterotrophic plate count (HPC) bacteria concentration, and potential increases in total	80,000	7,733	27,807	16	Los Angeles	IV	2009
2864	1910204	1910204-023	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Concrete tank replacement	Will be replaced with a bigger steel tank.	M	0	C	The existing concrete tank does not meet current domestic and fire protection standard.	1,460,000	7,733	27,807	16	Los Angeles	IV	2004
2865	1910204	1910204-026	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Sepulveda Feeder Interconnection Project	Los Angeles County Waterworks District 29 (District) is proposing the addition of a new water source through a new interconnection with MWDs' Sepulveda Feeder to boost gradient during high demand and emergencies. The new connection will be utilized as the primary source of water providing the District with a higher grade to overcome the head-loss from the distance between connection point to District boundary. The maximum capacity of the proposed connection will be 40 cubic feet per second – same as the existing connection. The proposed new connection point will be located on the influent pipeline to the Venice Pressure Control Structure/Power Plant. The project also consists of installing 1,800 linear feet of 30-inch diameter water main and the installation of a regulating station. The current connection with MWDs' Culver City Feeder will be continue to operate as a back-up connection for emergencies.	M	0	C	Metropolitan Water District of Southern California (MWD) provides the single source of water that supplies Los Angeles County Waterworks District No. 29 (WWD 29) through a connection with West Basin Municipal Water District (WBMWD). The water supply is delivered to the City of Malibu and the Topanga Canyon area through a 30-inch high-pressure transmission main from the District's interconnection approximately 15 miles away. The water then travels another 20 miles through the transmission main in Pacific Coast Highway (PCH) to the westerly boundary of the District. The water is pumped from transmission main on PCH into the District's storage tanks located in each of the canyons along this reach. This transmission main originates in the City of Los Angeles and extends through the City of Santa Monica prior to entering WWD 29's easterly boundary. Near the origination point of the transmission main, Marina del Rey water system has a connection to the main that serves all the residents in the Marina. Once it enters WWD 29's boundary, the transmission main extends west on PCH nearly to the border of Ventura County, passing through multiple landslide prone areas. In recent years, landslides and ground movement have damaged the transmission main and	5,350,000	7,733	27,807	16	Los Angeles	IV	2007

2866	1910204	1910204-052	LOS ANGELES CO WW DISTRICT 29 & 80-MA	Improving Water Quality in the Upper Encinal Tank	The purpose of the proposed project is to thoroughly mix the water in the tank to eliminate temperature stratification, short-circuiting and stagnant water conditions, which will provide a uniform, short water age. To accomplish this goal, the District proposes using one of the commercially available active tank mixing devices. The mixing device has little to no energy cost and requires virtually no maintenance, since it is powered by a solar panel placed on the top of the tank. This system efficiently mixes the entire reservoir by creating a near-laminar flow pattern, which wil reach and eliminate all the dead spots. The device will also be equipped with Supervisory Control And Data Acquisition (SCADA) output signals that allow for real time monitoring of the tank; and a chlorine injection system that helps maintain appropriate disinfectant levels in the tank.This mixing device, which consists of three floats in triangular pattern with total float buoyancy of 600 pounds, floats on the water surface with a down intake hose to draw water. The variable length hose automatically adjusts for the peak performance at any water depth. The intake remains stationary just above and in contact with reservoir bottom, preventing the machine from moving out of place or rotating. The proposed system is capable of pumping about 10,000 gallons per minute for mixing. The estimated total capital cost of the mixing device is $40,000.	M	0	C	The Los Angeles County Waterworks District No. 29 receives its water supply from West Basin Municipal Water District that, in turn, purchases imported water from the Metropolitan Water District of Southern California (MWD). The water supplied by MWD is chloraminated for disinfection.Within the District, the Upper Encinal tank located at 32911 W. Camino de Buena Ventura has a capacity of 70,000 gallons, storing the water delivered to the District through a 33" connection at Venice Boulevard and Sawtelle Avenue in Culver City. The freshest water added to the tank is the first to be drawn off. OTHER - DESIGN & CONSTRUCTION	M	0	C	VAUGHN WATER CO. DESIRES TO INCREASE ITS QUANTITY OF ABOVE GROUND STORAGE TO IMPROVE ITS EMERGENCY/STANDBY WATER SUPPLY CAPABILITIES. CURRENTLY THE CO. HAS 0.55 mg OF STORAGE WHICH REPRESENTS ONLY 2 HRS. OF STORAGE.	248,570	8,931	28,100 12	Kern	III	1998
2878	1510029	1510029-006	Vaughn WC INC	KCWA Intertie Pipeline	The Kern County Water Agency has installed and is operating a conveyance pipeline that extends from the Henry Garnett Water Purification Plant to the northwest area of Bakersfield. This project involves a connection to this existing 48-inch pipeline. A 24-inch PVC pipeline will be connected to the existing pipeline and extended approximately 4-miles within City and County rights-of-way to an existing Vaughn Water Company 2.7 million gallon welded steel storage tank. The pipeline will include isolation valves, air release valves, and blow off assemblies along the pipeline route. The pipeline will provide a permanent, reliable surface water supply to fill an existing storage tank whereby an existing booster pumping plant conveys the water to the distribution system. This will also serve to reduce the company's reliance solely upon groundwater.	M	0	C	Vaughn Water Company serves water to the Rosedale Community in Kern County, California. In 2007 and 2008 during peak hour system demands the water system received and documented numerous customer complaints regarding low system pressure. It is anticipated that in 2009 the company may experience peak hour system pressures below 20 psig and be out of compliance with State regulations if additional water supply is not acquired. The water company currently relies solely on groundwater supplies. Changing groundwater quality and more stringent water quality contaminant levels are making it increasingly difficult to rely solely on groundwater. An intertie with the Kern County Water Agency will provide a permanent, reliable surface water supply to the Vaughn Water Company system in the amount of approximately 6,000 ac-ft per year. Furthermore, it will reduce the companies use of groundwater and benefit the groundwater basin.	8,000,000	8,931	28,100 12	Kern	III	2009
2879	1510029	1510029-004	Vaughn WC INC	Catalytic Carbon Vessel Plant Expansions	Vaughn Water Company currently has two well sites that have catalytic carbon vessels to remove hydrogen sulfide concentrations (taste and odor) from the water before conveying the water to the distribution system. The capacity of these two wells can be increased, the catalytic carbon treatment system expanded, and the water supply to the distribution system increased approximately 55 percent for the two wells from 3,400 gpm to 5,300 gpm. The plans and specifications for the full treatment system design have been completed. The project will involve the construction of a concrete foundation, addition of two catalytic carbon vessels and associated piping and valving at each well site. Modifications will be made to the electrical and controls to accommodate the new vessels. These improvements will increase system pressure and ensure that the minimum system pressures are maintained.	M	0	C	Vaughn Water Company serves the Rosedale Community in Kern County, California. In 2007 and 2008 during peak hour system demands the water system received and documented numerous customer complaints regarding low system pressure. 2881	4110003	4110003-002	City of Burlingame	Replacement of Leaking Water Mains	The water main replacement project involves the installation of approximately 21,300 linear feet of new, PVC water mains to replace the old, unlined, cast-iron water mains and the abandonment of the existing pipe.	M	0	C	Currently, a portion of the City's water distribution system contains old,unlined, cast-iron water mains that are resulting in water losses through direct leakage as well as water main breaks. These water mains were installed circa 1925. Additionally, it is difficult to maintain an adequate disinfectant residual in these areas due to the enhanced degradation caused by the direct contact with the unlined cast iron.	1,500,000	8,966	29,867 17	San Mateo	II	2009

2882	4310028	4310028-003	San Jose State University	SJSU South Campus Well Renovation	The project provides improvements necessary due to the proximity of recycled water, repairs leaks and installs a disinfection system.	M	0	C	The San Jose State University (SJSU) Public Water System (PWS) serves a population of less than 10,000 and is intertied to the San Jose Water Company's PWS that serves more than 100,000. The SJSU South Campus Source Well serves a drinking water distribution system that supplies potable water to both athletic facilities and irrigation for playing fields. The Well has been in service for over 50 years and the well head is less than 50 ft from fields irrigated with recycled water. Improvements are required to provide necessary separation between the well head and recycled water. There is no disinfection system and the existing mechanical equipment has numerous leaks posing a health and safety risk.	93,100	1,000	30,000	17	Santa Clara	II	2009
2883	1510017	1510017-005	INDIAN WELLS VALLEY W.D.	New Construction - 400,000 gallon tank reservoir	Construction of a tank with a 400,000 gallon capacity for the Belle Vista area would bring storage requirements in alignment with District standards.	M	0	C	The development in the Belle Vista area has met or exceeded District's preferred water storage capacity for consumption and fire protection. Required storage consists of four components: equalization storage (20% of maximum day demand); fire storage (the volume required for a specified fire flow and flow duration); emergency storage (24 hours of maximum day demand); and Off-Peak Power Rate storage (six hours of maximum day demand).	1,200,000	11,688	30,000	19	Kern	III	2009
2884	1510017	1510017-007	INDIAN WELLS VALLEY W.D.	New Construction - Well Plant for New Well	Construct one well pumping plant, including site work, site piping, building structures, ventilation systems, motor control equipment and instrumentation and controls, and all related appurtenances at existing well pumping facilities. Work also to include removal, grading, and re-installation of temporary control, chlorination and piping equipment necessary to maintain continued service of the well during construction activities.	M	0	C	Well plant currently is located in a temporary facility.	650,000	11,688	30,000	19	Kern	III	2009
2885	4310028	4310028-004	San Jose State University	SJSU Water Distribution System Improvements Phase 2	The project reconfigures potable and irrigation systems with required backflow prevention devices and remediates abandoned piping and appurtenances that pose risks to distributions system's reliability and the public's health.	M	0	C	The San Jose State University (SJSU) Public Water System (PWS) serves a population of between 10,001 and 100,000 and is intertied to the San Jose Water Company's PWS that serves more than 100,000. The SJSU PWS has a potable loop and an irrigation loop with multiple cross connections. The system has been in service for over 100 years and has had multiple source wells that have been previously closed or abandoned in place.	527,533	1,000	30,000	17	Santa Clara	II	2009
2886	1510017	1510017-006	INDIAN WELLS VALLEY W.D.	Main Line Replacement	Two secctions that are ready to be replaced are: 1/2 mile 12" PVC line on Drummond Avenue, between Norma Street and Downs Street1/2 mile 12" PVC line on South China Lake Boulevard, between College Heights Boulevard and Norma Street	M	0	C	The District regularly schedules to replace sections of main line that are more than 30 years old or otherwise is in need of replacement. The District has several areas of main line that need to be replaced.	1,000,000	11,688	30,000	19	Kern	III	2009
2887	1510017	1510017-002	INDIAN WELLS VALLEY W.D.		INSTALL NEW PIPELINES IN THE EASTERN PORTION AND CONSTRUCTION A STORAGE TANK IN THIS AREA. OTHER -DESIGN AND CONSTRUCTION	M	0	C	LIMITED TRANSMISSION CAPACITY ON EAST SIDE RESULTING IN LOW PRESSURES. ADDITIONAL STORAGE CAPACITY REQUIRED IN THIS AREA.	11,975,000	11,688	30,000	19	Kern	III	1998
2888	4310028	4310028-002	San Jose State University	SJSU Campus Hydrants and Water System Improvements	The project installs hydrants and improves backflow devices in campus buildings	M	0	C	The San Jose State University (SJSU) Public Water System (PWS) serves a population of between 10,001 and 100,000 and is intertied to the San Jose Water Company's PWS that serves more than 100,000. The SJSU PWS serves 48 buildings in 10 square block area of downtown San Jose. The system has inadequate hydrant coverage and deficient cross control devices at the buildings putting the SJSU PWS and the public at risk due to contamination of the system and inadequate fire services.	374,800	1,000	30,000	17	Santa Clara	II	2009

2889	3610005	3610005-004	LAKE ARROWHEAD CSD	Backup Power Generators for North Bay PS & Bernina WTP	Install two backup power generators. One at the District's North Bay Intake Pumping Station and one at the District's Bernina Water Treatment Plant.	M	0	C	Backup power generators are required to ensure reliability of the District's water system during power failures due to extreme weather events and emergency conditions.	1,000,000	8,269	30,000	13	San Bernardino	V	2009
2890	3610005	3610005-003	LAKE ARROWHEAD CSD	Seismic upgrades to 19 water storage tanks	The project would include seismic upgrades at 19 water storage tank sites. Drainage improvements, brush and tree removal, repairs to undermined or damaged foundations and anchorage of reservoirs are among the scope of work. All of the currently unanchored reservoirs require seismic anchorage.	M	0	C	A condition and seismic evaluation of the District's existing water storage tanks was conducted as part of its March 2008 Water Facilities Master Plan. The results of this evaluation included several recommendations for seismic upgrades. The project would address these deficiencies.	2,000,000	8,269	30,000	13	San Bernardino	V	2009
2891	1910098	1910098-004	GSWC - NORWALK		REPLACE WATER MAINS IN CRITICAL AREAS	M	0	C	UNDERSIZED PIPES (<4") THAT DO NOT COMPLY WITH WATERWORKS STANDARDS	600,000	9,617	31,221	15	Los Angeles	IV	1998
2892	1910030	1910030-002	GSWC - CULVER CITY		CEMENT LINING WATER MAINS IN CRITICAL AREAS.	M	0	C	OLD CAST IRON PIPES WITH BIO-GROWTH AND POTENTIAL NITRIFICATION PROBLEM.	320,000	9,661	31,435	15	Los Angeles	IV	1998
2893	1910030	1910030-003	GSWC - CULVER CITY		REPLACE WATER MAINS IN CRITICAL AREAS	M	0	C	UNDERSIZED PIPES (<4") THAT DO NOT COMPLY WITH WATERWORKS STANDARDS	700,000	9,661	31,435	15	Los Angeles	IV	1998
2894	3410021	3410021-002	San Juan Water District		Install a 12-inch pipeline up to the tank and refurbish the existing tank, which belongs to a neighboring water agency. The neighboring water agency does not use the tank and they have agreed to let SJWD use it. Also requires four new 60 hp pumps.	M	0	C	Inadequate pressure to meet Waterworks Standards. As water demand increases, pressure drops below the State required minimum and temporary water outages are experienced during peak demands.	500,000	10,240	33,792	09	Sacramento	I	1998
2895	1910062	1910062-007	LA VERNE, CITY WD	3.5 MG Reservoir for Zone 1	The project will construct a 3.5 MG AWWA Steel tank, at the existing Amherst Treatment Facility Site.In addition, the project will also include site grading reconfiguration of the existing inlet/outlet pipelines and CEQA documentation.	M	0	C	Water storage criteria is based on operational, fire and emergency storage requirements; currently Zone 1 will be deficient by 1 million gallons at the project City build out. A storage deficiency indicates there will be inadequate supply under normal operation and especially during an emergency situation.This project will replace an existing tank at the Amherst Treatment Facility site that is nearing the end of its useful life. Demolishing and reconstructing this tank larger will proved additional storage supply to the zone and increase reliability in the system.The proposed site is currently owned by the City and is fairly large, approximately 5.5 acres; therefore, no additional land is required. Also, there is adequate room to construct the proposed tank prior to demolishing the existing tank. Once the tank is completed the existing tank can be demolished and that area could potentially be utilized for residential or open space use.	8,000,000	8,516	34,046	15	Los Angeles	IV	2012
2896	1910062	1910062-011	LA VERNE, CITY WD	Well Rehabilitation	The project will rehabilitate all of the City's existing wells, which are: Cartwright Well, Lincoln Well, Old Baldy Well and La Verne Heights Wells 1 & 2.The rehabilitation includes additional drilling, new casing, a conductor pipe, removal of the old casing and new gravel pack. Rehabilitating the existing City wells will not require additional land acquisition since the City currently owns all of the well sites.	M	0	C	The majority of the City's wells were drilled from 1913 to 1953 by cable tool method which has mills knife perforation and no sanitary seals to prevent entry of shallow contaminates into the well casing. In recent years, fewer and fewer wells have been used due to not only water quality problems such as nitrates and perchlorates, but also mechanical, structural, electrical, maintenance and operational problems. Due to these issues the City has lost 30-40% of it's total ground water production.If all the existing wells are in good working condition and could supply good quality ground water, they would supply 50% to 70% of water the City requires for the next 20 years.Rehabilitating these wells will allow the City to extract all of their groundwater rights. In addition, it will reduce the City's need for imported surface water.	3,500,000	8,516	34,046	15	Los Angeles	IV	2012

2897	1910062	1910062-010	LA VERNE, CITY WD	3 MG Reservoir for Zone 2	The project will construct an AWWA 3.0 MG Steel tank, that is preliminary sited northerly of Baseline Road in the vicinity of the Plateau Forebay - a siting study will be required prior to finalizing the location.In addition, the project will also include extensive earthwork for site grading construction of approximately 1,500 lineal feet of 16" pipeline for inlet/outlet and CEQA documentation.	M	0	C	Water storage criteria is based on operational, fire and emergency storage requirements; currently Zone 2 is deficient by 1.5 million gallons. At the City's planed build out this deficiency doubles to 3 million gallons. A storage deficiency indicates there will be inadequate supply under normal operation and especially during an emergency situation.This project will proved additional storage supply to the zone to increase reliability to the system.	8,000,000	8,516	34,046	15	Los Angeles	IV	2012
2898	1910062	1910062-013	LA VERNE, CITY WD	Reservoir Mixing Systems	The project would install an active mixing system in each of the City's 11 storage tanks.The preferred active mixing system is the PAX Mixer developed by PAX Water Technologies. The PAX Mixer utilizes a uniquely designed 4-½" diameter impeller, attached to a small submersible motor (0.5 hp) and mounted on a tripod to circulate the water within the storage tanks. This installation of this mixing system can be completed in a timely maner and without removing the tanks from service.	M	0	C	Water quality can degrade in storage tanks through stratification and loss of chlorine residual. Chlorine Residual Loss occurs in storage tanks when the chlorine components of the combined chloramines breakdown and dissipate into the open air at the surface of the water. The chlorine residual loss tends to occur in the warmer summer months when the temperatures of the water increase and in cooler winter month when system demands are lower and water levels in the reservoir do not rise and fall as frequently. As the temperature of the water increases bacteria begins to form and break down the remaining ammonia component of the combined chloramines. These bacteria convert the ammonia to nitrite in a process known as nitrification. Nitrification will begin occurring at temperatures of approximately 70 to 76 degrees Fahrenheit and the rate of the nitrification process will increase as the water temperature rises. Combined with stratification the chlorine will dissipate from the upper strata's first and the loss of chlorine residual will slowly propagate to the lower layers. Once the chlorine residual has been depleted enough the water within the tank can develop odors, grow pathogens and increase nitrates.The most common method for correcting the issues are to dose the tanks with additional chlorine. However, constant dosing is expensive and over time will corrode the hatches and roof structures where the dosing occurs.	400,000	8,516	34,046	15	Los Angeles	IV	2012
2899	1910062	1910062-009	LA VERNE, CITY WD	Phase 2 & 3 Distribution Pipelines	The proposed project will replace approximately 7,500 lineal feet of existing 4-inch mains in: 7th, "G", Pineland, Nordland, Marco, Sherwin, Harvard, Yale, Dartmouth, Columbia, Bayberry, Vassar, Princeton, Magnolia, Bonita, Maria, Pattiglen, Rosa, Wicker and Circle Streets with new 6-inch and 8-inch DI pipe. In addition, new fire hydrants will be installed at current design spacing requirements to improve fire flows to these neighborhoods.Lastly, new fire hydrants will be installed at all dead-end streets to improve water quality and water age through regular flushing operations.	M	0	C	Several existing distribution pipelines within the City are undersized. These undersized pipelines create pressure problems and limit fire flow capacities within the neighborhoods they service.In addition, these pipelines are also older cast iron pipes that have reached the end of their useful life-cycles. Replacing these with new larger ductile iron pipe will improve hydraulics and flow capacity in the vicinity for another 80-100 years (life-time estimate according to DIPRA).Lastly, the majority of these pipelines are located in dead-end streets. Dead-end streets can create issues with water quality as the water ages due to low utilization. To date water quality issues in these areas are minimal; however, installation fire hydrants at these dead-ends will allow for flushing of the mains ensuring water quality issues due to dead-end pipes will be non-existent.	1,600,000	8,516	34,046	15	Los Angeles	IV	2012
2900	1910062	1910062-003	LA VERNE, CITY WD	Second/Third Street 4" Pipeline Replacement	This proposed project would replace approximately 9,875 feet of substandard water main on Second Street, Third Street, Seventh Street, F Street and other adjoining streets with 8" ductile iron pipe. It also includes the installationof standard fire hydrants to improve fire protection. Project is being designed in phases to limit customer interruptions and school/business operations.	M	0	C	Several existing streets in La Verne are served by older 4" cast iron water mains. This creates not only pressure problems within these neighborhoods, but limits fire flow capacities.	1,500,000	8,516	34,046	15	Los Angeles	IV	2009

2901	1910062	1910062-008	LA VERNE, CITY WD	La Verne - E street Water Main Replacement	The proposed project will construct a new 16-inch DI pipe, for transmission, in "E" street between the recently completed MTA Tracks undercrossing and 6th street to the north, to replace the existing 14-inch riveted steel pipe.The proposed project will also construct a new 8-inch DI pipe, for distribution, in "E" Street between 6th Street and 8th Street, to replace the existing 14-inch riveted steel pipe.Design of the project was completed in 2007. Updates to the plans and specifications will be required to meet current design standards; however, these are expected to be minor. Meaning construction on the project could occur within a few months of receiving funding.	M	0	C	The existing 14-inch pipeline in "E" Street is a riveted thin-wall steel pipe that is estimated to be at least 80 years old. Due to excessive age, the pipe has long since reached the end of its useful life and experiences numerous leaks and failures. In addition, the pipe is also vulnerable to excessive damage in the vicinity of the two rail line crossings.As a major source of supply to the southern region of the City, mostly industrial land uses, long term failure of this pipeline will subject users to inadequate supply and fire flows. Construction of a new 16-inch ductile iron pipe will improve overall system hydraulics and supply to the southern region of the City for the next 80-100 years (life-time estimate according to DIPRA).	1,700,000	8,516	34,046 15	Los Angeles	IV	2012
2902	1910062	1910062-012	LA VERNE, CITY WD	16" Pipeline - Plateau Forebay to Summit	The proposed project will replace approximately 2,500 lineal feet of existing 16-inch steel pipe, between the Plateau Forebay and Summit Road, with new 16-inch Ductile Iron pipe.	M	0	C	The City of La Verne purchased the assets of the La Verne Plateau Mutual Water Company circa 1970, included in the purchase was the Plateau Forebay, pump station, and transmission pipeline. This existing 16" pipeline was originally constructed by the Plateau Mutual Water Company and is believed to be at least 50 plus years old.The pipeline alignment is through the Live Oak Canyon area and is a major source of supply to the City's upper reaches. Because of the elevation differential between the terminal reservoir and the Plateau Forebay the pipe is under high pressure. Any significant damage or rupture of this line poses a threat to the LeRoy Haynes Child Development Center and surrounding residences.The majority of the old transmission main has been replaced through development that has occurred in the area. This section of pipe is the last segment required to completely replace the origional transmission main.	1,200,000	8,516	34,046 15	Los Angeles	IV	2012
2903	2710017	2710017-007	Marina Coast Water District	ORD Reservoir #2 Relining Project	This project would include the following:- Perform an evaluation of the tank integrity.- Determine the appropriate liner for the tank. - Obtain appropriate permits for disposing of tank drainage/flushing water, if needed- Select a contractor to perform the re-lining of the tank.- Drain and isolate the tank from the drinking water system.- Blast the tank interior.- Recoat the tank and ready the tank for re-connection to the distribution system. - Confirm tank reliability.	M	0	C	The conversion of the Fort Ord from military use to domestic use included transferring ownership to the Marina Coast Water District for the existing Fort Ord public drinking water supply, treatment, storage and distribution system. The Marina Coast Water District is now responsible for public drinking water service to the public now using and residing on the former Fort Ord land. Reservoir 2 is a drinking water storage tank for storing groundwater that is treated for distribution in the Marina Coast Water District water transmission pipelines to citizens in the Ord service area. Reservoir 2 tank is coated on the interior with butyl mastic. The interior coating has failed and could become a health and safty drinking water quality issue.	300,000	8,133	34,600 05	Monterey	II	2008

2904	2710017	2710017-011	Marina Coast Water District	Monterey Regional Treated Water Conveyance Pipeline	As part of the Water for Monterey County Program, MCWD proposed a Surface Water Treatment Plant (SWTP) and a Regional Desalination facility, both of which would be co-located on Armstrong Ranch in North Marina. Surface water would be diverted from the Salinas River, treated at the SWTP, and supplied to urban users in the City of Marina, the former Fort Ord, Monterey Peninsula, and northern Monterey County. The desalinated water would be supplied to the same end users. In order to maximize benefits and minimize cost, the Regional Desalination Project and the SWTP would share the same treated water conveyance pipeline. By installing a shared transmission system for the treated surface water and desalinated water, users would realize consistent water quality through the blending the two sources, reduced cost for the plants, and local job creation for construction, and operation and maintenance of the lengthy pipeline.The Treated Water Conveyance Pipeline is an 8-mile long force main pipeline, up to 36 inches in diameter, which will deliver product water from the proposed Regional Desalination Plant and SWTP (to be located off Reservation Road in North Marina) to the Monterey Pipeline and Terminal Reservoir. The transmission pipeline will begin at the intersection of the TAMC ROW and Reservation Road. Water would be conveyed through the transmission pipeline south primarily for delivery to customers in the	M	0	C	Coastal Northern Monterey County has long faced water supply challenges; the problems of seawater intrusion and excessive surface water diversions have existed for decades. Seawater intrusion was first identified in Monterey County in the late 1930s, and in response to this problem, the Monterey County Water Resources Agency (MCWRA) developed and implemented Nacimiento and San Antonio Reservoirs on the Salinas River, the Castroville Seawater Intrusion Project (CSIP), and the Salinas River Diversion Facility (SRDF), currently under construction. These projects have halted the inward migration of subsurface seawater, but Monterey County continues to face water supply challenges.In 1995, the California State Water Resources Control Board (SWRCB) issued Order 95-10 requiring California American Water Company (the primary retail water purveyor on the Monterey Peninsula) to cut back its withdrawals from the Carmel River by 40% by the year 2015. In 2006, the Seaside Groundwater Basin, a major water source for coastal Monterey County and the Peninsula, was adjudicated and a legal decision in March of that year further reduced regional water supplies by 20%. Combined with increasing projected future demands resulting from local growth and the former Fort Ord redevelopment (to be served by Marina Coast Water District [MCWD]) and the area's isolation from State-wide water	54,856,600	8,133	34,600	05	Monterey	II	2009
2905	2710017	2710017-012	Marina Coast Water District	Monterey Regional Desalination Facility	A Regional Desalination Facility is proposed to help satisfy regulatory requirements and meet immediate potable water needs within Monterey County. The desalination facility would operate conjunctively with the proposed Regional Surface Water Treatment Plant and would share facilities with that plant. Desalination is a drought-resistant supply and will help meet the needs of Monterey County by providing significant regional benefits such as the development of a reliable, high-quality water supply; reduction in further seawater intrusion into the Salinas Groundwater Basin; and the creation of new jobs for construction, implementation, operation and maintenance of the facility.The Regional Desalination Facility is a part of the broadly supported Water for Monterey County Program, the regional water supply solution to meet northern Monterey County water needs. This component will consist of a 10 million gallon per day reverse osmosis desalination plant that would be located on a 10-acre site in the northwest portion of Armstrong Ranch, immediately adjacent to the existing Salinas Valley Reclamation Plant (SVRP). The project consists primarily of wells for extracting brackish (intruded) groundwater, a feedwater pipeline to transmit the water to the desalination plant, the reverse osmosis treatment plant itself, clearwells for onsite storage, and pipelines to connect potable supplies with the Treated Water	M	0	C	Coastal Northern Monterey County has long faced water supply challenges; the problems of seawater intrusion and excessive surface water diversions have existed for decades. Seawater intrusion was first identified in Monterey County in the late 1930s, and in response to this problem, the Monterey County Water Resources Agency (MCWRA), one of the primary custodians of potable water supplies in North Monterey County, developed and implemented Nacimiento and San Antonio Reservoirs on the Salinas River, the Castroville Seawater Intrusion Project (CSIP), and the Salinas River Diversion Facility (SRDF), currently under construction. These projects have halted the inward migration of subsurface seawater, but Monterey County continues to face water supply challenges.In 1995, the California State Water Resources Control Board (SWRCB) issued Order 95-10 requiring California American Water Company (the primary retail water purveyor on the Monterey Peninsula) to cut back its withdrawals from the Carmel River by 40% by the year 2015. In 2006, the Seaside Groundwater Basin, a major water source for coastal Monterey County and the Peninsula, was adjudicated and a legal decision in March of that year further reduced regional water supplies by 20%. Combined with increasing projected future demands resulting from local growth and the former Fort Ord redevelopment (to be served by	164,156,600	8,133	34,600	05	Monterey	II	2009

2906	2710017	2710017-013	Marina Coast Water District	Monterey Regional Surface Water Treatment Plant	The Surface Water Treatment Plant (SWTP) component of the Phase 1 project will have a treatment capacity of up to 14 million gallons per day. The plant would share facilities with the proposed Regional Desalination Facility, and would receive surface water diverted at the Salinas River Diversion Facility, currently under construction. In general, wintertime water would be diverted from the Salinas River, when available, and treated via a treatment train consisting of pretreatment, microfiltration (MF) membrane treatment, and post-treatment to remove particulate matter and pathogens from the raw surface water and possibly to control taste and odor issues. The Salinas River water quality at Chualar Bridge was used as the basis for the design of the SWTP as well as for the determination of treated water quality requirements. Pretreatment at the SWTP will consist of chemical coagulation with ferric chloride and an anionic polymer, high-rate sedimentation using ballasted flocculation, and turbidity removal using automatic self-cleaning strainers. Turbidity in the Salinas River varies over time and has been recorded as high as 90 Nephelometric turbidity units. Flash mixing of the ferric chloride, to be stored onsite, would be achieved using a pump diffusion flash mixer or high rate mixer in the coagulation tank of the ballasted flocculation system. When raw water turbidity is very low, the ballasted flocculation system	M	0	C	Coastal Northern Monterey County has long faced water supply challenges; the problems of seawater intrusion and excessive surface water diversions have existed for decades. Seawater intrusion was first identified in Monterey County in the late 1930s, and in response to this problem, the Monterey County Water Resources Agency developed and implemented Nacimiento and San Antonio Reservoirs on the Salinas River, the Castroville Seawater Intrusion Project (CSIP), and the Salinas River Diversion Facility (SRDF), currently under construction. These projects have halted the inward migration of subsurface seawater, but Monterey County continues to face water supply challenges.In 1995, the California State Water Resources Control Board (SWRCB) issued Order 95-10 requiring California American Water Company (the primary retail water purveyor on the Monterey Peninsula) to cut back its withdrawals from the Carmel River by 40% by the year 2015. In 2006, the Seaside Groundwater Basin, a major water source for coastal Monterey County and the Peninsula, was adjudicated and a legal decision in March of that year further reduced regional water supplies by 20%. 2913	5610018	5610018-008	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District No. 1 - Roseland Booster Pump Station	The Contractor shall furnish all materials, equipment, tools and labor for the construction of a booster pump station including booster pumps, fire water pump, piping, emergency generator, electrical and instrumentation. Upon completion of the project, customers will be ensured adequate fire protection; thereby protecting their health and safety.	M	0	C	The homes in the vicinity of Roseland Avenue within Ventura County Waterworks District No. 1 (outside Moorpark) receive water supply from a nearby water tank. Many homes have their own booster pumps to provide preferred domestic water pressure at their home sites, elevated above Roseland Avenue. During previous fire events, these homes did not have adequate fire-flow supply. The proposed booster station project is necessary in order to provide adequate fire flow protection.	1,000,000	10,180	36,786	06	Ventura	IV	2009

2914	5610018	5610018-007	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District No. 1 - Home Acres Pipe Line Replacement	This project will include the replacement of approximately 8,000 linear feet of aged 12 inch water water lines in segments at various locations throughout the District's water system. The work consists of installation of water lines, gate valves, air and vacuum relief valves, fire hydrants, reconnecting water service lines and appurtenances; and removal and construction of a pressure reducing station. The work also includes, but is not limited to replacement of fittings, disinfecting and testing, potholing, sheeting and shoring, insertion of temporary shut-off valves, temporary by-pass or supply line, removal and reconstruction of existing improvements, traffic control, disposal of all excess excavated or removed materials, and construction of temporary and permanent pavement resurfacing.Completion of this project will ensure a reliable water supply, meeting all Health Department Regulations.This project will also help conserve water, and reduce energy costs.	M	0	C	Ventura County Waterworks District No. 1 (District) water system is deteriorating because of aging and tuberculation. Consequently, valves, blow-offs, and firehydrants are malfuncting. Operation & Maintenance costs have been on the rise. As is typical of an aging system, the District is experiencing pressure problems, water quality and capacity issues, and frequent water line breaks.	2,200,000	10,180	36,786 06	Ventura	IV	2009
2915	5610018	5610018-010	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District #1 - Water Services Replacement	This project consists of replacing 3,442 linear feet of poly water service lines wiht copper service lines in accordance with the District's specificaitons. Upon completion, the system would be reliable and customers would be assurred a rmore reliable source of water.When completed this project will also help conserve the water and minimize disruptions to our customers.	M	0	C	Poly service water lines became popular in the middle of our last century. They were used mostly for service lines and ranged from 3/4 " to 2 ". It seemed to be the answer for a lifetime of service, until it began to split within ten years of service. It is just a matter of time before more will fail. The quality of service is compromised and interrupted as these services fail. Usually they fail one at a time which means time after time we must interrupt the service to our customers in order to replace these services with copper.	4,106,400	10,180	36,786 06	Ventura	IV	2009
2916	5610018	5610018-004	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District No. 1 - Stockton Reservoir Repair	Repair the leaks in the Stockton Reservoir to assure continued domestic water storage and fire protection in the 994 Zone.When this project is completed it will help to conserve the water supply, and reduce energy costs.	M	0	C	Ventura County Waterworks District No. 1 (District) Stockton Reservoir is a bolted steel reservoir. It is leaking at the seams in several locations. The reservoir is the only storage for the 994 Zone within the District. Without the reservoir the Zone would have no storage for domestic water, and fire protection would be a health and safety concern.	80,000	10,180	36,786 06	Ventura	IV	2009
2917	5610018	5610018-003	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District No. 1 - Well 96 Rehabilitation	Install a swage patch on the hole in the well casing. Conduct mechanical cleaning utilizing a standard steel wired brush to restore well performance. Install new column pipe, column tube and shaft, and well pump.When completed this project will also reduce energy costs, conserve the water supply, and reduce dependence on imported State water.	M	0	C	Ventura County Waterworks District No. 1 (District) well 96 was drilled and constructed in 1977. The well pump recently failed and was pulled for inspection. After inspection of the well equipment, it was determined that the pump, column pipe, and column tube and shaft need replacement. The well casing is also heavily encrusted with mineral deposits that must be removed.	300,000	10,180	36,786 06	Ventura	IV	2009
2918	5610018	5610018-001	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District No. 1 - Home Acres Reservoir	The contractor shall furnish all materials, equipment, tools, and labor for the construction of a 1.5 million gallon steel water tank.When completed this project will also reduce energy costs, conserve the water supply, and reduce dependence on imported State water.	M	0	C	Ventura County Waterworks Distric No. 1 (District) provides water service to the Home Acres Community. The existing Home Acres reservoir tank is a bolted steel tank constructed in 1965. The tank must be replaced in order to provide reliable infrastructure for distribution of potable water and fire protection for the Home Acres service area.	2,000,000	10,180	36,786 06	Ventura	IV	2009

2919	5610018	5610018-006	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District No. 1 - Walnut Acres Pipeline Replacement	This project is to replace approximately 7,062 linear feet of all undersized and inadequate water mainlines, service lines, and fire protection lines and apprutanances. Upon completion of this project this portion of the system would have adequate fire flows, meet current standards thereby ensuring the health and safety of our customers. This project will also reduce energy costs and conserve the water supply.	M	0	C	When the Walnut Acres Tract in Ventura County Waterworks District No. 1 was developed, the standards for domestic and fire flows were much different. A development could include four inch mainlines and wharf heads for fire protection. The lines are undersized according to our current CDPH standards and are in need of replacement, due to the fact that they are nearly fifty five years old.	1,200,000	10,180	36,786	06	Ventura	IV	2009
2920	5610018	5610018-009	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District No. 1 Wellhead Treatment (Well #20)	The Contractor shall furnish all materials, equipment, tools and labor for the construction of an operational facility to pump raw water at a rate of 1200 gpm from existing Well No. 20, (drilled and constructed in late 2007), and receive filtration to remove excess concentrations of iron and manganese, before supplying water to the 745 pressure zone and the existing 1 MG Balcom Canyon Reservoir. Work includes construction of the following: Well Pump, Booster Pump Station, Filtration System, Chemical Containment Area, Reclaim Water Tank and Pumps, Electrical and Instrumentation, and Site Work. This project will greatly reduce dependence on imported water	M	0	C	Well 20 within Ventura County Waterworks Distric No. 1 (District) was constructed by private developer Toll Brothers Inc. as a condition to replace aging and existing local wells within the Toll Brother's Tract 4928 in Moorpark. The District has a separate project to complete the well pump operation, provide filtration treatment, and supply 1200 gpm of local water to the existing 1180 pressure zone within the District. When the well was originally constructed and tested, water was found to have excessive concentrations of Secondary Contaminants, i.e. Iron and Manganese. Until this project is constructed, the subject supply of local water is not available for use to the District.	2,500,000	10,180	36,786	06	Ventura	IV	2009
2921	0710006	0710006-001	City of Martinez	Harborview Reservoir Replacement	The project will consist of the replacement of a 1964 1.25 million gallon treated water reservoir. Current capacity is limited to 1 million gallons to ensure structural integrity of the prestressed concrete. Replacement will consist of the demolition of the existing reservoir and the construction of a new 1.65 million gallon welded steel reservoir on the existing site. The existing 16" line will be lowered and 1500 feet of new 16" line will be added to meet the hydraulic flow requirements into the City of Martinez zone 1 system.	M	0	C	This project is intended to solve a water system deficiency in treated water storage capacity. California code of regulations title 22 chapter 16 california water works standards article 2 §64564 determination of needed storage volume. The project will consist of the replacement of a 1964 1.25 million gallon treated water reservoir. Current capacity is limited to 1 million gallons to ensure structural integrity of the prestressed concrete. The replacement volume will be 1.65 million gallons.	4,126,212	9,975	37,000	04	Contra Costa	II	2009
2922	1310002	1310002-002	Calexico, City of	Water Treatment Plant Upgrade	This project will consist of a new clarifier matching the size of the clarifier built in 1999 and replacing the clarifier built in 1949; two new filters matching the size of the filters built in 1999 and replacing the filters built in 1949; a new chlorination facility that meets new regulatory requirements and codes and replacing the chlorination facilities built in 1949; and an additional standby generator to supplement the existing standby generator. All of the improvements that will be done are necessary to provide a complete and operable facility. The new equipment utilizes the latest available higher efficient technology that will maintain the plant capacity at 16.0 MGD.	M	0	C	The City of Calexico Utility Services Department is proposing to upgrade the Water Treatment Plant located at 545 Pierce Avenue, Calexico, California. This upgrade is necessary as it will replace existing functional obsolete equipment and structures that are almost 59 years old with new structures and equipment.	10,000,000	7,835	37,000	14	Imperial	V	2009
2923	0710006	0710006-002	City of Martinez	Raw Water Pipeline Replacement	This project consists of the replacement of approximately 2300 feet of 32 inch steel water line. This pipeline was constructed in 1948 with the original Martinez Water Treatment Plant and is reaching the end of it's useful life. Leaks on the pipeline have developed and been repaired as needed to maintain water to the Martinez Water System. The pipeline is a single point failure to the water plant, and planning this replacement will require coordination with system demand to assure no risk to the Martinez Water system supply.	M	0	C	The City of Martinez source water pipeline has reached it's expected usefull life. This is a single entry point to the Martinez water treatment plant.California Code of Regulations Title 22 Chapter 16 California Water Works Standards Section 64554 (a) "At all times, a public water system's water sources shall have the capacity to meet the system's maximum day demand (MDD).No violation has occurred to date, but the probability of the pipeline failure increases with age.	1,000,000	9,975	37,000	04	Contra Costa	II	2009

2924	1910028	1910028-004	CRESCENTA VALLEY CWD		Replace the existing 11 wells with up to 16 new wells of modem design and construction to replace existing production.	M	0	C	The water systems has 10 old cable tool drilled wells and one (1) mud rotary drilled well. All of the wells were constructed prior to 1951 without sanitary seals and have biological growths, such as iron bacteria, and casing corrosion.	11,069,460	8,133	38,000	15	Los Angeles	IV	1999
2925	4110025	4110025-002	North Coast County Water Dist		Construct intertie with the City of San Bruno which will be second source of supply.	M	0	C	Need alternate water supply in case of emergency.	3,125,000	11,743	38,390	17	San Mateo	II	1998
2926	4110025	4110025-004	North Coast County Water Dist		Abandon tank and construct ne waterline to serve area.	M	0	C	Wooden tank has leakage abd a roof in poor condition.	250,000	11,743	38,390	17	San Mateo	II	1998
2927	4110025	4110025-003	North Coast County Water Dist		Construct loof to bring second supply line to this area.	M	0	C	Need alternate water supply line for a service area in case of an emergency.	425,000	11,743	38,390	17	San Mateo	II	1998
2928	4110025	4110025-009	North Coast County Water Dist	Distribution System Piping - Seismic Upgrade	Construct 8000 ft of seismically hardened piping on the west side of the fault. Additional modifications to pipe crossings.	M	0	C	8000 ft of distribution piping is seismically unstable and is connected to the Christen Hill Tank that serves a major portion of the distribution system.	3,090,000	11,743	38,390	17	San Mateo	II	2007
2929	4110025	4110025-010	North Coast County Water Dist	Christen Hill Tank Replacement	Replace tank.	M	0	C	Christen Hill Tank is seismically unstable.	7,500,000	11,743	38,390	17	San Mateo	II	2007
2930	4110025	4110025-008	North Coast County Water Dist	Replace existing 21inch transmission main	Project replaces the existing piping with a seismically hardened 24in ductile iron pipeline. Six isolation valve/transition assemblies will be constructed that isolates damaged pipe and transition flow to above ground after emergency piping installation.	M	0	C	6,000 ft of 21in transmission main is constructed above the San Andreas Fault. Severe damage is expected when the fault moves; it is anticipated to move six to twelve feet during a major earthquake.	2,100,000	11,743	38,390	17	San Mateo	II	2007
2931	3710021	3710021-004	San Dieguito WD	SDWD Water Valve Replacements for Distribution System, CWW09A	SDWD Water Valve Replacement project replaces approximately 60 water isolation valves in the distribution system. The new valves range in size from 8” to 12” gate valves. The valves being replaced are old, corroded, and no longer seal correctly. The replacement of valves involves shutting down the distribution system in an area, providing traffic control, digging out the valves, cutting the water mains 3 feet from the valve, removing the tee or cross, dropping in the new tee or cross with the valves, installing the concrete thrust blocks, backfill and compact area, flush and test water main, place asphalt to repair the road.Replacement of broken valves provides assurance that valves will operate when needed. If not replaced, District personnel will continue to experience operational inefficiencies, loss of resources, and thus impact greater areas upon occurrence water main breaks or shut downs for maintenance purposes. This project has been identified in the District’s Water Master Plan as Project No. HP-4.Supply of potable drinking water is a fundamental responsibility of the District, and is supported in the City's General Plan by RM-1 to, "conserve, protect, and enhance the water resources in the Planning Area."A Programmed Environmental Impact Report was certified by the District Board as part of list of Water Master Plan projects on May 22, 2002. This project was determined	M	0	C	SDWD Water Valve Replacement project replaces approximately 60 water isolation valves in the distribution system. The new valves range in size from 8” to 12” gate valves. The valves being replaced are old, corroded, and no longer seal correctly. Replacement of broken valves provides assurance that valves will operate when needed. If not replaced, District personnel will continue to experience operational inefficiencies, loss of resources, and thus impact greater areas upon occurrence water main breaks or shut downs for maintenance purposes. This project has been identified in the District’s Water Master Plan as Project No. HP-4.	450,000	11,135	38,500	14	San Diego	V	2009

2932	3710021	3710021-002	San Dieguito WD	SDWD Instrumentation, Telemetry, Centralized Control System and SecurityProject	This project involves the installation of an Instrumentation, Telemetry, and Centralized Control System. It would replace existing outdated Telemetry, Instrumentation, and Reporting System with a new enhanced automated record keeping and centralized control system. The system will connect 16 remote water facility locations to one centralized location.An enhanced system would offer monitoring, reduce field trips by operational personnel, improve system security and provide invaluable information during emergency situations. Supply of potable drinking water is a fundamental responsibility of the District, and is supported in the City's General Plan by RM-1 to, "conserve, protect, and enhance the water resources in the Planning Area."Categorical ExemptionArt. 19, Section 15302(c)NEPA will require a Categorical Exclusion.	M	0	C	SDWD Instrumentation, Telemetry, Centralized Control System and SecurityProject No. CWW98BThis project involves the installation of an Instrumentation, Telemetry, and Centralized Control System. It would replace existing outdated Telemetry, Instrumentation, and Reporting System with a new enhanced automated record keeping and centralized control system. The system will connect 16 remote water facility locations to one centralized location.	650,000	11,135	38,500	14	San Diego	V	2009
2933	3710021	3710021-006	San Dieguito WD	SDWD Cathodic Protection for Transmission Mains, Project No. CWW08G	Cathodic protection is used to control the corrosion of buried steel water pipelines. It has been demonstrated to be a cost effective way to extend the life of a pipeline. The construction of anode stations will include traffic control, trenching and resurfacing to expose the transmission main, remove and reinstall new lead connections, and construct new anode beds. Supply of potable drinking water is a fundamental responsibility of the District, and is supported in the City's General Plan by RM-1 to, "conserve, protect, and enhance the water resources in the Planning Area."Categorical Exemption Art. 19, Section 15302(c)NEPA will require a Categorical Exclusion.	M	0	C	This project involves installation of cathodic anodes to replace existing anodes that have deteriorated and no longer provides adequate corrosion protection to the District's 36-inch steel transmission main. Locations of the project are:Anode Bed No. 2Anode Bed No. 3Anode Bed No. 6	225,000	11,135	38,500	14	San Diego	V	2009
2934	1910042	1910042-006	PICO RIVERA - CITY, WATER DEPT.	Pico Rivera - SCADA and Automation for Energy Savings and Water Conservation	The project will initially include a comprehensive inspection program of Well #4, including a detailed survey, testing, and video inspections. Based on the results of the inspection program, as a minimum it is anticipated that the following rehabilitation improvements will be necessary at Well #4:1. Re-case the existing well by installation of well liner.2. Air Burst well3. Dual air swab well (mechanical re-development, airlifting, and swabbing, using a swab tool)4. Develop test well (re-development of well via pumping methods)5. Install a New Pump The City completed a SCADA Master Plan (Preliminary Engineering Report) in November 2007 outlining the component needs to upgrade the SCADA system. The SCADA upgrade project will include at a minimum the following:1. SCADA Workstation and new hardware plus redundant workstations2. Historian server for long term archiving3. Replace existing RTU's with PLC's4. Install uninterruptible power supplies for all devices5. Replace the leased telephone line communication with spread spectrum radio communicationsThe City will bid and contract services to design, manufacture, test and install a complete SCADA system for the city's plant and well facilities. The contracted services will hold workshops with City organizations vested in the new SCADA system to review the original plan and discuss changes that may be required due to new functional	M	0	C	On December 5, 2011, Southern California Edison performed an energy test on Well #4 turbine well pump. The energy test indicated that the pump is running inefficiently most likely due to the pump wear and failure of the pump design to meet existing conditions. The current turbine pump is running at 13.9% overall plant efficiency when taken at 60 Hz (cycles per second) and at 6.8% overall plant efficiency when taken at 56 Hz (cycles per second). At 60 Hz, the turbine pump used 1,539 kWh of energy per Acre Foot of water pumped while at 56 Hz, the turbine pump used 3,323 kWh of energy per Acre Foot of water pumped. The energy efficiency analysis estimated an improvement of overall plant efficiency from 13.9% to 71.0%, which will save the City up to 551,615 kWh of energy and $64,406.55, annually. The kWh savings translate to a 240-ton decrease in carbon dioxide emissions. Table 2.2 shows existing and improved statistics as related to the current and updated turbine pumps.In addition to the Well #4 rehabilitation, the City's current SCADA system is antiquated and many components are not reliable, which subjects the City to potential vulnerabilities should major water supply equipment failures. The City is very concerned that a critical water supply well may not be available and operated during a fire flow event, due to the outdated and unreliable SCADA system. In the past several	700,000	9,335	39,000	07	Los Angeles	IV	2012

2935	4310004	4310004-001	City of Gilroy	First Street Water Main Replacement	Replace existing water main on First Street between Monterey Street and Santa Teresa Boulevard with a new 24-inch diameter water main. The total project length is approximately 8,000 feet. Ductile iron pipe will be used to replace the existing pit cast iron pipe, which was installed in 1898 and has exceeded its service life. Mainline valves will be installed at each intersection to allow future repair work to be performed without affecting all businesses along the corridor. New fire hydrant, water service and fire service laterals will also be installed as part of the project.	M	0	C	The existing water main on First Street between Monterey Street and Santa Teresa Boulevard was installed in 1898 and consists of pit cast iron pipe. The pipe is out of round and standard pipe fittings cannot be used, making repairs very difficult. There are no mainline valves between Hanna Street and Westwood Drive, so any shutdowns affect all properties along this 5,000 foot section. A water main break occurred on January 20, 1998, and it took three hours for crews to isolate the leak. This project is intended to replace this water main, which has far exceeded its service life.	2,750,000	11,085	39,050	17	Santa Clara	II	2009
2936	1910090	1910090-005	MONROVIA-CITY, WATER DEPT.	Water Main Replacement	The solution to the issues described would be as follows:Grand Avenue - Replacement of 600 feet of 8 inch steel pipe with 8 inch ductile iron pipe from Greystone to ProspectGrand Avenue - Replacement of 200 feet of 8 inch steel pipe with 8 inch ductile iron pipe from Grand to Valle VistaFoothill Blvd. - Installation of 500 feet of ductile iron pipe from Canyon to GrandEl Dorado - Replacement of 900 feet of 6 inch cast iron pipe with 8 inch ductile iron pipe from Encino to FifthLinwood - Replacement of 900 feet of 4 inch steel pipe with 8 inch ductile iron pipe from Mayflower to VioletAny upgrades needed for fire hydrant requirements, air/vacuum release designs, water sampling criteria, or water service improvements will be addressed.All construction will be done by contract and will meet all City, State and Fereral requirements and the installations will meet current American Water Works Standards.	M	0	C	The City of Monrovia Utilities Division continually strives to improve water service, maintain water quality and improve fire fighting capabilities to the customers and citizens of Monrovia. To accomplish this we continually inspect, test and evaluate our current water mains and appurtenences. The following areas have been identified as substandard due to flow capabilities, high number of repairs required to maintain service , possible or existing water quality issues and the ability to meet fire flow standards;Grand Avenue - From Greystone to ProspectGrand Avenue - From Grand to Valle VistaFoothill Blvd. - From Canyon to GrandEl Dorado Avenue - From Encino to FifthLinwood Avenue - From Mayflower to Violet.	375,000	9,169	39,147	22	Los Angeles	IV	2009
2937	1910090	1910090-008	MONROVIA-CITY, WATER DEPT.	Install Additional Booster #1-6	The City would hire a contractor to supply and install all equipment, including electrical requirements, piping and related materials to provide booster #1-6.This additional booster would increase our flow capability to 3500 gallons per minute. Al materials and equipment would meet all current standards and specifications.	M	0	C	The City of Monrovia Water system is, during high demands, falling short of the amount of water we are able to pump from the City well site into the distribution system. The well site is our source of water and feeds the entire water system. This could interfear with our systems ability to supply fire fighting requirements and ability to recover from system demands from high use or maintenance problems.	100,000	9,169	39,147	22	Los Angeles	IV	2009
2938	1910090	1910090-004	MONROVIA-CITY, WATER DEPT.	Emergency water system connections	The City of Monrovia would have six emergency connections constructed in various locations in the City Water System. These connections would enable us to pump water from one zone to another, or around critical vunerable locations in a zone to continue providing a usable, uninterupted water supply. Each connection would consist of two (2) 2 1/2 inch and two (2) 4 inch fire hose connections permanently connected to the water system with a normally closed line valve installed in the watermain. In addition to the facilities constructed two trailer mounted potable water pumps, meeting all current Federal and State requirements, would be purchased and maintained by the City Water System. One of the pumps would be capable of pumping at 400 to 500 gallons per minute and the second between 1,000 and 1,250 gallons per minute.	M	0	C	The City of Monrovia is a community in and near the foothills of Los Angeles County. The City system has five pressure zones and a storage capicity of 23.5 million gallons. Currently there are no internal system connections or pumping equipment that would enable the City to provide water supplies, for extended periods of time, to a majority of it's residents in the event of wildfires, large system wide emergiecies (Edison power outages) or water system failures. These situations could produce low water pressure, or possibly no water pressure, in one or more of the pressure zones. This could result in boil water advisories, possible contamination to the drinking water system and a loss of system fire fighting capibilities.	400,000	9,169	39,147	22	Los Angeles	IV	2009

2939	1910090	1910090-007	MONROVIA-CITY, WATER DEPT.	Replace Electrical Control Panel at Ridgeside Reservoir	The City will hire a contractor to purchase and install a new electrical panel and conduits to supply all current and future power requirements and meet all standards and regulations that apply. This will ensure a continuing and reliable supply of water and security at the facility.	M	0	C	The existing electricial panel that is 50+/- years old is in poor condition and may fail at any time. The unit does not meet current National Electrical Code Standards or the standards for metered electrical service of Southern California Edison, our power provider.The panel provides all power for pump control, SCADA controls, lighting and security requirements. Failure of this equipment would seriously jepordize our ability to serve our customer with safe potable drinking water and may interfear with fire fighting needs.	250,000	9,169	39,147	22	Los Angeles	IV	2009
2940	3710019	3710019-006	Ramona Municipal WD	Bargar Water Treatment Plant	Construct a 4 MGD water treatment plant on the current Bargar Plant site by replacing the current inoperative processes with new, more efficient processes that will meet current and future water quality standards. The new plant will be modular in nature to allow further expansion if needed. Because the project is on the current Bargar Plant site, there is no impact to the environment or cultural assests or the area.	M	0	C	Existing facility fails to meet enhanced coagulation rule and is therefore inoperable. Its unavailability resulted in Do Not Use Order and later a Do Not Drink Order and a Boil Water Order during the Witch Fire. The water system is dependent on pumping imported treated water to the District and loss of power to the pumps, failure of the pumps, or loss of the pipelines would lead a repeat of the Do Not Use Order etc and the lack of water for the CalFire Fire Attack Base located in Ramona. Inaddition the unavailablity of this plant leads to higher TDS of effluent produced by two sewer treatment planst in Ramona which has resulted in violation of the RWQCB permit for discharging in the local ground water basin. The water source for this treatment plant has a much lower TDS concentration than CWA water and would result in improved groundwater TDS. Also placing the Bargar plant into operation will lower energy consumption at the District's wastewater treatment plant by lowering the amount of TDS that needs to be removed at the wastewater treatment, which is required by the Regional Water Quality Control Board. Also, with out the Bargar plant the District pumping uses a significant amount of electrical energy that results in a significant carbon footprint. This project will save energy costs associating with pumping treated water up 1000' feet from San Diego County Water Authority's pump sation	3,700,000	9,330	40,000	14	San Diego	V	2009
2941	3710019	3710019-004	Ramona Municipal WD	30 inch Pipeline Repair	The expansion joints are a main area of concern due to the fact that the original set distance for the joints is unknown and the amount of movement still available to the joints. At a minimum, the expansion joints and pipe should be adjusted in order for the expansion joints to be reset to the manufacturer's recommendations.Recoate the exterior coating of the pipe at various locations. This will ensure that the pipeline is appropriately coated for corrosion protection.Install additional concrete anchor blocks and expansion joints on the pipeline to meet the requirements specified in AWWA M11. The anchor blocks would ensure that concentrations of thrust forces in any direction will be resisted by the rigid concrete anchor rather than the relatively flexible steel pipe.All loose tie downs at pipe supports should be retightened and slipped pads should be moved back to their original positions.These improvements are currently under design.	M	0	C	Ramona Municipal Water District (RMWD) operates a 30-inch transmission main which delivers water from the Poway Pump Station to Mount Woodson Reservoir and Westend Reservoir. This pipeline extends from the Blue Sky Preserve to the edge of the District's boundary and is the sole active supply of water for the community of Ramona. The cement mortar lined and epoxy coated pipeline was installed in 2003 and travels above and below grade over a horizontal distance of approximately 5,850-feet. The elevation of the pipeline ranges between 800-feet to 1,460-feet. The steel class of the pipeline ranges from CL 500 pipe at lower elevations near Poway Pump Station to CL 200 pipe at the top of the hill where the pipe heads below grade. An 18-inch transmission main travels below grade parallel to the alignment of the above grade portion of the 30-inch pipeline. During the Witch Creek fire in 2007, the surrounding area near the above grade portion of the pipeline was extensively burned and caused visible damage to the pipeline's exterior coating and pipe support pads. A Federal Emergency Management Agency (FEMA) Report was written in December 2007 which documented the visible damage to the exterior of the pipeline. The above ground pipeline is supported by five (5) concrete thrust/anchor blocks and approximately 75 pipe supports spaced between 20 to 40-feet apart. The pipeline also travels	1,240,000	9,330	40,000	14	San Diego	V	2009

2942	4110023	4110023-010	City of San Bruno	Rehabilitation of Water Pump Station No. 4	This project is currently at the 65% design stage and will build a new pump station, including pumps, motors, controls with SCADA software and emergency generator backup power. The existing pump station will also be disassembled/demolished and the site restored. Construction of a new station was chosen because the site of the existing station lacks space for the required expansion.The new pump station will have three 550-gpm pumps situated above ground that will provide sufficient capacity (maximum day demand concurrent with refill for fire flow storage) for at least the next 50 years in conformance with the City's Water Master Plan Update and will ensure public health and safety. The new masonry block structure will be built on a reinforced concrete pad foundation and will replace the existing undersized wood-frame structure to ensure compliance with the latest codes. Other improvements consist of flexible connections to the water system, paved site access, perimeter fencing, landscaping, security features and lighting. As a portion of the site will be on Caltrans property (Skyline Blvd. SR-35), an encroachment permit from Caltrans has been obtained by the City.	M	0	C	Located in the northwest corner of the city at the corner of College Drive and Skyline Boulevard (CA-35), Pump Station No. 4 is the sole pump station providing water to the City's Pressure Zone 11, covering an area of approximately 460 acres containing approximately 900 residential structures plus the structures at Skyline Community College, the largest of which has an approximate area of 145,000 square feet.The current station does not meet existing water demands (maximum day concurrent with refill for fire flow storage) per the City's 2001 Water System Master Plan Update. The station has a firm capacity of 600 gallons per minute (gpm) but requires a capacity of 2300 gpm resulting in a current deficit of 1700 gpm. The pump station is also situated in proximity to the San Andreas earthquake fault line and currently does not have flexible connections to the water system. Approaching the end of its useful life, a loss of function for a period greater than eight hours would result in severe outage conditions, including loss of fire flow.	2,200,000	11,502	40,165	17	San Mateo	II	2009
2943	4110023	4110023-011	City of San Bruno	New Regulators on Four SFPUC Service Connections	This project will install four new regulators—fabricated vault with associated piping—that would regulate high pressure between from SFPUC supply and San Bruno's distribution system at four additional service connection points, thereby reducing the very high pressure that can damage sections of the City's aging distribution system. In addition, the City would be able to isolate its distribution system from the SFPUC distribution system during a seismic event.	M	0	C	The City of San Bruno has two sources of water that is delivered to the ratepayers. The two sources are: 1) the City's ground water and, 2) surface water provided by the San Francisco Public Utility Commission (SFPUC). The City has five inner tie connections with (SFPUC). These five connections provide half of the City's daily demand into the distribution system. One out of the five connections has a regulator moderating the connection between San Bruno's and the SFPUC distribution system. All connection lies within a mile of the San Andreas Fault. Without adding the additional four new regulators, the City will not be able to regulate the high pressure from the SFPUC water supply and in addition, in the event of pressure loss in the SFPUC system, San Bruno's system is not adequately protected to maintain its own safe operating pressure.	400,000	11,502	40,165	17	San Mateo	II	2009

2944	4110023	4110023-013	City of San Bruno	Sweeny Ridge Water Pipeline Rehabilitation	The City has completed a preliminary design report. The report suggested a trench less lining of the existing 4,850 feet of pipe. All access points for this lining project will be limited to already available and accessible locations, eliminating the need to perform heavy construction in environmentally sensitive zones. The benefits of doing the project with this methodology is that lining provides a smooth interior thereby reducing friction lost, and the lining strengthens the existing metal pipe. Lining is proven method for working in areas of complexity such as existing structures where dig and replace would inconvenience citizens or, as in this case, where environmental impacts can and will be reduced to zero. The City is familiar with lining projects and has ready to go specifications without significant change. In addition, the City has a qualified consulting engineering firm already under contract to design similar projects that can create the needed specifications and bid documents within a condensed time frame. Contractors would be available for such a project due to its size and dollar value. Again, the City has successfully completed projects of this type and this particular project is designed to prevent catastrophic failure that would impair fire flow and perhaps draw in contaminates into the City's drinking water supply.	M	0	C	Located near the uppermost elevation on the western edge of city limits, the Sweeny Ride Water Pipeline extends for approximately 4,850 feet and serves Water Tank No. 7, which is used for standby and fire suppression flows. At 50 years of age, the pipeline is at the end of its useful life, as demonstrated by its failures in recent years. Moreover, servicing the pipeline and responding to repairs is very difficult due to the lack of access roads. For example, during a recent main break in 2007, staff had to carry their gear on foot, taking approximately 45 minutes each way. In the event of a serious break—an event not unlikely given the pipeline's age and close proximity to the San Andreas Fault—staff is unable to respond in a timely manner to prevent significant losses of service. The pipeline is in an environmentally sensitive area that necessitates a carefully planned remediation of the problem pipe to minimize potential impacts. If extensive emergency repair is required, overcoming the obstacles of working in an environmentally sensitive area would make the emergency work time consumptive, thereby increasing the probability of low peak and low fire demand water supply for a long duration.	2,500,000	11,502	40,165	17	San Mateo	II	2009
2945	4110023	4110023-014	City of San Bruno	Mastick Avenue Water Main Replacement Project	This project will replace approximately 1.6 miles of 2-inch, 4-inch and 8-inch water pipelines. It is the City's intention to replace all lines with a single combined 12-inch ductile iron pipe (DIP). The replacement DIP will follow the existing sewer pipeline alignment with required distances and offsets between water supply and sewer drainpipes. Increasing the water pipeline to 12 inches assures the customer and the City with a supply condition that allows for future expansion to areas of the City fed by this water supply. Most importantly, this project provides an adequate, reliable water supply meeting all Health Code State standards for the existing customers with larger and new pipe.	M	0	C	The water main pipelines along Mastick Avenue are approximately 80 years old and account for more breaks proportional to its length than any other main section in the City. Breaks cause significant disruptions to water service and enhances the probability of a low-pressure event that can result in dirt and bacteria entering into the drinking water supply. The more breaks there are, the greater the likelihood that a low-pressure event will develop and lead to conditions detrimental to human health. In addition, breaks result in significant overtime costs for the City and divert resources from more proactive maintenance work such as troubleshooting existing systems, chemical metering and other active predictive maintenance activities. A long repair in the off work hours will cause a proportional decrease in staff during the next day, for those working on the prior evening or very early morning repairs are due needed rest and recuperation as required by labor bargaining agreements. The City has a complicated water system with wells, SFPUC water and a complex of pumping stations and water storage tanks that require adequate staffing to ensure a reliable and safe drinking water supply. Replacing these pipelines will significantly improve water service and lessen the risks to water quality due to the numerous breaks.	1,000,000	11,502	40,165	17	San Mateo	II	2009

2946	4910014	4910014-002	Rohnert Park, City of	Rohnert Park Water Main Improvement Project	The project involves construction of water mains and appurtenances within the City and will include trenching within existing roadways, installing ductile iron or plastic water pipe, backfilling, and restoring the road surface. Where there are existing water mains, new mains will be installed parallel to the existing mains to enhance capacity. The following components are included in the project:(1) A 16" water main in Rohnert Park Expressway, extending from the Sonoma County Water Agency (SCWA) aqueduct located within the railroad right-of-way to Snyder Lane. Three underground vaults will be installed, two with pressure regulating valves and the third with metering facilities.(2) A parallel 12" water main in East Cotati Avenue from the existing aqueduct turnout within the road right-of-way to Camino Colegio, a parallel 8" water main the East Cotati Avenue from Camino Colegio to Snyder Lane, and a parallel 8" water main in in Camino Colegio from East Cotati Avenue to Cala Way.(3) A parallel 12" water main in Snyder Lane from the City limit north of Holly Drive southward to Golf Course Drive and a parallel 8" main from Golf Course Drive to an intertie point at Coleman Creek.(4) A parallel 8" water main in Manor Drive between Mason and Apple Drives.(5) A parallel 8" water main in Golf Course Drive west of Fern Drive. An 8" pipeline across Golf Course Drive east of the railroad right-of-way	M	0	C	The City initiated the Water Main Improvement Project to increase the reliability and capacity of the water conveyance system. The project responds to a need for improved water pressure and fire flows in the existing water system and provides for future extension of service to areas designated for annexation by the City's General Plan.	2,235,300	8,720	42,650 18	Sonoma	II	2009
2947	4910014	4910014-001	Rohnert Park, City of	Rohnert Park Eastside Potable Water Tank	The Rohnert Park Potable Water Tank Project includes the construction of a 900,000 gallon gravity flow potable water tank, waterline connection, and service road including bridges/culverts for the service road. In addition to tank and road construction, the project costs also include grading; wet & dry utilities; site lighting; landscaping and irrigation; fencing; construction management; inspection; and resource agencies mitigation. The project will be built by the City on what is currently private property east of the Rohnert Park City Limits. The project includes purchase of the land by the City.At present, the plans are 95% complete and in plan check with the City. A letter of No Effect has been obtained from U.S. Fish & Wildlife Service for California Tiger Salamander. Wetland mitigation credits have also been acquired.	M	0	C	If constructed, the Rohnert Park Eastside Potable Water Tank project will be the only gravity-flow tank in the City's water distribution system. Currently, the system relies on booster pumps and 7 tanks to transmit water. The addition of a gravity-flow tank would reduce the reliance on pumping for water pressure and decrease pumping energy costs. The proposed tank would also provide fire flow, emergency water and potable water service for both new and existing development on the east side of the City.	7,400,000	8,720	42,650 18	Sonoma	II	2009
2948	5610059	5610059-006	Golden State Water Company - Simi	Simi Valley - Seismic Upgrades	Install double ball joints on lines into and out of two reservoirs in this system.	M	0	C	Earth movement in this seismically active area can cause rupturing of pipes running into and out of reservoirs. By installing double ball joints in these lines where they attach to the reservoir, the effects of seismic activity can be mitigated and the storage better protected.	500,000	13,385	42,717 06	Ventura	IV	2009
2949	5610059	5610059-007	Golden State Water Company - Simi	Simi Valley - Katherine Booster Upgrades	An additional 500 gpm of booster capacity should be added to the Katherine plants current 1,500 gpm total capacity.	M	0	C	Due to current and future anticipated growth, booster capacity at the Katherine plant is inadequate to meet Maximum Day Demand.	500,000	13,385	42,717 06	Ventura	IV	2009

2950	5610059	5610059-005	Golden State Water Company - Simi	GSWC-Simi Valley - Pineview, Alamo, & Tapo - Tide Flex Valves	Install Tideflex valves in the reservoirs	M	0	C	The Simi System is supplied by a combination of groundwater wells (chlorinated) and purchased water from the Calleguas Municipal Water District. Stagnation in the storage reservoirs can cause loss of residual chlorine or chloramine, resulting in long water age, taste and odors, and potential nitrification. The addition of the Tideflex valves to the reservoirs will increase the turnover and mixing of water within each reservoir, reduce water aging concerns, and ultimately enhance the water quality in the system while preventing taste and odor issues and nitrification.	126,000	13,385	42,717	06	Ventura	IV	2009
2951	1910156	1910156-006	BEVERLY HILLS-CITY, WATER DEPT.	Rehabilitation of fluoride treatment facility	In order to rehabilitate the fluoridation treatment facility, the City will make modifications and additions to meet Technical Requirements in CDC “Engineering and Administrative Recommendations for Water Fluoridation, 1995” below. Included are areas the City will need to improve: I. Technical Requirements A. General 1. Fluoride feed system must be installed so that it cannot operate unless water is being produced (interlocked). 2. Fluoride injection point in a water line should be located in lower one third of the pipe, and the end of the injection line should extend into the pipe approximately one third of the pipe's diameter (31,32).3. Two diaphragm-type, antisiphon devices must be installed in the fluoride feed line when a metering pump is used. The antisiphon device should have a spring-loaded diaphragm in the closed position. Devices should be located at the fluoride injection point and at the metering pump head on the discharge side. The antisiphon device on the head of the metering pump should be selected to provide back pressure required by manufacturer of the metering pump. 4. All antisiphon devices must be dismantled and visually inspected annually based on the manufacturer's recommendations. Vacuum testing for all antisiphon devices should be done semiannually. Operation of a fluoridation system without a functional antisiphon device can lead to an overfeed that exceeds 4 mg/L. 5.	M	0	C	The California state law requires all Cities to provide fluoridated water to their customers. The purpose of fluoridation is to help aide in the prevention of tooth decay. The City of Beverly Hills has been fluoridating their water supply since the 1970’s; however, the system is currently shut down and will not be allowed to be re-started until upgrades are made bringing the fluoride treatment facility up to standards as the Technical Requirements in CDC “Engineering and Administrative Recommendations for Water Fluoridation, 1995”. Metropolitan Water District has recently begun fluoridating the water that the City purchases, it is essential that the City rehabilitates the fluoride treatment facility in the event that Metropolitan Water District is unable to continue providing fluoridated water. The City made a commitment to its citizens in the 1970’s to provide fluoridated water and now the State of California has backed this up by law. The fluoridation saturator systems at the fluoride treatment facility must conform to the standard design for a saturator. In order to consistently achieve the saturated fluoride concentration in an upflow saturator, a water system must maintain no less than 12 inches of sodium fluoride and the up flow make-up water (soft water) should not exceed 2 gallons per minute (to give enough reaction time for the chemicals to dissolve). There are many	37,500	9,898	44,290	22	Los Angeles	IV	2009
2952	1910156	1910156-007	BEVERLY HILLS-CITY, WATER DEPT.	Mechanical mixing with green technology	Install SolarBee Potable Water Circulators in each of the five Steel Water Tanks identified as 3A, 4B, 5, 6, & 7. This will accomplish the following:• Completely mixes all sizes of tanks / reservoirs corner to corner • Provides uniform water age and impacts the complete boundary layer • Prevents stagnation, thermal stratification and short circuiting • Self-adjusts for varying water levels • Provides efficient system to boost or breakpoint chlorinate • Reduces nitrification and loss of residual chlorine or chloramines• Reduces high heterotrophic plate counts • Reduces excessive ice buildup in cold climates • Fits through hatches as small as 24" diameter • Requires minimal if any infrastructure changes (solar-powered) • SCADA outputs for monitoring • Unit operates day and night on solar power • High end motor and control system with a 25 year expected lifeThe City has already installed two units as a pilot study at its largest reservoir which has proven to improve water quality and reduce costs.	M	0	C	The steel tanks have inadequate mixing of water in the reservoir that causes stagnation, thermal stratification and short circuiting. The City of Beverly Hills has an agreement with Metropolitan Water District (MWD) to maintain a 7-day supply of water with 25% conservation figured in. The City also needs to maintain adequate fire protection at all times thus these two requirements impact the water age. The water distribution system consists of several pressure zones. The water that is purchased and delivered to the City enter through a structure where it is then pumped to other zones going from one elevation to another as the water is delivered to the highest elevation. The purchased water and local groundwater produced by the City uses chloramines as a disinfectant. A benefit of using chloramines is in keeping disinfectant-by-products within compliance for the health of the public. However, a drawback is that the ammonia in the chloramines can increase the occurrence of nitrification problems especially as water ages.	175,000	9,898	44,290	22	Los Angeles	IV	2009

2953	1910156	1910156-005	BEVERLY HILLS-CITY, WATER DEPT.	Octogenarian water line replacement project	The water lines serve over 35,000 residential and business customers. However the estimated daytime population, which includes employees, shoppers, tourists, and hotel users, includes an additional 70,000, for a total daytime population of over 105,000. The replacements of these aging lines are essential to the city's infrastructure. Approximately 8,500 linear feet of water lines of various sizes (8, 10, 12, and 16 inch) will be constructed to replace the current antiquated lines constructed in 1924. In addition to the water line replacement, there will be new services installed replacing the old existing services off the water line, fire hydrants and water valves will be replaced to ensure a reliable infrastructure. In addition, the City is replacing 4,000 linear feet of water line and five hydrants in a closed pressure zone that is vulnerable due to age and limited access. As part of this project Beverly Hills is partnering with Los Angeles Department of Water and Power to establish an emergency water connection to this vulnerable section of the City's water system.	M	0	C	The water lines were installed in 1924 and have exceeded their usable life. In fact, one third of the City's water conveyance system is 80 years old. The City has experienced numerous water main breaks on these water lines. The water main breaks result in damage to the piping infrastructure, roads and streets, residential homes, businesses, and threatens the health of consumers. In addition they cost the City in loss revenue due to the loss of water, costs of repairs for parts and labor, and environmental issues to receiving streams. Replacement of the water lines are necessary to improve the water system reliability, supply safe potable water for consumption as well as fire protection, and protect business and residential customers from damage caused by water main breaks.	4,261,700	9,898	44,290	22	Los Angeles	IV	2009
2954	1910156	1910156-004	BEVERLY HILLS-CITY, WATER DEPT.	Green potable water circulatory system	Install SolarBee Potable Water Circulators in each side of the Coldwater Reservoir. This will accomplish the following:• Completely mixes all sizes of tanks / reservoirs corner to corner • Provides uniform water age and impacts the complete boundary layer • Prevents stagnation, thermal stratification and short circuiting • Self-adjusts for varying water levels • Provides efficient system to boost or breakpoint chlorinate • Reduces nitrification and loss of residual chlorine or chloramines• Reduces high heterotrophic plate counts • Reduces excessive ice buildup in cold climates • Fits through hatches as small as 24" diameter • Requires minimal if any infrastructure changes (solar-powered) • SCADA outputs for monitoring • Unit operates day and night on solar power • High end motor and control system with a 25 year expected life	M	0	C	The Coldwater Reservoir has a volume of 8 million gallons and needs to maintain that volume to achieve the agreement the City of Beverly Hills has with Metropolitan Water District (MWD) to maintain a 7-day supply of water with 25% conservation figured in. The City also needs to maintain adequate fire protection at all times thus these two requirements impact the water age. With minimum exchange of the water can result with inadequate mixing of water in the reservoir that causes stagnation, thermal stratification and short circuiting. The purchased water and the water produced by the City use chloramines as a disinfectant. A benefit of using chloramines is in keeping disinfectant-by-products within compliance for the health of the public. However, a drawback is that the ammonia in the chloramines can increase the occurrence of nitrification problems especially as water ages.	125,000	9,898	44,290	22	Los Angeles	IV	2009
2955	1910003	1910003-001	City of Arcadia	Colorado Transmission Main - Chapman to Baldwin	The Project will construct two connected legs of transmission main as follows:1. Install 2,100 linear feet of 12" DIP transmission pipeline connecting intersection of Colorado Street and Altura Road with intersection of Colorado Street and Vaquero Road along Colorado Street. 2. Install 250 linear feet of 10" DIP transmission pipeline connecting intersection of Colorado Street and Monte Vista Road with intersection of Catalpa Road and Monte Vista Road along Monte Vista Road.	M	0	C	Substandard water system network in the area is causing low water pressures which limits flow availability along Colorado Street, Altura Road and Catalpa Road in Arcadia south of I-210 Freeway. Low water pressure has detrimental effect on fire fighting capacity of Arcadia Fire Department. Installation of new transmission pipeline will increase water pressures and will increase available flow in the area to improve supply to residences as well as increase available water hydrant fire flow for fire protection.The preliminary design was completed and the final construction plans can be prepared by City staff within a month.	320,000	14,719	44,814	22	Los Angeles	IV	2009

2956	1910003	1910003-002	City of Arcadia	Hugo Reid Blending Pipeline	The Hugo Reid Blending Pipeline Project will install 2,500 linear feet of new 8" DIP and connect it with existing pipeline in Michillinda Blvd. to connect the Hugo Reid Well to the existing reservoir and booster pumps at the Chapman Facility. Pipes will need to be installed from the Hugo Reid Well, through Hugo Reid Park and Michillinda Blvd. to the intersection of Michillinda Blvd. and Carol Pine Ln., where they will connect to existing pipes to the Chapman Facility. The configuration of pipes at Chapman Facility will be changed to discharge nitrate water to the reservoir, where it will blend with low nitrate water from Chapman Well and will be pumped back into the system using the existing booster pumps at the Chapman Facility. Water monitoring equipment added to the facility to monitor nitrate levels in the reservoir and will be monitored by an existing SCADA System.	M	0	C	In 2006 the Hugo Reid Well (Well), a major water supply well for the City of Arcadia went out of service due to high nitrate levels in the water pumped from the well. In order to reduce nitrate levels to meet DHS water standards, water from this Well must be blended with water which has little or no nitrates. The City is proposing to transmit high nitrate water from this Well to the Chapman water facility, where it will blend with other system water within an on-site reservoir. Blending this water will lower the concentration of nitrates which will allow he water to be pumped back into the system for customer consumption. The Arcadia Water Master Plan, 2008 Update, identifies this project as necessary to meet the current and future demands for water in Pressure Zone 2. The project also maintains the use of an existing source of water supply from the Raymond Groundwater Basin without constructing a new well in that basin. A long-term benefit of pumping from the Well is that the removal of nitrates from the groundwater will help remove nitrates from the basin and reduce the need for treatment in the future.	500,000	14,719	44,814 22	Los Angeles	IV	2009
2957	5610019	5610019-003	CAMARILLO WATER DEPT		Construct a 4 MG water storage reservoir which will provide peak storage capacity for pressure zones 1 and 2.	M	0	C	Inadequate storage capacity causes Water Works standards violation.	4,804,000	12,522	44,831 06	Ventura	IV	1998
2958	1910167	1910167-010	VERNON-CITY, WATER DEPT.	10 Million Gallon Reservoir Rehabilitation	The 10 Million Gallon Reservoir plays an intregal role in meeting the City's water demand requirements. The subject facility is an underground reservoir that has excessive corrosion to its interior sections. The work is needed to remove the corrosive properties that have resulted in deterioration to various structural components of the reservoir. The City depends on the subject facility to meet its water demand commitments to its industrial customers. If the repairs are not facilitated in a timely fashion, the structural integrity of the reservoir will be compromised and the City may have to purchase additional imported surface water supplies in order to meet its demand requirements.	M	0	C	The City of Vernon (City) had Harper & Associates Engineering, Inc. performed a detailed a dive inspection of the 10 Million Gallon Reservoir. The results of the subject inspection are as follows:1. The appurtenances and must need abrasive blast cleaning in preparation for a comprehensive three-coat epoxy coating system application. This process must be undetaken to remove and protect against further corrosion.2. All interior construction joints must be cleaned by brush-off blast cleaning to remove corrosion, calcium deposits, and loose concrete. The joints must then be filled with a polyurethane elastomeric sealant. If the corrosion is not removed and sealed the structural integrity of the tank could be compromised.3. Random tubercles are present throughout the tank. The tubercles must be cleaned by brush-off blast cleaning and filled with a cementitious material. The removal and sealing of the subject tubercles must be undertaken to prevent further deterioration to the tank.4. The inspection noted that the carbon steel hardware on the sump ladder braces and manual control rod supports need to be replaced with stainless steel equivalents. This work is needed to ensure long-term structural integrity of the tank. Please contact the City for a copy of the subject inspection reports.	200,000	1,217	45,000 15	Los Angeles	IV	2011

2959	1910167	1910167-009	VERNON-CITY, WATER DEPT.	Elevated Tank Interior Rehabilitation	The Elevated Tank was dive inspected by Harper & Associates Engineering, Inc. The results of the inspection are as follows:1. The coating on the underside of the roof and upper shell is in fair condition with the exception of severe corrosion at the structural connections and platform. The severe corrosion at the structural connections and platform need to be addressed in the near future to minimize any further metal loss at the subject locations. Harper & Associates Engineering, Inc. recommends that abrasive blast cleaning of the entire interior, and application of 15 mils of an epoxy coating system to all surfaces of the subject tank.	M	0	C	The Elevated Tank has extensive corrosion on the interior roof, bowl, drywell, riser, safety railings, and vent screen. Rehabilitation is needed to ensure for the long-term use of the tank. The Elevated Tank is the sole source of the City's water pressure, extending approximately 160-feet above grade. The City operates on a single water zone and cannot function without the subject tank on-line.	500,000	1,217	45,000	15	Los Angeles	IV	2011
2960	1910167	1910167-014	VERNON-CITY, WATER DEPT.	Vernon - Well 21 Conversion Project	The project will be for the design and technical support services for the construction of a fully operational pump station; herein referred to as Well 21. Cannon Corporation was awarded the contract to facilitate the development of the construction plans, specifications, and bid documents.The design will include the development of a fully functional pump station; this will entail the installation of electrical, emergency power source connections, disinfection system, SCADA system flow meters, piping to connect to the existing distribution system, and the design of grading, paving, and fencing of site. In addition, the design will include provisions for a detention basin to accommodate the well flushing cycle. The detention basin will be designed to connect to the City of Vernon storm drain system.The construction phase of the project is estimated to commence in November of 2012. Cannon will be tasked with performing contract management function for the duration of the project. The total project cost, both design and construction, is estimated to be $1,640,000.	M	0	C	The City of Vernon's (City) existing production facilities (8 Wells) are not able to produce sufficient water, in terms of gallons per-minute, to meet peak demand conditions. This has historically required the purchase supplimental surface water supplies from the Central Basin MWD. Moreover, with persistent drought conditions, a growing population, and environmental regulations reducing surface water supplies, it is important for water purveyors to do their part in reducing reliance on surface water supplies to meet water demand requirements. The City explored many options in this pursuit, and ultimately located an industrial well that remained on a property purchased by the City. The facility is located at 2170 55th Street, in Vernon, CA.The City retained the services of Richard C. Slade & Associates who performed a hydrogeological evaluation of subject well. The evaluation consisted of a multi phase test pumping methodology to asertain the downwell condition and to access the current production capacity and water quality. The Stage I Phase was performed utlilizing a normal pumping sequence without the use of a packer. The initial test results of Stage 1 Phase indicated that the well had elevated levels of Volatile Organic Compounds (VOCs) that exceeded the Maximum Contaminant Levels (MCLs) for those constituents. In the Stage II Phase, a packer was inflated at 500 feet in order to isolate the	1,640,000	1,217	45,000	15	Los Angeles	IV	2012

2961	1910167	1910167-008	VERNON-CITY, WATER DEPT.	Reservoirs 3-1, 3-2, & 3-3 Interior and Exterior Rehabilitation	1. Reservoir 3-1 was dive inspected by Harper & Associates Engineering, Inc. The exterior coating was found to be in fair condition, but due to its advanced age and needed spot repairs, the City had elected to recommend repainting of the entire exterior shell.The interior of the subject reservoir needs to have the existing coating removed by means of abrasive blast cleaning to Near White Metal (SSPC-SP10) and have a three coat epoxy coating system applied to a minimum thickness of 15 mils.2. Reservoir 3-2 was dive inspected by Harper & Associates Engineering, Inc. The exterior coating was found to be in fair condition, but due to its advanced age and needed spot repairs, the City had elected to recommend repainting of the entire exterior shell.The interior of the subject reservoir needs to have the existing coating removed by means of abrasive blast cleaning to Near White Metal (SSPC-SP10) and have a three coat epoxy coating system applied to a minimum thickness of 15 mils.3. Reservoir 3-3 was dive inspected by Harper & Associates Engineering, Inc. The exterior coating was found to be in fair condition, but due to its advanced age and needed spot repairs, the City had elected to recommend repainting of the entire exterior shell.The interior of the subject reservoir needs to have the existing coating removed by means of abrasive blast cleaning to Near White Metal (SSPC-SP10) and have a three coat epoxy coating system applied to a minimum	M	0	C	The interior and exterior shells of reservoirs 3-1, 3-2, and 3-3 are in need of rehabilitation. The work will require the existing paint/coatings be removed per developed specification. The existing exterior paints of the subject reservoirs are advanced in age and have several areas in need of spot repairs. The interiors of each reservoir need to be removed and reapplied.	900,000	1,217	45,000	15	Los Angeles	IV	2011

2968	5610020	5610020-005	THOUSAND OAKS WATER DEPT	Pump Station Improvements	This project will construct a new pump station as back up to the existing La Granada pump station which currently is the sole source of providing domestic water and fire storage to more than 16000 residents and businesses within the City's water service boundaries. Existing aging station, as stand alone, is in risk of break down and it is crucial that City provide a second station as back up to the existing system. Additional pumps including diesel fueled pumps or connection for transportable generators to provide power to three of the existing pump stations citywide are an extremely important measure during power outage (which could easily happen during natural or man made disasters). City will provide 20% matching fund.	M	0	C	Lack sufficient pumps during system's peak time, lack of back up in the system incase of existing station's malfunction or break down, and lack of diesel fueled pump to provide water to thousands of residents during power outage.	1,200,000	16,436	50,000	06	Ventura	IV	2009
2969	4410017	4410017-017	Soquel Creek Water District		Replace pipes.	M	0	C	Transmission main replacement at Huntington and Wallace.	819,300	15,115	50,000	05	Santa Cruz	II	1998

2970	4410017	4410017-028	Soquel Creek Water District	SqCWD - Cathedral Drive Area Main Replacements Project	The Cathedral Area Main Replacement Project will include the replacement of 410 lineal feet of 2-inch steel water main on Mattison Lane from 138 Mattison Lane to Cathedral Dr. with 6-inch water main, 550 lineal feet of 2-inch steel water main on Trillium Way from Cathedral Dr. and Farr Ave., up Farr Ave. to the end of Trillium Way with 4-inch water main, 1,900 lineal feet of 2-inch steel through an easement and along Cathedral Dr. and Campus Dr. with 4-inch water mains, and 350 lineal feet of 2-inch steel water main on Redwood Dr. from 1889 redwood Dr. to 1931 Redwood Dr. with 4-inch water main. This project includes 24 services to be replaced, ttying into existing water mains, abandonment of the existing water mains, and all other incidental work.All of the undersized watermain identified to be replaced are in excess of 40 years old and the District has minimal as-built information on their original layout. A new fire hydrant with associated control valves will be constructed as part of this project and and overall increase in flow and water availability will provide more reliable fire protection. The District also anticipates that the construction of the new water mainswill eliminate the problems associated with an antiquated mains (such as corrosion, leakage, low pressure, and poor water quality).	M	0	C	The District strives to optimize and upgrade deficient infrastructure as part of our ongoing watermain replacement strategy to replace antiquated pipelines that are substandard and lacking fire protection. The Cathedral Drive Area Mains Replacement Project includes several areas identified for system improvements: Mattison Lane, Farr Ave., Trillium Way, Cathedral Drive, Campus Drive, and Redwood Drive. This area in the foothills of Aptos, CA includes windy terrain, steep slopes, and discontinuous roadway surfaces. The 2" main on Mattison is an old section of pipe that was not replaced when a larger 6" AC main was connected to it in 1971. A 'bottleneck' has occurred whereby creating inadequate fire flow protection for the properties downstream side of the 2" main. In addition, like most pipes that have been in service for over 40 years, it is plagued with leaks which requires much staff time to keep up with all of the leaks that occurs. The Trillium- Farr project area currently has an above-ground 2-inch steel water main that rests on a steep brushy slope. This area is considered one of our high priority replacement projects in terms of staff safety since to perform any leak repairs or service on this section of pipe is arduous and dangerous. Cathedral Drive iand Campus Drive are currently served by an exposed 1.25" steel main with a 1" PE jumper on a steep slope that is used to feed Campus Dr. Again, this	480,000	15,115	50,000	05	Santa Cruz	II	2009
2971	5610020	5610020-006	THOUSAND OAKS WATER DEPT	GROUNDWATER FOR POTABLE USE	The City of Thousand Oaks proposes to install a one (1) MGD MF/UF water treatment system at the LRGC groundwater pump station to produce potable water supply. The project will include pilot testing to develop design parameters and criteria, designing an enclosed MF/UF treatment system facility adjacent to the LRGC groundwater pump station, construction of the facility, and connecting to the Calleguas Municipal Water District's water distribution system. The project is estimated to produce potable water at a total cost (capital plus O&M) of less than $200 per acre-feet. This project will be one of five or more projects planned to develop and exploit the local groundwater resource in the Conejo Valley estimated at more than 500,000 acre-feet.	M	0	C	The City of Thousand Oaks imports 100 percent of its more than 25 million gallons per day (MGD) water requirement from the State Water project. With the ever increasing threat of reduction in importable water, the City is looking at developing its local groundwater resources to augment the imported water supply. The city owned Los Robles Golf Course (LRGC) groundwater pump station is currently very much underutilized and is only used for non-potable water purposes (golf course irrigation). The 800 gpm well can supply at least one (1) MGD of potable water if treated through a microfiltration/ultrafiltration (MF/UF) water treatment system. The strategic goal is to produce about 10 MGD by developing other local groundwater supply citywide.	2,000,000	16,436	50,000	06	Ventura	IV	2009
2972	4410017	4410017-021	Soquel Creek Water District		Replace pipes.	M	0	C	Distribution pipe replacement at Rio Del Mar.	866,400	15,115	50,000	05	Santa Cruz	II	1998

2975	5610020	5610020-004	THOUSAND OAKS WATER DEPT	Wilder Water Storage and Pump Stations	Combination of a second Wilder reservoir and pump stations facilities (proposed) with the existing Wilder facilities will provide water service directly to 12,000 residents and businesses within the service area, and to an additional 2,400 customers through serving as the sole source of supply to Grissom reservoirs and their pump station. In addition to deficiency in available storage, outage of the existing reservoir or the pump station without the proposed back up system will leave well over 14,000 residents and businesses without water. Given that the City is a public entity and a non-profit organization, safety and wellbeing of the residents are the ultimate goals of this project. City will provide 25% matching fund for implementation of this project.	M	0	C	This project will address the 1.0 million gallon storage shortage to meet the standards for domestic and fire flow storage in Wilder service area of the City water system. Additionally, the wilder service area is the only system in the City with no back up facilities and should either the existing reservoir or the pump station go out of service and become disabled a large number of residents will remain without water for domestic and fire fighting use. Considering the recent Ventura County wild fire events, lack of sufficient storage and redundancy in the system have been growing concerns with the City.	2,925,000	16,436	50,000	06	Ventura	IV	2009

2976	4410017	4410017-024	Soquel Creek Water District		Replace pipes.	M	0	C	Distribution pipe replacement at Center St., Rio Del Mar flats.	957,800	15,115	50,000	05	Santa Cruz	II	1998
2977	4410017	4410017-026	Soquel Creek Water District	SqCWD - Barrett Way Main Replacement Project	The Barrett Way Main Replacement Project in La Selva Beach, CA will include the replacement of 440 lineal feet of 6-inch water main on Barrett Way from Robak Dr. to the end. This project also includes 7 services to be replaced and reconnected and one new 6-inch steamer fire hydrant to be installed. The project will include tying into an existing water main, abandonment of the existing water main, and all other incidental work.This undersized watermain identified to be replaced is in excess of 40 years old and the District has no as-built information since the original installation pre-date the inception of our Water District.This section of Barrett Way severely lacks fire protection but the proposed project will increase flow and water availability with the larger main size diameter and the installation of a steamer fire hydrant. The District also anticipates that the construction of a new 6-inch PVC water main will eliminate the problems associated with an antiquated 2" STL line (such as corrosion, leakage, low pressure, and poor water quality).	M	0	C	The District strives to optimize and upgrade deficient infrastructure as part of our ongoing watermain replacement strategy to replace antiquated pipelines that are substandard. Barrett Way in La Selva Beach currently is served with a 2-inch steel line that was built before the 1970's. There is no as-built information on this 2-inch line that is has recently been plagued with leaks. Served by a small diameter pipe, residents on Barrett Way are lacking fire protection. The nearest fire hydrant for homes at the end of Barrett Way approx. 480' which exceeds the Fire District's recommended 250' max. distance from a property to a hydrant.Corrosion, low pressure, poor water quality, and shut-downs for main repairs are other problems that occur with the water service on Barrett Way. These problems have resulted in considerable irrecoverable water loss, staff downtime and numerous customer complaints.	100,000	15,115	50,000	05	Santa Cruz	II	2009
2978	4410017	4410017-027	Soquel Creek Water District	SqCWD - Vienna Woods Area Main Replacements Project	The Vienna Woods Main Replacement Project will include the replacement of 2,000 lineal feet of 4-inch AC water main on Vienna Dr. from Austrian Way to Wilshire Dr. with 8-inch water main, 1,900 lineal feet 4-inch AC water main on Jennifer Dr. and Jennifer Place from Vienna Dr. to end near 2001 Jennifer Place with 6-inch water main, and 280 lineal feet of 4-inch AC water main on Vienna Dr. from Austrian Way to the fire hydrant at 3430 Vienna Dr. with 6-inch water main. This project includes 93 services to be replaced and reconnected. Two new 6-inch steamer fire hydrant will be installed along with all related valves and appurtenances to upgrade existing wharf hydrants. The project will also include tying into existing water mains, abandonment of the existing water mains, and all other incidental work.By constructing these main replacements in the Vienna Woods Area, the District anticipates moving the watermains into the right-of-way, removing the bottleneck between the Austrian and Park Wilshire Tanks, reducing staff time required to fix the leaky water main and services and improving system reliability and fire protection.	M	0	C	The District strives to optimize and upgrade deficient infrastructure as part of our ongoing watermain replacement strategy to replace antiquated pipelines that are substandard and lacking fire protection. The Vienna Woods Main Replacements Project includes Vienna Drive, Jennifer Drive, and Jennifer Way. This area in a moderately hilly neighborhood of Aptos, CA.Water system reliability, public safety, and the ability to meet fire flow demands are a priority for the District. The present piping in the Vienna Woods Area includes several deficiencies: undersized mains, poor operability between pressure zones, bottlenecking in the distribution system, leaky service connections, and inadequate fire protection. This watermain replacement project is both necessary and critical. Main replacements outlined in this project would significantly enhance the reliability of safe, high quality water to be delivered for drinking in addition to the required pressure/flow for fire protection. In addition, the nearly 100 service connections in this area are extremely substandard (bullhead-type) which amount to numerous service calls to respond and repair. On an increasing frequency, this has caused interruption of water service to our customers to remediate the problems.	900,000	15,115	50,000	05	Santa Cruz	II	2009

2979	5610020	5610020-002	THOUSAND OAKS WATER DEPT	Reservoir Mixing Improvements	City is proposing to use solar-powered, long-distance water circulation technology to install mixers at all reservoirs (total of eight reservoirs) experiencing the reduced water quality due to stagnation, thermal stratification and short circuiting. The intended improvements will entail installation of the mixing system while the reservoir is in service without disrupting the City's water system normal operations. The installed system will accomplish the followings at each reservoir: prevents stagnation, thermal stratification and short circuiting; provides uniform water age; self-adjusts to varying water levels; and reduces nitrification and loss of residual chlorine or chloramine. The proposed system will require minimal infrastructure changes, and provides SCADA outputs for monitoring day and night using solar power. This innovative green technology provides the City an energy-efficient, renewable-energy solution to marinating or improving the water quality delivered to its residents.The City will provide a 20% matching fund for implementing this project.	M	0	C	Several of the City's reservoirs experience loss of chlorine residual and therefore putting the quality of the stored potable water at risk. This has been an on-going challenge for the City to monitor and correct.	320,000	16,436	50,000	06	Ventura	IV	2009
2980	4410017	4410017-010	Soquel Creek Water District		Install reservoir - 50,000 gallon welded steel tank.	M	0	C	Additional storage tank needed to meet high demands and prevent water quality problems.	900,000	15,115	50,000	05	Santa Cruz	II	1998
2981	3710015	3710015-001	Poway - City of	High Valley Water Line Replacement	The existing High Valley Waterline is a 10-inch welded steel main which starts from the High Valley Pump Station at Espola Road and extends approximatley 4000 easterly along High Valley Road. There have been numerous leaks in the line requiring costly repairs and resulted in interpution of service to approximately 210 homes being served by this line. The proposed project will replace the entire lengh of the 10-inch CL&C welded steel pipe with a new 12-inch CL&C welded steel pipe. The replacement of the existing waterline will ensure continuous water service to the single family residents served by this line.	M	0	C	The existing 10-inch welded steel pipe has experienced numerous leaks which results high repair costs and interruption of service.	1,000,000	14,017	50,542	14	San Diego	V	2009

2984	1910019	1910019-001	CERRITOS - CITY, WATER DEPT.	Well C-5 Phase Two Project	The next phase would be to install a submersible motor, bowls, column pipe, pump house, chlorination equipment, meter, electrical, SCADA system, and other equipment. The city's engineer has estimated that an additional $3.0 million would be necessary to complete the project. Having this new well C-5 would increase the pumping capacity and reliability of the system. The city historically uses approximately 9,300 to 11,000 acre feet annually. Presently, if Cerritos were to lose one of the three wells that the city relies upon, it would put an undue hardship upon the City of Cerritos as well as the private water company and the municipal utility that supplies water to Artesia, Lakewood, Norwalk, and Hawaiian Gardens. The undue hardship would come in the form of a much higher cost per acre foot from MWDSC. The cost to deliver one acre foot of well water is approximately $528 and the cost to import one acre foot of surface water would be $980 at Tier 2 rate. This is an increase of approximately 46 percent. From a financial prospective, the Department of Water and Power is an enterprise fund and over the last nine of ten years the Department has been operating at a loss. Because of this fact, Well C-5 has not been able to be completed.	M	0	C	The City of Cerritos serves a population of 51,000 and a daytime population of 90,000 plus. The city also serves portions of adjacent communities of Artesia, Norwalk, Lakewood, and Hawaiian Gardens. Three wells supply approximately 9,300 to 11,000 acre feet or 95% of all water demands on an annual base. The remaining 5% comes from an interconnection with MWDSC. All three wells are located on the northern boundary of the city. This is an operational deficiency because the city's largest water users, a private water company and a municipal utility, may draw up to 4,500 gallons per minute on a continual base. Well C-5 is located midway on the southern boundary of the city. In 2007-2008 the city spent $1,041,000 in drilling the city's newest Well C-5. At the same time the city also installed a new 16 inch ductile iron transmission main at a cost of $794,000 that is 2,300 feet long was laid from the well site to the city's distribution system in anticipation of the well coming online. The next phase would be to install a submersible motor, bowls, column pipe, pump house, chlorination equipment, meter, electrical, SCADA system, and other equipment. The city's engineer has estimated that an additional $3.0 million would be necessary to complete the project. Having this new well C-5 would increase the pumping capacity and reliability of the system. The city historically uses approximately 9,300 to 11,000 acre feet annually. Presently, if Cerritos	3,000,000	15,483	51,488	16	Los Angeles	IV	2011
2985	5110002	5110002-019	City of Yuba City	Eliminate Deadend Mains by Adding Connecting Loops	Construct approximately 2,195 feet of connecting water main as follows:1) Construct 800 linear feet of 8-inch diameter distribution main and related appurtenances on Cassidy Avenue between Clark Avenue and Live Oak Boulevard.2) Construct 465 linear feet of 6-inch diameter distribution main and related appurtenances on Grant Way between Live Oak Boulevard and Plumas street.3) Construct 930 linear feet of 8-inch diameter distribution main and related appurtenances on Littlejohn Road between Richland Road and 498 Littlejohn Road.	M	0	C	The following areas are experiencing water quality issues due to deadend water mains. Construction of waterlines to connect the the deadends will complete distribution loops and thereby, improve water quality by reducing turbidity and disinfectant by-products, and increasing water flow. 1) 8-inch diameter water mains are stubbed at each end of Cassidy Avenue;2) 6-inch diameter water mains are stubbed at each end of Grant Way;3) 8-inch diameter water mains are stubbed at each end of the section of Littlejohn Road between Richland Road and 498 Littlejohn Road.	500,000	13,550	51,504	21	Sutter	I	2009

2992	1910044	1910044-003	GLENDORA-CITY, WATER DEPT.	Well 14 Drill and Equip	The existing Well 2 (located at the Arthur E. Cook, Jr., Water Production Facility, 1051 E. Sierra Madre Avenue, Glendora) was originally constructed in 1922 and has exceeded its useful life. Production loss has been recorded over the past several years due to deterioration of the casing and the hardening of the surrounding geologic formation. The City of Glendora's Water System Master Plan established a need for replacement of this well. The City has designated it's replacement as Well 14. A hydrogeolic/engineering firm has been hired and plans are very near completion. The proposed well is to be located on a City owned parcel of land, in the Main San Gabriel Basin, near Well 2.This project is necessary to utilize our current pumping right and reduce our dependency on MWD, import waters.The new well site will be located at a park with direct impact on a residential neighborhood. Because of this, a sound proof building will also be constructed that will provide sound attenuation as well as architectural compatibility with the surrounding homes.	M	0	C	The existing Well 2 (located at the Arthur E. Cook, Jr., Water Production Facility, 1051 E. Sierra Madre Avenue, Glendora) was originally constructed in 1922 and has exceeded its useful life. Production loss has been recorded over the past several years due to deterioration of the casing and the hardening of the surrounding geologic formation. The City of Glendora's Water System Master Plan established a need for replacement of this well. The City has designated it's replacement as Well 14. A hydrogeolic/engineering firm has been hired and plans are very near completion. The proposed well is to be located on a City owned parcel of land, in the Main San Gabriel Basin, near Well 2.This project is necessary to utilize our current pumping right and reduce our dependency on MWD, import waters.	1,200,000	13,802	53,000	07	Los Angeles	IV	2009

2998	4910006	4910006-005	Petaluma, City of	Casa Grande Road 16" Water Main	Project would loop needed areas in the system to provide adequate fire fighting pressures and ensure water turnover and protect public health.	M	0	C	The Project will relieve pressure and water turn over in an extended part of the system.	1,300,000	19,125	55,900	18	Sonoma	II	2009

2999	4910006	4910006-009	Petaluma, City of	Buckingham Lane 12" Water Main	Project would loop needed areas in the system to provide adequate fire fighting pressures and ensure water turnover and protect public health.	M	0	C	The Project will relieve pressure and water turn over in an extended part of the system.	450,000	19,125	55,900	18	Sonoma	II	2009
3000	4910006	4910006-004	Petaluma, City of	Washington Street 16" Water Main (Edith to Washington St. Bridge)	project replaces a failing pair of mains and combines them into one. This will allow the city to reunify the system and protect the public heath and provide fire fighting pressure accross town on it's backbone line.	M	0	C	The project is to replace one 8" and one 10" water main with a 16" need PVC main. current mains are failing and have been isolated to prevent further damage to the system and endanger public health.	1,500,000	19,125	55,900	18	Sonoma	II	2009
3001	4910006	4910006-008	Petaluma, City of	Washington Street 16" Water Main (101-Edith)	Project would replace this section of the failing main and the allow the system to provide addequat fire fighting pressures and ensure water turnover and protect public health.	M	0	C	Current 10" steel water main is failing and has required the city to isolate the main and pump around the city. This has severed the City's system and requires imidiate attention.	1,500,000	19,125	55,900	18	Sonoma	II	2009
3002	4910006	4910006-007	Petaluma, City of	Riesling Rd. 12" Water Main	Project would loop needed areas in the system to provide addequat fire fighting pressures and ensure water turnover and protect public health.	M	0	C	The system struggles in this area to meet need preassures	150,000	19,125	55,900	18	Sonoma	II	2009
3003	4910006	4910006-003	Petaluma, City of	Cross Creek 12" Water Main	Project would loop needed areas in the system to provide addequat fire fighting pressures and ensure water turnover and protect public health.	M	0	C	System Pressures in this area of the system require looping to get need water exchange and provide for more consistant fire fighting pressures.	500,000	19,125	55,900	18	Sonoma	II	2009
3004	4910006	4910006-002	Petaluma, City of	Petaluma Blvd. North 12" Water Main Extension	Project would loop needed areas in the system to provide adequate fire fighting pressures and ensure water turnover and protect public health.	M	0	C	The Project will relieve pressure and water turn over in an extended part of the system.	1,100,000	19,125	55,900	18	Sonoma	II	2009
3005	4910006	4910006-001	Petaluma, City of	Paula Lane Reservoir #2	The City of Petaluma is proposing to make improvements to its water distribution system to meet existing demand within the pressure zone. Proposed improvements include construction of a 1.6-million-gallon, above-grade, welded-steel, potable water reservoir at an existing reservoir site on Lavender Hill Lane.	M	0	C	Paula Lane Reservoir #2 is required to support the current Paula Lane Reservoir. The current reservoir is in a degraded condition and in need of repair, but due to its critical nature to the system it cannot be brought out of service for repair and recoating. This project alleviates the vulnerability of the city's water system, in terms of demand availability and water quality in this segment and provides for additionally needed storage to areas users.	2,250,000	19,125	55,900	18	Sonoma	II	2008
3006	4910006	4910006-006	Petaluma, City of	Petaluma Eastside Aqueduct 48"	The project is a parallel aqueduct to increase reliability for our delivery system and ensure that three public entities are able to access much needed water.	M	0	C	The current Aqueduct is undersized and is 50 years old. I its the back bone to southern sonoma county and 2 water districts in marin county. We have indications that this line is loosing its lining and that steel wall thicknesses are entering the critical stages. We anticipate that the line will be declaired impared to reduce flows in the line culminating in delivery reductions and increased demand on grownwater.	40,000,000	19,125	55,900	18	Sonoma	II	2009
3007	4910006	4910006-010	Petaluma, City of	Paula Lane Tank #2	Project replaces a 2MG tank. This is critical inferstructure to the city and protects public heath as the current tank is in poor condition and requires overhaul and recoating. Because of the system configuration the Existing tank cannot be taken out of service to repair and so the second tank is required.	M	0	C	The Current tank is Failing and a replacement Tank is required to maintain system operation and protect the public health,	2,996,000	19,125	55,900	18	Sonoma	II	2009
3008	2110003	2110003-038	North Marin Water District	Trumbull Pump Station Upgrades	This project proposes to upgrade the pumps at the Trumbull Pump Station. All three pumps would be replaced with 25hp pumps. Aging electrical service controls would be replaced and installed in an onsite enclosure to protect them from the elements and extend their useful life. Also, the valves in the pump station would be replaced and a new check valve added to increase operational flexibility of the pump station and increase water distribution efficiency. These upgrades would ensure that the 1,000 customers can be guaranteed water delivery during times of peak demand.	M	0	C	As identified in the Novato Water System Master Plan, Trumbull Pump Station does not have sufficient pumping capacity to keep up with current demands. Trumbull Pump Station is the sole pump station that provides water to approximately 1,000 services in the distribution system. The three 15hp pumps are undersized and peak system demands can barley be met with all three units operating; leaving no backup pump available if one fails.	150,000	20,639	56,000	18	Marin	II	2009
3009	5710006	5710006-011	City of Woodland	Replacement of wells 6 and 1	This project involves the replacement of the below fround structures. The above ground structure of the existing wells will be re-utilize for the new well.	M	0	C	These wells (6 and 1) has nitrate levels above the 45Mg/L, they need to be replaced in order to comply with drinking water standard.	6,500,000	14,065	56,000	09	Yolo	I	2009

3010	2110003	2110003-015	North Marin Water District	emergency power for WTP	STUDY NEEDS, IMPLEMENT AS APPROPRIATE.	M	0	C	Surface WTP lacks emergency power.	100,000	20,639	56,000	18	Marin	II	1998
3011	2110003	2110003-035	North Marin Water District	Pacheco Valle Tank Mixing System	The project proposes to install a mixing system inside of the tank to improve water quality and to bring this tank connection up to the current Water Works Standards. This mixing system will eliminate stratification that occurs in the tank and increase historically low chlorine residual levels. The addition of the mixing system will eliminate the need to manually monitor the water quality on a weekly basis and should eliminate the need for frequent chlorine additions.	M	0	C	Pacheco Valle Tank is a 5MG water tank the currently has only one inlet/outlet valve and no internal mixing system & piping. This does not meet current Water Works Standards. Water quality is impacted by this current tank configuration not allowing regular turnover of water resulting in decreased disinfection residuals. Staff are currently required to manually monitor the residual chlorine levels inside the tank on a weekly basis. The chlorine levels typically drop below detectable levels during peak demand and frequent chlorine additions are necessary.	110,000	20,639	56,000	18	Marin	II	2009
3012	2110003	2110003-034	North Marin Water District	2nd Feed to Amaroli Tank	This project proposes to construct a second pipeline feed to Amaroli Tank. A second feed to the tank from the north would significantly enhance flows and provide direct connection to a greater portion of the southern distribution system area. Installation of 1,500-feet of 16" pipe from end of Pamaron Way to the existing 16" pipe along Igloo Road (at the base of Ammo Hill) would ensure that sufficient water supply could be delivered to the approximately 900 customers in this southernmost portion of the distribution system.	M	0	C	The 4.5 MG Amaroli Tank is currently served by a single pipeline from the northern section of the distribution system to serve customers in the southern portion of the system. This pipeline does not efficiently deliver water to or from the tank, and water flows from the northern to southern portion of the distribution system are limited. The existing tank supply line extends a distance of over 13,500 feet. The reliance on such a long single pipeline to supply the tank makes the South Novato area vulnerable to loss of storage capacity. Changes need to be made so that Amaroli Tank can be utilized more efficiently to increase flow capacity of the system within the area, enabling sufficient water delivery capability to meet current demand.	550,000	20,639	56,000	18	Marin	II	2009
3013	2110003	2110003-036	North Marin Water District	Lynwood & San Marin Pump Station Upgrades	This project proposes to replace the motor control centers at the Lynwood and San Marin Pump Stations. These replacements will enable the pumps to restart when the power is restored after an outage, restoring water service to those approximately 12,000 customers who would otherwise have to wait until the motor control centers could be manually fixed.	M	0	C	The Lynwood and San Marin Pump Stations are the sole pump stations that provide water to approximately 12,000 services in the distribution system. Due to the age and condition of the electrical distribution equipment at these pump stations, if a power outage were to occur catastrophic failure of motor control centers would interrupt water service to all of these customers. Massive water outages would result, as all the customers would be required to wait until the pumps electrical systems could be manually rewired. The Lynwood & San Marin Pump Stations need to be upgraded to continuously provide enough water delivery capacity to supply current demands.	176,000	20,639	56,000	18	Marin	II	2009

3014	2010002	2010002-013	MADERA-CITY	City of Madera Water Tank Recoating Project	Work to be accomplished includes the complete removal of all existing interior coatings and replacement with an ANSI/NSF Certified immersion grade epoxy liner. As part of this effort the contractor shall apply caulking to the shell/roof interface, all roof plate lap seams, and other crevices that preclude proper coating application. Additionally, the repair of all exterior paint, which includes spot repairs of rusting areas and overcoating the entire vessel using epoxy and polyurethane protective coatings will be included in the project's scope of work.Completion of this project is considered to provide the most effective method to combat further metal loss and prevent rust and iron particles from entering the water system. Additionally, the recoating of the water tower exterior will prevent further chalking, mildew growth and small areas of flash corrosion due to spots of exterior coating breakdown.	M	0	C	The Loy E. Cook Water Storage Tower in the City of Madera is an elevated reservoir built in 1966. The structure is approximately 134 feet tall with the tank body, or bowl approximately 76 feet in diameter by 35 feet high, providing a nominal storage capacity of 1,000,000 gallons of potable water. The interior coal tar enamel coating system on the roof plates and the area above the high water level is in extremely poor condition. Additionally, the interior coating on the tank sidewalls is in poor condition. The extremely poor condition of the coal tar enamel system has led to massive areas of corrosion. As a result of the breakdown of the interior coating, rust and iron particles are able to enter the potable water. Therefore, the interior coal coating system should be removed and relined as soon as possible to prevent further metal loss. In addition to the condition of the interior of the tank, the exterior of the water tower exhibits several conditions that need to be addressed as well. While the exterior coating system is in fair condition, the tower coating does exhibit chalking, mildew growth and small areas of flash corrosion due to a lack of coating as well as spots of complete coating breakdown. In order to prevent further breakdown, the exterior coating system should be re-coated as soon as possible.This pre-application is to pay for the costs of recoating the water tower exterior and replacing the interior coating system	500,000	12,419	57,318	11	Madera	III	2011
3015	3310020	3310020-005	Indio Water Authority	Indio Hills Reservoir Emergency Water Storage Facility	The City/IWA is currently seeking funding for Indio Hills Reservoir emergency water storage and distribution facilities. The objective for this Project is to increase emergency storage by 10 million gallons. Other elements of the Project include:.. Indio Hills Distribution and Transmission Pipelines – The Project includes 23,000 feet of 18-inch diameter transmission lines from Wells 13-A, 13-B, and X to a booster station for pumping to the elevated emergency storage reservoir. The Project also includes 18-inch diameter distribution pipelines from the reservoir to the distribution network. The pipeline is needed to provide water to the reservoir and to provide gravity flow to Zone 2 properties located north and west of the Whitewater storm channel. The reservoir and pipeline design, technical specification and bid documents are completed. The Indio Hills emergency storage project is "construction ready". .. Indio Hills Booster Pump Station – The project includes a Booster Pump Station equipped with emergency power supply and a photovoltaic (PV) solar power system. The pump station has a capacity of 9,000 gallons per minute at built-out conditions. The Indio Hills Booster Pump Station is required to pump well water to the reservoir located at a higher elevation. In case of an emergency, water can then be supplied by gravity forces (no external power source is required) to satisfy	M	0	C	Since 2000, the City has experienced exponential population growth from 49,116 to its current population of 83,937: This is a 70% increase in the population over eight years. As one of the fastest growing cities in California, residential growth has lead to commercial, retail and industrial opportunities. However, water infrastructure developments have lagged behind. Current emergency water storage capacity is 11.5 million gallons, which is far short of a required minimum of 37 million gallons, based on operational, emergency and fire flow demands. The proposed Project will add 10 million gallons of emergency storage capacity enabling the City to meet its emergency water needs for existing developments north and west of the Whitewater Stormwater Channel. Project design is completed. However, due to the unforeseen decrease in the IWA's Development Impact Fees payments and the IWA's obligation to pay debt service on a 2006 bond for $61.8 million, without Federal funding, the IWA will not be able to proceed with all of the projects identified in the 2007 Water Master Plan to meet the IWA's need for emergency water storage facilities.	22,000,000	19,453	58,823	20	Riverside	V	2009

3016	3310020	3310020-004	Indio Water Authority	Lost Horse Reservoir Emergency Water Storage Facility	The City/IWA is currently seeking funding for Lost Horse Reservoir emergency water storage and distribution facilities. The objective for this Project is to increase emergency storage by 5 million gallons. Other elements of the Project include:.. Lost Horse Pipeline – The Project includes two pipelines, 18-inch diameter, 5,100 feet long from the reservoir to the City's Terra Lago pump station. The pipeline is needed to provide water to the reservoir and to provide gravity flow to Zone 5 and multiple zone properties. The reservoir and pipeline design, technical specification and bid documents are completed. The Lost Horse emergency storage project is "construction ready". .. Lost Horse Well 13-A – With the addition of new emergency storage facilities, a new well, has been drilled to provide additional water supply north of the I-10 corridor. The new well is 1,300 feet deep, it has been test pumped, and Title 22 water quality testing has also completed. The Lost Horse Well 13-A equipment project is "construction ready". .. Zone Separation Pressure Reducing Valves (PRV) – To manage water pressure throughout the system, PRV stations are necessary. The installation of required PRV stations will be in accordance with the City's/IWA standard drawings. The PRV project comprising two PRV stations is "construction ready".	M	0	C	Since 2000, the City has experienced exponential population growth from 49,116 to its current population of 83,937: This is a 70% increase in the population over eight years. As one of the fastest growing cities in California, residential growth has lead to commercial, retail and industrial opportunities. However, water infrastructure developments have lagged behind. Current emergency water storage capacity is 11.5 million gallons, which is far short of a required minimum of 37 million gallons, based on operational, emergency and fire flow demands. The proposed Project will add 5 million gallons of emergency storage capacity enabling the City to partially meet its water needs for planned development projects north of the I-10 corridor and west of Dillon Road. Project design is completed. However, due to the unforeseen decrease in the IWA's Development Impact Fees payments and the IWA's obligation to pay debt service on a 2006 bond for $61.8 million, without Federal funding, the IWA will not be able to proceed with all of the projects identified in the 2007 Water Master Plan to meet the IWA's need for emergency water storage facilities.	14,492,644	19,453	58,823	20	Riverside	V	2009
3017	3310020	3310020-003	Indio Water Authority	Plant 2; 5 Million Gallon ReservoirEmergency Water Storage Facility	The City of Indio is currently seeking funding for Plant 2 Reservoir emergency water storage and distribution facilities. The objective for this Project is to replace the existing 2 million gallon concrete reservoir that is not seismically sound with a 5 million gallon concrete reservoir; thereby increasing emergency storage by 3 million gallons. Other elements of the Project include:.. Plant 2 Pipeline – The Project includes four pipelines, 18-inch pump suction lines leading to the vertical turbine pump cans. Isolation valves will be provided on each 18-inch pump suction line. Also, to provide for more flexibility, a 20-inch by-pass line will interconnect the pump suction line and the well inlet manifold. These pipeline enhancements will provide greater pressure stability to Zone 2. The reservoir and pipeline design, technical specification and bid documents are completed. The Plant 2 emergency storage project is "construction ready". .. New Well 2E – With the addition of new emergency storage facilities, a new well, has been designed to the City/IWA's current well designed standards. The new well will be located off-site, to a depth of 1,300 feet. The land for construction of the well has been purchased and a pumped and Title 22 water quality testing will commence at the same time as construction of the Plant 2 reservoir. Plant 2 Well 2E equipment project is "construction ready". .. Solar Panel System – A photovoltaic (PV) system will be	M	0	C	Since 2000, the City has experienced exponential population growth from 49,116 to its current population of 83,937: This is a 70% increase in the population over eight years. As one of the fastest growing cities in California, residential growth has lead to commercial, retail and industrial opportunities. However, water infrastructure developments have lagged behind. Current emergency water storage capacity is 11.5 million gallons, which is far short of a required minimum of 37 million gallons, based on operational, emergency and fire flow demands. The proposed Project will add 5 million gallons of emergency storage capacity enabling the City to partially meet its water needs for planned development projects south of the I-10 corridor. Project design is completed. However, due to the unforeseen decrease in the IWA's Development Impact Fees payments and the IWA's obligation to pay debt service on a 2006 bond for $61.8 million, without Federal funding, the IWA will not be able to proceed with all of the projects identified in the 2007 Water Master Plan to meet the IWA's need for emergency water storage facilities.	12,568,520	19,453	58,823	20	Riverside	V	2009

3018	3010018	3010018-003	City of La Habra	Municipal Water Yard/Water Facility SCADA Upgrades and Security Improvements	The Project is located at the City's Municipal Water Yard, three reservoir sites, six booster pump stations, and a number of import connections. The appropriation would assist in providing the needed security to City property, the prevention of vandalism and damage to critical facilities, and providing safety for City employees and those otherwise providing services to the City by monitoring any unauthorized entry into City facilities. The project includes upgrades to and the addition of video surveilance equipment for the Water Division's central SCADA system. The upgrades to the SCADA system would provide for the control of of the remote site faciilities from the central SCADA location as well as the ability for the enhanced security equpiment to be integrated into the SCADA system. The enhanced security system would provide monitoring of the remote facilities via motion and intrusion alarming in conjunction with still and video monitoring. A proposed card or code entry system would be utilized at all points of entry. The security improvements to the various sites would be monitored as "satellite" locations from the central maintenance yard facility and would provide enhanced protection to the City's extensive water supply facilities and reservoirs, protection against potential threats to public health, and protection against vandalism or potential acts of terrorism. In addition to the security improvements, the project	M	0	C	The City of La Habra owns and operates facilities deemed critical to the operations of the City and to the reliable delivery of potable water. Providing protection to these facilities from vandalism and potential acts of terrorism is critical to the protection of the City's water supply for fire protection and general public consumption purposes, as documented in the City's Security Vulnerability Assessment. Additionally, improvements to the operations of these facilities with the integration of emergency back up power generators would help prevent loss of system pressure and potential compromise or contamination of the public drinking supply, and enhance overall system reliability.	1,000,000	12,548	61,454	08	Orange	V	2009
3019	3010018	3010018-002	City of La Habra	Idaho Well Motor Control Center and Backup Generator	The project consists of the replacement of the existing obsolete motor control center with a fully automated PLC-based design. In efforts to conserve energy, the deep well pump will utilize a soft-start configuration and the booster pump will be controlled by a variable-frequency-drive. The addition of an approximately 400KW emergency backup generator will help to ensure the reliability of the City's only local groundwater source and the well's 24/7 operation.The use of a PLC-based motor control center will allow for the compatibility to the City's SCADA system and ability to provide both local and remote operation of the well, as well as provide the ability to remotely monitor and control treatment and other system processes.	M	0	C	The Idaho Well and Booster Station is currently the City's only source of local groundwater and operates 24 hrs/day. The existing motor control center is over 25 years old and has outlived its designed life expectancy. Parts are currently unavailable or increasingly hard to obtain. During events where the motor control center experiences electrical component or power failures, the well can be offline for days or weeks at a time, until repairs can be completed or power to the area restored. Currently, there is no available backup power for scheduled or emergency power outtages.In the event of a loss of imported water supply, this well becomes the City's only source of water. The installation of a modern motor control center with an emergency backup generator will ensure the availabilty of at least one water source for the City, enhancing system reliability and maintaining the ability to provide fire protection .	400,000	12,548	61,454	08	Orange	V	2009
3020	4310009	4310009-001	City of Palo Alto		Replace water mains.	M	0	C	Water mains are aging and need to be replaced. Main breaks cause customer service problems.	2,200,200	19,344	62,000	17	Santa Clara	II	1998
3021	4310009	4310009-008	City of Palo Alto		Contract a new intertie to Hetch-Hetchy Division tubes 3 & 4 to add second feed into Hospital Zone.	M	0	C	Needs improvement on transmission lines.	1,800,000	19,344	62,000	17	Santa Clara	II	1998
3022	4310009	4310009-005	City of Palo Alto		Construct a new return pipe from Montbello reservoir to pressure zone 1.	M	0	C	System's ability to utililize stored water needs to be improved.	2,000,000	19,344	62,000	17	Santa Clara	II	1998
3023	4310009	4310009-004	City of Palo Alto		Install variable frequency drives and water treatment to connect wells to standby wells.	M	0	C	More storage is necessary for emergency water supply. Current city wells need repairs and treatment.	1,200,000	19,344	62,000	17	Santa Clara	II	1998

3024	0710008	0710008-001	City of Pittsburg	Buchanan Place Water Main Replacement	This project will replace deteriorated distribution infrastructure within a publicly owned water distribution system operated by the City of Pittsburg in Contra Costa County. Specifically, the project will replace approximately 300 LF of 8" water main and 650 LF of poly water service lines with 1" copper service lines. The project also involves replacement of 4, 8" gate valves and residential fire hydrants in an effort to eliminate a maintenance problem area identified within the water distribution system. This segment requires more maintenance than other segments of similar age in order to maintain service to our water customers. This capital project will reduce these maintenance expenses and service interruptions, thereby presenting a cost-effective solution.	M	0	C	The Buchanan Place Water Main project will replace a segment of water distribution line within a publicly owned water system that is subject to frequent waterline breaks. The segment is an area identified as requiring a disproportionate share of the total system maintenance performed by the City of Pittsburg, which is the water purveyor and also owns, operates and maintains the water distribution system. The project will also replace poly service lines, which according to adopted policy is a cost to be borne by the City of Pittsburg. While the problems are significant, to date this problem has not required public notification or involved violation of drinking water standards, regulations or CDPH directives.	300,000	16,041	62,000 04	Contra Costa	II	2009
3025	4310009	4310009-006	City of Palo Alto		A two million gallon reservoir is needed to improve storage.	M	0	C	System's water storage needs improvement.	4,000,000	19,344	62,000 17	Santa Clara	II	1998
3026	3010046	3010046-004	City of Tustin		Repairs will consist of installing a new top slab on the existing reservoir along with repairs to the columns and roof beams. A hypalon liner is proposed for the floor and side slopes of the reservoir after the existing roots have been removed and th	M	0	C	Aged Simon Ranch reservoir could cause contamination.	670,000	14,071	62,100 08	Orange	V	1998
3027	3010046	3010046-006	City of Tustin	RAWLINGS RESERVOIR - ER	The City's water distribution system is divided into three pressure zones and currently provides 7.83MG of the total storage from five reservoirs. Before Rawlings Reservoir was taken out of service, it provided an additional 3.82 MG (33%) of storage for the City's Zones 1 and 2 to meet operational, fire and emergency storage requirements.The Rawlings Reservoir Replacement Project involves the: (1) demolition of the existing reservoir; (2) the construction of two partially buried prestressed concrete 3.0 MG water tanks and associated improvements; and (3) the construction of off-site storm drain facilities. The construction of the two new reservoirs is estimated at approximately 22 months per the following schedule: site excavation and grading:2 months; new tank construction:15 months; site backfill:1 month; pipeline construction and other appurtenances:2 months; site paving:1 month; and clean-up/demobilization:1 month.Reservoir DemolitionThe proposed project includes demolition of the existing reservoir. During the first stage of demolition, the reservoir roof, roof-support columns, perimeter side walls to grade, and the reservoir membrane liner will be removed. Asbestos containing materials have been identified in the existing roof mastic, floor and wall mastic, and in the wall fiberboard. These materials will be removed and disposed per applicable State and local regulations. The second	M	0	C	The City of Tustin is located in central Orange County, and is responsible for providing drinking water to the community and adjacent unincorporated areas. The City's water distribution system includes six reservoirs, the largest being the 4MG Rawlings Reservoir. It was built in 1971 and is a partially buried, rectangular, concrete-lined, earthen reservoir, covered by a timber and sheet metal roof. The NE and NW sides of the reservoir are cut into a hillside which is partially retained with concrete-block retaining walls. The earthen side walls and the floor are constructed with asphalt concrete overlay and two layers of asphalt panel lining. The earthen sides and floor are lined with a hypalon liner to prevent leakage. Rawlings Reservoir was taken out of service in late 2004 due to the following significant structural deficiencies:1. The splitting and delamination of the glulaminated roof beams prevents the structure from supporting the code-required 20 psf live load.2. The lateral force resisting system for seismic loading is deficient. The existing horizontal diaphragm is inappropriate and not approved for transferring the lateral seismic forces to the perimeter shear walls. There are no horizontal load resisting elements to transfer horizontal loads through the roof cupola opening.3. The live-load capacity of the roof rafters does not meet current code requirements.4. The column tie spacing in the precast	14,000,000	14,071	62,100 08	Orange	V	2009

3028	3010046	3010046-007	City of Tustin	TUSTIN AVENUE WELL - ER	The Tustin Avenue Well project includes the demolition of an existing well, followed by the drilling and equipping of a modern well facility. The new well will improve domestic water service for Tustin's water service area. The proposed project also includes the replacement of approximately 500 feet of undersized 8-inch waterlines with new 12-inch water mains. The Tustin Avenue Well project consists of a drilling and an equipping phase. The new well will be drilled to a depth of 1,200 feet. The diameter of the borehole will be 30 inches. The drilled hole will be stabilized with alternating sections of solid and perforated 20 inch diameter stainless steel casing. The perforations will maintain the integrity of the hole while allowing water to flow through it. A gravel pack, sanitary seal, and accessory tubes will be installed around the steel casing to ensure well stability and protect the local groundwater from potential contamination. A temporary sound barrier will be erected around the well site to minimize construction noise effects on adjacent commercial businesses. The well will also be tested to determine its pumping capacity and developed. The test data will be used to design the pump and other ancillary equipment. The drilling phase is estimated to be completed in approximately three months.During the equipping phase, a 3,025 square foot concrete reinforced masonry block building will be built to secure	M	0	C	The City of Tustin [City] is located in central Orange County [OC] and supplies domestic water to the community and adjacent unincorporated areas. Approximately 80% of the City's water supply comes from local groundwater, with the balance purchased from imported water supplies. The City has several older wells that were not built to California Department of Water Resources water well standards that are beyond their useful production life and must be replaced. The City's Tustin Avenue Well project includes the demolition of the existing 1950's era Tustin Well, and the construction/equipping of a new well. An additional old well would be taken out of service and demolished once the project is on-line. The Tustin Avenue Well will feature several significant improvements not found in the older wells: a disinfection system, back-up power, post-911 security improvements, and incorporation of NPDES requirements. In addition, the new well will feature an improved sanitary seal and provide for future floridation capability per DPH standards. The construction of Tustin Avenue Well will add an extra 3,548 AF of annual pumping capacity, and reduce the City’s reliance on more expensive imported water by approximately 50%. The City's long-term groundwater objective is to meet approximately 85-90% of its customer needs from groundwater, with the balance	4,500,000	14,071	62,100	08	Orange	V	2009
3029	3010046	3010046-008	City of Tustin	ABANDONED WELL DESTRUCTION PROJECT	Once funding becomes available, a licensed contractor will be hired to inspect the wells, to remove associated equipments and obstructions, destroy the well casing, fit the well and annual space with cement/grout, then seal and cap the well according to standard specifications.The contractor who will perform the well destruction activities will be selected through a competitive bidding process. The contractor will properly destroy the well, restore the property as appropriate, and prepare a well destruction reports, which will be distributed to local regulatory agencies and to the Department of Water Resources.	M	0	C	In City of Tustin's service area, there are two abandoned wells that pose a significant risk for contaminants to migrate into deeper groundwater aquifers. Abandoned wells have the potential to provide a conduit for anthropogenic contaminants to migrate into the the deeper groundwater aquifers. These abandoned wells were taken out of service in 1990s due to high nitrate concentration and excessive sand production. Well rehabilitation or drilling a new well have been ruled out due for several reasons. Well site is too small to drill a new well that is an adequate distance from the old well; site is surrounded by residences; site access and logistics for drilling are poor; no guarantee on improved water quality; and no onsite or proximal storm drains for discharge of water from drilling or rehabilitation operations.The abandonment and destruction of these wells are recommended by the Department of Water Resources to eliminate the threat of contamination into deeper aquifers. These sites are surrounded by residential area and potential high risk businesses such as a gas station. With minimal monitoring and access control, these abandoned wells pose a significant risk to larger groundwater basin. Since Orange County relies upon groundwater for 60 to 75 percent of its water supply, all practical measures should be undertaken to help preserve the quality of groundwater in this area.	50,000	14,071	62,100	08	Orange	V	2011
3030	3010046	3010046-001	City of Tustin		Removing soil from the roof and installation a waterprood cement based slurry on the roof deck. 3032	1910174	1910174-001	SUBURBAN WATER SYSTEMS-WHITTIER		PHASE 1 OF 2: DEMOLITION AND PREPARATION WORK	M	0	C	PHASE 1 OF 2: RESERVOIR 216 HAS AN OLD CORRUGATED METAL ROOF THAT HAS DETERIORATED BEYOND REPAIR	950,000	19,088	63,188	07	Los Angeles	IV	1998
3033	5010019	5010019-002	Turlock, City of	City of Turlock - Well #40	The City has found a suitable site for a new well (Well 40) and a test hole was drilled to confirm that water quality meets all applicable drinking water regulations. In addition, a pump test was completed to determine the potential capacity of the well. Based on the preliminary information from the test well, a well with a capacity of 1,250 gpm can be constructed at this site. Construction of the well will include site preparation, drilling the well, installing distribution water lines, installing security fencing and monitoring equipment, and installing equipment and controls. This project is ready to be bid and the environmental review process is close to complete (Notice of Intent to Adopt a Negative Declaration). Construction could start in a few months.	M	0	C	A new water well is necessary increase supply to meet peak demands and fire flows. Currently, the only water source available to the City of Turlock is deep wells that draw water from below the E-clay. The City of Turlock historically has been operating these wells with only a minimal reserve capacity available. During the summer peak hour demands, all of the wells are on the line in order to maintain water pressure and volume. Just recently, Well 24 had to be removed from service due to nitrates that exceeded the MCL. Because this well was one of the largest water producers, peak hour demands and/or additional fire flow demands will likely drop water pressure and flow to minimal levels. The Department of Health Services (Southern California Drinking Water Field Operations Branch – Stockton) has recommended that the City increase the water supply production. In the 2006 Annual Inspection report they state "Based on this analysis, it appears that total City capacity may not be adequate during prolonged peak water usage. If one or more wells were off line for mechanical problems or MCL exceedences, the City's ability to meet peak demands would be further diminished." The proposed project helps rectify this existing, documented deficiency in the City's water system.	750,000	16,691	64,215	10	Stanislaus	III	2009

3036	1910239	1910239-009	LAKEWOOD - CITY, WATER DEPT.	Rehabilitation of Plant 13 Booster Station	The rehabilitation of Plant No. 13 includes the following:1. Replacement of the electric planel, which currently has no intetgrated safety system. The project removes the 3 wire set up that connect the electrical panel to each booster pump and replaces it with a 4 wire configuration with G.F.I. to meet current standards.2. Inceases the reliability, security and safety of the booster pumps. The existing booster pumps are in an unsecured confined space. This project removes the confined space and installs a new structure to house the electrical panel and the booster pumps.3. Replaces the steel piping that connects the five water tanks to the boosters and replaces the steel piping that connects the booster pumps to the discharge into the water distribution system. The piping from the tanks to the boosters and from the boosters to the water discharge have never been replaced. This project would increase the reliability from this storage facility and reduce the potential of water quality complaints triggered from this facility.	M	0	C	Plant No. 13 contains five welded steel tanks and four boosters. It maintains a storage capacity of 2.1 million gallons. Plant No. 13 has been operational for over 50 years without rehabilitation to the electrical and piping structure of the plant. The proposed project would correct seismic, safety and security problems at the facility.	1,900,000	20,219	66,000 07	Los Angeles	IV	2009
3037	1910239	1910239-010	LAKEWOOD - CITY, WATER DEPT.	City of Lakewood Water Main Replacement Project	The City of Lakewood has replaced over 33 miles of 4 inch unlined cast iron water mains since 1990. However, approximately 50 miles of 4 inch cast iron mains remains in the water distribution system. These mains not only create flow problems for fighting fires, but create water quality complaints due to rust suspended in the water. This project proposes to replace another 10.5 miles of water main. The project, once complete, will eliminate the rust which becomes suspended in the water when water flows increase in volume or change direction in the neighborhoods slated for water main replacement.	M	0	C	The City of Lakewood is plagued with customer complaints regarding rusty water. Most of the 109 complaints received in 2008 were related to rusty water. The source of rusty water is generally the 4 inch cast iron mains in the water distribution system. The City has approximately 50 miles if unlined cast iron mains and plans to replace these mains with C900 pipe.	5,320,000	20,219	66,000 07	Los Angeles	IV	2009
3038	1910239	1910239-008	LAKEWOOD - CITY, WATER DEPT.	City of Lakewood Plant #22 Reservoir Replacement Project	Though the inspector indicated that costs to repair the reservoir would not be cost effective, the proposed project would include an analysis of the renovation and retrofitting the tank to meet current structural standards, including seismic needs. The large expense associated with the rehabilitation of the existing structure has two significant drawbacks: requires a decrease in the reservoir's capacity due to the need to strengthen the existing walls and floor to meet new structural standards, and only extends the life of the facility approximately 20 years.Plant #22 is located in an established neighborhood. Adjacent homes are as close as 15 feet from the reservoir. This makes replacement a difficult task. Shoring restrictions, construction clearance, and construction sequencing need careful consideration. The replace of the reservoir would include the preparation of a pre-design report to determine project alternatives, geotechnical evaluation, fully engineered plans and specifications to construct the reservoir, demolition of the existing reservoir and booster pumps, construction of the reservoir, booster pumps, wet well and sump, piping connection to the adjacent well and associated electrical required for operation of the storage facility.	M	0	C	Plant #22 is a 2.5 million gallon partially buried all concrete reservoir built in the early 1950s. The reservoir is the only water storage facility on the west side of the service area, which makes it an important source of water generally but an essential source during emergency situations like earthquakes.According to the most recent inspection, the reservoir has significant structural concerns including cracks in the roof large enough to let rain enter the storage facility, a significant gap near the overflow weir, rust stains caused by exposed rebar and cracks in the floor. The joints in the reservoir are in poor condition. The inspector suspects seepage in several locations. The underdrain system is always wet, which could be the result of leakage, groundwater intrusion or both. The shape, size and design of the existing reservoir is conductive to stagnant water pockets which can result in the loss of chlorine residual and promote water quality problems. Plant #22 reservoir does not meet modern standards for water storage facilities. Replacement, rather than repair, is the more cost effective method of solving these structural problems. Plant #22 reservoir does not meet ACI 350-06 and ACI 350.3-06, that is an essential structure intended to remain usable for emergency services after a maximum credible earthquake. In fact, past earthquakes have moved the walls enough to initiate leaking at the joints.In addition the reservoir	5,500,000	20,219	66,000 07	Los Angeles	IV	2008

3039	4310005	4310005-002	City of Milpitas	Well Upgrade Project-Curtis 7076	This proposed project would complete the construction of the replacement well and meets Category C ranking criteria. The needed facilities include pumps, motors, controls, building, back-up generator, yard piping, and chloramination facilities. Preliminary indications are the well would have a capacity of approximately 1.5 mgd. Completion of this well would increase the local emergency water supply to 3.2 mgd, which is equivalent to 41% of winter demand. The project plans and specifications were completed in 2006 and construction bids were received. Due to higher than anticipated costs, the city did not award a construction contract. The plans and specifications went through peer-review and are being modified to incorporate suggestions. The City's Well Upgrade project includes multiple phases of work. These phases have been completed: design and construction of Pinewood Well improvements, design of Curtis Well improvements, and Curtis well drilling with casing. The City's accounting system does not allow us to identify the portion of the total project costs that were attributable to the Pinewood Well work. Therefore, the total project of $5,000,000 reflects the combined total amounts for both Pinewood Well and Curtis Well. The requested amount of $3,100,000 reflects only the amount needed to construct the remaining Curtis Well improvements as described above.	M	0	C	The City of Milpitas needs additional funding to construct the Curtis Well. The well is needed to increase the amount of local emergency water supply in the event a major seismic event or other catastrophe interrupts deliveries of imported supplies. The Curtis Well is a replacement for the City's former Marylinn Well, which was originally drilled in the 1950's as an irrigation well and did not meet Water Well Standards. In 1995-1996, the City was directed by CDPH to rehabilitate or destroy the Marylinn Well due to the direct influence of surface water and an inadequate sanitary seal. Due to the extensive amount of rehabilitation needed, the City destroyed the Marylinn Well and is constructing a replacement. This Curtis Well project falls under Category C in the project ranking criteria.The City of Milpitas is located between the Cities of San Jose and Fremont. The City is home to 66,200 residents, large and medium commercial retail outlets, and various industries including high-technical/electronic facilities. The City purchases treated drinking water from two wholesalers, San Francisco Public Utilities Commission (SFPUC) and Santa Clara Valley Water District (SCVWD). Average daily potable water purchase is 10.5 million gallons per day (mgd) through 14,808 service connections. The winter potable water demand is about 7.9 million mgd.The SFPUC wholesale water supply is seismically vulnerable	3,100,000	14,808	66,200	17	Santa Clara	II	2009
3040	4310005	4310005-003	City of Milpitas	Gibraltar Reservoir & Pump Station Improvements 7101	This project provides for significant rehabilitation of the Gibraltar Pump Station and Reservoir facility to correct the deficiencies. The proposed work includes: pump rehabilitation, replacement of diesel engines with electric motors to meet recently updated Bay Area Air Quality Management District regulations, automated chloramination facilities, overhaul of operational controls to allow for pressure set points, seismic upgrades for roof, wall, and diaphragm, sealing of concrete floors and masonry walls, installation of additional piping to allow for water recirculation and testing, plumbing of reservoir overflow to sanitary sewer to meet urban runoff program requirements, existing control room soundproofing, construction of an auxiliary building to house the operational control equipment, SCADA Center, and water quality monitoring equipment, installation of conduit and connections for future solar panels, installation of yard piping for future Curtis well connection, clean and paint the pump station exterior, exterior reservoir ladder replacement, pavement repair, and other related work.	M	0	C	The City of Milpitas needs additional funding to rebuild its Gibraltar Pump Station and Reservoir. This is a critical component in the City's potable water distribution system. The existing station pumps and engines are past their design lives and need to be replaced to comply with new air quality standards.The City of Milpitas is located between the Cities of San Jose and Fremont in the seismically active Silicon Valley. The City is home to 66,200 residents, large and medium commercial retail outlets, and various industries including high-technical/electronic facilities. The city purchases an average of 10.5 million gallons per day potable water purchase. The Gibraltar Pump Station and Reservoir facility is located at 641 Gibraltar Court. It houses 3 pump stations under one roof and two 5 million gallon reservoirs. Also located at this site are two of the City's five wholesaler Turnouts. Two peak-shaving pump stations can draw water from either reservoir into the distribution system at a capacity of 11,000 gallons per minute each. A booster station provides the capability to increase SCVWD Turnout pressure in the event SCVWD is experiencing water supply pressure problems. This facility is the heart of the Milpitas distribution system and its continued operation is essential to maintaining a safe water supply. This facility has been designated as a critical facility in the City's Seismic Improvements Strategic Plan	7,500,000	14,808	66,200	17	Santa Clara	II	2009

3041	4310005	4310005-001	City of Milpitas	S Milpitas Boulevard Pipeline Replacement 7098	The proposed project will replace approximately 4,800 linear feet of backbone piping consisting of aging unreliable 16-inch diameter welded steel water main with a seismically strengthened pipeline intended to withstand seismic events. The design criteria have been upgraded to meet backbone standards for pipelines located within liquefiable soils. These criteria include the use of a ductile material, restrained joints along the entire length, additional gate valves to allow for greater isolation of small pipeline segments, and polyethylene wrap for corrosion control. This phase of pipeline replacement spans along South Milpitas Boulevard between East Calaveras Boulevard and Yosemite Drive. In addition, the project scope will replace eight broken fire hydrant valves on Los Coches Street. If in the future one of these hydrants is sheared, the distribution system would remain in service while the hydrant is replaced.	M	0	C	The City of Milpitas needs additional funding to rebuild the backbone water pipeline in South Milpitas Boulevard. This major distribution pipeline is a critical component in the City's potable water distribution system. The existing pipeline is reaching the end of its useful life and has experienced several breaks. Replacement is needed to insure continuous water supply to the City's industrial service area under normal operating conditions and city-wide during emergencies.The City of Milpitas is located between the Cities of San Jose and Fremont. The City is home to 66,200 residents, large and medium commercial retail outlets, and various industries including high-technical/electronic facilities. Most of the city sits on liquefiable sandy/silty sediments. The Hayward Fault passes through the City's eastern foothills. The city purchases an average of 10.5 million gallons per day potable treated water supply. The water distribution system pipeline in South Milpitas Boulevard is a 16 inch diameter welded steel cylinder pipe that was installed in 1975. This pipeline conveys water from the SCVWD Turnout and City's primary pump station and reservoir facility to the distribution system. The pipe has experienced several breaks in the past 10 years due to corrosion as a result of failure of the exterior coating. The temporary solution of installing additional galvanic anodes along the pipeline has successfully delayed	3,100,000	14,808	66,200	17	Santa Clara	II	2009
3042	1910104	1910104-001	CALIFORNIA WATER SERVICE CO. - PALOS VER		DESIGN AND CONSTRUCT A SECOND LIFT TRANSMISSION MAIN TO PROVIDE GREATER RELIABILITY OF THIS COMMUNITY'S WATER SUPPLY. 3043	1910225	1910225-003	LAS VIRGENES MWD	Twin Lakes Pump Station Emergency Intertie	The Twin Lakes Pump Station Emergency Intertie project consists of three pipeline segments:1) a 2,900 foot long 14-inch main between the pump station and a 30-inch Las Virgenes MWD feeder,2) a 750 foot long 10-inch main between the MWD meter and pump station,3) a 200 foot long 12-inch main between the MWD feeder and meter as well as a meter upgrade. The pipelines will be installed in the public right of way (City of Los Angeles streets), a public park (City of Los Angeles Chatsworth Park South) and existing Las Virgenes MWD easements.	M	0	C	Twin Lakes Pump Station serves the area north and south of 118 Freeway west of Topanga Canyon Blvd and east of Ventura County. Supply for the pump station is treated water from the Metropolitan Water District of Southern California (MWD). The meter connection is on their West Valley Feeder # 2. Existing and future domestic and fire flow demands will exceed the capacity of the pump station and pipelines from the MWD connection to the pump station in the near future. When service is not available from MWD due to either planned or unplanned interruptions a temporary connection is made with the City of Los Angeles but is very limited in capacity. The construction of a 2,900 foot long 14-inch emergency connection to a Las Viregenes MWD 30-inch feeder will provide critical back up to meet maximum day demand at all times as required by section 64554 (a) of the Waterworks Standards.	1,398,000	20,838	70,000	22	Los Angeles	IV	2009

3044	4110022	4110022-001	City of Redwood City	Seaport Boulevard Water Transmission Pipelines Cathodic Protection Project	It is known that Providing Cathodic Protection to metallic infrastructure would increase its live up to more than 50%. This project proposes the replacement of the depleted cathodic protection system with a new system consisting of installation of Cathodic Protection Rectifiers for “active” type protection; installation of Galvanic Anodes for “passive” type protection; drilling and installing deep well anodes; and installation of test stations for system monitoring.	M	0	C	Seaport area is located on the east side of Redwood City; and is the venue of a very active Industrial and Business Park and also the Port of Redwood City. The water supply to these businesses relies on two transmission pipelines: one, 8 inch steel pipe installed in 1937; and two, a 16 inch steel pipe installed in 1978. Approximately 7,500 feet in length, each. Since its original installation, the pipes were provided with corrosion protection systems. However, the existing corrosion protection systems are no longer operational and need to be updated or replaced in order to extend the live of the pipelines.These pipelines have experienced breakages due to corrosion effects; resulting on service disruption, asphalt damage, traffic delays, man hours, and the potential risk of system contamination.Service disruption to this area represents great economic loses to private and public sectors.	300,000	22,992	75,402	17	San Mateo	II	2009
3045	4110022	4110022-006	City of Redwood City	Roosevelt Avenue and Valota Road Area Watermain Replacement Project	The decaying water mains, valves, domestic water services and deficient fire hydrants will be replaced with water systems made with safe, durable, functional and reliable materials in order to provide safe drinking water to the community and avoid risk of contamination. the minimum size of the water mains to be installed is 8 inch, the fire hydrant runs are 6 inch to comply with Fire Fighting requirements. In general, the work will consist on: Furnishing and installing new water systems, including pipes, shut off valves, air release valves, corrosion protection, pipe restraints, and all associated fittings, connecting to existing pipelines, vehicular and pedestrian traffic control and safety. Furnishing and installing new domestic water services, meter boxes, and service connections. Furnishing and installing new fire hydrant assemblies and removing existing fire hydrants. Performing all necessary pressure testing and disinfection of water pipe; and bacteriological examination in compliance with CDPH. All work to be performed providing storm water pollution prevention.	M	0	C	The Project proposes replacement of highly tuberculated cast iron water mains, some of them up to 87 years old. These water mains show a high incidence of breakage; this condition results not only in service disruption, but also releases a series of Health Risks:1-Potential system contamination,2-Redish color in the drinking water due to operation of highly corroded valves; and3-Potential spread of Iron Bacteria.The sizes of the water mains to be replaced ranges from 2 through 6 inch in diameter. All of these sizes are considered sub-standard, as the 2 inch mains provide deficient water supply to the homes been served and will not support the functioning of domestic fire sprinkler systems due to low water flow and excessive pressure losses. 4 inch mains do not support the functioning of Fire Hydrants. The majority of the existing Fire Hydrants are tapped to the 6 inch water mains. The distance between existing Fire Hydrants exceeds the maximum distance allowed by the Fire Code. In general, due to the degree of tuberculation, the inside diameter of the pipes is expected to be reduced and the internal wall roughness to be high, resulting in low Fire Flows.	1,430,000	22,992	75,402	17	San Mateo	II	2009

3046	4110022	4110022-003	City of Redwood City	Poplar and Junipero Area Watermain Replacement Project	The decaying water mains, valves, domestic water services and deficient fire hydrants will be replaced with water systems made with safe, durable, functional and reliable materials in order to provide safe drinking water to the community and avoid risk of contamination. The minimum size of watermain will be 8 inch. The Fire Hydrant runs will be 6 inch to comply with fire fighting requirements. The project includes the installation of 2,650 linear foot of 12 inch mainline that will serve as transmission line from the SFPUC Bay Division Pipelines to the area and connect to another backbone waterline to provide additional water source in case of emergency. In general, the work will consist on:Ø Furnishing and installing new water systems, including pipes, shut off valves, air release valves, corrosion protection, pipe restraints, and all associated fittings, connecting to existing pipelines, vehicular and pedestrian traffic control and safety. Ø Furnishing and installing new domestic water services, meter boxes, and service connections.Ø Furnishing and installing new fire hydrant assemblies and removing existing fire hydrants.Ø Performing all necessary pressure testing and disinfection of water pipe; and bacteriological examination in compliance with CDPH.Ø All work to be performed providing storm water pollution prevention.	M	0	C	The Project proposes replacement of highly tuberculated cast iron water mains, some of them up to 81 years old. These water mains show a high incidence of breakage; this condition results not only in service disruption, but also releases a series of Health Risks:1-Potential system contamination,2-Redish color in the drinking water due to operation of highly corroded valves; and3-Potential spread of Iron Bacteria.The sizes of the water mains to be replaced are 6 inch in diameter. This size is considered sub-standard, as the majority of the existing Fire Hydrants are tapped to the 6 inch water mains. The distance between existing Fire Hydrants exceeds the maximum distance allowed by the Fire Code. In general, due to the degree of tuberculation, the inside diameter of the pipes is expected to be reduced and the internal wall roughness to be high, resulting in low Fire Flows.	1,126,000	22,992	75,402	17	San Mateo	II	2009
3047	4110022	4110022-002	City of Redwood City	Valota and Jefferson Area Watermain Replacement Project	The decaying water mains, valves, domestic water services and deficient fire hydrants will be replaced with water systems made with safe, durable, functional and reliable materials in order to provide safe drinking water to the community and avoid risk of contamination. Minimum size of watermains to be installed is 8 inch. Fire hydrants run will be 6 inch to comply with fire protection requirements. In general, the work will consist on:Ø Furnishing and installing new water systems, including pipes, shut off valves, air release valves, corrosion protection, pipe restraints, and all associated fittings, connecting to existing pipelines, vehicular and pedestrian traffic control and safety. Ø Furnishing and installing new domestic water services, meter boxes, and service connections.Ø Furnishing and installing new fire hydrant assemblies and removing existing fire hydrants.Ø Performing all necessary pressure testing and disinfection of water pipe; and bacteriological examination in compliance with CDPH.Ø All work to be performed providing storm water pollution prevention.	M	0	C	The Project proposes replacement of highly tuberculated cast iron water mains, some of them up to 87 years old. These water mains show a high incidence of breakage; this condition results not only in service disruption, but also releases a series of Health Risks:1-Potential system contamination,2-Redish color in the drinking water due to operation of highly corroded valves; and3-Potential spread of Iron Bacteria.The sizes of the water mains to be replaced ranges from 2 through 6 inch in diameter. All of these sizes are considered sub-standard, as the 2 inch mains provide deficient water supply to the homes been served and will not support the functioning of domestic fire sprinkler systems due to low water flow and excessive pressure losses. 4 inch mains do not support the functioning of Fire Hydrants. The majority of the existing Fire Hydrants are tapped to the 6 inch water mains. The distance between existing Fire Hydrants exceeds the maximum distance allowed by the Fire Code. In general, due to the degree of tuberculation, the inside diameter of the pipes is expected to be reduced and the internal wall roughness to be high, resulting in low Fire Flows.	1,378,000	22,992	75,402	17	San Mateo	II	2009
3048	4110022	4110022-004	City of Redwood City	Glenwood Pump Station Retrofit	The Glenwood Pump Station Improvements Project consists of upgrading the existing motors, pumps, furnishing VFDs, building enclosure, and permanent standby engine generator.	M	0	C	The operation of the Glenwood Pump Station was evaluated to determine whether it meets the flow and pressure requirements to convey water into the Lakeview Reservoir and Lakeview Pump Station for reliability and emergency supply. The evaluation concluded that the Glenwood Pump Station needed to be improved by increasing the horsepower of the motors and changing the existing vertical turbine pumps. The reliability of the Glenwood Pump Station is critical since it is one of the two sources that is connected to the San Francisco Public Utilities Commission Hetch Hetchy pipeline turnout.	700,000	22,992	75,402	17	San Mateo	II	2009

3059	1910009	1910009-016	VALLEY COUNTY WATER DIST.	Distribution System Piping Replacement	The District's consulting engineer will prepare Engineering Plans and Specifications for the identified pipelines to be replaced with a minimum 8-inch diameter. The District will then solicit competitive bids for the construction of the pipelines and award a contract. The District will perform all construction inspection as well as project management of the pipeline construction.	M	0	C	The District currently has approximately 14.5 miles of undersized mains 4-inch and smaller, equaling about 13% of the total system . These pipelines are also 50-years and older, therefore approaching the end of their useful life cycle. These undersized mains pose problems for flows and pressures in the areas of the Distribution system where they are located.	4,600,000	12,323	77,130	15	Los Angeles	IV	2011
3060	1910009	1910009-009	VALLEY COUNTY WATER DIST.	Infrastructure Replacement	To purchase new and improved SCADA equipment for monitoring of the water system. To install intrusion alarms on all water production and storage facilities to be monitored by the SCADA system.	M	0	C	Water security improvements needed.	400,000	12,323	77,130	15	Los Angeles	IV	2008
3061	1910009	1910009-011	VALLEY COUNTY WATER DIST.	Water Storage Improvements	The District will purchase land and construct two 3.0 million gallon ground storage reservoirs and an affiliated booster pumping station and necessary piping to connect to the existing distribution system.	M	0	C	The District needs to acquire property and construct new storage reservoirs and a booster pumping station to help meet storage requirements for max day and peak hour demands as well as fire flow requirements. The District has an identified need for an additional six million gallons of storage capacity.	3,175,000	12,323	77,130	15	Los Angeles	IV	2008
3062	1910009	1910009-010	VALLEY COUNTY WATER DIST.	Distribution Piping Replacement	The District will have its Consulting Engineer develop Plans and Specifications for the installation of the required pipelines as well as assist with Project Management. The District will competitively bid out the project, award a contract and inspect construction. The District would replace all 4-inch and under pipelines with a minimum of 8-inch pipe.	M	0	C	The District currently has approximately 110 miles of water mains, of this approximately 14.5 miles are 4-inch and smaller in size. This equates to 13% of the total system pipes. By replacing these pipelines with a larger size, will improve distribution system pressures and fire flows.	2,500,000	12,323	77,130	15	Los Angeles	IV	2008

3063	2810003	2810003-008	Napa, City of	Alta Heights DBP Compliance and Fire Protection Improvements	Each pressure zone in the region was analyzed individually, as the upper and lower pressure zone. In order to facilitate the movement of fresh water and meet the fire flows in the upper region, it was determined that the existing pump station needs to be upgraded with larger pumps. Since these pumps need to push water 3/4 of a mile to a pressure tank, the losses in the pipe are too severe, even with the existing pumps. It is clear that the full length of pipeline between the pump station and the pressure tank needed to be upgraded to reduce the friction losses.To improve the movement of fresh water, meet fire flows, and obtain regular use of the water from the gravity tank to eliminate the stagnant water issue and avoid the creation of THMs and HAAs, the system must be redesigned so all fire hydrants are connected to the gravity system, and only the homes above a certain elevation to be served off of the pressure system (which would reduce the number of homes dependent on the pressure system by 80%). This will provide better turnover of the large gravity tank and make the fire hydrants more reliable. This will also increase the reliability of critical water supplied to the area by reducing the impacts of the small pressure tank, and be able to provide water to the residences in this area for a longer period of time if power is lost as is common during an emergency event.The lower system, currently	M	0	C	There are two immense benefits that result by making improvements to the water system in the Alta Heights Area of the City of Napa: ensure compliance with the Department of Public Health's Disinfection By-product Rule DBPR) and increase fire flows to meet current Fire Code Regulations. Due to heightened awareness after the fires in Oakland hills, the fire risk areas of the City of Napa (City) were analyzed. The Alta Heights regions were deemed to be the largest risk for fires in the City due to the topography of the area, and the proximity of the homes. If a fire were to reach this area, and the fire breached the hill, the entire City would be at risk from the fire, as the high home density and tree-covered hills would facilitate rapid spreading of the fires through the adjacent area of high density homes.The Alta Heights region was originally developed in the 1950's, thus the water system was not designed to meet today's fire flow requirements. The water system consists of two pressure zones. Both pressure systems depend on a single pump station (located at the base of hill) to maintain power and not be taken off-line. This single pump station system currently serves the entire region along the fire risk area. The only support available is aircraft water drop support.The upper zone consists of a single long dead-end pipe approximately 1-mile in length, with a 60,000 gallon fire tank as the only redundancy to the system. This system lies along the	3,000,000	24,990	79,959	03	Napa	II	2009
3064	2810003	2810003-010	Napa, City of	Pressure Regulator Monitoring Improvements	This project will include the installation of pressure gauges on each side of the pressure regulators, remote valve operation installed for each meter at each regulator, and remote monitoring on the City's SCADA system. This project incorporates all 12 pressure regulators.The work will incorporate providing power to each regulator pit, equipment necessary to remotely operate the valves, equipment to monitor flow and pressure on each side of the meters, and SCADA changes to incorporate the pressure regulators, the settings, and activity at each regulator.This work results in less than significant environmental impacts because it is upgrading existing facilities. The design is near complete at this time and upon approval of funding the construction can commence during July 2009.	M	0	C	The City of Napa's water system is broken down into five pressure zones. Of these pressure zones, two are served by gravity tanks and supported by pressure regulators. There are twelve regulators, each with two meters to move water from the main pressure zone (directly served by the City's treatment plants) into the lower pressure zones.The regulators are not on the City's SCADA system which would allow staff to monitor water movement through the pressure regulators. Currently, flow gauges are used to monitor the flow through the meters, but the information is collected manually, and does not indicate if the valves are open or why they are open.Several years ago, during a standard shutdown for construction, 700 homes were unexpectedly out of water. It took over an hour to determine the regulator that should have been back-feeding the area was closed. Although all confirmation water quality tests met regulations, and no contamination was introduced into the system, there was cause for great concern associated with the uncertainty. This issue could have been resolved immediately and staff assured of the system integrity if the regulator status information was available through the SCADA system.In early 2009, one of the tanks in the lower pressure zone reached higher levels than permitted by the settings of the altitude valve. No settings in the system had been changed, so significant	800,000	24,990	79,959	03	Napa	II	2009

3065	2810003	2810003-011	Napa, City of	Silverado Area Pressure Zone Modifications	This project will shift homes impacted by the low pressure areas into a higher pressure zone. This work includes the installation of approximately 7,000-ft of new 12" water main along the main access road. This water main will facilitate better system flow by looping a series of dead-end water mains and will provide the means to transfer services to the upper pressure zone.As each property owner may need to add a pressure reducer on their service to manage the additional pressure, the City's contribution to the project will cover the significant cost to transfer each of the services to the new water main and to work with each property owner to have a pressure reducer installed on the service side of the facility. Approximately 275 residents will be switched over to the higher pressure zone, another 150 residents will benefit from the additional looped systems, and the City of Napa will ensure compliance with the DBPR and meet the goal of delivering high quality water at a consistent pressure to each customer.This project has no significant environmental impacts since it all takes place in the existing roadway and street section. The design of this system will be complete by April such that the bid package can be released in June. Upon confirmation of funding, construction of this work can start in early July 2009.	M	0	C	The Silverado region of the City of Napa's water service area contains three pressure zones due to the nature of the steep hillsides and rapid increases in elevation of the distribution system. The majority of this water infrastucture was designed and installed in the late 1960's. The system included transmission mains, a pump station, and a storage tank. Portions of the water mains installed in the 1960's served a large number of homes from the lower of the three pressure zones. Due to the fact that this system is served by conveyance of water through a long dead-end line at the furthest point from the City's primary treatment facilities, the water quality is reduced, chlorine residual is low and the formation of Trihalomethanes (THMs) and Haloacetic Acids (HAAs) can occur due to the time elapsed for the water to travel from the treatment plant to this location. This area threatens the City's ability to meet the Disinfenction Byproduct Rule (DBPR). In addition, the pressure at several high points along the main access road has been determined to be extremely low, too low to incorporate fire flows to the region as it might reduce the pressure below 20 psi and increase the potential of system contamination due to backpressure on the system from the higher elevations.	1,400,000	24,990	79,959	03	Napa	II	2009
3066	2810003	2810003-009	Napa, City of	Replacement of Failed 4MG A-Tank	The project replenishes 4MG of treated water storage in the distribution system that was lost during the summer of 2006 due to failure of the prestressed concrete tank. The project will demolish the failed 4 MG concrete tank and replace it with a 4 MG steel tank within the same footprint on the site. The new replacement tank will tie into the distribution piping that exists to the site. There are no significant environmental impacts on the site since it is replacement of an existing tank within the footprint of the failed tank. The site is on preoperty owned by the City of Napa and the construction impact area will be within an area that is paved with asphalt.The design of this replacement project is near complete and the drawings and specifications will be ready to go out to bid in May 2009. Upon approval of funding, construction of this project can start in July 2009.This project will contribute to job creation or retention within the steel manufacturing, transportation, and construction industries.	M	0	C	The existing 4 million gallon (MG) prestressed concrete tank, A-Tank, in the City of Napa's distribution system unravelled and failed during summer 2006. The distribution system has been void of 4 MG of system storage since the tank failure. The reduced water storage decreases the reliability of the water system in the event of transmission main leaks and the need for temporary shut downs. There is increased risk to public safety with reduced system storage since there is less fire flow storage available especially during the dry summer months when peak system demands and high fire dangers coincide.	5,100,000	24,990	79,959	03	Napa	II	2009

3067	2810003	2810003-013	Napa, City of	Browns Valley Corrosion Protection Project	Our corrosion specialist has devised two basic options that would ensure protection of the existing pipe and avoid total pipe replacement. One of the options is to dig up each section of pipeline and bond each section together with anodes (which would cost approximately $13,000,000). This method would create more certainty of connection to the services and the water mains, and ensure corrosion protection on all services.However, the most cost-effective method and highly preferred by the City is to attach corrosion protection at each water meter and hydrant. The density of the houses in this area ensures that the majority of pipelines will be protected, and it will avoid the need to dig in the street sections. This will protect over 90% of the water mains for $1,600,000.This corrosion protection will retain the condition of the pipelines, noting that minimal pipeline replacements will be required in select areas if the pipes are too corroded. However the project will have low impact on the streets and services, and will gain 30 to 50 years of life on the existing pipe, allowing funds to be focused towards upgrading under sized water mains and pipelines in the City that have reached their useful lives of 80 to 100 years old.With this project, we will attach sacraficial anodes to approximately 1400 services and approximately 300 hydrants with a corrosion designed to protect the water services and water mains for 50 years. The design ill be simple and consistent	M	0	C	From the 1960's through the 1980's, ductile iron pipe and copper services were installed throughout the City of Napa (City). In 2002 water mains that were only 30 years old started to fail in the Browns Valley region of the City. When crews repairded the leaks, the pipe was observed to be seriously corroded around the pipe or along the bottom. For the past 5 years, the number of leaks in Browns Valley has increased dramatically indicating the need for action to protect the water facilities in the region from further corrosion damage. Recently, a corrosion specialist conducted a basic soils test in the region to analyze the severity of corrosion that will continue to our distribution system if the problem is not addressed. The whole area was determined to have highly corrosive soils, and the problem is exasperated due to high levels of fast moving groundwater in the region. Approximately 1500 homes, 100 commercial services, and a school are impacted by this issue in addition to approximately 30 miles of pipelines. To replace the water mains would cost over $31,000,000, an excessive cost that the City can not afford. Each leak is a potential health risk to our customers due to the potential for contamination to enter into the distribution system. Some leaks aren't discovered for long periods of time, further increasing contamination risks and contributing to the loss of water in a time when water supply and conservation of	1,500,000	24,990	79,959	03	Napa	II	2009
3068	3610037	3610037-010	REDLANDS CITY MUD-WATER DIV	Country Club Reservoir #1 Upgrade	City of Redlands's Country Club reservoir number 1, was constructed in 1924 in a residential neighborhood in the city and has a storage capacity of 1.0 million gallons. The partially buried potable water reservoir has an outside diameter of approximately 103 feet and a depth of nearly 18 feet. The reservoir currently operates in tandem with Country Club Reservoir number 2 which is located at the same site. In order to effectuate needed improvements at the Country Club reservoir site, city will need to repair, upgrade or install approximately $1.8 million of infrastructure. These facilities will allow city to meet existing and future demands and improve water quality, distribution, and storage. To meet these demands, city will install at the Country Club Reservoir site:• New one-million gallon reservoir. The findings of a Dive Corr inspection report indicated numerous horizontal cracks around the circumference of the walls, root intrusion through cracks at the bottom slab and walls, extensive concrete spalling at the exterior walls above grade, and possible leaking along the joint at the base of the wall. Because of these findings city is currently designing a replacement reservoir. This reservoir is to be the same volume and at the same location as the existing one. • Installation of 3,650 gallon per minute booster station. The existing booster at the County Clus site are equipped with out-of-date electrical panels and controls that no longer provide	M	0	C	City of Redlands's Country Club reservoir number 1, was constructed in 1924 in a residential neighborhood in the city and has a storage capacity of 1.0 million gallons. The partially buried potable water reservoir has an outside diameter of approximately 103 feet and a depth of nearly 18 feet. The reservoir currently operates in tandem with Country Club Reservoir number 2 which is located at the same site. In the 1970's the California Department of Public Health began requiring potable water reservoirs be covered. In turn, Country Club number 1 had a membrane-type covering installed. In 1980, this cover was replaced with an aluminum geodesic dome. This added additional weight to the top of the reservoir wall which was not considered during the original design to support. This additional weight coupled with the reservoirs age has caused the cracking and leaks in the side of the walls. As part of a routine maintenance program, city had the reservoir inspected in July of 2003 by Dive Corr Inc. Inspection activities included a visual inspection of the interior of the reservoir by an experienced diver and tank inspector with the reservoir in service. The findings of the inspection identified numerous horizontal cracks around the circumference of the walls, root intrusion through cracks at the bottom slab and walls, extensive concrete spalling at the exterior walls above grade, and potential leaking along the joint at the base of the wall. Severe	1,800,000	21,851	80,000	13	San Bernardino	V	2009

3069	2410009	2410009-008	MERCED, CITY OF	Source Water Contaminants Removal	The City proposes to install an ion exchange wellhead treatment at well site 7 for nitrate removal. The equipment is anticipated to include three 12 foot diameter ion exchange vessels, a brine storage tank, brine waste storage tank, pumps, water softeners, analyzers and system control panels, inline continuous monitoring equipment, and a building.The City proposes to treat Arsenic using coagulation/filtration treatment system. The system consists of: Design and Construction at two different well sites. Components would include: Static mixers, six seven feet (7ft) diameter by fourteen foot (14ft) long filter vessels, actuated control valves, control panels, two thirty feet (30ft) diameter by sixteen feet (16ft) tall wash water holding tank, pumps, chemical feed systems, chemical storage tanks, inline continuous monitoring equipment, and two buildings to house the equipment.	M	0	C	The City of Merced Water System has two Source water wells that contain an average of 50 milligrams per Liter (52 mg/L) of Nitrates each, the Maximum Contaminant Level (MCL) is 45 mg/ L. The CDPH regulates Nitrates at 38 mg/L. The City has to remove some of the Nitrates in order to meet regulatory requirements.One of the City of Merced Source wells has an average of 12 micrograms per Liter of Arsenic while another well averages 9 micrograms per Liter of Arsenic. The MCL for Arsenic is 10 micrograms per Liter. The City has to remove some of the Arsenic in order to meet regulatory requirements.	10,000,000	20,262	80,608	11	Merced	III	2011
3070	3010003	3010003-001	City of Buena Park	Emergency Intertie Between City of Buena Park and Anaheim	Buena Park would connect an existing 12" water main to an underground connection facility in a secured vault at one of several possible locations. The City of Anaheim would do likewise. The interconnection facility will include components such as control valve, check valve, isolation valve, blow off valve, flow metering and telemetry connections. The control valve would automatically activate in case of pressure drop to either water system. Once constructed, the intertie will provide both cities with access to supplemental water during an emergency that interrupts flow from their own sources. The proposed intertie will be able to deliver up to 4.5 MGD during emergencies.	M	0	C	The City of Buena Park (City) currently has no emergency interties. The City's 2005 Water Master Plan Study recommended that several be installed. The proposed intertie between the City and Anaheim water systems would be a two-way emergency only interconnection. The City of Anaheim previously submitted this intertie for funding in 2007 along with another intertie between Anaheim and the City of Orange. The intertie was listed as number 30 on the list for water system security projects, chapter 3 of Prop 50. The cover page of the list stated that almost all funding for that section was committed. “Most likely no projects will be invited for funding in 2008/2009.” No funding was offered.	300,000	20,422	82,450	08	Orange	V	2009
3071	4210004	4210004-014	GOLETA WATER DISRICT	GWD-City of SB Sterret Interconnect	Install new water system interconnection including: New concrete interconnect enclosure, two booster pumps, pressure and flow control valves, shutoff valves, metering equipment, associated piping into interconnect enclosure, approximately 800 feet of 20 inch piping in street to tie into the city of Santa Barbara's water system, electrical switchgear panels, control and SCADA panels. This would allow for transfer of approximately 2800 gpm in either direction (a 42% increase in water transfer rate).	M	0	C	During warm weather, high water demand periods or when either water system treatment plant is offline for maintenance purposes, moving water from one system to another is currently very restricted to a maximum of 1600 gpm in either direction. Both water systems could use substantially more capacity to transfer water in case of treatment problems during high summer demand periods or having the ability to have one treatment plant offline for an extended period in wintertime for construction or maintenance purposes.	500,000	16,088	84,000	06	Santa Barbara	IV	2009

3072	4210004	4210004-013	GOLETA WATER DISRICT	San Ricardo Well ASR Rehab	Rehabilitate the existing well for Aquifer Storage and Production (ASR). Clean existing well bore. Test for well production and injection capacities. Install new - well pump/motor, pump column, injection piping, electrical motor control center, filter under drains and media, valves and electric actuators, ASR control panel with new PLC and tied to district SCADA system, liquid chemical feed systems, well water level transducer for constant level monitoring, online chlorine residual and turbidimeter, auto-dialing alarm monitor, video-graphic chart recorder with historical data retention capability. Replace filter backwash settling tank and aeration/detention tank.	M	0	C	San Ricardo well was last used for production purposes in 1991 during a severe drought. The well has sat idle since then and is now in need of major repairs. The well pump and motor were recently tested with an overall efficiency of 2.5%, so the pump and motor need to be replaced. The district has switched all of its treatment facilities to liquid chemical feed systems, from gas chlorination, so this equipment also needs to be replaced. The Filtronics Iron and Manganese filter needs to have the media replaced and all valves and actuators replaced. The electrical switchgear does not meet current standards and needs to be replaced. The original well control system is obsolete and needs to be replaced to work with our current SCADA system. The well is expected to produce 500-750 gpm and would reduce our need to import State water by making better use of our existing groundwater supply. The district has also used this well for injection purposes in the past, and would like to automate this for higher injection rates in the future.	600,000	16,088	84,000	06	Santa Barbara	IV	2009
3073	1910146	1910146-008	SANTA MONICA-CITY, WATER DIVISION	10th Court, 11th Court and Marguerita Avenue	This project entails replacement of mains in three streets. The project groups three streets into one project for geographic proximity and cost efficiency. Tenth Court - replace 1570 l.f. of 6" CIP with 8" DIP. Eleventh Court - replace 1355 l.f. of 6" CIP with 8" DIP. Marguerita Avenue - replace 1620 l.f. 8" CIP with 8" DIP.	M	0	C	Existing mains are cast iron pipe and were installed in approximately 1920. Repeated main breaks indicate pipes are at their end of useful life. Mains are undersized to meet present day domestic and fire flow demands.	748,603	17,098	84,184	16	Los Angeles	IV	2009
3074	1910146	1910146-007	SANTA MONICA-CITY, WATER DIVISION	Euclid Court and 12th Court Main Line Replacement	The project entails three main replacement projects in two streets. The project groups the streets into one project for geographic proximity and cost efficiency. Twelfth Court - replace 688 l.f. of 6"CIP with 8" DIP. Euclid Court - replace 2100 l.f. of 8" CIP with 8" DIP. Euclid Court - replace 3880 l.f. of 12" CIP with 12" DIP.	M	0	C	Existing mains are cast iron pipe and were installed in approximately 1920. Repeated main breaks indicate pipes are at the end of their useful life. Mains are undersized to meet present day domestic and fire flow demands.	1,100,634	17,098	84,184	16	Los Angeles	IV	2009
3075	1910146	1910146-009	SANTA MONICA-CITY, WATER DIVISION	Third Court Water Main Replacement	Replace 2120 l.f. of 8" CIP with 12" DIP. Project includes replacement of all domestic and fire protection services. The project is located in a high density office/professional/commercial/residential area with adjacent underground garage parking for all buildings. Third Court is a concrete paved alley which presents significant construction and staging challenges.	M	0	C	Existing main is 8" cast iron pipe installed approximately 1920. Repeated breaks indicate pipe is at the end of its useful life. This main is located in a high value commercial district. The existing pipe is undersized to meet present day domestic and fire flow demands.	1,584,700	17,098	84,184	16	Los Angeles	IV	2009

3076	5610023	5610023-003	VENTURA WWD NO. 8 - SIMI VALLEY	1330 / 1172 Interzone Connection	The 1330 / 1172 Zone Interconnection consists of construction of approximately 1,000 feet of 8-inch water line and a pressure reducing station to connect the 1330 Zone with the 1172 Zone. The pressure reducing station will include monitoring and control equipment to operate the valves supplying the 1172 Zone from the 1330 Zone while maintaining a range of water levels and storage in the Mellow Lane Tank.	M	0	C	The City of Simi Valley, Ventura County Waterworks District No. 8 (District) operates the 1172 Zone and the 1330 Zone to supply water to a portion of the City of Simi Valley. Water facilities for the 1172 Zone include the Mellow Lane Tank, which is deficient in storage capacity with only 423,000 gallons that does not provide for adequate reliability and fire storage. The 1172 Zone requires a minimum of 390,000 gallons of storage to maintain proper pressure regulation plus 360,000 gallons of additional storage in reserve to meet the District standard for fire storage and reliability. The Casual Court Pump Station operates with the Mellow Lane Tank to supply the 1172 Zone.With deficient storage, the 1172 Zone is more vulnerable to a loss of supply and water pressure from a pump station failure, power outage affecting the pump station, or broken fire hydrants or water mains that could result in boil water orders to be issued.Water facilities for the 1330 Zone include the Wood Ranch Tank No. 3 with a capacity of 3,000,000 gallons, which has excess capacity that lead to excessive stored water detention times resulting in water quality degradation from disinfectant residual loss and nitrification of the stored water. Chlorine treatment of the stored water to address nitrification leads to increased trihalomethanes and other disinfection byproducts that can exceed Maximum Contaminant Levels.Interconnecting the 1330 Zone to	300,000	24,811	86,000 06	Ventura	IV	2009
3077	5610023	5610023-005	VENTURA WWD NO. 8 - SIMI VALLEY	Emergency Generators for Select Pump Stations	The project consists of the installation of one emergency generator, driven by natural gas or propane, at the following facilities:a) Oak Knolls Pump Stationb) Station No. 2 Pump Stationc) Station No. 3 Pump Stationd) Alta Vista Pump Statione) Cottonwood Pump Stationf) Bridal Path No. 2 Pump Station	M	0	C	The City of Simi Valley, Ventura County Waterworks District No. 8 (District) operates a number of pump stations that supply water to various areas with distribution systems that have marginal water storage capacity and are potentially deficient in relability. These pump stations include the following:a) Oak Knolls Pump Station serving the Santa Susana Knolls areab) Station No. 2 Pump Station serving the Box Canyon areac) Station No. 3 Pump Station serving the Box Canyon aread) Alta Vista Pump Station serving the Santa Susana Knolls and Box Canyon arease) Cottonwood Pump Station serving a portion of the City of Simi Valleyf) Bridal Path No. 2 Pump Station serving a portion of the City of Simi ValleyEach of these pump stations operate in distribution systems with marginal water storage capacity and have experienced power outages that have resulted in severe water pressure losses and near loss of supply.Boil water orders can result from a loss of water pressure and supply due to a pump station failure from a power outage.	720,000	24,811	86,000 06	Ventura	IV	2009

3078	5610023	5610023-004	VENTURA WWD NO. 8 - SIMI VALLEY	Water Storage Mixing Systems	The project consists of the installation of Solar Bee Water Circulation Systems (or equivalent systems) in the following District water storage tanks:a) Walnut Tank No. 1b) Walnut Tank No. 2c) Stow Street Tank No. 1d) Stow Street Tank No. 2e) Stow Street Tank No. 3f) Stow Street Tank No. 4g) First Street Tank No. 1h) First Street Tank No. 2i) First Street Tank No. 3j) First Street Tank No. 4The circulation systems will also include a chemical feed system designed to work with the circulation systems to add sodium hypochlorite solution at a low dose and with efficient mixing to boost a declining disinfectant residual, if necessary due to excessive stored water detention time, while limiting trihalomethane and other disinfection byproduct formation.	M	0	C	The City of Simi Valley, Ventura County Waterworks District No. 8 (District) operates and maintains more than 40 water storage tanks, ranging in capacity from 20,000 gallons to 5,000,000 gallons, throughout its service area including portions of the City of Simi Valley and unincorporated areas of Ventura County. The tanks provide operating storage for proper regulation of water pressures, water supply reliability, and fire storage in reserve for their service areas.Under normal operating conditions, a small portion of the stored water is used while the larger portion remains in the tank for reserve and fire resulting in longer detention time for the water stored in the tank. Stored water detention times in excess of five days can cause water quality degradation due to disinfectant residual loss and nitrification. The lack of proper water circulation and related temperature stratification effectively increases the stored water detention times and exacerbates the water quality degradation.Treating the stored water with chlorine to address the residual loss and nitrification can increase trihalomethanes (THMs) and other disinfection byproducts to exceed Maximum Contaminant Levels (MCL). Also, inefficient chlorine feed to treat the stored water can further exacerbate the levels to THMs and other disinfection byproducts to exceed the MCL.	800,000	24,811	86,000	06	Ventura	IV	2009
3079	4310020	4310020-001	City of San Jose - Evergreen/Edenvale	Timberline Drive Main Replacement	Replace existing steel mains with approximately 1,500 feet of ductile iron pipe and reconnect customers.	M	0	C	Aging infrastructure and deteriorating steel mains resulting in increased main breaks and decreased system reliability	660,000	21,902	88,196	17	Santa Clara	II	2009
3080	4310020	4310020-005	City of San Jose - Evergreen/Edenvale	Gumdrop Drive Main Replacement	Replace existing steel water mains with approximately 2,500 feet of ductile iron pipe and reconnect customers. M	0	C	Aging infrastructure and deteriorating steel water mains resulting in increased water main breaks and decreased system reliability causing health and safety problems to the public.	1,000,000	21,902	88,196	17	Santa Clara	II	2009
3089	4310020	4310020-008	City of San Jose - Evergreen/Edenvale	Elkins Way Main Replacement	Replace existing steel mains with approximately 1500 feet of ductile iron pipe and reconnect customers.	M	0	C	Aging infrastructure and deteriorating steel mains resulting in increased main breaks and decreased system reliability	800,000	21,902	88,196	17	Santa Clara	II	2009
3090	4310020	4310020-006	City of San Jose - Evergreen/Edenvale	Villa Vista Pump Station and Tank Infrastructure Upgrades	Modify and upgrade existing piping at pump station and reservoir facility, including the installation of siesmic retrofits.	M	0	C	Aging infrastructure and current piping configurations may result in increased main breaks and failure during siesmic events	1,030,000	21,902	88,196	17	Santa Clara	II	2009
3091	1910051	1910051-006	INGLEWOOD- CITY, WATER DEPT.	Water main improvement project	Tasks involved for the project includes replacement of old water main, install numerous sampling stations and flushing stations.	M	0	C	In some areas there was a presence of nitrate detected. Most water pipes are very old, approximately 50 years old, and needs replacement.	2,000,000	14,916	100,000	15	Los Angeles	IV	2012
3092	1910051	1910051-002	INGLEWOOD- CITY, WATER DEPT.	Morningside Reservoir Rehabilitation	Rehabilitation of the City's Morningside water supply reservoir is anticipated to provide assurance of water quality, reliability, for operational, emergency and fire storage to the water distribution system, during and after a major seismic event.	M	0	C	Incorporated in 1908 the City of Inglewood serves a constituency of 112, 600 persons, located on the Coastal Plain adjacent to the Baldwin Hills in Los Angeles County. The City is responsible for domestic water supple to 14,000 customers. The City completed a water master plan update in 2005 which identified several major improvements to its water system. The programs and projects described herein will increase water system reliability for domestic and fire suppression supplies within the City's water service area. This effort will be completed in time to provide definitive input as to specific projects which will be initially addressed under the proposed "Water System Infrastructure Program" (WSIP). This program is considered to be a significant first step and of primary importance toward reaching the City's goal of a more effective and efficient water supply and storage system.	3,200,000	14,916	100,000	15	Los Angeles	IV	2009
3093	1910051	1910051-001	INGLEWOOD- CITY, WATER DEPT.		DEMOLISH THE EXISTING RESERVOIR AND RECONSTRUCT THREE 5.3 MG PRESTRESSED CONCRETE RESERVOIRS.	M	0	C	16 MG RESERVOIR IS DETERIORATED DUE TO AGE AND SEISMIC ACTIVITY OF THE REGION. IT ALSO HAD BACTI PROBLEMS.	10,000,000	14,916	100,000	15	Los Angeles	IV	1998

3094	4810003	4810003-001	City of Fairfield	East-West Water Transmission Pipeline, Easterly Segment 6B	The ambitious East-West Water Transmission Pipeline (Project) was developed to address both of the previously described service and supply problems. The Project was originally planned in two large, distinct portions, including about 2.5 miles of 30-inch pipeline from Hale Ranch Road near the Fairfield Anheuser-Busch brewery to the intersection of Westamerica Drive and Echo Valley Drive ("Westerly Portion") and 7.5 miles of 36-inch pipeline from the intersection of Clay Bank Road and Cement Hill Road to the intersection of Cordelia Road and Hale Ranch Road ("Easterly Portion").For economic and technical reasons, the City has divided the Project into 15 segments that will be constructed as individual projects. Construction is complete or underway on 3 segments to date. Of the remaining 12 segments, several have been assigned to development projects that are now delayed, but two that are "shovel ready" are under City control and could go out to bid as soon as financing is available: Easterly Segment 3 and Easterly Segment 6B.Descriptions:East-West Water Transmission Pipeline, Easterly Segment 3 (separate application)Approximately 3,900 feet; 36-inch diameterBroadway and Illinois Streets from Union Avenue to Pennsylvania AvenueEstimated cost $2,400,000East-West Water Transmission Pipeline, Easterly Segment 6B (this application)Approximately 2,000 feet; 36-inch diameterClay Bank Road from Quail	M	0	C	As part of its water system planning in the 1980's, the City of Fairfield, California, identified the existing single 36-inch pipeline crossing of Suisun Valley from the central city to its Cordelia area as a fundamental weakness of the water system. Failure of this single line, or interruption of the lone treatment plant (Waterman WTP; the City has two plants) feeding that line, could result in an inability to supply water to Cordelia from the City system. Another concern was the existing system's inability to serve water to large parts of the City from the new North Bay Regional Water Treatment Plant (NBR Plant), which was the City's only source of Sacramento River delta water.	1,200,000	27,235	100,147	04	Solano	II	2009
3095	1910234	1910234-003	WALNUT VALLEY WATER DISTRICT	Eastgate Reservoir Seismic Retrofit and Recoating Project	This project will ensure that the District's system served from the Eastgate reservoirs will continue to provide domestic service and fire protection following a significant seismic event. This will accomplished by constructing a foundation and bolting the 1.5 MG tank, and upgrading the flexible joints on both tanks.In addition, the project will include installation of an internal mixing system within the tanks to enhance water quality and minimize the potential for nitrification and subsequent water quality issues while allowing the reservoirs to remain at higher operating water levels.Finally, as part of this project, the District intends to re-coat the two reservoirs to remove the coal tar and existing epoxy from the reservoir interior and exterior to ensure that the tanks are adequately protected.	M	0	C	The District's Eastgate Reservoir site consists of two tanks (a 1.5 MG and a 4.4 MG). The 1.5 MG tanks is not currently bolted to a foundation.Both of the existing tanks have older style flexible joints that will need provide adeqaute movement during the design siemic event. Historically, both tanks have experienced nitrification related water quality issues requiring the deep cycling of the reservoirs to maintain adequate chlorine residuals within the distribution system.Both reservoirs were last coated in 1990 with a combination epoxy coating and coal tar coaing on the inertior and an epoxy coating on the exterior.	1,100,000	26,638	100,406	16	Los Angeles	IV	2011
3096	3710037	3710037-009	Padre Dam MWD	Alpine Blvd. Valve and Main Modifications, Phase 2	This project is the second phase of a project designed to provide greater operational flexibility of Padre Dam MWD's steel transmission mains through the installation of isolation valves. The scope of the Phase 2 project has been expanded to not only include the installation of valves, but also to provide for replacement of segments of damaged steel transmission main.This project includes the following tasks:1) Installation of a valve on the 27-inch steel transmission main in Alpine Blvd. to allow for isolation of the main with continued use of the Chocolate Summit Reservoir.2) Installation of a valve on the 27-inch steel inlet/outlet pipe to the Blossom Valley Reservoir to assist in hydraulic balancing with the East County Square Reservoir (Job No. 202024, IFP No. W-1022 and W-1023).3) Replacement of a segment of 27-inch steel transmission main in Arnold Way.4) Replacement of a segment of 20-inch steel transmission main connecting to Alpine Blvd.	M	0	C	Replace a portion of damaged steel transmission main in the Eastern Service area. Additionally, installing additional isolation valves so smaller number of customers will be affected if a problem exists with the water distribution system.	750,000	22,768	100,509	14	San Diego	V	2009

3097	3710037	3710037-016	Padre Dam MWD	Five Reservoir Retrofit Program - Phase 1 (Chocolate Summit)	In 1996, the Department of Health Services (DOHS) inspected the District's reservoirs, pump stations, and general system operations. The DOHS concluded that although the District has a well-operated and maintained water system, the roofing structures on Blossom Valley, Mountain Top, Chocolate Summit, West Victoria, and, East Victoria Reservoirs needed to be replaced. The Five Reservoir Retrofit Program is a comprehensive project that addresses all of the DOHS concerns. The execution of the project is divided in phases to ensure the water deliver system maintains its ability to serve potable water to existing customers. Phase 1 of this project includes the following scope of work for Chocolate Summit Reservoir:o Replacement of the existing wood-framed roofs with new aluminum flat roof covers.o Structural and seismic retrofits.o Overflow structure improvements.o Site drainage improvements.	M	0	C	Chocolate Summit Reservoir is partial buried concrete reservoir with a decaying roof system (timber frame). Roof system had an interim repair after it failed 10 years ago and was under CDPH directive to repair to ensure water quality is adequately protected. Additionally, the concrete structure was not designed to meet today's seismic code/standards.	2,500,000	22,768	100,509	14	San Diego	V	2009
3098	3710037	3710037-018	Padre Dam MWD	5 Reservoir Retrofit Project, Phase 3	In 1996, the Department of Health Services (DOHS) inspected the District's reservoirs, pump stations, and general system operations. The DOHS concluded that although the District has a well-operated and maintained water system, the roofing structures on Blossom Valley, Mountain Top, Chocolate Summit, West Victoria, and, East Victoria Reservoirs needed to be replaced. The Five Reservoir Retrofit Program is a comprehensive project that addresses all of the DOHS concerns. The execution of the project is divided in phases to ensure the water deliver system maintains its ability to serve potable water to existing customers. Phase 2 of this project includes the following scope of work for Mountain Top and East Victoria Reservoir:o Replacement of the existing wood-framed roofs with new aluminum flat roof covers.o Structural and seismic retrofits.o Overflow structure improvements.o Site drainage improvements.o Replace the existing East Victoria Reservoir with a new, 125-foot diameter, circular pre-stressed concrete reservoir.o Replace the existing East Victoria Pump Station with a new pump station. A new pump station would be constructed north of the existing pump station. The existing pump station will be operational during construction of the new pump station. Once construction of the new pump station is complete, the existing pump station will be demolished.	M	0	C	Padre Dam's water distribution system serves 85 square miles and includes 24 reservoir tanks. The West Victoria Reservoir and Blossom Valley Reservoir are both partially buried concrete tanks with decaying roof systems (timber frame). The roof system on each tank was repaired on an interim basis after it failed 10 years ago and the California Department of Public Health issued a directive to repair each roof to ensure water quality is protected. Additionally, the concrete structure of the tanks was not designed to meet today's seismic code/standards. Included in this project is the replacement of the West Victoria pump station to meet the new design standards to ensure reliable water delivery.	6,500,000	22,768	100,509	14	San Diego	V	2009

3099	3710037	3710037-011	Padre Dam MWD	Flinn Springs Pump Station Emergency Generator Project	This project will provide a new emergency generator at the Flinn Springs Pump Station. Following the devastating Cedar Fire in 2003, the District fast-tracked a strategy of redundancy and reliability for the Eastern Service Area. Currently the ESA is served by one transmission main. The strategy includes construction of new parallel water supply transmission mains and pump stations, as well as emergency power supply for key pump stations. Currently the Chocolate Summit zone and all zones to the east are dependent on the Flinn Springs Pump Station. The scope of this project will include the installation of a 1.5 MW power generator with appropriate automated transfer switch and instrumentations and controls to properly operate the generators.	M	0	C	Over 500 customers living in Padre Dam's mountainous Eastern Service Area (ESA) lost their homes in 2003 to the Cedar Fire. Serving the ESA involves a 2000 foot elevation gain and pump stations are critical for providing water and for firefighting.Following the Cedar Fire, the District fast-tracked a strategy of redundancy and reliability for the customers in the ESA. Currently the ESA is served by one transmission main. The strategy includes construction of new parallel water supply transmission mains and pump stations, as well as emergency power supply for key pump stations. Residents in the Mountain Top and Crest Pressure Zones are dependent on the Rios Canyon Pump Station. This emergency generator became critical in Fall 2008, when SDG&E announced that they will proactively shut off power in mountainous areas during high wind conditions to prevent fires. Padre Dam, other water district and school district are opposing SDG&E's plan to the Public Utilities Commission (PUC) and negotiating with SDG&E, but, to date, the issue is unresolved.	1,300,000	22,768	100,509	14	San Diego	V	2009

M	0	C	Over 500 customers in Padre Dam's mountainous Eastern Service Area (ESA) lost their homes to the Cedar Fire in 2003. Serving the ESA involves a 2000 foot elevation gain and pump stations are essential to providing water and to firefighting. Following the Cedar Fire, the district fast-tracked a strategy of redundancy and reliability for our ESA customers. The ESA is served by one transmission main. The strategy includes construction of new parallel water supply transmission mains and pump stations, as well as an emergency power supply for key existing pump stations. This project became more critical in Fall 2008, when San Diego Gas and Electric (SDG&E) announced they will proactively shut off the power in mountainous areas during high wind conditions to reduce fire danger. Padre Dam, other water districts and school districts have opposed SDG&E's plan to the Public Utilities Commission but the issue remains unresolved.	500,000	22,768	100,509	14	San Diego	V	2009

3102	3710037	3710037-014	Padre Dam MWD	ESA Secondary Connection Project	As part of the East County Regional Treated Water Improvement Program (ECRTWIP), a comprehensive program of capital improvements and usage guarantees involving the PDMWD, San Diego County Water Authority (SDCWA), Helix Water District, Otay Water District, and Lakeside Water District. The ESA Secondary Supply Connection Project consists of approximately 4,000 feet of new pipeline, a new forebay reservoir (approximately 2 million gallons), and a new 12 million gallon per day (MGD) pump station. In addition, Padre Dam will design and construct the new CWA Flow Control Facility No. 7 which will be located on the site. This facility will replace the existing El Capitan Pump Station and Connection #6 as the primary potable feed into the District's Eastern Service Area. This project is the corner stone of a comprehensive capital improvement to provide potable water transmission reliability to address concerns raised from the last two wild fires experienced by the District.	M	0	C	Over 500 customers in Padre Dam's Eastern Service Area (ESA) lost their homes to the Cedar Fire in 2003. The ESA is devastated by fire approximately every 30 years; San Diego County experienced extensive wildfires again in 2007; and, climate change studies indicate less annual precipitation in this area in coming decades. The ESA is mountainous and serving water to these customers involves a 2000 foot elevation gain. These customers rely on one distribution pipe and multiple pump stations for their water supply and for firefighting.Padre Dam has developed a comprehensive capital improvement program to improve the reliability of the water distribution system in the ESA. This project will provide a new, more reliable source of water for the ESA, and eliminate dependency on one pump station.	18,000,000	22,768	100,509	14	San Diego	V	2009
3103	3710037	3710037-015	Padre Dam MWD	Five Reservoir Retrofit Program, Phase 2 - Mt. Top & East Victoria	In 1996, the Department of Health Services (DOHS) inspected the District's reservoirs, pump stations, and general system operations. The DOHS concluded that although the District has a well-operated and maintained water system, the roofing structures on Blossom Valley, Mountain Top, Chocolate Summit, West Victoria, and, East Victoria Reservoirs needed to be replaced. The Five Reservoir Retrofit Program is a comprehensive project that addresses all of the DOHS concerns. The execution of the project is divided in phases to ensure the water deliver system maintains its ability to serve potable water to existing customers. Phase 2 of this project includes the following scope of work for Mountain Top and East Victoria Reservoir:o Replacement of the existing wood-framed roofs with new aluminum flat roof covers.o Structural and seismic retrofits.o Overflow structure improvements.o Site drainage improvements.o Replace the existing East Victoria Reservoir with a new, 125-foot diameter, circular pre-stressed concrete reservoir.o Replace the existing East Victoria Pump Station with a new pump station. A new pump station would be constructed north of the existing pump station. The existing pump station will be operational during construction of the new pump station. Once construction of the new pump station is complete, the existing pump station will be demolished.	M	0	C	Padre Dam's water distribution system serves 85 square miles and includes 24 reservoir tanks. Mountain Top Reservoir is a partial buried concrete reservoir with a decaying roof system (timber frame). The roof was repaired on an interim basis after it failed 10 years ago and the California Department of Public Health issued a directive to ensure water quality is protected. Additionally, the concrete structure was not designed to meet today's seismic code/standards. East Victoria Reservoir is a partial buried concrete reservoir with a decaying roof system (timber frame). The roof was repaired on an interim basis after it failed 10 years ago and the California Department of Public Health issued a directive to ensure water quality is protected. Included in this project is the replacement of the the East Victoria pump station to meet new design standards and ensure reliable water delivery.	6,500,000	22,768	100,509	14	San Diego	V	2009

3110	3810010	3810010-002	SAN FRANCISCO INT L. AIRPORT		Clean and refurbish a fire protection storage tank for ise in an emergency as a potable water source.	M	0	C	No storage or backup water supply. San Francisco Water Dept. unable to send us water.	250,000	1,001	103,423	04	San Francisco	II	2001
3111	4310012	4310012-004	City of Santa Clara	Walsh Elevated Tank Replacement Project	Demolition and removal of existing 500,000 gallon steel elevated tank and reconstruction of a new 500,000 gallon steel fluted pedestal tank, including foundation, painting, piping, accessories, etc., to be known as the "Walsh Avenue Elevated Tank" for the City of Santa Clara, California in accordance with the Specifications and Drawings.	M	0	C	The Walsh tank is located in an extremely high risk seismic hazard area. A seismic vulnerability study, completed by G&E Engineering (2005) has identified major seismic vulnerabilities. The conclusion of the study is that the Walsh tank has major structural deficiencies with a high potential for damage and loss of function in future earthquakes. The tank provides the primary storage for about 10,000 people in the City of Santa Clara as well as more than half the 135,000 workers employed in the northern industrial portion of the City. The tank provides the primary fire flows via gravity flow for the northern industrial part of the City of Santa Clara. Loss of water service would have great economic impact on the more than 10,000 residents and to the great number of high value business enterprises in the City of Santa Clara.	3,200,000	26,610	105,831	17	Santa Clara	II	2009
3112	4310012	4310012-002	City of Santa Clara		Purchase and install ground motion sensors and motor activated valves at seven tank outlets. This will include ancillary pipe reconstruction and SCADA expansion.	M	0	C	City needs automated shutoff valves at seven existing reservoirs and needs ground motion sensors and motorized valves.	1,050,000	26,610	105,831	17	Santa Clara	II	1998

3113	5610017	5610017-013	VENTURA WATER DEPARTMENT	Water Storage Tank Circulation Improvements	The Preliminary Design Report for Water Storage Circulation Improvements (Project) indicated that the SolarBee mixing technology has the lowest maintenance and operating cost, is clog free, is equiped with solar panels and a chlorine injection system.The Project includes the installation of 6 (six) SolarBee mixing systems. One SolarBee will be installed in each compartment for each reservoir and include the following:Power Reservoir stores 15,000,000 gallons in two rectangular compartments.Bailey Reservoir stores 5,100,000 gallons in two rectangular compartments. Hall Canyon Reservoir stores 8,200,000 gallons in two rectangular compartments.	M	0	C	The water system began using chloramination for the disinfection of its potable water in December 2002. Although the use of chloramination has improved water quality, it has created nitrification concerns due to the lack of adequate mixing in the large water storage reservoirs. Prolonged detention time and stagnation, temperature stratification and short circuiting in the large rectangular reservoirs are the cause of nitrification problems. Our monthly nitrification sampling program has indiated at times an increase in HPCs, the presence of nitrite and decreasing total chlorine residual. To correct this problem mixing improvements are needed in the largest treated water reservoirs to reduce the occurence of nitrification, maintain total chorine residual levels at acceptable levels by decreasing detention time.	400,000	31,312	107,490	06	Ventura	IV	2009
3114	5610017	5610017-010	VENTURA WATER DEPARTMENT		Design and construct, new Saticoy well #3, connect pipelines, upgrade and expand existing Saticoy Fe & Mn TP from 4 MGD to 8 MGD.	M	0	C	Eastside of city has insufficient water supply,treatment reliability & redundant capabilities. Water Outages caused by operational difficulties and/or limited fire supply could occur resulting in Total Coliform Rule violations.	4,735,000	31,312	107,490	06	Ventura	IV	2002
3115	5610017	5610017-012	VENTURA WATER DEPARTMENT	Waterline Replacement - Lincoln Drive Neighborhood	The project includes the replacement of about 19,000 feet of 4-inch and 6-inch cast iron pipelines with 8-inch AWWA C900 PVC pipelines in the Lincoln Drive Neighborhood area. This project also includes the replacement of a dedicated 12-inch trasmission main to the Mariano Tank site, upgrade a pressure regulating station, 34 new and/or replaced fire hydrants, 40 additional and/or replaced isolation valves, replace 205 water services to residents, install 7 deadend blow offs and install 8 air release valves.	M	0	C	The 2009 Water Master Plan recommends replacement of 19,000 feet of undersized and deteriorating 4-inch and 6-inch cast iron waterlines in the Lincoln Drive neighborhood area that are over 50 years old, have fireflow defeciences, are experiencing numerous breaks, require significant repairs and increases the operating budget. The lack of isolation valves and the poor closure conditon cause larger then needed areas to be out of water during the repair.Water quality is negatively impacted by entrained air, brownish color and sediment from tuberculated pipes due to the numerous shutdowns needed to make the repairs. The replacement of an aging transmission mainline that fills a water storage tank is in the Project. When a mainline break occurs and is isolated for repair; the tank fill mode is interupted and the tank level can drop to low level that is still feeding other areas of the neighborhood.There are very few air release valves in the hillside community to effectively purge air from the pipelines.Additional hydrants are needed to improve fire protection coverage in the narrow streets.A pressure regulating station needs to be upgraded due to age, which has the potantial to fail and overpresurrize the pipelines at lower elevations.	4,800,000	31,312	107,490	06	Ventura	IV	2009
3116	5610017	5610017-011	VENTURA WATER DEPARTMENT		Design and Construct 8,400 linear feet of 18-inch diameter water transmission pipeline from Main/Callens Road to Telephone/Victoria Ave. Connect existing 18-inch 330 pipeline to existing 30-inch 330 mainline.	M	0	C	City's primary source, Ventura River water supply needs to be better utilized on the eastside of city. Large transmission mains do not exist to move water east to west and is operating vary inefficiently.	1,818,000	31,312	107,490	06	Ventura	IV	2002

3117	1910213	1910213-006	TORRANCE-CITY, WATER DEPT.	Walteria and Ben Haggott Reservoirs nitrification and rehabilitation project	This project is to install piping and valves on transmission mains and inside the reservoirs:i) to convert the Ben Haggott and the Walteria reservoirs from end-of-pipe reservoirs to in-line reservoirsii) to allow water to circulate in the reservoirs thus preventing stagnation of wateriii) to improve water quality and stop nitrification inside the reservoirs and distribution system.	M	0	C	This project is to prevent nitrification in the two City reservoirs, the Ben Haggott Reservoir (10 mil gal) and the Walteria Reservoir (18 mil gal). If water is allowed to to accumulate in the reservoirs, nitrification occurs in the reservoirs and the distribtion system due to the age of the water.Nitrification is highest during the summer months. Last year approximately 1.5 million gallons of water had to be flushed to waste due to nitrification in the reservoirs and the distribution system.	2,500,000	26,432	113,136	22	Los Angeles	IV	2009
3118	1910213	1910213-004	TORRANCE-CITY, WATER DEPT.		Institute a phased pipeline improvement program to replace pipelines having a history of frequent breaks, are beyond their useful life or are failing due to other external factors such as ccorrosive soils. Project involves: Design, and Construction	M	0	C	WW standards defect. Old water mains are in need of replacement.	13,208,000	26,432	113,136	22	Los Angeles	IV	2006
3119	4810007	4810007-005	City of Vallejo	Hollywood Street 400 & 292 Zones Pump Station	The project involves the construction of a new pump station at Hollywood Street near Magazine Street near the existing old pump Magazine Street Pump Station.The project will consist of three (3) 60 Horse Power vertical pumps that pump to the Glen Cove 400 Pressure Zone and two (2) 20 Horse Power vertical booster pumps that pump into the Glen Cove 292 Pressure Zone. The project includes the construction of the building, electrical and mechanical work, power transformer and metering facility, pipelines and appurtances, and telemetry.Pipeline work includes the construction of 600 feet of 18" suction pipeline from the 24" South Trans-Vallejo Pipeline and approximately 2000 feet of 12" and 14" discharge pipelines.Upon completion, the City can elect to reconstruct, and/or isolate and demolish Swanzy Reservoir.	M	0	C	The old pump station the project intends to replace currently draws its suction from the Swanzy Reservoir, a water reservoir in South Vallejo. The reservoir has wooden walls and an old roof that needs replacement. The frame supporting the roof structure also needs seismic retrofit. The cost of the seismic retrofit and reconstruction of is extremely expensive that the City cannot afford to undertake these fixes within the foreseeable future.Because of the above, this reservoir is being considered for abandonment due to the consistent water quality issues (total and fecal coliform and trouble meeting new disinfection by product rules) associated with it. Moreover, it also has major security and vulnerability concerns.This project aims to move the pumping facility to a site that will allow the City the ability to permanently abandon or disconnect this facility from the City's water system.Also, the project intends to move the existing underground Fulton Street Booster Station that has confined space issues into this new facility making it more effiicient and a safe working environment.	1,400,000	36,663	125,000	04	Solano	II	2009
3120	4810007	4810007-004	City of Vallejo	Fleming Hill Grid Pump Station Renovation and Bypass Project	This project will allow the City to more consistently supply adequate pressure to one-half of the City and provide opportunities for the water system to reduce energy consumption at the Fleming Hill Pump Station by elimination of the pressure regulators, installation of highly efficient low head high volume pumps in the grid pumps bay, and by retrofitting the existing gas engine driven pumps. It will also allow the City to feed the Grid Zone by gravity during periods of low demand particularly in the winter time.	M	0	C	This project will address issues with reduced water pressure which could result in potential backflow within the system. In addition, the Grid Pump Station is composed of seven large natural gas engines which are old and inefficient. These gas engines are contributers to the greenhouse gases. By retrofitting the gas engines, this will provide stability and reliability to the water system and provide less of a carbon footprint.	1,400,000	36,663	125,000	04	Solano	II	2009
3121	4310014	4310014-006	City of Sunnyvale	Equipment Replacement at Hetch-Hetchy Connections	This project provides for the replacement of pressure reducing valves, gate valves, control valves and vaults, and for the installation of magnetic meters at six connections to the Hetch-Hetchy water supply pipeline. Most valves to be replaced are 8" to 16" in diameter. The SFPUC (Hetch-Hetchy) connections are located at Lawrence, Fair Oaks, Borregas, Lockheed, Palomar, and Mary.	M	0	C	The project replaces old components and updates them so that they can be remote-controlled by the City's SCADA system. This will increase system efficiency and help during emergencies, by allowing staff to react more quickly to isolate possible problem points from the potable water system as a whole. The equipment is being replaced because of age (40 to 50 years old) and to provide upgrades allowing each facility to be connected to the City's Supervisory Control and Data Acquisition (SCADA) system.	527,645	29,324	133,751	17	Santa Clara	II	2009

3122	4310014	4310014-005	City of Sunnyvale	Wolfe/Evelyn Water Plant Mechanical Reconstruction	The project will upgrade the mechanical and electrical systems at the Wolfe/Evelyn water plant in order to better serve the City's needs. This project involves replacing booster pumps and regulating valves, motors, motor control center, and booster room underground piping at the Wolfe/Evelyn water plant. It will also replace an existing motor and pump with a propane generator and transfer switch and install a magnetic flow meter.	M	0	C	The Wolfe/Evelyn water plant was built in 1959, and all the current equipment is original. Replacement of parts is currently very costly due to obsolescence of the pump. The electrical panels are sub-standard and in need of replacement. The Wolfe/Evelyn plant is an integral part of maintaining the municipal water system, providing supply, emergency storage, and fire suppression capacity to the City. It has exceeded its useful life and is in need of replacement. The current equipment is not reliable due to the age of the system.	1,066,505	29,324	133,751	17	Santa Clara	II	2009
3123	4310014	4310014-008	City of Sunnyvale	Cleaning of Water Tanks	This portion of the project provides for the interior cleaning of large water tanks at the Wright and San Lucar plants and 5 small tanks at the Central and Hamilton plants.	M	0	C	This project involves cleaning the inside of all City-owned water tanks and effecting minor repairs, as needed. There are six large tanks and the tanks have been must be placed on a cleaning schedule, per Department of Public Health recommendation to maintain water quality standards. The City's water tanks are critical to the storage and delivery of safe drinking water. Additionally, this infrastructure provides fire suppression capacity, and emergency storage capacity. The project will preserve the City's investment in its infrastructure and will help maintain water availability and quality.	84,000	29,324	133,751	17	Santa Clara	II	2009
3124	4310014	4310014-004	City of Sunnyvale	Air Flotation Tanks Rehabilitation	This project includes repair/replacement of the steel and mechanical portion of this structure, repair and/or replacement of the influent gates and coating of the concrete walls, extending their useful life for approximately 15-20 years. Condition assessment of the tanks is complete. Design is currently underway with construction of the tanks ready to begin in 2009.	M	0	C	The City of Sunnyvale needs funds to rehabilitate and provide corrosion protection for four Air Floatation Tanks at the Water Pollution Control Plant (WPCP) which are steel and concrete structures. Air floatation tanks are used to remove the algae that grows during secondary treatment in the oxidation ponds. Three of these structures were built in 1975 and the 4th one in 1982, and all are in need of significant rehabilitation.	2,923,000	29,324	133,751	17	Santa Clara	II	2009
3125	4310014	4310014-003	City of Sunnyvale	Replacement of Supervisory Control and Data Acquisition System	This project involves replacing the (SCADA) system hardware and software at 37 sites. Staff estimates that SCADA's life expectancy is around 15 years. After that time, the software system only will need to be upgraded.	M	0	C	The Supervisory Control and Data Acquisition (SCADA) system provides operators with remote control and monitoring of the water, sewer and storm stations, and it also provides information on water pressure, flow and tank levels. A Vulnerability Assessment conducted several years ago recognized the need for immediate remote-control of valves in the event of an attack on the system. This system will provide operators will have crucial information on water pressure and instantaneous indication of flow and position of pressure regulating valves (PRVs).Implementation of the project will give the City refined control of the water system through PRVs. Upon completion of work, each location will provide operators with crucial information on water pressure and instantaneous indication of flow and position of PRVs. PRVs will be outfitted with a solenoid for remote operation. This will allow staff to:(1) track water flow to minimize source blending and provide customers more precise water quality information; (2) prevent costly water main breakages through early detection of valve malfunction; (3) further integrate system with a hydraulic water model for more precise water demand and fire flow planning; (4) allow for quick response and stabilization of water system in regional emergencies.	770,000	29,324	133,751	17	Santa Clara	II	2009

3126	4310014	4310014-007	City of Sunnyvale	City-Wide Water Line Replacement	This project replaces aged and damaged water lines. There is over 300 miles of underground water transmission and distribution lines in the City, varying from 4" to 30" in diameter, with many different material compositions (Asbestos Concrete, Cast Iron, Ductile Iron, Steel Pipe and PVC). The project upgrades the water system by standardizing materials used PVC (C-900) with tracer line, new valves and fire hydrants. The project also upgrades pipes and fittings for seismic stability, thus minimizing the need for costly emergency response activities caused by pipe breaks.	M	0	C	The integrity of the City's water supply system is critical to protect public health, enhance sanitation, prevent environmental pollution and provide fire suppression. The success of these goals is dependent on the maintenance and eventual replacement of aged and worn infrastructure. Currently, many portions of the water system have exceeded their estimated life expectancy or deteriorated over time because of chemical reaction with certain soils. Failure of a line due to structural failure of the eroded pipe material can result in failure of the pipe to deliver water, subsequently endangering a neighborhood or degrading the pressure and supply of the entire system, depending on the pipe size and location.	2,003,466	29,324	133,751	17	Santa Clara	II	2009
3127	4310014	4310014-002	City of Sunnyvale	City of Sunnyvale Well Connections to Transmission Mains	The City of Sunnyvale Well Connections to Transmission Mains Project will provide funding to connect the Raynor and Ortega Wells to the transmission water main that is connected to the Santa Clara Valley Water District's (SCVWD) water system. This will give the City the ability to supply the transmission main with well water in the event that the SCVWD cannot provide the City with treated water because of intentional or accidental contamination, large earthquake or equipment failure. Both connections will include the installation of isolation valves and pressure reducing control valves with pressure transmitters to monitor and control the transmission and distribution systems.	M	0	C	Reliability of the City of Sunnyvale's water distribution system depends upon the City's wells as alternate sources of supply if disruption of water delivery occurs from the two wholesale suppliers (Santa Clara Valley Water District and San Francisco Public Utilities Commision) due to intentional or accidental contamination, a large earthquake, or equipment failure. The use of Raynor and Ortega wells will also help to maintain adequate system pressure during peak demand periods such as during the summer months or in the event of a major fire.	1,130,000	29,324	133,751	17	Santa Clara	II	2009
3128	3310038	3310038-002	Rancho California Water District	Natural Gas Clean Engine Conversion	The Natural Gas Clean Engine Conversion Project will replace six existing natural gas engines at the Ace Bowen Pump Station and six existing natural gas engines at the East Bluff Pump Station with AQMD Rule 1110.2 compliant natural gas engines. AQMD Rule 1110.2 will require the engines at these pump stations to be permanently removed from service on July 1, 2010 at the Ace Bowen Pump Station (engines greater than 500 horsepower) and July 1, 2011 at the East Bluff Pump Station (engines less than 500 horsepower) as these engines cannot meet the VOC requirements of 30 ppm.At the Ace Bowen Pump Station six, twenty-five year old, Waukesha L5108G, 624 horsepower, rich burn, natural gas engines are proposed for replacement with AQMD compliant natural gas engines to drive the water pumps. In addition to turn-key installation of the compliant engines, a state-of-the-art Continuous Engine Monitoring Systems (CEMS) will be installed. Benefits of the CEMS system include improved efficiency and lower emissions. Six engines used to power water pumps are proposed for replacement at the East Bluff Pump Station: two thirty-eight year old, Waukesha L1197G, 137 horsepower, rich burn engines and four thirty-eight year old, Waukesha L11905G, 208 horsepower, rich burn, natural gas engines. The project scope includes replacement of the six engines with three larger and more efficient engines. In addition, to turn-key	M	0	C	RCWD cannot meet Air Quality Management District Rule 1110.2 engine emission requirements at two of its pumping facilities, Ace Bowen Pump Station and East Bluff Pump Station. Concentration limits effective July 1, 2010 apply to the engines at the Ace Bowen Pump Station. RCWD cannot meet the VOC emission requirements of 30 ppm. Thus, under the Rule, RCWD must remove the engine from service or replace the engine with an electric motor.Concentration limits effective July 1, 2011 apply to the engines at the East Bluff Pump Station. Similar to the engines at the Ace Bowen Pump Station, RCWD cannot meet the VOC emission requirments of 30 ppm and RCWD must remove the engines from service or replace the engines with electric motors.	10,000,000	41,604	133,859	20	Riverside	V	2009

3133	3010027	3010027-006	City of Orange	Reservoir Seismic Retroffing	Up to this year, 5 of the 16 reservoirs had been seismically retrofitted to enhance the ability to absorb seismic forces and movements. The City of Orange Water Division's goal is to upgrade the remaining 11 reservoirs in the next 2-3 years. By complete retrofitting the inlet/outlet pipes, it will enhance the pipes' ability to sustain seismic forces and movements and minimize time, labor and costs to repair damages to the reservoirs, pipes, sites and avoid having the reservoirs out of service for extent period of time.	M	0	C	The City of Orange water system currently consists of 16 reservoirs ranging from 0.5 MG to 5.0 MG (million gallons) in capacity. Most of these reservoirs were constructed in the 1970's and were not seismically met the current UBC. As a result, the Water Division had continued to by replacing the rigid connection in the inlet and outlet pipes with flex-coupling joints which had been proved to withstanding seismic forces and movements better.	400,000	35,645	138,640	08	Orange	V	2008
3134	1910070	1910070-055	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Avenue M/62nd Street West Reservoir Nos. 2, 3, and 4	The proposed project consists of constructing three 3.2 MG water storage tanks and appurtenances at a District-owned site located southeast of the intersection of 62nd Street West and Avenue M in the City of Palmdale. The additional storage will help reduce the deficit storage capacity for the system and reduce the large pressure fluctuations. The tank site will be enclosed by block walls and landscaped with trees and shrubs to mitigate any visual or aesthetic effects. The proposed tanks will connect to a 36-inch water main located along Avenue M to 60th Street West to feed the west side of the 2555 pressure zone.	M	0	C	The 2555 pressure zone of District No. 40 Region No. 4 in the City of Lancaster encompasses approximately 25 square miles. This zone currently has a storage need of 38.8 million gallons (MG) to satisfy fire flow storage requirements and the District's one-day storage of drinking water under maximum day demand. However, there are only two gravity storage tank sites in the 2555 zone: Avenue M and 7th Street West with 7.6 MG of storage and Avenue M and 5th Street East with 12 MG of storage.	8,000,000	46,878	144,215	16	Los Angeles	IV	2011
3135	0110006	0110006-041	CITY OF HAYWARD		Make miscellaneous seismic improvements on the existing water system.	M	0	C	Vulnerability to damage from seismic events	500,000	31,678	146,398	04	Alameda	II	2004
3136	0110006	0110006-045	CITY OF HAYWARD		Install 5,200 LF of new 12" water lines and a new Pressure Regulating Station	M	0	C	improve fire suppression capacity in 330 pressure zone	1,205,000	31,678	146,398	04	Alameda	II	2004
3137	3310037	3310037-006	Corona, City of	R-3 Reservoir Construction	The proposed R-3 Reservoir project site is about 400 feet north of Ontario Avenue, immediately east of the Main Street Storm Channel and about 600 feet west of Garretson Avenue in the City of Corona, Riverside County. The proposed R-3 Reservoir is to be located on the same property as the abandoned reservoir. The existing reservoir will be demolished with the new reservoir being constructed in its place. The proposed replacement will be approximately 135 feet in diameter compared to the 180 feet of the existing reservoir. The roof elevation of the proposed reservoir will be approximately 18 inches taller than the existing reservoir's roof elevation. Moreover, the proposed reservoir will be constructed from concrete and the existing reservoir is constructed with wood framing corrugated steel sheeting above grade. The proposed project will meet all AWWA design requirements and satisfy the necessary storage needed in Zone 2 to accommodate the fire flow storage.	M	0	C	The City of Corona owns and operates 17 reservoirs. Due to the age and structural integrity of R-3 Reservoir, it was abandoned in the early 1990's. The construction features and current condition of the existing reservoir do not conform to pertinent health criteria per the California Department of Public Health (CDPH). Further, it is not practicable to rehabilitate the existing reservoir. Therefore, it is proposed to replace the existing reservoir with a new reservoir of the same storage capacity. Replacement of the existing 2.5 MG reservoir is needed to meet the water storage, fire flow, and emergency storage requirements within the City's Zone 2 service area in accordance with the recommendations contained in the City's Water Master Plan (September 2005). As identified in the Water Master Plan, the City is required to have adequate storage for 50% maximum day demand by the greatest anticipated fire flow. A complete analysis of the City's storage capacity was conducted within the Master Plan and determined that an additional reservoir is required within Zone 2.	2,560,000	41,861	150,253	20	Riverside	V	2009

3138	3310037	3310037-002	Corona, City of	Regional Drought Mitigation Interconnection with WMWD's Arlington Desalter	This interconnection consists of connecting a portion of the City of Corona (Corona) water system with a portion Western Municipal Water District (WMWD's) water system. The main purpose of the project is to allow both water agencies to supply water to one another during times of need and fully utilize groundwater resources. More specifically this project will consist of constructing a 16-inch waterline from WMWD's 30-inch Arlington Desalter (Desalter) pipeline to Corona's 30-inch Zone 2 water distribution system. This will allow WMWD to supply water to Corona in times of need. Additionally, a connection will be made from Corona's 16-inch Zone 3 water distribution system to WMWD's 30-inch Desalter system to allow Corona to supply water to WMWD in times of need.The project will consist of constructing a water meter to monitor flow, control valves, Supervisory Control and Data Acquisition (SCADA) system, electronic and electrical gear, 500 gallon ammonia storage tank, 25' x 35' concrete masonry unit building, approximately 200 feet of 12-inch ductile iron piping and appurtenances.	M	0	C	Due to expecting state cutbacks on water supply from Metropolitan Water District, the City of Corona Department of Water and Power (Corona) and Western Municipal Water District (WMWD) are working together to utilize local groundwater resources. In order to add additional water supply and improve the reliability of their individual water supply systems, Corona and WMWD intend to construct and operate an interconnection between the two existing systems within Promenade Avenue in the City of Corona. The interconnection will be between Corona's Zone 2 and 3 systems and WMWD's Arlington Desalter system.	520,000	41,861	150,253	20	Riverside	V	2009
3139	3310037	3310037-004	Corona, City of	Local Groundwater Resource Rehabilitation Project – Well 11A	The proposed Well has been sited in an area that has adequate groundwater to supply an additional 1.72 million gallons per day (MGD) to the water distribution system. The well would be designated as Well No. 11A and will be located at 1865 Pomona Road.The well would be drilled to a minimum depth of approximately 300 feet below ground surface and would be 28-inches in diameter to accommodate a 16-inch diameter casing. It is estimated that the pump will be driven by a 200 Horsepower (hp) motor and would have a pumping rate of 1200 gallons per minute (gpm).	M	0	C	In response to expected state water supply cuts due to drought and environmental law conditions by Metropolitan Water District and the State of California, the City of Corona Department of Water and Power (Corona) is proposing to replace Well 11 with Well 11A. Due to the fact that Well 11 was constructed in 1953 and has come to the end of its life cycle, its supply capacity has declined to a point that requires significant retrofits. Corona is proposing to construct Well 11A which is estimated to supply 1.72 million gallons per day (MGD) of water verses the existing 0.57 MGD supplied by Well 11. The supply from Well 11A will be pumped to the Mangular Blend Station and combined with other water sources to increase the Corona's water quality. The additional water supply from Well 11A will also provide greater reliability and redundancy to the Corona water system.	850,000	41,861	150,253	20	Riverside	V	2009

3140	3310037	3310037-003	Corona, City of	Develop Local Groundwater Resource for Water Quality – Well 31	The proposed well has been sited in an area that has adequate groundwater to supply an additional 2 million gallons per day (mgd) to the Desalter. The well would be designated as Well 31 and is to be constructed on Assessor's Parcel Number (APN) 118-302-011 at 211 North Buena Vista Avenue, currently a vacant lot on the east side of Buena Vista Avenue, approximately 280 feet south of State Route 91 (SR-91). The underlying land use designation for the proposed Well 31 site is High Density Multi-Family Residential and it is zoned R3.The well would be drilled to a minimum depth of approximately 500 feet below ground surface and would be 36 inches in diameter to accommodate a 24-inch diameter casing. It is estimated that the pump will be driven by a 250 Horsepower (hp) motor and would have a pumping rate of 1200 gallons per minute (gpm). The pump will be enclosed in a decorative masonry building approximately 390 square feet and 14 feet high.	M	0	C	The proposed project is to construct a 2.0 million gallon per day (MDG) municipal water well and associated collection pipeline. The main objectives of this project are to 1) enhance the reliability and capacity of the groundwater collection system for the existing Temescal Desalter Water Treatment Facility (Desalter), 2) meet the Total Dissolved Solids (TDS) discharge limits of 700 milligrams per liter (mg/L) in wastewater effluent discharge from the City's Water Reclamation Facilities, 3) decrease the City's dependence on imported water, 4) decrease the amount of imported water treated by the City of Corona (Corona) and thereby assisting in drought management policy's for local area and 5) improve the quality of water supplied to our customers by meeting a drinking water goal for nitrates of less then 38 gm/L.The Desalter is currently supplied an average of 10 MGD of water from five dedicated wells. The addition of this well will increase the average daily supply to approximately 12 MGD, thereby enhancing the reliability and capacity of supply to the Desalter. The proposed project will assist the Corona in meeting a mandatory Total Dissolved Solids (TDS) discharge limit of 700 mg/L from the City's Water Reclamation Facilities into the Temescal Creek by lowering the overall TDS in the City's distribution system. The discharge limit is mandated by the Santa Ana Regional Water Quality Control Board in order to comply with the National	1,250,000	41,861	150,253	20	Riverside	V	2009
3141	4910009	4910009-002	Santa Rosa, City of	Steele Lane Water System Improvements	This project replaces approximately 2200 feet of existing 6 inch water main with 12 inch water main. Upsizing the water main will bring the area up to current fire flow requirements and reduce maintenance costs.Replace 270 lf of 6-inch pipeline with 270 lf of 8-inch pipeline along Steele Lane east of County Center Dr. Replace 270 lf of 6-inch pipeline with 270 lf of 8-inch pipeline along Steele Lane east of Nordyke Ave. Replace 410 lf of 6-inch pipeline with 410 lf of 8-inch pipeline along Steele Lane east of Myers Dr.	M	0	C	This project replaces undersized watermains to will bring the area up to current fire flow requirements and reduce maintenance costs.	1,532,000	54,603	157,985	18	Sonoma	II	2009

3153	3010062	3010062-006	City of Garden Grove	Water Main Improvements Projects No. FF010, FF014 and FF017	The City of Garden Grove is seeking grant funds in the amount of $2.6 million dollars from the California Department of Public Health Economic Recovery Drinking Water State Revolving Fund to subsidize Water Improvements Projects: FF010, FF014 and FF017 (PROJECT). The Project will encompass the following areas: West Street from Chapman Avenue to Daniel Avenue; Daniel Avenue from West Street to Smallul Drive; Candy Lane from West Street to Holyoak Lane; Holyoak Lane from Candy Lane to Simmons Avenue; Loara Street from Chapman Avenue to Patricia Drive; Jerry Lane form Elmwood Street to Oakwood Street and some other locations crossing the Chapman Avenue/West Street and Chapman Avenue/Laora Street intersections. The PROJECT is scheduled to begin in August 2012 and will be completed in January 2013. The PROJECT consists of constructing new replacement water mains in West Street, Daniel Avenue, Candy Lane, Loara Street, and Jerry Lane. The water improvements comprise approximately 10,600 feet of 12-inch Polyvinyl Chloride (PVC) pipe with new valves and wet barrel fire hydrants. The project also includes the replacement of approximately hundred (100) mixed sized domestic and fire-water service lines.Projects Plans and Specifications will be generated and finalized based on City Ordinance requirements and will be approved by regulatory agencies prior to implementation. The Site Specific	M	0	C	With the recently completed City of Garden Grove's Water Master Plan based on field measurements and hydraulic modeling came the conclusion that the Water Improvements Projects No. FF010, FF014 and FF017 were the highest priority replacement projects to rectify fire flow deficiencies. The mixed Residential - commercial areas are severely limited in terms of pressure and fire flow availability and were determined to be grossly out of compliance with the California Fire Code Appendix B, Section B105 (2007).These priorities have been recognized due to undersized 4-inch and 6-inch mains, aging gate valves up to fifty years old, as well as having a number of partially functioning dry barrel fire hydrants within these priority areas.These projects will provide an upgraded water main system that will better serve various sectors of the community, such as a local elementary school, commercial and residential properties, and it will ensure public safety by meeting California Fire Code requirements.	2,620,000	34,077	172,781	08	Orange	V	2011

3162	3410001	3410001-015	Sacramento Suburban Water District	SSWD - Crestview Pipeline	Since the early 1990's, the District has made improvements to mitigate the problems in the Arvin system. One such improvement was to construct and install new transmission mains to assist in circulating water from north to south and west to east in the Arvin service area. To provide the necessary facilities, the District developed a six-phase project to construct transmission mains capable of providing sufficient flows through out the Arvin area. Since the 1990's the District has constructed five of the six-phases. The remaining phase is the design and construction of approximately 9,200 linear feet of new transmission pipeline. The new proposed pipeline is distributed into the following lengths and sizes: 5,300 linear feet of 16-inch transmission pipeline, 2,700 linear feet of 12-inch pipeline and 1,200 linear feet of 8-inch pipeline. Included with the project are miscellaneous tie-ins to the existing distribution system and fire hydrants spaced to meet local fire agency guideline standards. The new pipeline would also connect to the existing phase 5 pipeline, then proceed south through residential streets to the south end of the Arvin area connecting into an existing pipeline of adequate size. Along the pipeline route, the new pipeline would be connected to the existing distribution system to provide flows, pressure and circulation throughout the Arvin system. The installation of this new pipeline will	M	0	C	In 1986, the Sacramento Suburban Water District (District) purchased the former Arvin Water Company (Arvin). Arvin was a privately owned water company consisting of approximately 3,800 accounts made up of single-family residential, multi-family residential and light commercial retail/medical development. The area is basically built out with no future growth. The location of Arvin is in Sacramento, California bounded by the following streets: Auburn Boulevard to the north, Winding Way to the south, Manzanita Avenue to the west and Dewey Drive on the east. The existing water system was constructed in the late 1940's and consists of small sized water mains ranging from 2-inch to 10-inch. The pipeline material is predominately asbestos cement pipe and is of adequate quality but lacks size for circulation and transmission. Five groundwater wells constructed in the 1940's originally provided the water source to the area. Through the years the wells have developed bacteriological water quality issues. Although the issues are secondary, the quality problems have caused nuisance problems such as taste and odor. Due to an uncorrectable water quality issue in one of the wells, only four active wells currently exist. The main water supply problem that currently exists is a circulation problem within the Arvin system. This is due to the small diameter water mains, lack of transmission mains and water quality issues.	4,100,000	44,744	177,000	09	Sacramento	I	2008
3163	3410001	3410001-018	Sacramento Suburban Water District	SSWD Security - Well Site Surveillance	The District has a number of key well sites where site security could be greatly improved. The District proposes to install up to two 20' tall light standards with security cameras at these key well sites. The lights and security cameras would be wired to motion sensor(s) and would activate upon an unauthorized intruder entering the site. There are a total of ten (10) well sites where the site security work described above is proposed. The work at each site would consist of the following:- Purchase and install one or two 20' light poles with flood lights, day/night cameras and motion sensors. - New electrical enclosure to house Digital Video Recorder (DVD), keyboard, LCD monitor, and other related equipment.- Install electrical conduit and conductors between the light poles and the electrical enclosure.- Install and wire up door sensors installed on the well pump enclosure, chlorination enclosure and/or fluoridation enclosure.- Engineering, programming, and field services. If a fiber optic connection can be obtained to each of these key sites, District operations staff would receive an alarm through the existing radio telemetry system and Supervisory Control and Data Acquisition (SCADA) system and would be able to view the camera image in real time. The estimated total cost per site is $50,000 for the above described work. [Note: A budgetary cost quote has been obtained from a District contractor (Tesco Controls) and is available	M	0	C	Water security improvements needed.	250,000	44,744	177,000	09	Sacramento	I	2008

3164	3410001	3410001-016	Sacramento Suburban Water District	SSWD - Flaming Arrow Pipeline	A pre-design study prepared by a local engineering consultant has recommended two new transmission pipelines to connect with a tee to an existing 30-inch pipeline at the intersection of Verner Avenue and Flaming Arrow Drive. One branch is a 16-inch diameter pipeline (approx. 2,070 feet in length) that heads southeast, parallel to and west of an existing 12-inch water line in Flaming Arrow Drive. It then turns south and parallels the exsiting 12-inch pipeline and ties in at the 14-inch water line in Indian River Drive at the southerly intersection with Flaming Arrow Drive. The other branch is a proposed 24-inch diameter pipeline (approx. 3,825 feet in length) which heads southwest on the west side of Verner Avenue parallel to an existing 16-inch water line. It then ties in to that 16-inch line as it crosses Verner Avenue north of the Verner Avenue Mini Storage.	M	0	C	The Greenback Woods subdivision is located in the northeast portion of the District's North Service Area. Currently, during periods of sustained and extreme hot weather conditions over multiple years, this neighborhood experiences pressure below 35 psi, which is the District's minimum for maximum-day demand conditions. A new transmission main would would improve water pressures in this area and would allow for better distribution of surface water from the Cooperative Transmission Pipeline (CTP) into the North Service Area. Such a pipeline will also solve the low-pressure and circulation problems which exist in this area. More surface water could be taken via the CTP which would further conjunctive use and lessen the use of groundwater when surface water is available. Therefore, this pipeline will improve water distribution and system pressures, improve the flow and distribution of surface water into the system and minimize groundwater overdraft on the basin.	1,500,000	44,744	177,000	09	Sacramento	I	2008
3165	3410001	3410001-012	Sacramento Suburban Water District	SSWD - Storage Reservoir at McClellan Park	The proposed project consists of a 3 million gallon (MG) above-ground steel storage tank/reservoir, a booster pump station, a backup emergency generator, chemical feed facilities, paved surfaces within the site, and fencing and landscaping around the site. The reservoir tank would be used to store both surface water and groundwater during low demand periods for use during peak demand periods or in the event of a fire.The proposed storage tank would be approximately 100 feet in diameter and 40 feet in height. The finished height of the tank would be determined during final design and will depend in part on the depth of excavation needed beneath the tank.The proposed facility would also contain a pump station structure, approximately 50 feet x 20 feet in area and 20 feet in height, to fully enclose pumps and related equipment to be used to pump water from the tank into a nearby pipeline. The structure will also house chemical treatment facilities for disinfection and possibly fluoridation. The facility will contain a backup emergency generator to provide power to the pumps in the event of a power outage. The generator will run on propane or diesel and be fully enclosed for noise attenuation.An 8-foot high concrete block wall will enclose the site. "Razor wire" will be installed along the top of the wall to ensure adequate security at the site. Landscaping will be installed around the site for screening purposes.Property for the	M	0	C	In 1998, Sacramento Suburban Water District took over operation of the water system within McClellan Air Force Base (AFB). McClellan AFB officially closed on July 13, 2001, and is now within the control of the County of Sacramento. The former air force base, which encloses 2,856 acres of land, has now been transformed into a master planned community called McClellan Park.The County of Sacramento hired a development equity partner, McClellan Business Park, LLC, to market and redevelop the base. Of the approximately 11 million square feet of buildings on the base, McClellan Park has already leased well over 2 million square feet with many additional leases pending. In addition, McClellan Airport's 1.5 million square feet of aviation related facilities provide for hanger storage, repair/maintenance and painting capabilities for both corporate and personal aircraft.With the considerable amount of planned future development, water supply and supply for fire protection are critical for McClellan Park.A reservoir tank is proposed to improve the reliability of water supply and provide improved fire protection for McClellan Park.	5,000,000	44,744	177,000	09	Sacramento	I	2008

3166	3410001	3410001-010	Sacramento Suburban Water District	SSWD - Verner Storage Reservoir	The proposed project consists of a 3 million gallon (MG) above-ground steel storage tank/reservoir, a booster pump station, a backup emergency generator, chemical feed facilities, paved surfaces within the site, and fencing and landscaping around the site. The reservoir tank would be used to store both surface water and groundwater during low demand periods for use during peak demand periods or in the event of a fire. The District already owns a 2.5 acre site for the proposed reservoir tank and related facilities. This site is located within the urban setting of the City of Citrus Heights. The site is bounded by Verner Avenue and U.S. Interstate 80 (I-80) to the west, Flaming Arrow Drive and the Foothill Golf Center to the north and northwest, a partially developed city park to the east, and a residential neighborhood to the south and southeast. The proposed storage tank would be approximately 100 feet in diameter and 40 feet in height. The finished height of the tank would be determined during final design and will depend in part on the depth of excavation needed beneath the tank. It may be determined during final design that a wider and lower tank design is preferable to avoid significant impacts to existing trees on the site and to not exceed a City height variance.The proposed facility would also contain a pump station structure, approximately 50 feet x 20 feet in area and 20 feet in height, to fully enclose pumps and	M	0	C	The proposed project is located in the northeast portion of the District's North Service Area. This area is higher in altitude than the surrounding area and there is no well source. Surface water is available to the District's North Service Area through a contract with Placer County Water Agency (PCWA) but this water is not always available. When surface water is not available, this area can experience lower water pressure. In addition, there is poor water circulation in this area which can lead to secondary taste and odor problems. The proposed project will improve water pressure and the reliability of water supply to customers located in the northeast corner of the District's North Service Area. A reservoir tank is proposed that will provide additional water supply storage capacity and increase water supply availability for fire protection. The proposed reservoir tank will provide water to customers during peak demand, fire-related flow periods and during power outages.By providing storage, the proposed reservoir will also enhance conjunctive use capabilities in the North Service Area. When it is available, surface water can be stored in the reservoir and used in lieu of groundwater resources. An opportunity also exists for the District to partner with a local park and recreation district to provide for multiple uses of the existing site.	5,000,000	44,744	177,000	09	Sacramento	I	2008
3167	3410001	3410001-008	Sacramento Suburban Water District	SSWD - Water Main Installation in Sierra Oaks Vista Subdivision	The District proposes to design and construct new pipeline facilities within the streets of the Sierra Oaks Vista area. The proposed design includes valves, properly spaced fire hydrants as set forth under guidelines of the local fire department, new metered water services to each and every lot and backflow protection should the homeowners wish to keep their existing water wells for irrigation and connection into the District's existing transmission and distribution systems. The proposed project calls for the installation of approximately 17,000 linear feet (LF) of 12-inch water pipeline, 18,000 LF of 8-inch water pipeline, 75 new fire hydrants, 310 new metered water services with backflows and tie-in connections to the existing transmission and distribution system. The project would follow the District's specifications for placement of the 12-inch mains on a 1,300 foot grid with the 8-inch mains interconnected to the 12-inch mains. Fire hydrants would be installed on a 500 foot radius to provide ample fire protection for the area. The proposed new distribution system would be connected to the District's existing distribution and transmission systems on Fulton, Watt and Northrop Avenues. New metered water services would be installed to each lot and connected to the house. Backflow devices would be provided and installed should the homeowner wish to keep the private well for irrigation purposes.	M	0	C	In the late 1990's, The Sacramento Suburban Water District (District) increased its service area by acquiring a small service area along the south boundary of its South Service Area in Sacramento, California. The area is bounded by Northrop Avenue on the north, Fair Oaks Boulevard on the south, Fulton Avenue to the west and Watt Avenue to the east. The area consists of commercial type retail and single-family residential housing. Included in the area are on two small production wells and a partial distribution system. The existing distribution system mainly exists in the commercial area. The residential area (called Sierra Oaks Vista) consists of the two wells and a small amount of distribution pipeline.A major portion of the Sierra Oaks Vista residential area does not have a potable distribution system that provides domestic or fire protection. The majority of the existing residential units are all on private groundwater wells producing sufficient flows for domestic and irrigation use. Current fire fighting procedures have the fire department connecting to the nearest fire hydrant around the site and extending fire hose around and through the neighborhood to suppress fires. Existing swimming pools are also used to assist in the fire fighting.The District has a major concern for the area due to the lack of fire protection, the potential deterioration of the ground water table, the age of the wells and the water	15,200,000	44,744	177,000	09	Sacramento	I	2008

3168	2110002	2110002-010	Marin Municipal Water District	MMWD Pipeline Replacement Project	This project is “shovel ready” and includes replacing 11,000 feet of pipe from the list below, at a total cost of $2,200,000. This project will partially address system deficiencies presented by very old distribution pipelines with significant leak or break potential.Marin Municipal Water District (MMWD) was established in 1912, and is the oldest water district in California. MMWD’s water system includes 900 miles (4.8 million feet) of operating distribution and transmission piping. Much of this piping is close to 100 years old. The average anticipated service life of all of the piping is in excess of 100 years, though the older pipe in the system had an anticipated service life, when new, of 75 years or less.The piping system is composed of, approximately: 43% cast or ductile iron pipe, with an average age of 50 years and a service life of 75 years; 35% welded joint steel pipe, the current District standard, with an average age of less than 40 years and a 200 year service life; 6% asbestos cement pipe with an average age of less than 40 years and a service life of 50 years; 6% galvanized threaded pipe with an average age of about 85 years and a normal service life of less than 50 years; and, 6% PVC pipe with an average age of less than 15 years and a service life of in excess of 200 years.Of the above listed piping, about 80,000 feet (2% of the total footage)	2,500,000	60,599	190,800	18	Marin	II	2009
3169	2110002	2110002-002	Marin Municipal Water District		Replace floating cover and configuration.	M	0	C	Floating cover does not meet seismic standards.	1,000,000	60,599	190,800	18	Marin	II	1998
3170	2110002	2110002-001	Marin Municipal Water District		replace any average two tanks a year. With other types of storage,	M	0	C	Older redwood tanks do not meet seismic standards.	3,000,000	60,599	190,800	18	Marin	II	1998
3171	2110002	2110002-009	Marin Municipal Water District	MMWD Fire Flow Pipeline Replacement Project	MMWD initiated a Fire Flow Master Plan (FFMP), as described in Section J - Problem Description, in order to increase the water distribution system’s ability to provide water for fire protection and to strengthen the system to increase its survivability during a seismic event. The District is currently in the 12th year of this 15 year improvement program. The work completed on the Fire Flow Master Plan through June 30, 2008 includes approximately 271,000 feet of pipeline replacements as well as seismic retrofits of the treatment plants and the critical transmission tanks and pump stations. This project includes $2,500,000 in pipeline replacement work remaining on the FFMP project list. This work is “shovel ready”.	M	0	C	This project will improve Marin Municipal Water District’s ability to provide water for fire protection and suppression in MMWD’s service area in Marin County, which is located within the seismically active San Francisco Bay Area. MMWD’s water system is in need of strengthening in order to increase its survivability during a seismic event. This project meets Safe Drinking Water SRF Project Ranking Criteria for Category E: Water systems with water outages or significant water quantity problems caused by source water capacity or water delivery capability.In addition to being located within a seismically active geographic area, MMWD’s service area is characterized by suburban neighborhoods, many in or near wooded and open space lands, with homes that are surrounded by highly flammable, overgrown vegetation. Property development with fire-prone landscaping has also increased fire danger. It has been more than 70 years since the last major fire (Mill Valley Fire 1929) touched this area. If the same fire were to burn within a similar footprint, nearly 850 homes and inhabitant lives would be affected, and that area is just one of many vulnerable neighborhoods within MMWD’s service area. Wildland fire hazards in these communities are ranked as “high” in Marin County’s Fire Plan. A major fire such as the Oakland Fire of 1991 could also have a devastating affect on MMWD’s watershed lands,	2,500,000	60,599	190,800	18	Marin	II	2009

3172	2110002	2110002-008	Marin Municipal Water District	MMWD Redwood Tank Replacement Project	As described in Section J - Problem Description, MMWD's water system includes 26 aging redwood tanks which must be replaced. This project involves replacing two of these redwood tanks with steel tanks. The total cost for replacing all 26 of the redwood tanks is $28,600,000. This project seeks funding to replace two of those tanks, projects which are in "shovel ready" status, at a total cost of $2,200,000.	M	0	C	This project will partially address system deficiencies caused by aging redwood water supply tanks that have significant structural, water quality and security issues. This project meets Safe Drinking Water SRF Project Ranking Criteria for Category E: Water systems with water outages or significant water quantity problems caused by source water capacity or water delivery capability. Marin Municipal Water District (MMWD) has 140 water storage tanks in service at 117 tank sites. The tank system is used to regulate pressures in the system and is the primary' source of water used for meeting water demand peaks, for fighting fires and for emergency situations. The problem is that of these 140 water storage tanks, 26 are made of redwood and have exceeded or are close to exceeding their service life. The redwood tanks present the District with significant structural, water quality and security issues. The average age of the redwood tanks is 37 years; which is approaching the estimated average useful life of about 40 years. Recent surveys have indicated that the physical decline of these structures is accelerating, posing a health and safety concern.	2,200,000	60,599	190,800	18	Marin	II	2009
3173	3710034	3710034-004	Otay Water District	Otay Water 1485 Pump Station	The new station will be constructed on the southern portion of the existing 1485-1 Pump Station property owned by the District. The station will include three electrical driven pumps, a diesel emergency generator, a perimeter fence, and landscaping. The Station will be enclosed to protect the pumps and electrical equipment from the environment. There will also be a bridge crane for service and maintenance and onsite parking for utility vehicles. It is intended to improve the transmission of potable water in the 1485 pressure zone and to convey flow to the new 1485-2 Reservoir.	M	0	C	This project addresses a critical reliability issue. The current pump station which has been exposed to the elements (heat, cold, moisture and sunlight) is at the end of its useful life.	2,375,000	45,446	191,500	14	San Diego	V	2009
3174	3710034	3710034-003	Otay Water District	East County Regional Treated Water Improvement Program 36-Inch Pipeline	The ECRTWIP Otay WD project will connect the Helix WD system Levy WTP to the existing Otay WD system. The project infrastructure will consist of construction of approximately 27,000 feet of 36-inch steel pipe and construction of a flow control facility to convey 16 million gallons per day (mgd) of treated water.The ECRTWIP project will address the following primary objectives of the Otay WD: • Acquire local water system capacity to access the regions raw water supply, transmission, storage, and treatment systems.• Acquire an alternative supply source to sustain a minimum of ten (10) continuous day's outage.The primary benefits to Otay WD as an outcome of this project are as follows.• Local water treatment plant and transmission capacity of up to 16 mgd.• Enhanced reliability, flexibility, and security via access to raw water supply sources (i.e. water supply source diversification).• Local treatment and transportation capacity allowing for the potential treatment of Otay WD acquisition of future raw water supply.• Maximize local production sources.• A level of independence from the regions treated water system.	M	0	C	The East County Regional Treated Water Improvement Program (ECRTWIP) Otay Water District (WD) project addresses issues of water system reliability to resolve water outages caused by source water delivery capability that is insufficient to supply current demand.In May 2004, the San Diego County Water Authority (Water Authority) adopted its Regional Water Facilities Master Plan (Master Plan) identifying infrastructure needs to the year 2030. In addition, in August 2004, the Water Authority approved their Long Range Financing Plan. These two plans set the framework for major regional water improvements for many years to come.One element of the Water Authority Master Plan includes the expanded utilization of local water treatment plants owned and operated by their member agencies along with related raw water supply, pipelines, pump stations, and interconnections. The Master Plan earmarked $150 million for cost effective local projects to better utilize the regional raw water supply and local treatment system.The Board of Directors of the Water Authority, Helix WD, Otay WD, Padre Dam Municipal WD, and Lakeside WD all approved binding ECRTWIP Agreements, which outlines an integrated plan, in which each agency commits to certain capital improvements and/or guaranteed usage levels. The Helix WD agreement is essentially a Water Authority capacity purchase of the Helix WD system and	20,000,000	45,446	191,500	14	San Diego	V	2009

This new water supply will supply up to 11,000 homes in the disadvantaged community of Perris, California, and reduce imported water demands at a rate of 1 to 1. The supporting infrastructure includes: seven new wells and associated equipment; 60,000 feet of pipeline (12,000 feet of potable water, 45,000 feet of well-water transmission, and 3,500 feet of brine line); inline water pumping and storage facilities; and well head treatment, monitoring, and other equipment as determined by final project design.EMWD is funding the construction of the desalter through a combination of local, federal, and state funding sources. This application covers the SUPPORTING INFRASTRUCTURE costs related to the Perris II Desalter.The goals of this project are to:• Reduce demand on imported water • Protect drinking water sources• Provide and enhance water security• Supplement water supplies for disadvantaged communitiesIn order to reduce EMWD's dependence on imported water, additional local water supplies are being identified and infrastructure developed to provide sustainable potable water to the surrounding community.EMWD has successfully constructed two groundwater desalination plants and implemented a desalination program within the last 5 years. Currently,	M	0	C	The goals of this project are to:• Reduce demand on imported water sources;• Protect drinking water sources;• Provide and enhance water security; and• Supplement water supplies for disadvantaged communities.Eastern Municipal Water District (EMWD) provides water to a 555-square mile area in western Riverside County, serving approximately 660,000 people. Of EMWD's total potable water demand of 134,000 acre feet per year (AFY), 82% is met with imported water from the State Water Project Water (SWP) and Colorado River Aqueduct (CRA) while the remainder is provided by local groundwater. To reduce dependence on imported water, additional local water supplies are being identified and infrastructure developed to provide sustainable potable water to EMWD's service area.EMWD has successfully constructed two groundwater desalination plants and implemented a desalination program within the last 5 years. Currently, up to 8 million gallons per day (MGD) of locally-derived potable water is generated. These efforts were implemented in order to:• Increase reliance on local groundwater, decreasing dependence on imported water;• Increase reliance on local water resources in the event of an emergency (such as an earthquake) that cuts off imported water supplies;• Increase local drought preparedness and mitigation responsiveness; • Supplement water supplies to	20,000,000	141,243	414,710	20	Riverside	V	2008

3185	3310009	3310009-061	Eastern Municipal WD	Cactus Feeder Phase IIA Transmission Main-Moreno Beach Dr.	The Cactus Pump Station (CPS) and Transmission Pipeline Phase I and Phase II will provide a regional transmission and storage supply of treated water from the Henry J. Mills Water Filtration Plant (Mills) of the Metropolitan Water District of Southern California (MWD). The MWD will deliver up to a maximum flow of 70 cubic feet per second (cfs.) at the designated EM-23 connection located near the boundary of the Eastern Municipal Water District (EMWD). The District is nearing completion of the Cactus Pump Station (CPS) and Phase I Transmission Main. The Phase I Transmission Main extends easterly from the CPS at the Interstate 215 Freeway to the intersection of Cactus Avenue and Heacock Street. The Phase II Transmission Main will be extended easterly from the intersection of Cactus Avenue and Heacock Street for 5.5 miles in Cactus Avenue to a proposed terminal storage facility to be located in the east Moreno Valley Service Area of the 1764 Pressure Zone. The Phase II Transmission main will also extend north 4,600 LF in Moreno Beach Drive (Phase IIA). The Phase IIA Cactus Feeder Main will complete connection between two existing transmission mains in the east Moreno Valley Service Area of the 1764 Pressure Zone.With completion of the Phase II and Phase IIA Transmission Mains EMWD anticipates being able to serve existing and future customers through planning year 2030. The Phase IIA Transmission Main to	M	0	C	Eastern Municipal Water District (EMWD) provides water to a 555-square mile area in western Riverside County, serving approximately 675,000 people. EMWD's total potable water demand of 134,000 acre feet per year (AFY) includes 82% of imported water from the State Water Project and Colorado River Aqueduct and the remainder is provided by local groundwater.EMWD has recently completed an updated Water Facilities Master Plan (WFMP). The WFMP has identified supply and demand scenarios, deficiencies and required infrastructure improvements through ultimate build-out. The required infrastructure improvements include major supply, conveyance and storage facilities within the District's four major service areas, Moreno Valley, Perris Valley, East Valley and South Valley. The second largest service area is the Moreno Valley Service Area and due to the pace of growth in recent years will require a large investment for supply, conveyance and storage facilities to meet existing and ultimate demands. EMWD in conjunction with the Metropolitan Water District of Southern California (MWD) and Western Municipal Water District (WMWD) have embarked upon a regional water supply project, the Perris Valley Pipeline (PVPL), to deliver additional potable water supplies to Southwest Riverside County. The Perris Valley Pipeline, owned and maintained by the MWD, is a 96-inch water	3,600,000	141,243	414,710	20	Riverside	V	2009
3186	1010007	1010007-020	FRESNO, CITY OF	T-3 Water Storage and Pumping Facilities	In meeting California Water Works Standards and Fire Codes related to peak water demand periods, fire suppression, and system pressure requirements for current and future developments within the City of Fresno's (City's) southeast service area, the City has procured property (~3.39 acres) within this area for the installation of a permanent three-million gallon water storage tank and pumping station (T-3 Facility) . The property is located at 6736 E. Dakota Avenue (APN 310-20-143T; T13S/R21E). Permanent project improvements will include grading and paving, installation of storm drain and site utilities, a six-foot (6ft) perimeter block wall fence, automatic entry gates, and other remote and site security measures. For additional information, and as non-inclusive to this funding request, this particular area presents unique service challenges, due to nitrate and other groundwater contaminants such as pesticides from agricultural applications. As such, an interim package treatment plant will also be used at this facility. Treatment plant facilities are anticipated to be operated May through October of each year, and will be staged in 2 million gallon a day (2 MGD) increments to an ultimate build-out of 8 MGD as needed in meeting rapid local development until the larger regional plant as described in the Problem Description can be brought online. The new three-million gallon tank will be filled in off-peak periods and then discharged for distribution	M	0	C	The 1996 Fresno Metropolitan Water Resources Management Plan identified the need to construct a water storage and pumping facility within the City of Fresno's (City's) southeast service area. Soil lithologies and low yields of existing wells indicate that groundwater wells alone are not capable of supplying sufficient water to meet peak period pressure, demand, and fire suppression requirements for the build-out and current tempo of development within this area. In meeting California Water Works Standards, Fire Codes, and current area growth demand, The City has procured property within this service area for the installation of a permanent three-million gallon water storage tank and pumping station to aid water supply requirements for developments within the vicinity of the proposed storage tank property. Although a regional surface water treatment plant within the southeast area is being proposed and targeted for operation in 2015, build-out of current development areas near the project are anticipated to significantly out-pace proposed treatment plant operational timelines. After the new treatment plant is brought online, the water storage tank and pumping facilities will permanently remain in meeting and maintaining vicinity peak demand periods, system pressures, fire suppression, and emergency storage. Proposed storage tank facilities will also provide interim and future benefits to area	4,000,000	128,152	457,511	11	Fresno	III	2008

3192	4310011	4310011-013	San Jose Water Company	GRAYSTONE LANE TANK REPLACEMENT	A new tank will ensure consumers benefit from many decades of a high quality and reliable water supply. Key consumer benefits of this alternative include improved system reliability, minimal disruption of water service, and improved water quality. The estimated cost for replacing the existing concrete block tank at the Graystone Lane Station is $600,700. These costs include all labor, materials and permits needed to build a new tank at this facility. Major components of this cost estimate are shown on Table 1 (see attached). SJWC recommends the replacement of the existing concrete cinder block tank at the Graystone Lane Station. This alternative is superior to the do nothing or the interim repair alternatives because it will allow SJWC to provide consumers a high quality and reliable water system. The consumer benefits from improved system reliability, minimal disruption of water service, and improved water quality for many decades to come.	M	0	C	SJWC has 96 distribution storage tanks or reservoirs of varying sizes (from 20,000-gallon to almost 20MG) and types within the distribution system. The majority of the tanks are either welded or bolted steel, and only a few redwood and concrete tanks are remaining in the system. SJWC replaced most of its redwood and concrete tanks with steel tanks in the 1980's and 1990's. Tanks that require replacement do so for a variety of reasons, including but not limited to its age, size, and condition. On an average year, SJWC completes two (2) tank replacement projects.Graystone Lane Tank is proposed for replacement due to its age and condition. This tank is currently 53 years of age. According to the SJWC asset ledger, the useful asset life ranges from 35 to 50 years suggesting the tank is already beyond its useful life. Tanks that are 50 years of age or older usually cannot provide the desired level of service and will eventually fail. In addition, this concrete block tank was unlikely constructed to an industry standard and is unlikely to survive a significant seismic event.The latest inspection reveals that the tank is in poor condition. Due to its age, the roof system has failed beyond repair and is a water quality risk. In addition, aging and deteriorating concrete blocks will greatly increase risks of not only potential tank failure but also water quality problems. These problems over the long-term will result in a lower level of service	600,700	219,571	998,000	17	Santa Clara	II	2009
3193	4310011	4310011-038	San Jose Water Company	Pipeline replacement Saratoga Ave (Dagmar to Scotland)	Replacement of 1,890 of steel pipe with 24-inch Ductile Iron Pipe on Saratoga Ave from Dagmar to Scotland. The pipeline will provide improvements to water quality, fire protection, and system transmission and distribution reliability in response to earthquakes in the vicinity of the project.	M	0	C	A critical need for replacement of potable water transmission and distribution system infrastructure has been identified by SJWC due to the changes in demography in the 1950's and 60's. based on past San Jose Water Company developed infrastructure studies as well as publications and reports from American Society of Civil Engineers (ASCE) and federal agencies such as EPA and GAO, SJWC's water main replacement performance over the last decade has averaged approximately 9 miles per year. Plant new replacement trees.02) Earth work: excavate approx. 3,270 CY of the ex. slope, remove approx. top 12" of the ex. fill material under the tank, and backfill and compact.03) Slope protection: approx. 8000 sqft wire mesh drapery and 250 ft of K-rail.04) Tank #1 concrete foundation for the 90' dia. X 38' high tank.05) Drainage system: conc. valley gutter, drain pipes, conc. catch basins, etc. 9 CB, 240' 12" C-900, 290' valley gutter, 400' 18" corrugated HDPE ditch, 44' 12" CMP.06) Tank #1 inlet-outlet piping (~100'), valves, reuse EBAA cplg, tie in ex. 12" main, etc.07) Tank #1 - 14″ Tideflex Mixing System08) Tank #1 altitude valve,sensing line,vault,sump pump/discharge line,pumper conn vault.09) 90′ dia x 38′ high welded steel tank.10) Tank exterior and interior coatings.11) Heating and de-humidifying.12) Electrical: relocate WL transmitter/alarm/RTU/antenna, remove cathodic protection sys. install site transformer,subpanel,water level transducer,lights,wires,switches,conduits,etc.13) Paving: approx. 4320 sqft 2" AC over 6" Class II aggregate rock base.14) Relocate approx. 110 ft existing chain-link fence and gate.To replace the existing welded steel tank which is deteriorated and beyond economic repair.	M	0	C	SJWC has 75 tanks of varying sizes (from 100,000-gallon to over 15MG) and types within the distribution system. The majority of the tanks are either welded or bolted steel, although five redwood tanks remain in the system. SJWC replaced most of its redwood tanks with steel tanks in the 1980's and 1990's. Tanks that require replacement do so for a variety of reasons, including but not limited to its age, size, and condition. On an average year, SJWC completes two (2) tank replacement projects.Greenridge Terrace Tank #1 is proposed for replacement due to its age, condition, and size. This tank is currently 45 years of age. According to the SJWC asset ledger, the useful asset life ranges from 35 to 50 years suggesting Tank #2 is reaching the end of its useful life. Tanks that are 50 years of age or older usually cannot provide the desired level of service and will eventually fail. The latest inspection report also shows Tank #1 to be in poor condition. Due to its age, the interior coating shows signs of deterioration and peeling. According to company records, the recommended useful life of an interior coating is 20 years. The interior coating of Tank #1 is over 37 years of age. The peeling of the interior coating causes not only water quality problems but also results in more rapid corrosion of the tank. These problems over the long-term cause damage to the tank, result in a lower level of service experienced by the consumers, and	2,412,000	219,571	998,000	17	Santa Clara	II	2009

A temporary system is currently in use at Needles.	M	0	C	The Needles Station has a temporary chlorination system and needs a permanent system. Chlorine is fed to groundwater to maintain a residual in the distribution system, providing stable water quality and keeping pipes and tanks clean.	418,400	219,571	998,000	17	Santa Clara	II	2009

3211	4310011	4310011-025	San Jose Water Company	Mt. District Pavilion Tank & Pump Station	System improvement includes development of water storage tank (~95,000 gal) and pump station site that includes; new electrical service, motor control center, three booster pumps with variable frequency drives, parking for two trailer mounted diesel powered electric generators and on-site storage of emergency repair materials. The site and service area is in the mountainous and wooded terrain of the Santa Cruz Mountains. Improvements provide for increased reliability of water supply to a relatively isolated and vulnerable area of SJWC's service territory. Direct customers in Redwood Estates and adjacent mutual water companies benefit by having addition storage and improved pump facilities for domestic supply and firefighting porposes as well as ready access to two mobile emergency power generators in a location that frequently experiences power outages due to storms and falling trees. Improvements also include reconfiguration of piping to allow five existing fire hydrants to be readily and reliable used by firefighters with up to 90,000 gallons of stored water. The existing hydrants are only intermittenly available for use by firefighters when downstram pumps are running. Even with pumps running only about 400 gpm of water would be available without a reliable source of supply in an emergency situation.Project will provide overall increase in reliability of service and significant	M	0	C	Insufficient storage for fire protection and domestic supply in event of equipment failures or power outages in an area subject to acts of nature that commonly cause such interruptions of water supply to the relatively isolated area of the water system. The community known as Redwood Estates is situated in a high relief and wooded area in the Santa Cruz Mountains and is more vulnerable to damage from wild fires, storms and earthquakes such as slope failures, tree falls and power outages. These risks all necessitate that increased reliability of water service for potable and fire protection are justified. A series of four pump stations currently supplies water from the water treatment plant to Redwood Estates and other mutual water companies. The pump stations and pipeline was constructed with FEMA assistance shortly after the 1989 Loma Prieta earth quake, which devestated the water supply and distribution system in what was then Redwood Mutual Water Company. In 2006 San Jose Water Company acquired Redwood Mutual Water Company and identified some areas for improvement. The most significant being storage between pump station three and pump station four. The existing configuration places the community at risk because a failure of any one of four pump stations cripples the water supply and transmission system to the Redwood Estates Community.Additionally five existing fire	2,400,000	219,571	998,000	17	Santa Clara	II	2009

Based on past San Jose Water Company developed infrastructure studies, as well as publications and reports from American Society of Civil Engineers (ASCE) and federal agencies such as EPA and GAO, SJWC's water main replacement performance over the last decade has averaged approximately 9 miles per year. The latest revised program to normalize replacement of pipeline infrastructure describes an annual length of pipeline replacement increase to about 17 miles in 2009, about 21 miles in 2010 and leveling off at about 25 miles in 2011 and beyond. SJWC total length of pipeline infrastructure is approximately 2,400 miles. Thus a rate of about 25 miles per year is in line to achieve a 1% per year recommended replacement rate.	460,400	219,571	998,000	17	Santa Clara	II	2009

3219	4310011	4310011-017	San Jose Water Company	Water Main Replacement on Hickory Way, San Jose	Category O Project – Replace 1,960-ft of 6" water main on both Hickory Way and Cascade Dr in San Jose, CA, between Belvedere Dr & Blackford Ave and Aurora Ave & Tanbark St and Belvedere Dr & Saratoga Ave.Water Main Replacement: A critical need for replacement of potable water transmission and distribution system infrastructure has been identified by SJWC due to the changes in demography in the 1950's and 60's. Based on past San Jose Water Company developed infrastructure studies, as well as publications and reports from American Society of Civil Engineers (ASCE) and federal agencies such as EPA and GAO, SJWC's water main replacement performance over the last decade has averaged approximately 9 miles per year. 3221	4310011	4310011-021	San Jose Water Company	Greenridget Terrace Tank #2 Replacement	01) Tree removal (3 trees) and site erosion protection. Plant new replacement trees.02) Earth work: excavate approx. 640 CY of the ex. slope, overexcavate approx. 640 CY of the ex. fill material under the tank, and backfill and compact.03) Slope protection: approx. 5300 sqft wire mesh drapery and 180 ft of K-rail.04) Tank #2 concrete foundation for the 90' dia. X 38' high tank.05) Drainage system: conc. valley gutter, drain pipes, conc. catch basins, etc. 6 CB, 135' 12" C-900 drain pipe, 185' conc valley gutter.06) Tank #2 inlet-outlet piping (~70'), valves, reuse EBAA cplg, tie in ex. 12" main, etc.07) Tank #2 - 14" Tideflex Mixing System08) Tank #2 altitude valve,sensing line,vault,sump pump/discharge line.09) 90' dia x 38' high welded steel tank.10) Tank exterior and interior coatings.11) Heating and de-humidifying.12) Electrical: remove ex. breaker/WL transmitter/cathodic protection/conduits/wires, etc. install subpanel,WL transducer,lights,wires,switches,conduits,and move antenna, etc.13) Paving: approx. 2380 sqft 2" AC over 6" Class II aggregate rock base.14) Retaining wall: approx 70' treated wood retaining wall with hand rail.To replace the existing welded steel tank which is deteriorated and beyond economic repair.	M	0	C	SJWC has 75 tanks of varying sizes (from 100,000-gallon to over 15MG) and types within the distribution system. The majority of the tanks are either welded or bolted steel, although five redwood tanks remain in the system. SJWC replaced most of its redwood tanks with steel tanks in the 1980's and 1990's. Tanks that require replacement do so for a variety of reasons, including but not limited to its age, size, and condition. On an average year, SJWC completes two (2) tank replacement projects.Greenridge Terrace Tank #2 is proposed for replacement due to its age, condition, and size. This tank is currently 45 years of age. According to the SJWC asset ledger, the useful asset life ranges from 35 to 50 years suggesting Tank #2 is reaching the end of its useful life. Tanks that are 50 years of age or older usually cannot provide the desired level of service and will eventually fail. The latest inspection report also shows Tank #2 to be in poor condition. Due to its age, the interior coating shows signs of deterioration and peeling. According to company records, the recommended useful life of an interior coating is 20 years. The interior coating of Tank #2 is over 37 years of age. The peeling of the interior coating causes not only water quality problems but also results in more rapid corrosion of the tank. These problems over the long-term cause damage to the tank, result in a lower level of service experienced by the consumers, and	2,211,000	219,571	998,000	17	Santa Clara	II	2009
3222	3710020	3710020-057	San Diego - City of	RB pump station upgrade	The RB pump station upgrade project includes the addition of pumping capacity to the existing 25 mgd capacity pump station.	M	0	C	RB pump station upgrade is needed to supply the current and projected demand growth in the 793 zone. The existing pump station is operating at capacity and is currently using all its four regular duty pumps and its one back-up pump tp meet existing deman	8,000,000	273,015	1,266,731	14	San Diego	V	2002
3223	3710020	3710020-055	San Diego - City of	Miramar WTP clearwell no. 2	Demolish 30 million gallon clearwell no. 2 and replace with new prestressed concrete tanks which complies with current seismic code.	M	0	C	Miramar WTP clearwell no. 2 does not comply with seismic code and suffers form considerable structural damage and needs to be replaced.	20,000,000	273,015	1,266,731	14	San Diego	V	2002
3224	0110005	0110005-035	East Bay MUD	Advanced Metering Infrastructure	This project consists of installation of new metering equipment, related telemetry, and computer systems to remotely collect (real time) EBMUD customer meter reads as frequently as every hour. The project will be coordinated with EBMUD's SCADA systems and other telemetry-based field equipment to provide on-demand pressure zone balances, and perform distribution system leak detection. The project will also include the development of computer software to track, manage and provide customer internet access to their individual water use accounts as well as a wealth of conservation best management practices and services. These systems can readily detect water waste and other conservation opportunities. They can also provide individual water budgets that can be updated daily based on weather fluctuations. The EBMUD AMI project will collect real-time demand data from customer meters that will be made available to customers via a secure website. The water usage data collected from the meter reads can then be accessed in graphical format via an EBMUD-supported Intranet connection where it will be shared with customers for their use in identifying water conservation opportunities. EBMUD water conservation staff will then work with these customers to identify water conservation strategies such as fixing leaks, alternative irrigation techniques, and replacing older appliances	M	0	C	EBMUD currently provides water service to 1.3 million residents through more than 400,000 customer accounts. Each account's meter is manually read bimonthly by in-person visits from meter reading staff. Today, new tools are needed to inform the marketplace of its water use patterns and associated costs. Customer and market surveys conducted by EBMUD and the California Urban Water Conservation Council, among others, have consistently reported that roughly two-thirds of residents report their household water use at approximately 50 gallons per day (GPD) when the actual average use is nearly 8 times the amount at close to 400 gpd. Customers are likely to conserve more water (and reduce energy use) if they know their actually use, when and where water is being used, and the direct benefits from its conservation.EBMUD conducted pilot studies using Advanced Metering Infrastructure (AMI) systems. These studies show that AMI systems have the benefits of conserving water and eliminating waste; reducing energy use; improving system reliability, providing better, real-time data used in forecasting and system operations; improving customer service and satisfaction; improving business practice efficiencies, thus reducing costs; and providing green environmental benefits through reduced landscape over watering and energy savings.In order to meet California's goal of reducing water consumption	20,000,000	386,065	1,300,000	04	Alameda	II	2009

3225	0110005	0110005-036	East Bay MUD	Shapiro Reservoir Replacement	The project consists of demolition/removal of the existing 4.0 MG open cut reservoir and replacement with a new partially buried 1.0 MG, pre-stressed concrete tank in the existing reservoir basin. To support water service during construction, a temporary storage tank and a new regulator from the Pearl Pressure zone is included to maintain service. The bottom and overflow elevations of the new reservoir will match the other tanks in the pressure zone.	M	0	C	The existing Shapiro Reservoir is a 4.0 million gallon (MG) open cut reservoir located in the San Pablo/Richmond area. The existing reservoir is approximately four times larger than needed for serving the pressure zone demand, and lacks separate inlet and outlet which has contributed to water quality problems. The existing reservoir is covered with a pre-cast concrete panel roof system that needs extensive structural rehabilitation and that allows movement of water into the reservoir. The existing reservoir ventilation system is inadequate and the floor lining system leaks and needs replacement.	8,000,000	386,065	1,300,000	04	Alameda	II	2009
3226	0110005	0110005-034	East Bay MUD	South Reservoir Replacement	The project consists of demolition of the existing 50 million gallon concrete reservoir and replacement with two - 10 million gallon steel reservoirs at the same site.	M	0	C	South Reservoir is a 50 million gallon storage facility located in Castro Valley, California. The project consists of demolition of the existing oversized reservoir and replacing it with two 10 million gallon tanks which will better serve our customers.The reservoir was originally constructed in 1956 by excavating the site and placing fill for an embankment to create an “open-cut” reservoir.The precast concrete roof system at South Reservoir has deteriorated to the point where it is a potential life safety issue to District personnel and a water quality issue due to leakage.	17,000,000	386,065	1,300,000	04	Alameda	II	2009
3227	0110005	0110005-033	East Bay MUD	Walnut Creek Water Treatment Plant Improvements	The project includes the following improvements at the Walnut Creek WTP: 1) two new filters; 2) a new Leland Pressure Zone pumping plant; 3) improvements to the backwash wastewater treatment system; and 4) landscaping at the WTP prior to construction to provide screening. The new Leland Pumping Plant will correct hydraulic problems in the Leland Pressure Zone.	M	0	C	Improvements to the Walnut Creek Water Treatment Plant are needed to meet existing and future water demands in the Lafayette, Moraga, Orinda and western Walnut Creek area; to meet future water quality standards; to comply with environmental permit conditions; and to replace and upgrade aging infrastructure. Additional treatment capacity is required to address occasional changes in source water quality. Increases in turbidity in spring and early summer, and recent increases in algae in Pardee Reservoir have adversely affected the source water quality at the WTP. Consequently, the efficiency of the filters is reduced, and the ability of the plant to meet demands is constrained.	20,000,000	386,065	1,300,000	04	Alameda	II	2009

3228	1910067	1910067-040	LOS ANGELES-CITY, DEPT. OF WATER & POW	LOS ANGELES RESERVOIR WQIP - BULL CREEK	The Bull Creek project is the first phase of the Los Angeles Reservoir Water Quality Improvement Project. The second phase is the construction of an ultraviolet light treatment facility to disinfect the outflow from the Los Angeles Reservoir.The Bull Creek project includes the relocation of the Bull Creek Extension Channel and other storm water diversion facilities to prevent runoff from entering the Los Angeles Reservoir. The Bull Creek Extension Channel diverts storm water through a series of detention basins located on the Van Norman Complex. This project will include the expansion of the inlet structure to the channel to allow increased storm water flows into the channel, as well as protecting the Los Angeles Aqueduct Filtration Plant backwash water ponds from potential inundation. The channel will be relocated to the west, portions of the channel enlarged, and a new diversion structure constructed to direct more of the runoff to the San Fernando Storm Water Detention Basin where it can then be stored for future groundwater recharge. The current spillway from the Lower Debris Basin to the Los Angeles Reservoir will be filled in, and a new spillway from the debris basin will be constructed to allow flow from the basin to the San Fernando Storm Water Detention Basin.	M	0	C	The Los Angeles Reservoir must comply with the Long-Term 2 Enhanced Surface Water Treatment Rule. Currently under high intensity storm conditions, runoff can enter the reservoir via a spillway from the Lower Debris Basin located west of the reservoir. The Los Angeles Reservoir WQIP-Bull Creek will cut off the spillway and re-route the storm water around Los Angeles Resevoir to the San Fernando Storm Water Detention basin located to the south.	83,194,923	686,422	4,071,873	15	Los Angeles	IV	2011
3229	2702268	2702268-003	NEW CAMALDOLI HERMITAGE WS	Domestic Supply Well Development	The proposed solution is to develop a domestic supply well to augment the water supplied by S1. The well site will be chosen by a geologist and selected based on accessibility and probability of accessing water. The well will have a sanitary seal and the design will comply with local and State regulations. An environmental analysis for CEQA review will be conducted.The well pump and control system will operate the well based on a signal from the existing storage tank. The control system will include safety features such as dry-run protection and over-current protection.The estimated cost includes the costs for equipment, materials, labor, and engineering and permitting; is approximately $140,000 as shown in the following cost breakdown:Description CostGeologist $10,000Engineering and Permitting $10,000Environmental Consulting $10000Well drilling and casing $50,000Testing of well $ 5,000Pump and Control System $15,000Piping and plumbing $10,000Labor $30,000TOTAL $140,000	M	0	P	The water needs are supplied by two springs. Spring No. 1 (S1) is consistently coliform-free, and supplies all water for domestic – i.e., direct human – uses. Spring No. 2 (S2), is very close to some large redwood trees and becomes infiltrated by their roots and has tested positive for coliform bacteria during recent years. Water from S2 is used for irrigation and cooling of the electrical generator. Until now, S1 has supplied enough water to meet domestic needs. During recent years, however, toward the end of the annual dry season, the flow rate from S1 has decreased to a low level which is an indication that it will likely be insufficient to meet the minimum water needs of the Community in future years, especially during periods of lower than average rainfall or drought. In anticipation of such a shortage, and in the hope of increasing the supply of high quality, coliform-free water, S2 was recently reworked to remove the redwood roots and seal it more securely against surface water infiltration. This work, however, failed to completely eliminate coliform bacteria from the S2 water. In order to have a sufficient supply of coliform-free water for the future, the need to develop a new water source is anticipated. The feasibility of developing a new spring was investigated but no suitable site was found.	140,000	1	25	05	Monterey	II	2009

3234	5400638	5400638-001	SIERRA SCHOOL	Cutler-Orosi JUSD Sierra School Pre-application	DWP funds will be used to drill a 4 inch well of approximately 1,000 feet in depth. Funds will also be allocated to determine the location of underground water and avoid, if possible, having to drill through the rock that is usually found at various depths on the property.Our plan is to keep the current wells and pumps, due to the uncertainty of the water source. The County Health Department will be involved in the inspection of the drilling and insulation of the pump. The new well will be connected to the existing water lines to bring the water to the school and the teacher's house.	M	0	P	Sierra School has 2 wells next to each other with a pump for each well. Both wells are over 700 feet deep. We are only able to obtain 1 gallon/minute from the two wells combined. Often, especially during the summer months, one well will dry up, and a single well is used, though flow is maintained at 1 gallon/minute. These wells serve the teacher's house and the school, with currently 9 students K-8 in this remote mountain school. Currently there is no landscaping or grass on the playground due to the need to conserve water for drinking and sanitary purposes.The school has a potential to serve up to 90 students, based upon past enrollment. As property in the area is developed, there is further possiblity for school expansion. However, the existing wells do not meet current needs, much less the needs of an expanded student population.	500,000	1	40 12	Tulare	III	2008

3245	4901095	4901095-002	Westminster Woods Camp	Westminster Woods Camp Additional Water Storage	Our current distribution center features two 10,000 gallon redwood tanks that are nearing failure due to leaks and overall aging of the tanks. This project would consist of constructing either one large, 60,000 gallon storage tank or two smaller 30,000 tanks to replace the current distribution center tanks. We have researched types of tanks that would suit our camp as well as accounted for the health services requirements of safety in distributing water and the best mode of construction. With all these factors, we have settled on a factory coated bolted carbon steel water tank both for quality assurance and the ability to deliver the materials to the site of the distribution center. In order to build the new tank(s), we would be required to shut down our entire system for the time required to install the new tanks. To do this in the fastest, most cost effective and thorough way, we would hire out professional help for construction and installation. The company would need to deliver the tanks in pieces and construct them on site. We are committed to using a company that has policies for construction meeting the most current standards and regulation. With this new system in place, an updated pump system would also be required to full the tanks properly and efficiently. The benefits of this system include a better more sustainable material in construction of the tank. This would then allow us to offer a more stable water supply and better facilities to	M	0	P	Westminster Woods Camp and Conference Center 501(C)(3) non-profit organization that strives to use our own resources when we have them available. We work hard to maintain the systems that are in place, so our guests receive the most hospitable and welcoming environment upon their arrival. One advantage that we have through our location is to be part of a very well functioning watershed that allows us to filter and use water directly from our property. However, over the past years we have often experienced a shortage of water supplies due to an aging storage tank which leaks and has caused a significant loss in usable water. Additionally, the amount of storage we have often is not enough during our high use seasons, particularly in drought years when there is little rainfall. When such a shortage occurs, it disables our ability to be fully accommodating to large numbers of guests present on site. As water supplies reach low levels due to both problems at hand, we humbly ask our guests to cut back on showers, conserve water where they can, use paper plates and cups instead of our dining sets, and when that does not help, we have to buy water. The root of the problem, however, is not a shortage of spring water or bad use of resources by the facilities or guests; rather it is a lack of well functioning storage that hinders our ability to meet the needs of a full camp. During the peak of the summer and other dry seasons, we gather five	100,000	16	120 18	Sonoma	II	2008
3246	2210908	2210908-001	COULTERVILLE - GREELEY HILL SCHOOL	New well to augment single well	The proposed project consists of the construction of a new well.	M	0	P	The existing water system has only one hardrock well. An additional well is needed to supplement the existing well.	200,000	1	122 11	Mariposa	III	2008

3248	3301385	3301385-001	JOJOBA HILLS SKP RESORT, INC.	Water Storage Tank Replacement	This is a large project for our cooperative RV park. We are going to address the problem of two cracked and corroded water storage tanks sitting on damaged foundations by replacing the foundations and the two upright water storage tanks with one larger, horizontal tank set on a new foundation. We will also install new distribution piping and improve the maintenance access. The project will include the following six stages:I. Planning. A geotechnical report to identify soil and earthquake considerations.II. Development. Final plans and specifications to be completed in August 2010.III. Sources. Obtaining bids and awarding contracts for engineering, geotechnical services, and installation and plumbing services will be completed by September 1, 2010. IV. Preparation: o Delivery of engineering submittals (September 2010);o Release of materials for fabrication (October and November 2010);o Material delivery and crew mobilization (by Christmas, December 2010).V. Erection and installation (December 2010): (a) One 66,000-gallon, bolted-carbon steel, cylindrical tank OSHA-approved ladders and maintenance access, (b) Foundations and access area, (c) About 200 feet of 4-inch distribution system piping.VI. Hydrotesting, crew demobilization, and project closeout (January 2011).o Assessment of compliance with all requirements, including drinking water standards. o Remedy of any problems.o Crew	M	0	P	Jojoba Hills is a cooperative, over-55, 501(c)7 RV resort. Jojoba Hills has three welded steel water tanks. They are used to store the drinking water that is pumped from our 5 wells. The capacity of each tank is 15,000 gallon, with a total capacity of 45,000 gallons.The three water storage tanks were installed in 1990. In May of 2007, an inspector-diver from Dive/Corr observed corrosive cracks in the bottoms of Tanks #1 and #2. The divers' inspection report indicated that the cracks invaded the tank bottom to within 50% of the total thickness of the bottom of the tanks. Rust tubercules were densely packed, and the galvanized material was deteriorated. The divers' report concluded, "It is this Inspector's opinion that since the original steel thickness of these tanks is so thin and the costs of recoating, plus the cost of safety and code upgrades is relatively high, consider replacing these tanks in lieu of repair." He also commented that the damage to our tanks was among the worst he had seen. Furthermore, because of the age of the tanks and the extent of internal corrosion, they estimated that the tanks would last less than 10 years. In the last three years, deterioration has increased. Now, cracks also go down through the outer, visible eight-inch thick portion of the foundation. The cracks emanate radially outward from the corners of two of the four large anchor fittings. The piping connecting to the park's distribution system was	140,000	280	154 20	Riverside	V	2011

3251	1900767	1900767-001	GOLDEN VALLEY MUNICIPAL WATER DISTRIC	Domestic Well Replacement and Supply Line to Storage Tank	The project involves the replacement of a deteriorating domestic well with a new domestic well, destruction of the existing deteriorating well, the construction of a new well masonry block pumphouse to replace the existing very small wooden pumphouse structure that is deteriorating, the replacement of deteriorating almost 30 year old electrical controls and equipment for the well and pumphouse, the replacement of deteriorating well piping and equipment with new PVC or DIP piping, , and the replacement of almost 30 year old 4 inch deteriorated steel water supply line from the well site to the water storage tank with 4 inch PVC or DIP pipe. The well and pumphouse site will also be fenced around the perimeter with 6 foot high chain link fence to provide security for the well and pumphouse facilities. Currently, the well and pumphouse are not fenced and vandalism has occured in the past. The replacement features as noted above are necessary to provide a long term and relaible source of potable water for the Gorman community.	M	0	P	The Golden Valley Municipal Water District has a critical need for a replacement domestic well, pumphouse, and supply water line to the District's water storage tank that serves the community with potable water. The District has only the single existing well that provides the only source of water for the community. Currently, the well is in a deteriorating condition. The well was drilled in 1981 and is almost 30 years old. The steel well casing is thin walled material at 0.188 and has recently developed hole(s) in the casing wall that caused gravel rock material to be sucked into the submersible pump bowl causing major damage to the pump and requiring an emergency replacement of the submersible pump and motor that had previously been replaced about a year ago. The District plans as a temporary measure this fall when water use in the community is much lower to pull the submersible pump and motor and drop pipe and perform a down hole video to try to locate the hole(s) in the casing wall and perform a temporary patch of the hole(s) in the deteriorating casing wall until the well can be replaced. If the deteriorating well fails, the entire community would l be left without any source of potable water and serious health and safety issues would occur with major impacts to the community population and businesses.	762,000	24	200 16	Los Angeles	IV	2011

3278	3301494	3301494-001	PALM SPRINGS AERIAL TRAMWAY	Valley Station drinking water storage tank replacement	PSAT would like to remove the current Valley Station drinking water storage tank and replace it with 2 new 25' x 20' 73.5kg drinking water storage tanks. The purpose of having 2 storage tanks is to continue providing safe drinking water to customers if the other tank needs to be repaired. The type of storage tanks are Glass Fused to Steel Bolted Tanks with steel floors and knuckle roofs. These storage tanks provide internal and external corrosion and abrasion resistance and assures continuous service by minimizing tank maintenance requirements. The project includes building a foundation, erecting storage tanks, and servicing the tanks. The cost does not include PSAT's responsibility to drain and dispose of the water, remove the current storage tank, prepare the site for the foundation, unload storage tank materials and place them within close proximity, and fill the storage tanks for testing and servicing. These are PSAT's responsibility, however, if more funds are provided for the project, PSAT would like to outsource some of these items.	M	0	P	The Palm Springs Aerial Tramway (PSAT) is a Special District created by a special act by the state of California. PSAT provides aerial tramway transportation from the Valley Station (in Palm Springs) to the Mountain Station (in the San Jacinto mountains) where the public/customers can enter the Mount San Jacinto State Park for recreation. PSAT has approximately 400,000 riders each year and must provide safe drinking water to those riders as well as employees, vendors, concessionaires, etc. The Valley Station drinking water storage tank is in disrepair according to an inspection done by the Riverside County Department of Environmental Health. PSAT is required to repair the major leaks by 9/30/07. The storage tank is made out of redwood and is not expected to last more than 5 years. PSAT would like to replace the storage tank within 1 year in order to avoid having to pay for further repairs, which would not be cost beneficial. PSAT would also like to prevent any further loss of drinking water from leaks in the current storage tank. There are also drinking water storage tanks at the Mountain Station that are in disrepair, but those are expected to last more than 5 years. The Valley Station storage tank is the only source of drinking water for the Mountain Station storage tanks (water is hauled up to the mountain on tram cars). Therefore	267,038	2	1,000	20	Riverside	V	2007
3279	3400180	3400180-001	BRANCH CENTER		Construct 500,000 g water storage tank with a 1,500 gpm booster station facility. Involves design and construction.	M	0	P	Due to contamination, wells were shut down. Temporarily, the water is being provided through inter-tie with Citizens. Pressure loss is very large and no emergency water storage is available.	500,000	36	1,500	09	Sacramento	I	2006

3282	3301155	3301155-001	COLLEGE OF THE DESERT		Install new.	M	0	P	System is in need of new piping, lines, and backflow devices.	900,000	1	4,000	20	Riverside	V	1998
3283	3200139	3200139-001	Almanor Heights MWC	Water tank replacement for Almanor Heights Mutual Water Company	Replace our 25,000 gallon steel bolted tank that is 40 years old and has rust problems on the interior. We would like to replace this with a 50,000 gallon steel bolted epoxy lined tank which would provide adequate and improved water supply and additional fire protection for our community. The existing tank has deteriated to a point where repairs are not cost effective. Due to our lot size the old tank will have to be removed and the new tank will be constructed on the same site. We have a estimate that includes everything from design layout, new 50,000 gallon tank and decommission of existing tank. Please contact us with any questions or comments.	M	0	N	The existing 40 year old 25,000 gallon steel bolted tank has deteriated due to rust problems. We intalled a PVC liner 16 years ago but now rust on the spider rods and tank top, along with pin holes are beyond repair. Documentation, both written and photographed, will be provided of these conditions.	163,000	37	25	02	Plumas	I	2007
3284	3601016	3601016-001	Ponderosa Guest Ranch		Construct new storage tank, rehab well, replace mainline	M	0	N	Inadequate source and storage capacity, old mainline	2,500,000	1	25	13	San Bernardino	V	1998
3285	2910300	2910300-003	Malakoff Diggins SHP	Replacement of Derbec Well Shed at Malakoff Diggins SHP	For this project, we would install a building on the same location of the existing building. The new building would measure approximately 40' X 40' and the color to blend into the environment. The roof will have exhaust vents located on the top to remove summer heat and a heater installed inside the building with appropriate BTUs to heat the building and with appropriate exhaust venting. It would have 1 large roll up door for equipment access and two normal doors. One on either end of the building. We would then install 2 new 7500 Watt propane generators in order too keep with the State's green initiative and a 500 gallon propane tank with piping. We would then upgrade the main control panel and float switches to bring it into State and Local code. We would then have a pump company come in and raise the well head to the required height. The existing diesel tank will be removed and the area cleaned up. We would then install needed S.C.A.D.A. equipment and antennas on the building to transmit data to the appropriate areas.	M	0	N	Currently the Derbec Well located at Malakoff Diggins State Historic Park is in the need or replacement. The existing building does not accommodate the needed equipment. The well is located approximately 5 miles from the nearest electrical lines so it has 2 diesel generators inside that run the well and other needed equipment. The well head is also lower than legally required. We would like to increase the size of the well building to accommodate all of the equipment. The new building would be insulated, and have a heater inside to keep the facility warm during the winter months. Several times a year, freezes hit the area and if we are not prepared for these conditions, pipes and valves within the building freeze rendering the facility inoperable. We would then install 2 new propane generators and get rid of the diesel ones. This would cut back on emissions discharged into the atmosphere. We would then work on the control console for the generators which tell them when to turn on and off and bring it up to code. We would then repair the well head and bring it up to code by raising it to the required height. Another addition we would do to the building would be to install exhaust vents on the building. During the summer month, temperatures in the area exceed 110 degrees and their is not adequate ventilation within the building. Finally, we would install a S.C.A.D.A. system in the building. This would monitor	275,000	1	25	21	Nevada	I	2009

3286	3103666	3103666-001	SILVER CREEK SUMMER HOME TRACT	Silvercreek Arsenic Treatment	To bring arsenic into compliance, under the MCL of 10ug/L, would require installation of new treatment technology and possibly utilizing a new water source or blending water sources. All scenarios require replacement and upgrading of the storage and distribution systems. When the current well was installed in 1990 the water quality was good at 100 feet, but the quantity was insufficient. The well was then drilled to about 400 feet. The quantity is sufficient, but the quality, very poor. Previous temporary solutions have included two filtration systems, not designed to the capacity of the mineral concentrations, and an aeration system. In 2004, Silvercreek hooked up to an existing surface water spring that is utilized by nearby residents, prior to regulation by Placer County DHS in 2006 for violation to bacteriological guidance. It is possible that benefits to water quality may be obtained by capping the well at 400' interval and re-screening to the 100' water table. A larger storage tank may be sufficient to operate the system under the one well scenario. However, should pumping rates preclude necessary water capacity, a second well could be drilled in a nearby talus area that is likely to also hit	M	0	N	The drinking water for Silvercreek poses a serious health risk to consumers. The untreated community well services 23 dwellings. Water samples, analyzed at the entry point in the system, are high in arsenic, above the EPA's MCL. This is exacerbated by extremely high iron concentrations (35mg/L). Bacteriological and other mineral concentrations are also in excess of MCL and MCLG. Accretion of arsenic occurs as it binds with iron particulates in the source water and accumulates in the distribution and storage systems. This is evident by the discolored scaly deposits within the pipe and storage tank. Very high mineral concentrations are visually evident in the reddish brown tap water. The flashy nature of the system is due to frequent breaks in the water main, causing the tank to empty, and the particulates become resuspended. In an effort to reduce mineral concentrations, Silvercreek HOA has tried various options including utilizing a spring source. Directives by Placer County Health Services, in 2006, required disconnection from the spring above the community. Violation of bacteriological standards prompted a potable water notification by Placer County Health Services. Most likely this was due to the deficiencies in the condition of	211,000	23	25 02	Placer	I	2007
3287	1900893	1900893-001	CAMP BLOOMFIELD	Junior Blind Potable-Water Storage and Conditioning Project	As noted above, the well that supplies water to our Camp's storage towers has high levels of iron — exceeding the maximum allowable level by 450 parts per million. Camp Bloomfield has two water towers (10,000 gallons and 126,000 gallons). The 10,000-gallon water tower continues to have issues relating to rust (despite being relined), and must also be removed from its location on a hillside in order to avoid a landslide. However, removal of the small water tower will leave Camp Bloomfield 10,000 gallons short of the required amount of water we must maintain on the property at all times in order to provide sufficient water for our service population and comply with fire-safety regulations. To resolve these problems, we propose the following: (1) Remove the small, 10,000-gallon water tower from the hillside entirely; (2) Replace the large, 126,000-gallon water tower with a larger, 136,000-gallon water tower; and (3) Condition the water from the well — before the water enters the storage tank — in order to reduce the level of iron, helping to bring our secondary-standard contaminant levels into compliance with applicable regulations and helping to eliminate future issues with rust in the water towers. In order to install the 136,000-gallon tank, we will also need to install a concrete tank foundation — to ensure adequate support for the new storage tank — and a pressure-reducing station, to maintain proper pressure	M	0	N	Junior Blind of America is a nonprofit organization dedicated to helping blind, visually impaired and multi-disabled children, youth and adults achieve independence. Our Camp Bloomfield provides children and youth who are blind, visually impaired or multi-disabled with a natural and safe environment to build independence, develop self-esteem and fully experience the joys of childhood. Nestled in the Santa Monica Mountains in Malibu, this 40-acre campground offers various week-long camp sessions for children of all ages and disabilities. The largest of its kind in the Western United States, Camp Bloomfield serves hundreds of campers free of charge each summer and is accredited by the American Camping Association. We serve a disadvantaged community at Camp Bloomfield: Three out of every five children we serve is from a low-income household. Because of this, our camp registration fees are set at only $25 per camper — which includes water usage charges. However, even this fee can be an economic hardship for the low-income families we serve, and the fee is thus often waived. The camp's maximum capacity is 200 people. All water needs — including drinking water — for the camp are met through two water towers: A 10,000-gallon steel water-storage tank and a 126,000-gallon steel water-storage tank. Camp Bloomfield's water-system problem is three-fold: First, our water well	500,000	5	25 16	Los Angeles	IV	2011
3288	1900594	1900594-001	CAMP VERDUGO OAKS BOY SCOUTS	New well	Drill new well	M	0	N	Limited water delivery capacity and capability of existing source	27,000	1	30 16	Los Angeles	IV	2004

3289	4500017	4500017-001	MOOSE CAMP	Moose Camp Rehab	The current system consists of two 20 gpm wells that are about 20 years old, a 10,000 gallon above ground storage tank, 10,000 feet of very old (40 to 60 years old) 2 and 3 inch failing steel pipe serving 52 houses with the potential of about 70 total users. Water pressure ranges from below 20 to over 60 psi and there is inadequate fire flow capacity. The low water pressure may be causing inflitration. There are no fire hydrants and only a few anti-back flow devices at the user connections. There are only a few blow off valves at the ends of lines and the old pipe is not buried deep enough for frost protectiuon and not properly bedded. A master water plan has been prepared by a civil engineer and proposes replacing all the steel water lines with 2 and 3 inch pvc pipe buried below frost line and properly bedded in an envelope of gravel. Looped water lines will be installed with isolation valves and fire hydrants at 600 foot spacing. All ends of water lines will have a new blow off valve. All new service connections are proposed with anti-flow devices. Also a new 40 gpm well is proposed in the center of the system to provide fire flow capacity with a hydro-numatic tank and standby generator, or to retrofit one or both of the existing wells to 40 gpm. There is a third well not being used which we may either/or retrofit.	M	0	N	We have had inflitration caused by low water pressure, backflow from users, leaking old pipe lines, stagnation from ends of lines, and possibly repairs to the system. We seldom but on occaission have not passed our water tests due to the detection of coliform. We have no automatic clorination facility so we do it by hand when we fail a water test. We also have inadequate fire flow capacity and no fire hydrants. We are basicly in a "reactive" mode in lieu of a "proactive" mode of operation.	170,000	50	50 02	Shasta	I	2007
3290	4901223	4901223-001	Sonoma County Parks-Putnam Park		Replace well, distribution lines, water pumps, chlorinator and tank.	M	0	N	Need well, distribution lines, water pumps, chlorinator and tank replacement.	125,000	1	50 18	Sonoma	II	1998
3291	3700184	3700184-001	LEMURIAN FELLOWSHIP - THE GATEWAY	Closure of Well #3 at Lemurian Fellowship-The Gateway	Destruction of Well #3 will be accomplished by Tri-County Drilling, a C-57 licensed well driller. A backhoe will be used to remove the concrete cap of the well. An impermeable 2-foot bentonite seal will then be placed in the bottom of the well, followed by approximately 2 to 3 feet of intermediate gravel backfill, and another 2-foot thick bentonite seal above the gravel. The existing concrete walls of the well will next be excavated and removed to a depth of 5 feet below ground surface, a 1-foot thick concrete cap will be placed over the top of the well, and 4 to 5 feet of clean soil will be placed in the excavation, sufficient to fill the hole to the ground surface. All work will be completed in accordance with current Department of Water Resources Bulletin 74-90 requirements and County of San Diego Dept. of Environmental Health guidelines. All concrete debris will be removed from the project site and hauled to a landfill and there will be no waste dishcarge to the ground during well destruction.Because the well is situated near an intermittent stream, the ground around the well tends to become soft while there is water in the stream making it inadvisable to use heavy equipment in the vicinity during that time. Therefore, destruction of the well will be accomplished during the dry season when the stream has stopped flowing.	M	0	N	Well #3 is a 5-foot diameter, 12-foot deep hand-dug well that was present on the property when it was purchased in 1941 by the Lemurian Fellowship (current property owner). The problem is that the well is no longer useful, has not been used in over 30 years so is in deteriorating condition, and is not part of the Lemurian Fellowship-The Gateway water system. According to Section 20 of the California Department of Water Resources Water Well Standards (Bulletin 74-90), in its current state, the well must be destroyed to assure that the groundwater supply is protected and preserved for further use, and to eliminate the potential physical hazard that it poses. Because the Lemurian Fellowship is a church (non-profit religious corporation), funds to destroy this well are very limited and this is the reason we are applying for a grant.The bottom 7 feet of the well is unlined, and the top 5 feet of the well are lined with unreinforced concrete that extends two feet above ground surface. Cracks are visible in the above ground portion of the wall. The well is capped with a flat 3-inch thick, 5-foot diameter unreinforced concrete cap that has a 20 by 20 inch opening covered with a padlocked steel lid. The lid is not water tight. The concrete cap is in deteriorating condition and structurally unsound. The poor overall structural condition of the well is the reason it poses a physical and safety hazard.An open overflow pipe passes through the well wall and is	10,000	7	50 14	San Diego	V	2011

3295	0500028	0500028-001	SHERMAN ACRES MUTUAL WATER ASN	Sherman Acres Mutual Water Assoc. - Pipeline Replacement & Well	Project will consist of two phases: 1. Replacement of water mains - all mains (approx 8500') will be replaced with modern pipe and the system will be engineered and designed to meet all modern codes and standards. 2. Development of a back-up well - a second well will be established in order to provide an alternate supply of water for the community. Depending upon the loation of the well, a pump station may be required in order to move the water to the existing water storage tank.	M	0	N	Water system is composed of aging PVC pipe installed in the early 70's with volunteer labor. The system was poorly designed and is not "looped" per modern construction standards. There are multiple dead end lines without adequate flush outs/blow-offs. These non-looped "dead-ends" are a source of contaminated water. Due to the age of the system, the main water lines are subject to failure and the entire system needs replacement before a catastrophic system failure occurs. Such a failure would leave the residents with no water. The system is also in need of a back-up well, as it relies on a single source of groundwater. There are no alternate water sources as the system is located in a remote area of the Sierra Nevada at approximately 7000' in elevation.	2,000,000	30	120	10	Calaveras	III	2007

3299	3210300	3210300-002	Plumas-Eureka S.P.	Plumas Eureka State Park Water Main Re-route	With this project, we would take the existing 6" main line water pipe where it comes down from the main water tank and install a T and a fire hydrant next to the historic buildings and then continue out to Jamison Mine Road. We would then turn and go up Jamison Mine Road towards the parking area at the end of Jamison Mine Road. In the parking area, we would install 2 laterals with fire hydrants on each to protect the historic structures in this area. We would then continue to run the line through the parking area and up the fire road towards the campground. The line would need to be attached to the bridge crossing Little Jamison Creek. This would remove the pipe from the creek bed. Once across the bridge, we would continue down the fire road to the campground by campsite # 53. At this point, we would run the line down the road towards the intersection by campsite #40. We would then connect into the main 4" water main that currently exists in within the park. Along the entire route, we would install isolation valves and air release valves as needed. All pipe, valves, fire hydrants, and air release valves would comply with American Water Works Association, State and local codes. We would then go to the area of Camp Lisa where the water line currently crosses Little Jamison Creek and cap the line with an end of line valve. Inside the campground where the old line came into the campground we would also install	M	0	N	Currently, the main waterline supplying Plumas Eureka State Park is an elevated pipe above Little Jamison Creek. This line back 10 years ago was approximately 5 feet below the creek-bed. Over the years, downward cutting of the stream exposed the pipe and now across 1/3 of the creek it is approximately 3 feet above the creek-bed. Last year we had a park visitor attempt to walk over the pipeline to avoid getting wet from the creek and broke it. This drained the entire system before park staff was notified. When we got the line repaired, we were required to disinfect the entire system and then flush it completely. This took approximately 1 week to accomplish because this system receives its water from an artisan spring which produces water at approximately 10 gallons per minute. Once the system was disinfected, we were required to draw samples from various areas of the system and have them tested to assure the water was safe for park visitors. Since the break, we have had several times where the system has comeback with positive samples requiring us to place a boil order on the system and then re-disinfecting the system and taking new samples. Their has been several instances also where we receive heavy thunder showers or during the spring run off period where we have had the line fail due to debris coming down stream and hitting it. We currently have a permit from the Department of Fish and Game for the	250,000	1	194	02	Plumas	I	2009

3301	1000573	1000573-001	MOUNTAIN VALLEY COMMUNITY CHURCH	Mountain Valley Community Church Water System - PreApp	California Department of Public Health notified all water systems that they strongly recommend that a totalizing flow meter be installed as soon as possible to be monitored on a regular basis. The church operates totally on donations and would appreciate assistance with funding to install the recommended flow meter.The Mountain Valley Community Church Water System is located in the mountains east of Fresno and does experience freezing temperatures on a regular basis in the winter months. The area even experiences snow several times each winter. A pump house over the well head, pressure tank and piping would keep the system from freezing and any interruption of water service.	M	0	N	The funds requested are to cover the costs of installing a flow meter to monitor water usage and pay for the pump house that protects water source 01 well head, pressure tank and piping from freezing during the winter months.Squaw Valley, California is an economically disadvantaged area east of Fresno, California in the foothills with a population of 3,268 and a median household income of $38,768 per 2000 census.	10,000	2	240	23	Fresno	III	2008
3302	1000170	1000170-002	CAMP FRESNO WATER SYSTEM	Camp Fresno Water System Improvements	The project will include engineering and development of plans and specifications, and the construction and installation of a new water distribution system to serve Camp Fresno, including fire hydrants. The project will remove the current deteriorated two (2) inch galvanized water mains and will be replaced with four (4) inch diameter PVC water mains, in accordance with section 64573 of the Health and Safety Code. The project would also replace the 60 year old redwood storage tank. The current tank has a ten (10) to fifteen (15) thousand gallon capacity. The new water storage tank would be constructed in accordance with American Water Works Association (AWWA) standards. The current source capacity limits the adequacy of the supply system and may impact fire suppression and emergency response to Camp Fresno which would result in the possible loss of property and life.	M	0	N	Camp Fresno is a family oriented facility located along Dinkey Creek in the Sierra Nevada Mountains, in Fresno County, California. Since 1926, the City of Fresno has held a lease agreement with the U. S. Forestry Department for Camp Fresno, a 34 acre site, and an additional four acres were added with Camp Fresno Jr. in 1956, for a 37.24 acre total. The camp provides inner city, low income youth with opportunities to experience nature and outdoor activities, from hiking to campfire programs. Camp Fresno facilities include 55 rental cabins equipped with water and electricity. The water distribution system at Camp Fresno is over 60 years old and needs to be replaced to improve capacity, reliability and safety. The water line system has deteriorated beyond repair and is in constant need of maintenance and repair. In addition, the water storage tank does not meet current standards and does not provide adequate standby capacity to meet potential emergency requirements. A lack of action in replacing the water system will compromise the safety of the facilities during fire emergencies, continue to increase maintenance and repair costs, and may pose a health concern associated with the potential introduction of bacterial contaminates that may be introduced with stagnant water during repair and maintenance work. The current water line pressure is only nine gallons per	200,000	1	250	23	Fresno	III	2007

3303	3600534	3600534-004	De Benneville Pines Inc	Replacement of existing 2" water lines with 8"	The planned project will replace existing 2700 feet of 2" galvanized decaying galvanized water mains that range in age from 45 to 65 years with current AWWA and NFTA code lines. The new lines and mains will vary from 8" to 2" in diameter depending on the location in the system.The project will start at the current horizontal well and utilize a 650' in length 2" HDPE (High Density Polyethylene) to supply the existing 45,000 gallon storage tank. This line must remain surface run as portions of this line are located within the San Gorgonio Wilderness located in the San Bernardino National Forest. The well is artesian The current steel storage tank was relined with fiberglass approximately 7 years ago and has an indefinite life expectancy at this time. However, the tank must be modified to allow for the installation of an 8" outlet. Additional connections are designed into the project to allow for the installation and connection of an additional tank if such becomes necessary. The work installing the new outlet is scheduled for April of 2009.In May of 2009 a temporary 2" water main will be installed so that once work on the 8" line commences in August 2009 the existing 700 foot section from the storage tank to the campus can be replaced without fear of destroying the existing line and interrupting service.Camp de Benneville Pines is located in the breeding zones for Southern Spotted Owls. As such,	M	0	N	Camp de Benneville Pines is a faith-based summer camp and conference center located in the mountains of the San Bernardino National Forest. This institution was acquired in 1961 from the Boy Scouts, who operated a facility on this site from the mid to late 1940's. Our existing water delivery system is a combination of 2" galvanized shallow buried pipes installed by both the Boy Scouts in the late 1940's and by Camp de Benneville Pines in the early 1960's. Due to the age of the existing lines (45-65 years in age) we are experiencing a high level of both water main breaks and leakage. In addition to the age of the lines, Camp de Benneville Pines is located on the flank of Mount Anderson in a region known as the Barton Flats. The Barton Flats were created approximately 20,000 years ago from an earthquake created landslide. The resulting soils are still settling and pipe breakage resulting from both age and earthquake induced soil settlement are causing multiple links and an extremely degraded system.Camp de Benneville Pines in no longer in accordance with NFTA and AWWA codes and standards. The facility is located on federally leased property in the San Bernardino National Forest and is in an extreme fire risk zone. Current standards for fire safety systems imposed by the San Bernardino County Fire Marshall require 8" earthquake resistant lines and 6" supply line hydrants.Camp de Benneville Pines drinking and fire	250,000	2	250	13	San Bernardino	V	2009
3304	1000170	1000170-001	CAMP FRESNO WATER SYSTEM		REPLACE THE OLD EXISTING STEEL PIPE AND VALVING.	M	0	N	THE WATER SYSTEM IS ABOUT 70 YEARS OLD AND THE ENTIRE DISTRIBUTION SYSTEM NEEDS TO BE REPLACED.	110,000	1	250	23	Fresno	III	1998

3306	3600534	3600534-006	De Benneville Pines Inc	Water System Source, Storage and Delivery Improvement and Repair	The proposed project has three major components, listed below in priority order:1. Enhance our water source by drilling a new vertical well and installing a pump and power source, or making other significant improvements.2. Add a 100,000 gallon tank to provide about three times the water storage currently available3. Replace the existing water mains throughout the camp and extend the system to create a circular flow. This will avert complete system failure and, at the same time, eliminate any "dead ends" in the system to create a healthier water supply for human consumption.These objectives are discussed in the paragraphs to follow.Water Source UpgradeOur first priority will be to develop a more productive water source. This may be done by drilling a new well and installing a pump and power generating equipment as well as a larger diameter HDPE feed line from the wellhead to the tanks, currently a distance of about 700 feet. We will also explore the possibility of improving our existing gravity-fed system to see if we can avoid the ongoing energy cost of pumping water from a vertical well. We estimate the cost of this phase to be approximately $100,000.Addition of a 100,000 Water Storage TankOur second highest priority, to be addressed in this phase, is additional water storage. We plan to purchase a 100,000 gallon bolted steel storage tank to be installed on an existing level area	M	0	N	Camp de Benneville Pines is a 501c3, not for profit camp located in the mountains of the San Bernardino National Forest. This institution was acquired in 1961 from the Boy Scouts, who operated a facility on this site from the mid 1940's. The camp is open to all and provides programming for youths, families and adults of all ages regardless of race, religion, gender, sexual orientation or any other factors. The facility is located on federally leased property in the San Bernardino National Forest on the northern slope of Mount Anderson in a region known as Barton Flats. Camp de Benneville Pines drinking and fire suppression lines are combined and are supplied by a horizontal well located above a 45,000 gallon storage tank. The system is gravity fed and flow from the well head is normally slightly higher than 3 gallons per minute. In severe drought years, the flow has gone as low as 1.5 gallons per minute. Due to the age of the existing 2" galvanized lines (50-70 years in age), exposure to freezing temperature due to shallow burial, and surface soil instability, we are experiencing a high level of both water main breaks and leakage.The Camp is operated year-round, although there is seasonal variation in use. During peak use, the camp population can reach 250 or more persons. Average water use per person per day is generally assumed to be about 90 gallons or 18,000 gallons per day for the entire camp during our peak season (which also	600,000	2	250	13	San Bernardino	V	2011
3307	0900506	0900506-001	SPRING CREEK TRACT ASSOCIATION		To replace the aging distribution system using larger pipe to increase flows for fire protection.	M	0	N	SCTA's water distribution system which was installed in 1954 is experiencing an increasing number of leaks. Our leak repair program will soon not be cost effective because of the large number of leaks. The repairs cannot always be made in a timely manner	685,000	140	280	09	El Dorado	I	1998

3308	2000821	2000821-001	CAMP OAKHURST INC.	Camp Oakhurst Well System Repair	Pull two well pumps out and repair/replace them to get them back on line and pumping adequate water.Drill new well to meet or exceed Maximum Daily Demand in conjuction with the other wells pumping together.Replace two 31 year old aging water tanks before failure occurs.	M	0	N	The well pumping system at Camp Oakhurst does not keep up with the Maximium Daily Demand (MDD) during the summer season or times of large group usage. (California Waterworks Standards Sub Section 64551.30) We have to stop irrigating most landscape plants and the lawns resulting in the plants dying back. One well is currently not working and the pump will have to be pulled to find out the cause. The other wells are only pumping 3 gal./minute, 6 gal./min, and 8 gal. min respectively. The 3 gal./min. well has a pump that is going to soon fail before next summer according to a well expert brought in to assess the problem.In addition to the low output of the wells, our two 15,000 gallon water tanks are showing signs of leakage. They were installed in 1979 and according to the well contractor they will need to be replaced within the next two to five years before failure occurs.	40,000	8	325	11	Madera	III	2011
3309	1000165	1000165-001	BSA/CAMP CHAWANAKEE		INSTALL A 60,000 GALLON STORAGE TANK AND PIPELINES.	M	0	N	THE TANKS ARE OLD AND RUSTED.	250,000	19	400	23	Fresno	III	1998

3311	5500031	5500031-001	CAMP MATHER	Camp Mather Water Tanks Replacement/Treatment Upgrade	1. Demolish and remove six existing 50,000 gallon/each wooden clear water holding tanks.2. Install six new 65,000 gallon/each metal clear water holding tanks.3. Remove and replace one 50,000 gallon mixing tank.4. Complete upgrade of existing chemical treatment plant, which includes all new treatment facility.5. Surrounding infrastructure upgrade road and firebreak and pavment.	M	0	N	The city of San Francisco owns and operates a large camp ground facility as well as providing emergency services staging area, if needed, for the Hetch Hetchy water operations. Currently the system, which consists of eight large tanks holding approx. 50,000 gallons each and an addional water treatment plant, is antiquated and leaking. It's purpose is to provide potable drinking for the public each year. Our goal is to replace six of the eight tanks and to upgrade the water treatment facility.	650,000	15	500	11	Tuolumne	III	2009
3312	2701184	2701184-001	SAN ANTONIO LAKE PARK SOUTH WS	Lake San Antonio, South Shore, Drinking Water Treatment Plant Facility Upgrades	New electric valves need to be purchased and installed and auto controls need to be installed to operate the new electric valves.Also, upgrading and replacement of pipe systems, valves, and water distribution equipment.	M	0	N	Monterey County Environmental Health has stated that the treatment plant will need to be fully automated in the near future. Twelve, forty plus year old pneumatic values are ultimately not working properly and need to be replaced. Many of the existing old valves cannot shut down automatically causing possible contamination of treated water.	115,000	1	650	05	Monterey	II	2009
3313	2701183	2701183-001	SAN ANTONIO LAKE PARK NORTH WS	Lake San Antonio, North Shore, Drinking Water Storage Tank Replacement	Replace four existing water storage tanks that supply potable water to all campgrounds at North Shore, Lake San Antonio. No current violations have been issued. However, Monterey County Environmental Health will require these tanks be replaced.Upgrading and replacement of pipe systems, valves, and water distribution equipment.	M	0	N	Old existing tank linings are failing, causing rust through perforation and leakage, this problem continues to worsen as they get older. Two of the tanks have already been taken out of service. This is a major concern to the parks department during the busy summer season for our patrons' use and fire protection.	112,000	1	999	05	Monterey	II	2009

3314	0210300	0210300-001	CA State Parks - Grover Hot Springs	Grover Hot Springs State Park Main Water Line Rehabilitation Project	We plan on identifying the location of the water line within the park prior to beginning the project. We would then pothole down to the water line and insert a valve into the main line. This can be accomplished without having to shut the system down and then disinfecting it. The new valve insertion process has been approved by the California Department of Health Services and is approved by the American Water Works Association. All valves and hydrants would be installed to State and local codes by a certified company. All valves will also be equipped with traffic grade boxes and signed for easy identification. As the project is progressing, all valves, hydrants and relief valves would be GPS ed and coordinates would be logged and plotted on maps for future reference. in areas that the pipe is in need of repair, we would pothole down to the line and replace sections of line as needed. The water lines currently are not a problem but not having valves in them makes it a problem. All valves and equipment used will be approved by the American Water Works Association, State and local agencies.	M	0	N	Grover Hot Spring State is a popular campground and geothermal pool complex located on the Eastern Sierra's. The parks water service comes from Buck Creek which runs through the park. We draw a portion of the water out of the creek and run it through a treatment facility and pump the treated water to a water storage facility (tank #1) located above the campground. The water is then gravity fed down to the campground and to another storage tank located above the pool complex (tank #2). Another main line runs down through the park and services the residence and maintenance area of the park. Both of these tanks have isolation valves located on them so we are able to isolate the tanks from the system. The tank located above the pool complex runs the pools to keep them full and to blend with the geothermal water to cool it down. The main line when they come out of the water plant and goes to storage tank #1 does not have any isolation valves on it. If we were to have a break, we would have to drain the entire line in order to work on it. The main lines that runs form tank #1 to tank #2 and also to the maintenance/residence area also does not have any isolation valves on it. If we have a break in the system, we would have to drain the main line completely before completing repairs. This is a distance of over 2 miles of pipe. We would like to install new isolation valves on the system to adequately be able to	200,000	11	1,000	09	Alpine	I	2009
3315	2905001	2905001-001	South Yuba River State Park	Installation of Water Storage Tank and Supply/Distribution Line	We propose to install an 25,000 gallon water storage tank on the hill next to S. Yuba River State Park. This park has a visitation of up to 2,500 visitors per day during the summer months and is currently only has 3 pressure tanks installed in the water system to provide water. With the installation of this new tank, we would be able to meet demand on the system whenever. We would install the tank on the hill next to the park which is owned by the State and install water pipes from the well and to the distribution system. All lines would be underground and system would be built to AWWA standards. We would also build a new treatment building and move all equipment out of the historic structure it currently occupies and install it in the new building.	M	0	N	Currently the S. Yuba watersystem operates on a demand basis. We do have 3 pressure tanks installed in the system but we do not have any treated water storage. When we have power failures effecting the well, we must use a portable generator to power the well until it is restored. If the well goes down, we cannot maintain water in the system until repaired. We would like to install a 25,000 gallon water tank above the park and connect it to the well for storage purposes. The property that we would like to install the tank on is owned by the state and the only restrictions we would have would be creating an easement across the county road. As stated earlier, the park runs off of 3 pressure tanks only. If a new 25,000 gallon tank was installed on the hill by the park, we could eliminate these tanks and run off of the new storage tank.	500,000	1	2,500	21	Nevada	I	2007

3316	0910301	0910301-002	CA State Parks - D.L. Bliss	Completion of S.C.A.D.A. Monitoring System for Sierra District Water Plants	We plan on continuing the installation of hardware and software needed for the S.C.A.D.A. system at each water plant to facilitate in the collection of data at a central location within each park unit. This data would then be transmitted via a secure Internet link which is currently at each of our park locations to our main district S.C.A.D.A. data collection station at D. L. Bliss State Park which is located in the Lake Tahoe Basin. This data would then be stored on the mainframe computer for health department reporting. Information being sent would include levels, flows, valve positions, turbidity's and alarms. Alarms would be sent on a priority basis which would trigger the paging out of the Districts Chief Plant Operator. This system would also allow the Chief Operator or each park operator to control the water plant from remote locations removing drive time to the facility unless absolutely needed.	M	0	N	Water Plants within the Sierra District are rather spread out. The entire length of our District is approximately 400 miles long and 200 miles wide. It consists of 10 water treatment facilities and 9 sewage pumping facilities. The District has 1 Chief Operator and site operators at each plant. Park water plants are monitored each day by the units site operator but only once per day as per California Department of Public Health requirements. If a water plant goes into alarm or there is a problem (treatment, flow, security), or if a problem occurs after the operator does his checks, the system will either shut down or backwash until the problem is noticed either by the system loosing pressure or the sounding of an alarm. If the operator is not on sight which is the case in most of our park units and an alarm is noticed by a park resident or visitor due to no water pressure or an alarm sounding, they have to notify our dispatch center and once the chief operator is notified via phone or radio and arrives on scene, it could be up to a 6 hour response time due to distances and longer if Sierra weather plays a part. The D. L. Bliss State Park water system is currently on S.C.A.D.A. (Supervisory Control and Data Acquisition). The system was installed back several years ago to oversee and operate the Bliss water treatment plant. When the system was installed, it was setup to accept information from all Sierra District water plants. This year, we	350,000	13	2,800	09	El Dorado	I	2009
3317	3400297	3400297-001	GIBSON RANCH COUNTY PARK		Upgrade wells' double check valves, install new backflow preventers, and replace chlorine gas treatment to liquid Hypochlorite treatment.	M	0	N	No backflow devices on wells. Double check valve does not meet standards. Chlorine gas storage unit is in noncompliance.	25,000	10	10,000	09	Sacramento	I	1998
3318	4900788	4900788-002	El Crystal Mobile Home Park	El Crystal MHP pre-appication	We would like to hook up to city water.The connection is just at the front of the mobile home park.We would need to re-plumb the the mainlines and laterals in the park as the exisiting plumbing might not be adequate to handle the increased pressure of city water.We would also install water meters.The cost for this project we estimate would be between $200-300,000.	N	35	C	The problem was exceedance of a chemical MCL, i.e. Manganese.We have installed filtration equipment and are currently in compliance but other problems with the system remain.City water is right in front of the property so hookup would be fairly easy.There is also a migrating plume of MTBE and other chemicals associated with an old gas station storage tanks which have leaked.	50,000	56	130	18	Sonoma	II	2009
3319	2010014	2010014-001	HILLVIEW WC-OAKHURST/SIERRA LAKES	Hillview Water Co., Inc. 3320	5110002	5110002-038	City of Yuba City	Sri Guru Nanhk Sikh Temple Water System	The requested funds would enable the City to purchase and install 1400 feet of 8- inch pipe, fittings and meter. Although this is only one business, it serves a large number of residents each week. It is important to them that their water system provide clean, safe drinking water.	N	30	C	The Temple is experiencing deteriorating ground water quality and failure to meet regulatory requirementis for arsenic, and/or nitrates, iron, and manganese is imminent. The system is located with the City of Yuba City's Sphere of Influence and Water Rights Place of Use. The Temple leaders have expressed an interest in joining the City'sclean drinking water municipal system. The system is located on Bogue Road in the southern part of Yuba City. The connection would include installation of a water meter to meet the State's requirement.Yuba City has been declared a disadvantaged community by CDPH.	175,700	13,550	51,504	21	Sutter	I	2009
3321	2300730	2300730-002	Westport County Water District	Iron & Manganese Treatment	Install treatment to remove Fe & Mn to below secondary standards	N	25	C	Fe & Mn above secondary standards	500,000	69	70	03	Mendocino	II	2004
3322	0400026	0400026-003	MEADOWBROOK OAKS	Meadowbrook	Install new water treatment sytem and pressure tanks, backwash filters & water softeners. Building construction and necessary fencing to protect and house the equipment. Removal of old equipment & pressure system.	N	20	C	Water & filtrartion system to remove excess iron (feric & ferrous), Manganese and bring down turbity to acceptable levels per Butte County Health Department.	40,000	25	50	21	Butte	I	2009

3323	1610006	1610006-002	Stratford PUD	Stratford PUD Odor Mitigation and Water Storage Project	The proposed project is to furnish and install two (2) - 150,000 gallon water storage tanks connected to well #7. The purpose of the tanks are to aereate the water from well #7, provide fire flow and maximum day demand. The pipeline will allow for bypassing of either tanks. The tanks will be equiped with exhuast systems for venting purposes. During normal operations, two (2) - 5 horse power Variable Frequency Drive (VFD) centrifigal pumps with a capacity of 300 gpm each will transfer the water from the first tank to the second tank. After the second tank two (2) 15 horsepower centrifigal pumps with a capacity of 300 gpm each will pump the water into a 6,000 gallon hydropnuematic tank that will maintain the system pressure at 50 psi. A 60 KW standby generator is proposed to power the pumps to the tanks and blowers should regular power fails. A chlorine disenfection system will be installed. It is anticipated that the site requirements are a 115 feet by 150 feet area to contain the tanks and ancilliary facilities. The site is to be fenced and paved with gravel. The tank site will be adjacent to the well # 7 site.For Normal operation, the tanks will operate in series. The system can also operate with one tank off-line and one tank on-line.	N	20	C	In and effort to increase source water production, the District installed a new well (#7) in June 2004 to supplement the water production from the existing wells (#5 and #6). However, well # 7 has an odor problem and has been placed off line. The District also has concerns with regards to needed storage for fire protection and emergency power if the main power source fails.	1,400,000	294	837	12	Kings	III	2009
3324	1310011	1310011-010	Coachella VWD: I.D. NO. 11	Highway 86 Transmission Main Ph II and Booster Station	The Highway 86 Transmission Main Ph II and Booster Station project will provide safe, reliable domestic water to areas along the west shores of the Salton Sea. Infrastructure improvements include approximately six miles of 30-inch ductile iron pipe and a 4,500 gallon per minute booster pump station.Design plans for the transmission main are approximately 50% complete. The project would include the design of the booster station, easement acquisition, environmental documentation and permitting, and construction of both the transmission main and booster station.	N	20	C	The Coachella VWD - I.D. No. 11 water system provides drinking water and fire protection to the communities of Desert Shores, Salton Sea Beach, and Salton City along the west shores of the Salton Sea. The water system infrastructure consists of three wells, approximately 10 miles of 16/18-inch transmission mains and one 1.0 million gallon storage reservoir.The three wells cannot be depended on as a long-term water supply source due to both reliability and water quality issues. The well field is located on the eastern slopes of the Santa Rosa mountains and taps into a shallow aquifer. As water levels continue to drop approximately 4-5 feet per year, the measured levels of TDS continue to increase and currently exceed the 1,000 mg/L secondary contaminant level.Consolidation of the Coachella VWD - I.D. No. 11 water system with the Coachella VWD - Thermal water system will provide additional safe, reliable water supplies to the communities along the west shores of the Salton Sea. The TDS levels in water supplies from the Thermal water system historically average at 160 mg/L. In addition to enhancing the I.D. No. 11 water system, the transmission main is sized to allow additional service connections along the rural project route. This area is scattered with small disadvantaged community water systems that are plagued with water quality issues. The project will enable the Coachella Valley Water District	6,500,000	2,624	4,198	20	Imperial	V	2011
3325	0610004	0610004-004	City of Williams	New Well and Treatment	upgrade system capacity; identify and develop well on new site to include storage facility; conduct preliminary engineering study of existing system quality, production; develop plans and specs; etc	N	20	C	failing wells, productivity; water quality inferior; health and safety issues	4,000,000	1,324	5,250	21	Colusa	I	2003

3326	1510045	1510045-008	GOLDEN HILLS CSD	Wellhead Treatment Project	The project consists of the installation of a package water treatment system for manganese removal. The method of removal would be by oxidation, precipitation and filtration through the use manganese greensand. The treatment system would include a chemical feed unit, pressure filter, and backwash system including pump and tank. Because of the freezing temperatures in the Tehachapi Mountains, the system would be housed within a small building. With the installation of this system, Well B would be able to meet the Secondary MCL for manganese, and will increase the supply capacity and reliability of the District water system.	N	20	C	The Golden Hills Community Services District (District) is located in the Tehachapi Mountains in Kern County, 40 miles east of Bakersfield. The District has a Median Household Income (MHI) of $48,047 (which is 3 percent higher than the Disadvantaged Community MHI threshold). Currently the District's Maximum Day Demand (MDD) is approximately 1800 gpm during the peak summer months. The District's total source capacity is about 1900 gpm, excluding two wells that are currently not used due to poor water quality. One of these wells, Well B (120 gpm capacity), does not meet the Secondary MCL for manganese. The manganese levels for Well B are typically twice (approximately 0.10 mg/L) as much as the MCL. Currently the District uses a sequestering chemical agent to mitigate manganese. The presence of manganese in a water distribution system can cause growth of microorganisms leading to high chlorine demand, taste, odor and turbidity.	288,000	2,796	7,434	19	Kern	III	2009
3327	5110002	5110002-036	City of Yuba City	Ozone System	Install an Ozone system at the Water Treatment Facility.	N	20	C	Ozone is the #1 preferred disinfectant process for obtaining optimum taste and minimum odor in the water. The WTP experiences seasonal taste and odor problems due to source water inceases in Geosmin algae. This has resulted in many customer complaints and impacts food providers in the community. At this time of year we have problems keeping under the secondary standard MCL for odor.	495,000	13,550	51,504	21	Sutter	I	2009
3328	2100581	2100581-001	HOG ISLAND OYSTER CO.	Hog Island/Marshall Tavern Joint water Project	Consolidation with the Marshall Tavern water system, which has an existing groundwater well with superior water quality compared to Hog Island's, is characterized by the local LPA as the most cost effecient and logistically superior solution to the water systems problems and the reason why the LPA brought the idea to us, the water system operators at Hog Island Oyster Co. The well is located on an adjacent property in a region where access to neighboring land to drill new wells is difficult. The Marshall Tavern owners have already established rights to the well, and have the option to drill a second well. Most of the Hog Island land is not suitable for drilling, and is dominated by wetlands and coastal marshes. In early 2007, a well was unsuccessfully attempted in one of the remaining locations for a secure well. Consolidation. as reccomended by Scott Callow LPA, Marin County Environmental Health, will include distribution lines, storage tanks for domestic use and fire control, pumps and valves along the distribution lines, fencing around the well (source water protection in an area with range animals), destruction of two old wells, engineering of distribution and storage facilities, as well as all construction requirements. Scott Callow LPA is in the process of reclassifying Hog Island as a NTNC because we have grown, expanded our	N	20	N	The sole water source, located close to Tomales Bay, is exhibiting water quality problems that are consistent with salt water intrusion. Flouride levels of 2.6 mg/L exceed the Primary MCL. Significant Secondary MCLs are violated. TDS is 1200 mg/L; Specific conductance is 2300mg/L; Chloride is 620 mg/L; Sodium is 360 mg/L. The complicated water treatment system includes five treatment components and a blending stage. Consequently, the system has not complied with all monitoring directives, as required by Scott Callow LPA, Marin County Environmental Health, including Sec. 64432 (b), (2), and (d). The system has yet to obtain a wastewater discharge permit for disposing of byproduct water from the Reverse Osmosis treatment system, as discussed with Scott Callow LPA, Marin County Environmental Health. Two attempts over the last five years to drill a suitable second well on Hog Island property have proven unsuccessful.	100,000	3	25	18	Marin	II	2007
3329	2300506	2300506-003	Meadow Estates Mutual	Water Quality Improvement	Installation of an ozone/permanganate treatment system to reduce the levels of manganese and iron to acceptable levels. System will include a solution feed tank for permanganate, addition of Green Sand to our current pressure filter tanks, and installation of an ozone generator in each of the anticipated new holding tanks.	N	15	C	Our source water exceeds State of California standards for manganese and iron which cause user complaints related to staining, taste and odor.	15,000	35	85	03	Mendocino	II	2009

3330	1610006	1610006-004	Stratford PUD	Well 7 Methane Reduction	The project proposes the installation of an air stripper at Well 7. The site is large enough to accommodate the improvements. The air stripper will reduce the level of methane gas from the well. The improvements will also include a wet well, electrical, controls, booster pump and discharge piping modifications. This will allow Well 7 to be used by the District.	N	15	C	The Stratford Public Utility District (District) provides both water and sewer service to the unincorporated community of Stratford. The District's water supply consists of three wells. The wells pump directly into the distribution system with an elevated storage tank. Well 6 is currently not in operation due to sanding problems. Well 7 which was completed in 2004 to improve the water system reliability is shut down because of methane gas. The level of gas in the well has resulted in the District not being able to use the well except for a short time during critical periods. The District constructed Well 7 in 2004. The water pumped from the well contains significant amounts of methane gas resulting in the well being turned off. The gas causes a dangerous situation for the community. Without Well 7 the District does not have an adequate water supply and experiences low pressure within the water system. The source water supply for the District does not currently meet the Title 22 Water Works Standards. The residents within the community are low income with a median household income of $29,205 based on the 2000 census. There are 380 service connections in the District with a population of approximately 1,500.	750,000	294	837	12	Kings	III	2009
3331	0610004	0610004-008	City of Williams	Williams Manganese Filtration	In order to achieve compliance the City proposes to install filters specifically designed to remove Iron and Manganese at each of our three primary wells as the wells enter into the distribution system directly, not to a central storage tank. The filters that we have spec'd are Filtronic brand package utilizing the model V-1000 reaction Vessels. Along with all associated piping and pumps, electronic control and basins.	N	15	C	Our water significantly exceeds State and Federal limits for potable water for Manganese and Iron concentrations at all ground water sources. Because of these excesses, the City cannot obtain CDPH permits on our wells. Manganese Maximum Contaminate level 50 City average level is 101 Iron Maximum Contaminate level 30 City Average level is 546 The public was notified per Consumer Confidance Report of 2008	1,720,000	1,324	5,250	21	Colusa	I	2009
3332	1503145	1503145-002	BERRENDA MESA WATER DISTRICT, DOM SY	Domestic Water Pipeline Replacement	The project consists of the replacement of 10 miles of 6-inch diameter pipe with 8-inch diameter pipe (complying with Kern County Development Standards for fire protection). The pipeline begins at an existing tank and booster station near Brown Material Road and Highway 46 and proceeds northwest to Highway 33. The pipeline connection to Blackwell's Corner begins at Section 30 and proceeds south to Highway 46. The existing casing and pipeline underneath Highway 46 has been replaced in the past 5 years and will not be replaced. Other project components include isolation valves that will be installed every mile and air release valves at any high points along the alignment. The pipeline would be installed with the recommended cover over the pipe, thereby complying with the California Waterworks Standards.The implementation of this project will greatly reduce the potential for pipeline breaks and leaks. Ultimately the project could save the District up to 8 acre-feet per year in water losses. More importantly, potential contamination of the distribution system is reduced thereby ensuring compliance with drinking water standards. Also, outages due to breakages will be less likely to occur resulting in better water service to the customers. Replacing the aging pipeline will maintain the existing intertie between the two water districts.	N	10	C	Berrenda Mesa Water District (BMWD) purchases treated wholesale water from the Lost Hills Public Utility District (LHPUD) and provides metered water service to the Blackwell's Corner community located near the intersection of Highway 33 and 46 in northwestern Kern County. According to the 2000 Census, the community is within the Census Tract 45, which has a Median Household Income (MHI) of $29,132. The wholesale water is conveyed through 8 miles of 6 inch diameter pipe to a 35,000 gallon tank within the community. Other rural customers are also served from this system through an additional 2 miles of pipeline. These steel pipelines were installed in the 1950s and are now severely corroded leading to leaks and breaks in the system. Pipeline breaks and leaks frequently occur, which requires BMWD maintenance staff to perform emergency repairs to the pipeline. Each leak or break places public health at risk from potential contamination. Low pressure may result in contaminants entering the system. In addition, the District does not continuously chlorinate its water supply making it more susceptible to contamination.There are multiple locations of pipeline that are above ground or near the ground surface. Because of the lack of cover over the pipe, vehicles or farm equipment, can damage the pipeline. Section 64570 of the California Waterworks Standards requires	1,900,000	8	80	19	Kern	III	2009

3333	1503329	1503329-001	Hart Creek Estates Mutual Water Co.	Iron and Manganese Removal System	The two existing water supply wells are piped together and convey water to an existing storage tank. The project involves installing a treatment system to remove the iron and manganese from the water exiting the storage tank. This will be accomplished by means of oxidation-filtration for a flow rate of approximately 110 gpm. Sodium hypochlorite and potassium permanganate will be added to the raw water and the water pumped into the storage tank. The iron and manganese particulates will be allowed to settle out in the storage tank. The tank will be cleaned out annually to remove settled particulates. As the water exits the tank it will be filtered using activated carbon and then enter the distribution system.	N	10	C	The Hart Creek Estates Mutual Water Company serves approximately 56 residential customers in a remote mountain community in Kern County, California. The water system consists of two small hard rock wells that supply an existing storage tank. The storage tank then supplies the community by gravity through the distribution system piping. Well 03 pumps approximately 50,000 gpd. The manganese concentration in this well is approximately 70 ppb and exceeds the chemical MCL of 50 ppb. Well 12 pumps approximately 45,000 gpd. The manganese concentration in this well is approximately 80 ppb and exceeds the chemical MCL of 50 ppb. The iron concentration in this well is approximately 2,358 ppb and exceeds the chemical MCL of 300 ppb. These attribute to colored water and create damage to pipes, clothes, and residential appurtenances.	500,000	56	499	19	Kern	III	2009
3334	0400012	0400012-001	FARM LABOR HOUSING	Gridley FLH - Water System Upgrade	This project would involve a water treatment system to be installed at each of our two wells in order to remove the manganese in our water system. The east well or Well #1 would have a 200 GPM Quadaplex System, which would require (4) 36x72 automatic Iron/Manganese filters along with any plumbing and electrical work needed to install this system. The same would be done for the west well or Well #2 with the exception of the (4) 42x72 automatic Iron/Manganese filters. Also, required for this project would be two buildings to protect the system from weather at a minimum size of 6' x 14' for the east well and 6' x 16' for the west well. In addition the system would require drains for both wells that could handle 75 GPM flow (east well) and 100 GPM (west well).	N	10	C	Chemical testing of our water system has found an elevated amount of Manganese above the secondary MCL for consumer consumption. These "black deposits" were first detected in our water system back in 1975. Along with the appearance of the water it also has an odor, which many of our residents have complained about. To date there have been no health risks with these elevated levels of Manganese in our water system, but we believe filtering out the Manganese would be beneficial for our public's health.	68,880	144	500	21	Butte	I	2009
3335	1910018	1910018-007	Bellflower Municipal Water System	High Capacity Well #2	The Bellflower Municipal Water System (BMWS) Company plans to construct a new "high capacity" well to enable each agency to withdraw its full entitlement as necessary during dry-years. This would enable flexibility in supply so that the two agencies could better respond to any cutback in imported supply by Metropolitan Water District of California. Additional well capacity is recommended as a high priority. Additional well capacity for BMWS would benefit the BMWS system more economically if constructed within the backbone system or as direct supply to the reservoir at the City Yard. This has the direct affect of reducing the City's dependence on imported supplies, which MWDSC highly encourages. Cutbacks to current State Water Project water deliveries have been the topic of discussion from Department of Water Resources. This can be considered a local water project enhancing local supplies.Future well potentially necessary to replace aging groundwater wells, and support the BMWS and other City purveyors in order to maximize the use of local sources and reduce dependency on imported supplies.	N	10	C	BACKGROUND - In January 2007, the City acquired the assets of the Peerless Water Company for the sum of $5.8 million. On March 21, 2007, the California Department of Health Services (DHS) made their first site visit and inspection of the water system since 1999. Their engineering report identifies a number of problems, including:a. The water pressure in portions of the system must be limited due to the deteriorated condition of the piping (paragraph 2.4.1).b. Wells 2, 3 and 8 exceed the secondary MCL (Maximum Contaminant Level) for manganese (paragraph 2.6.1.2).c. Well 8 exceeds the secondary MCL for iron (paragraph 2.6.1.2).d. The System Operations Plan does not address sequestering treatment of manganese and iron (paragraph 2.5.2).e. Wells 2, 3 and 8 require the City to initiate proper testing of manganese and iron (paragraph 2.6.1.2).f. Unregulated Chemicals Monitoring Regulation (UCMR) monitoring is deficient. A round of monitoring for hexavalent chromium should have been completed by December 31, 2002. g. The Stage 2 Disinfection Byproducts Plan due to DHS was not submitted by the October 1, 2006 deadline. The plan must be implemented by October 1, 2007 (paragraph 2.6.2.3).h. Wells 4, 5, 6, 7, 9, 11, 12, 14, 15, and 16 (total of 10) are inactive and must be rehabilitated or destroyed in accordance with County Health Department regulations (paragraph 3). i. Wells	2,750,000	1,819	5,967	16	Los Angeles	IV	2009

3336	1610005	1610005-004	Lemoore, City Of	City of Lemoore Well #12 Water Tank	Install a 400,000 gallon water tank at the existing well #12.	N	10	C	Well #12 has a limited capacity and a color problem. The tank will help with capacity during peak demand periods and allow a settling period to reduce/eliminate the color problem	1,000,000	5,597	24,500	12	Kings	III	2009
3337	3310044	3310044-005	Rubidoux Community SD	Well 17 & 18 Manganese Removal Treatment Facility	The Well 17 & 18 Manganese Removal Treatment facility is being proposed to eliminate Manganese from the water of 2 existing groundwater wells. The project includes the design and construction of a 5,000 gpm (max) Manganese removal facility. The treatment process involves oxidation and filtration to removal the Manganese. The District currently operates another Manganese removal facility associated with another groundwater Well and has found the operation and maintenance of the facility to be reliable and economic. Current and planned growth for the District does not allow the option to "blend" the water to meet the secondary MCL limits for Manganese.	N	10	C	The proposed project involves the construction of a 5,000 gpm (max) Manganese removal treatment facility on District owned property. The proposed facility will treat the water from 2 existing on-site groundwater wells, each with Manganese concentrations in excess of the secondary MCL. Most recent Manganese concentrations are 200-250 ppb. The construction of this facility will allow the District to use both of the wells for potable purposes, meeting the District's goal of providing safe and reliable drinking water to our customers.	5,000,000	6,206	26,177	20	Riverside	V	2007
3338	3610038	3610038-007	RIALTO-CITY	City Well #3 Replacement	This project would allow the City to lessen its demand of purchasing water from our state agency and meet current demands for potable water as well as water quality standards.	N	10	C	Currently the well fails to produce both water quantites and per water quality secondary standards. The well currently pumps 1,028 acre feet of water per year. The City's water rights are 2,024.6 acre feet of water.	1,500,000	11,923	48,418	13	San Bernardino	V	2009
3339	3701747	3701747-001	NORTH PEAK MUTUAL WATER COMPANY	Storage tank replacement and water line and filtration upgrade	Master plan includes three primary phases:First phase to include filtration system used to reduce iron content MCL approximately 5 fold above excepted levels.Second phase to include replacing primary current storage tank approximately 30,000 gallons with 160,000 gallon tank. Secondary tank approximately 5,000 gallons to be repaced with 40,000 gallon tank. Upgrading the primaryand secondary tanks will fulfill two needs, First primary tank heavily damagedby the cedar fire, secondary tank is underground which currently does not meet the current share holder demands for potability and fire suppression.Third phase is to include replacing the thirty year old water lines, approximately 8 to 10 linear miles. The majority of the water line system is 2 inch in diameter. Current regulation requires 6 inch diameter -	N	5	C	Currently NPMWC supplies approximately 90 meters with infrastructure approximately thirity years old. Water lines are currently at 2 inch width,service lines stretch less than ten linear miles. Primary water tank capacity is approximately 30,000 gallons. Secondary water tank is approximately five thousand gallons (underground - cement) Current infrastructure averages approximately 3 to 5 water breaks/year.With each break NPMWC notifies all shareholders to boil water due to thepotential of contamination due to breaks.NPMWC system is powered by three diesel generators (10kw) - system is completely off the grid (nearest power line is approximaely three miles). Our primary well produces approximately twenty-five gallons/minute, unfortunately exceeds state level of iron content MCL by five fold. NPMWC currently has 90 water shares that currently have 45 meters in use.Approximately 20 homeowners are fulltime and approximately 25 shares (meters) are used part-time (less than 3 times per week occupied). NPMWC is physically located in the Cleveland National Park, due to the undersize of our line feed (water lines) - CDF is unable to draw water from fire hydrants due to the undersize of the lines. Master plan includes upgrading water filtration system, upgrading storage tank to 160,00 gallons, upgrading water lines from two inch to six inch by current code requirements.	2,000,000	90	25	14	San Diego	V	2009

3340	1910098	1910098-006	GSWC - NORWALK	TDS removal by membrane at Dace Well	Dace Well is an active well with limited time of operation due to high TDS. This well's capacity is approimately 610 gpm. In addition of high TDS, the water from this well also has high hardness (up to 610 ppm), high conductivity (up 1800 umol/cm) and organic contaminants as well, such as TCE and PCE. Due to so many issues, membrane is the best option to treat this water. Other treatment normally can only deal on issue. For example, GAC only remove organic, while additional treatment is still required to removal TDS, hardness, etc. GSWC would like to purchase membrane skid, add PLC control unit and bring this well back online to supplement current water supply shortage.	N	5	C	This well has a very high TDS up to 1200 ppm. TDS is a secondary MCL, with recommended value at less than 500 ppm and max no more than 1000 ppm. Due to water shortage, GSWC would like to pump more water from this well. All the wells from Norwalk System have organic contamination problem; so GSWC is limited to the possibility of finding new well locations with good water quality. As a result, GSWC would like to utilize current wells adding treatment to bring the well to its fullest capacity. The benefit of this project is to explore the membrane project, which is becoming more popular. It is a very efficient way to remove TDS with minimum waste discharge. Membrane treatment has been shown to be one of the best treatment options for this well. GSWC would like to use this project as a showcase to explore membrane treatment and whenever applicable, apply membrane treatment at other systems in order to lower treatment cost as much as possible.	800,000	9,617	31,221	15	Los Angeles	IV	2009

3343	2100565	2100565-002	GREEN GULCH FARM	Iron and Manganese Treatment Upgrade - Groundwater Source	The proposed project would improve water quality and control MCL-exceeding manganese levels at the groundwater well while ensuring sufficient water supply by replacing the archaic, high-maintenance gravel filter with an automated water softening system.	N	0	C	Green Gulch Farm's alternate water source, used for 10-20% of the community's annual drinking water, is a groundwater well with manganese contamination. Manganese levels in raw well water are far in excess of the 50 ug/L MCL, ranging from 120-300 ug/L over the last three years of testing. Currently a low-tech, high-maintenance aeration and gravel filtration system is in place, and keeps manganese contamination within acceptable levels. The current system, however, cannot efficiently accomodate the water volume needed during periods of well source use. The gravel filter clogs after several thousand gallons and slows to a rate insufficient to supply the consumers. At that point, the well must be taken off-line and the filter manually backwashed. The water system does not have sufficient staff to maintain this frequent backwash schedule.	10,000	17	75	18	Marin	II	2009

3353	3702354	3702354-001	WARNER SPRINGS ESTATES	Warner Springs Estates/Stone Ridge Well #8	Purchase and install a filtration system to lower Iron (4.37 mg/L) and Manganese (0.14 mg/L) levels in Well #8's water so that the State of California will approve the water for consumer use. A concrete base, storage structure, flushing system including backflow valve, storage tank and other required equipment and materials, electrical and water connections, appropriate engineering consulatation, plans drafted and approved, and permits will be required. In order to complete the project, bids will be let to interested professional companies to complete the work in accordance with all laws and ordinances. An environmental study may be required. Until funding becomes available, it is not possible to fully describe all that the project may entail.	N	0	C	To date the Well #8, our newest and most productive well, has been a five year project yet to be completed. As drilled in 2004 this well is capable of providing 150 gallons per minute. We have been able to equip the new well with electricity, fencing, valves, a fast-fill 2-1/2" hose connection for use of fire agencies in times of emergencies, connections for a future generator, and have met all mandated requirements except achieving an acceptable level of Iron and Manganese contents in tested water. Both of these minerals exceed State of California levels. The 2004 test resulted in a level of 4.04 mg/L Iron, which should be 0.3 or less, and 0.14 mb/L Manganese, which should be 0.05 or less. The June 6, 2007 test resulted in an Iron level of 4.37 mg/L which is even higher than that of 2004, exceeding the limit of 0.3 by 4.34 mg/L. In order receive state approval to supply this water source to our community, a filtration system is needed to lower the Iron and Manganese levels for consumer use. Full implementation of Well #8 is vital to Warner Springs Estates/Stone Ridge, a 55+ incorporated condominium community of 300 lots and approximately 400 residents. Located 8 miles north of Warner Springs and 30 miles south of Temecula, we are totally	200,000	227	340 14	San Diego	V	2007

3360	2110005	2110005-007	Bolinas Community PUD	BCPUD Pilot Study: Elimination of Taste & Odor Problems	The BCPUD would like to conduct a pilot study to determine the origin contaminant(s) causing the taste and odor problems in its reservoir water sources and recommend a solution thereto. The study will involve the district retaining a chemical engineer, water quality specialist and other appropriate professionals to design and carry out this project. The BCPUD regularly receives numerous taste and odor complaints about the drinking water from the public during summer months, which is when the district historically relies on the reservoirs to meet demand.	N	0	C	The BCPUD has three water supply sources: (1) surface water from the Arroyo Hondo creek; (2) surface water from Woodrat #1 reservoir; and (3) surface water from Woodrat #2 reservoir. The source of the water feeding the unnamed streams which fill the two reservoirs is rainfall runoff from the surrounding hillsides which are located in the Point Reyes National Seashore. The BCPUD experiences taste and odor problems in its drinking water when it is drawing upon the two reservoirs (this problem does not arise when the BCPUD is drawing exclusively from the Arroyo Hondo creek). The contaminant(s) creating the taste and order problem are unknown. The BCPUD has water rights permits allowing the diversion of up to 56 acre feet annually from these reservoir sources.	150,000	587	1,200	18	Marin	II	2007

3367	2410003	2410003-001	GUSTINE CITY	City of Gustine Water System Prop 84 Pre-Application	The project elements include the following: Design and construct a replacement well for Well No. 1, and provide wellhead treatment for nitrate at the new well. The well should be of equivalent capacity to deliver and treat 1,100 gpm. Design and construct wellhead treatment for nitrate at the other two wells with elevated nitrate levels. Treatment capacity should be approximately 2,000 gpm for these two wells. Implementing this nitrate treatment will provide full compliance with nitrate standards, provide full capacity to the water system by allowing the new Well No. 1 to operate normally (not as standby only), and allow compliance with the TDS MCL in the distribution system by accommodating blending of water from Well No. 5 which is high in TDS. Replacement of Well No. 1 will also prevent sand from entering the distribution system.	N	0	C	The 2002 Water System Master Plan identified the major water quality problems in the City's wells. These include high concentrations of salinity as measured by total dissolved solids (TDS) and high concentrations of nitrates, chlorides and sulfates. Previously, the City had to shut down and replace wells that exceeded the MCL for nitrate. Presently, three of the four existing supply wells exceed one half the MCL for nitrate and require quarterly monitoring. Well No. 1 typically produces water with a nitrate concentration of 40 to 43 mg/L and only serves as standby capacity. Two other wells produce water with nitrate concentrations ranging from 22 to 38 mg/L. Studies of the local area groundwater basin and recent drilling of test wells show nitrate levels increasing rapidly since 1990 with groundwater containing low nitrate concentrations not within the area of the existing water distribution system. Well No. 5 has developed water quality problems with TDS concentrations consistently exceeding the MCL, averaging approximately 1,200 mg/L. Well No.1 has been in operation over 60 years and produces sand that enters the distribution system. Previously, the City had to replace a well when the casing collapsed due to sand.	3,500,000	1,756	5,311	11	Merced	III	2007

3368	4110010	4110010-043	Montara Water and Sanitary District	Iron and Manganese Treatment and Rehabilitation at Portola 2 Well	This project will involve chemical rehabilitation of the existing Portola No. 2 well and installation of wellhead treatment for iron and manganese.	N	0	C	The District owns and used to operate Portola Well No. 2. Water from the well showed high levels of iron and manganese and the well was taken out of service for this reason. This project will allow for chemical rehabilitation of the existing groundwater source and putting it back in service with wellhead treatment for iron and manganese. This project will enhance the District's water supply portfolio by putting an existing source back in service.	135,000	1,640	5,412	17	San Mateo	II	2009

3384	5710001	5710001-006	City of Davis	Well 34 - New Deep Well and Well Treatment for Source Water Capacity	Project Description: Construct new deep aquifer Well 34 and well treatment system to help supply current demands, comply with manganese secondary MCL levels, and improve source water quality for the city's wastewater treatment plant. The overall purpose of the new deep aquifer Well 34 and well treatment system is to replace lost well capacity to the City of Davis by providing a reliable source of high quality potable water that meets all regulatory requirements and results in the lowest overall cost to the consumer. Specific project objectives are to:• Provide necessary groundwater supply lost from wells removed from service and compensate for historic increase in demand.• Construct the well treatment system to obtain better water quality.• Meet current and anticipated primary and secondary drinking water standards established by CDPH.• Improve aesthetic water quality and reduce consumer related costs. • Lower the level of constituents of concern in wastewater supplied to the City's wastewater treatment plant to minimize potential for violating current or anticipated NPDES permit requirements.The new deep Well 34 will be completed into the deep aquifer (to a depth between 700 and 2000 feet below ground surface) with a pumping capacity of 2,250 gpm. The new well will help supply current demands and replace 30 percent of the supply lost from the abandoned intermediate depth wells. The new well	N	0	C	Problem Description: Significant water quantity problems caused by source water capacity are insufficient to supply current demand. The City of Davis relies solely on groundwater to meet 100 percent of its potable water demand. Since 1917, the City of Davis policy had been to utilize the intermediate depth aquifer. Therefore the current wells can range from 22 to over 50 years old. Since 1987, the City has had to remove seven intermediate depth wells from service due to age, poor water quality, production, and/or operations and maintenance problems. The total average well capacity removed from service is approximately 6,050 gpm, resulting in a significant water quantity problem and an inability to supply current demand. Since 1992, the city policy changed to require that all new wells be installed in the deep aquifer where the supply is better and of higher quality. A new deep aquifer Well 34 is required to replace lost well capacity to the City of Davis and meet current demands. The City strives to provide the best water quality possible to its customers. The intermediate depth aquifer has experienced water quality problems including elevated levels of calcium, manganese, TDS, nitrate, boron, hexavalent chromium, and selenium. Studies indicated that better water quality exists in the deep aquifer, with much lower levels of hardness, selenium, total salinity, nitrates and other	3,750,000	16,339	68,420	09	Yolo	I	2009

3385	4210011	4210011-001	SANTA MARIA WATER DEPARTMENT	Santa Maria Groundwater Treatment Pilot Program	In 2008, the City of Santa Maria completed a feasibility study for groundwater treatment that determined that reverse osmosis or electrodialysis reversal treatment on a side stream of the groundwater supply are likely to be the two most cost-effective treatment options for addressing the constituents of concern in the City's groundwater. Both of these technologies are sensitive to specific water quality, and may or may not work as expected.Other water suppliers implementing similar technologies have benefited from pilot studies to determine if the water supply has some constituents that negatively impact the use of the technology, and to gather data necessary for the design of a cost-effective full scale facility. The City's pilot project would provide this same opportunity on a water supply with different water quality.	N	0	C	The primary concerns regarding Santa Maria groundwater are the Total Disolved Solids (TDS) with a concentration ranging from 600 parts per million (ppm) to 1,200 ppm and a long-term average of 844 ppm; and nitrate, with concentrations of 70 mg/L in two of six production wells. Currently groundwater represents approximately 35% of the the City's water supply. The remainder of the water supply is imported water received through the State Water Project. A water sale between the City of Santa Maria and Nipomo Community Services District (NCSD) mandated per the Santa Maria Groundwater Litigation, Lead Case No. 770214, requrs that NCSD receive a minimum of 2,500 acre feet of water minimum from the City of Santa Maria to cure their basin overdraft. With next year's anticpated State Water allocation of 10% it is necessary to begin groundwater treatment to service this jurisidiction with a quality water supply through groundwater treatment at the City's Blending Facility. Santa Maria holds the rights to 27,095 acre feet of water from appropriative rights validated through the litigation as well as Twitchell Dam Project yield. In order to make use of these much needed resources, treatment must occur. The current production volume of groundwater is 4,940 acre feet of water. The anticipated production would increase to up to 7,440 acre feet of water with treatment.	1,000,000	21,204	83,756	06	Santa Barbara	IV	2008
3386	4210004	4210004-018	GOLETA WATER DISRICT	Anita Wellhead Treatment Project	Preliminary design is 75% complete. Complete final design specifications and construction drawings, construct wellhead treatment system incoporateing Iron removal by oxidation and filtration, along with TTHM formation reduction process (to be determined in final design).	N	0	C	Anita well is now producing levels of Iron and TTHM above the MCLs, of each contaminate. Well head treatment is required to operate this well on a continuous basis.	405,000	16,088	84,000	06	Santa Barbara	IV	2011

3388	5610017	5610017-014	VENTURA WATER DEPARTMENT	Saticoy Conditioning Facility Renovation	This 2009 Water Master Plan capital improvement project involves the renovation of the Saticoy Conditioning Facility (Project) to 7 MGD. Some of the existing facilities and equipment can be utilized or by retofit and upgrade during construction. The existing plant footprint will not be increased beyond what it is now.Three groundwater wells will be connected to the Saticoy Plant and include the existing Saticoy Well #2 (1,000 gpm) and the County Yard Well (2,000 gpm), and the future Saticoy Well #3 (2,000 gpm) expected in 2010. Only two (2) wells are expected to pump to the plant during operation. The plant production will range between 4.3 to 5.7 MGD.The Project will include the following: Additional filters to remove iron and manganese, refurbishment of the existing filters and replacing media, replace all valves and include Device-net capability, replace instrumentation, automated control upgrades, retrofit controls for decant/sludge system, install plant site security system by connecting to City's emergency response resources and upgrade the electrical room. The Project includes the replacement of sodium hypochorite disinfection system with gaseous chlorine. Gas chlorination is the City's standard and is used at the Avenue and Bailey treament plants and operated in compliance with Federal Risk Management Plans and State Accidential Release Program. This includes the following: Replace the	N	0	C	Iron and Manganese treatment is required for the Santa Paula Basin groundwater wells located on the eastside of the City. Throughout the Santa Paula basin iron levels flutuate widely and periodically exceed the SMCL, and the manganese levels continuously exceed the SMCL by 3 to 10 times. The renovation of the existing treatment plant (Project) is recommended in the 2009 Water Master Plan as a means to continually meet iron and manganese SMCLs, utilize local groundwater supplies to the fullest extent, replace losses of surface water supply, maintain the existing level of water supply, and provide for drought-proofing, backup and redundancy of the water supply.This project will not increase the overall supply of water for the City. The Ventura River surface water supplies are the highest quality and lowest cost water available to the City. However, the Ventura River supply is subject to limitations due to cyclical drought shortage conditions, and operational contraints during the summer and fall due to the endangered steelhead trout. A loss of about 2,000 acre-feet is projected each year to help sustain and restore fish habitat and passage. Additional supplemental and more reliable groundwater supplies are needed to offset the loss of the less reliable surface water supply and this amount is about 2,000 acre-feet. This also includes expected drought shortages from the wholesale surface water supplier, Casitas Municipal	11,000,000	31,312	107,490	06	Ventura	IV	2009

3389	1910213	1910213-003	TORRANCE-CITY, WATER DEPT.	Iron and Manganese Hjydrogen Sulfide Treatment	A groundwater treatment facility is proposed that will improve water quality by eliminating odor complaints and by meeting secondary standards for iron and manganese. The proposed facility will also mitigate possible future contamination by the …	N	0	C	Wells contain hydrogen sulfide that has caused customer odor complaints, also iron and manganese concentrations are exceeding secondary standards. In addition, a saline water plume is encroaching on the groundwater production area,	7,027,000	26,432	113,136	22	Los Angeles	IV	1998

3395	1500296	1500296-001	FULLER ACRES MUTUAL WATER COMPANY	Consolidation Project with Lamont PUD or Arsenic Treatment	Install 3000 feet of pipeline to connect to Lamont PUD; replacement of 7,000 feet of undersized and old distribution system with a 6-inch PVC pipe, installing 185 meters,and destruction of existing system wells.	O	45	C	Well 01 produces water with arsenic 12 ug/L which is above the new EPA arsenic MCL of 10 ug/L. Also our distribution system piping is over 30 years old and will need to be replaced when consolidating with Lamont PUD. We will also need to install meters on 185 service connections.	1,200,000	200	571	19	Kern	III	2007
3396	1000105	1000105-002	MADISON ELEMENTARY SCHOOL	Madison Elementary Connection to City of Fresno Water System	The project will consist of a preliminary design report. The report will analyze the alternative solutions prior to commencing with the design and construction. One potential solution is connecting the potable lines to the City of Fresno water system located approximately one (1) mile to the East, while maintaining the existing well for irrigation purposes. This is the preferred solution as the City system is already expanding in the school's direction and will eventually supply development surrounding the school. Another potential solution includes treatment of the existing well using either Ion Exchange, Reverse Osmosis (RO), Lime Softening or Electrodialysis Reversal (EDR). These methods of treatment are effective but often include ongoing monitoring and maintenance. A third alternative is the construction of a new well. A test well would be drilled, zone tested, and analyzed for water quality prior to construction of a production well.During the preliminary design report phase, Central Unified School District (CUSD) will discuss the options with the City of Fresno and the feasibility of connecting to their system. Once the analysis has been completed, the construction documents will be prepared and the project will be put out to bid.	O	45	P	The Madison Elementary School water system consists of a single well that serves approximately 350 users (students and staff). The school is located at 330 South Brawley Avenue, Fresno, CA (Northeast corner of Brawley and Madison Avenues). The site consists of approximately 18 acres and is comprised of buildings, playgrounds, fields, parking lots and other typical elementary school facilities. The site is approximately one half (1/2) of a mile west of the City of Fresno, and approximately one (1) mile away from the existing City water system. The site is inside of the current City of Fresno Sphere of Influence. As shown in the 2009 Consumer Confidence Report (CCR) dated 02/15/2010, the contaminant level of Barium detect was 27 parts per million (ppm), which exceeds the Maximum Contaminant Level (MCL) of 1 ppm. The CCR also noted a detection of Coliform Bacteria. Additionally, there were subsequent monitoring samples completed in June of 2010 that resulted in the 90th percentile lead concentration of 0.030 milligrams per liter (mg/L). This exceeds the MCL of 0.015 mg/L.	1,090,000	1	722	23	Fresno	III	2011

3406	1410001	1410001-004	CITY OF BISHOP	Emergency Interconnection with Indian Creek Community Services District Stimulus Funds	Since Well 1 cannot be used as a source of drinking water for an extended period of time due to its high levels of Fluoride, an emergency interconnection for fire-flows or other unplanned emergencies (major water system shut down), would be beneficial. The City's 1 million gallon tank can contribute to increase Indian Creek Community Services District's water system reliability by providing some emergency storage that they currently lack.The connecting system will be able to operate on a regular and emergency basis. Emergencies and circumstances that could require use of the interconnection could be earthquakes, floods, fire, well collapse, power outage, facility maintenance, storage system failure, planned connection system testing, pipe collapse, or water quality.The proposed interconnection will be a permanent connection between the two systems. Both the City of Bishop and Indian Creek CSD will give and receive water. There are currently no source water monitoring requirements for system interconnections. The City must submit a permit amendment application with the California Department of Health Services to add the connection to their list of approved sources.	O	35	C	City of Bishop's Well 1 cannot be used as a source of drinking water due to its high levels of Fluoride, which exceeds its MCL. For this reason, Well 1 is regarded as a stand-by well by California Department of Health Services (CDHS). Well 1 also has high levels of Arsenic, close to its MCL. The condition leaves the City's productive wells to Well 2 and Well 4. If either one of the productin wells fail (2 or 4), or require extensive maintenance or inspection, the remaining well will not be able to supply the summer demands by itself.Near Highway 168, portions of the City's and Indian Creek CSD's systems are in close proximity to each other, although no connection exists. The proposed interconnection could supply water to either the City of Bishop or the ICCSD by the other entity. The Indian Creek Community Services District water system has 770 customers and 210 service connections. The Indian Creek CSD has excess capacity from which the City of Bishop can benefit. Indian Creek CSD has no potable water storage, but the City does have storage. The City's storage could then be available to the ICCSD through the interconnection. This will be especially helpful during summer months, extended downtime of wells, and fire events. The interconnection can be used for emergency, seasonal, or continuous use. The interconnection can flow either direction. The Indian Creek CSD system is located, as the crow flies, less than	619,000	1,161	3,643	13	Inyo	V	2009
3407	2400066	2400066-001	PLANADA SCHOOL		INSTALL A PIPELINE TO INTERCONNECT TO THE PLANADA CSD WATER SYSTEM.	O	35	P	THE SCHOOL WOULD LIKE TO CONSOLIDATE WITH THE PLANADA CSD WATER SYSTEM.	50,000	1	605	11	Merced	III	1998

The project would inlcude approximately 10,000 feet of pipleine to connect with the Vaughn Water Company. The project would also include upgrading of distribution system of Mustang MWC if required by Vaughn Water Company for consolidation.	O	30	C	Arsenic in the system well water exceeds the new EPA arsenic MCL of 10 ug/L.	1,500,000	50	200	19	Kern	III	2007
3409	2700773	2700773-002	Sunny Mesa Water System	Pajaro/Sunny Mesa Community Services District (PSMCSD) - Hudson Landing Area Water Project	PSMCSD currently provides potable retail water services to the Fruitland Avenue area which is immediately adjacent to the proposed Hudson Landing project. The project would consist of water lines, pumps, and storage tanks that would be constructed and connected to PSMCSD's existing water system. The construction of the system for Hudson Landing would result in the retirement and closure of numerous contaminated wells. Additionally it would provide a guaranteed pure and potable source of domestic water supplies to approximately 72 residences in the area. Many of these residences are occupied by very low income farm worker families that would not otherwise be able to afford the construction of a water system to cure their grave water pollution problems.	O	30	C	The Hudson Landing/Wells Road/Spring Road area of the Pajaro/Sunny Mesa Community Services District (PSMCSD) is a very old, low-income residential community that developed in the 1920-1930 period. At the time, fresh, surface water (springs) was originally the source of consumptive supplies, however this source was quickly exhausted and replaced with a proliferation of shallow, unsealed wells on small, individual lots. These lots are also occupied by numerous old, leaking, septic tanks. The proximity of these septic tanks to the numerous small domestic wells has led to chronic and acute well water contamination from nitrates and household wastes.Additionally, in 1995, a catastrophic flood in the Pajaro Valley caused millions of dollars of damage to the infrastructure of the area. There are nineteen (19) aging wells that were damaged in the 1995 flood. This proposed project would connecct to an exisitng Public Water System.The private wells currently serving the residents have both quanity and severe quality problems with extremely high levels of nitrate and salt intrusion. The nitrate contamination is caused from the numerous failing septic tanks leachate in the areas and from fertilizer run-off from the increasing large number of strawberry and vegetable farms surrounding the areas.The Hudson Landing Road area is a very low income area. The majority of residents in the area are very impoverished	2,840,000	275	880	05	Monterey	II	2009

Delleker well #2 has exceeded the MCL for uranium. Sauers Engineering has proposed a plan to CDPH which will identify the necessary actions to take to correct the violation. This plan identifies that automatic control of the wells is necessary to either prove or disprove that compliance with the uranium MCL can be achieved by blending the water from each well before entering the distribution system.Additionally, radio telemetry and controls would be installed at the Delleker storage tank. This would allow the system to "talk" to one another and controll the on/off cycles of the wells feeding the storage tank.	15,000	199	657	02	Plumas	I	2009

3448	5400792	5400792-004	WOODVILLE FARM LABOR CENTER	Woodville Farm Labor Center new water system	The orginal water system that began in 1937 is still in place, and after 72 years needs to be replaced. The current system that utilizes two well was developed in 1949. The orginal water lines that were previously in place (prior to 1949) were not touched. Over the years more home sites have been added, and the accompanying water lines were added to the orginal lines. Now the lines must all be replaced, starting at the wells, and ending at the last of the 173 home sites. The orginial lines being 70 years old. In addition to the water lines, there are no street located shut-off valves. Any repair work to the system requires turning off all of the water to the entire project until necessay repairs are made. Last and certainly not the least, is the need for a backup generator system for the water supply. If electricity is lost (Woodville FLC is in a very rural setting) , there is no water. Not only does this effect the lack of drinking water, it also means no fire protection, large or small. We are requesting the replacement of the primary water lines throughout the project. Secondly to better serve the community there is a strong need for localized street level shut off valves. And lastly a viable backup generator for drinking water and fire protection.The manpower requirements for this project would be significant. Five to eight different trade organizations would be utilized, for a total of 20-30 individuals that would be needed to complete the	O	25	C	The Woodville Farm Labor Center (FLC) was built in 1937. It was known then simply as the Woodville Labor Camp. Since its inception, the center has been through remodels and modernization projects large and small. Plus over the years, additional housing has been added to meet the continued needs for expansion and growth. The Woodville FLC now serves 173 families year around. All of the tenants work in farm related employment. Rents are determined by the tenants income. The rental income from the Woodville FLC covers the basic maintenance and repair of all the home sites. However, there is never enough cash reserves to cover the cost of major improvements to the site.The orginial water system that began in 1937 is still in place, and fully operational. As the center continued to grow, new lines were added, however the original system has never been replaced. Simple math says that we have a 72 year old system that is in serious need of replacement. The sewer system and wastewater treatment plant duplicate the fresh water story. It is also 70+ years old. Rental income generated from the FLC will never be enough to cover the cost of purchasing a new water system. Waiting until the lines collapse before addressing the problem is not a wise decision. A methodical plan designed to replace the old system now is a much better approach to the problem verus waiting for major problems to start occuring at inconvient	1,500,000	181	725	12	Tulare	III	2009

3454	1610009	1610009-007	Kettleman City CSD	Water Distribution Replacements	The Kettleman City Community Services District is proposing to replace all of the defective gate valves and fire hydrants. The KCCSD staff will have to coordinate a systematic approach to the gate valve and fire hydrant replacement program to minimize customer outages.	O	25	C	The Kettleman City Community Services District (KCCSD) water distribution gate valves were installed in the early 1970's. A large major of the original gate valves will not close, or remain frozen in the "open" position. Likewise, it is also possible for the working gate valves to become stuck in the "closed" position. When repairs or connections to the distribution system are made, the gate valves must be closed. Due to the failed condition of the many valves, it first becomes necessary to determine the location of the properly functioning valves nearest to the repair area. Often, a large portion of the system must be shutdown to isolate the repair site, which can disrupt water service to a significant portion of the population for a three to four hour period. It is not uncommon for an area varying from 2 to 6 blocks, or 30 to over 100 residences, to be without water at one time during the initial repair work. These repairs also affect schools and businesses.On many occasions the connections are made in a "wet" condition with water flowing down the street because the gate valve(s) will not close. When the repair is completed, more water is lost due to the required flushing and sanitizing of the water distribution system. The majority of the KCCSD fire hydrants were also installed in the early 1970's, and are not equipped with break off risers and check valves. Thus, the only method available to close the hydrant when unanticipated	1,300,000	356	1,499	12	Kings	III	2009

3461	1310008	1310008-002	Westmorland, City of	City of Westmorland Reservoir Rehabilitation Project	Due to the high level of coating blisters, it is important that the City of Westmorland re-coat the two reservoirs and replace the roofs. This cost is extremely expensive for this process. The City would also like to have the roofs replaced as well as having the exterior of the reservoirs painted as well. As noted in an underwater inspection, internally the center column is in need of re-coating; the roof underside costing is rated as fair to poor and the roof underside affected zones are to large to patch. It was also recommended that the float guide wire be replaced with a new one of the proper length; the beam end coating in the last 2 - 3' of the beams is in poor condition in all cases and roof underside coating is in poor condition also. Having had an Underwater Inspection performed and the recommendations in hand the City of Westmorland is ready to move forward with implementing the recommendations as soon as funds are awarded.	O	25	C	Deterioration of the roof underside and scale formation/metal loss is beginning to appear. The underwater conditions of the water reservoirs are as follows: the big tank (0.78 MG) is more severely affected than the small (0.35 MG) tank. In the large tank, all patches placed are in poor condition. A moderate size rust tubercle is found at each of the patch sites. In addition, there are many patches of coating blisters on the floor and to a lesser extent on the wall and center column. Where the blisters were exposed, they break to the steel. The rectifiers should be monitored every two weeks or monthly at the most by in-house personnel. The City's residents were notified "Boil Water Order", as the water contains a high level of chlorine residual.Although the reservoir tanks were built in the year 2000, it is unsettling as to why the rust tubercles are so large.	800,000	601	2,444	14	Imperial	V	2009
3462	1710001	1710001-008	Clearlake Oaks County Water District	Clearlake Oaks 2007 Infrastructure Improvements-Main Replacement	Install 4500 feet of PVC main to replace existin concrete-asbestos mains in the Caltrans right of way.	O	25	C	Asbestos mains are failing due to age and ground movement, causing potentially catastophic highway failure. Booster stations have no back-up power causing low pressure problems, potentially allowing backsiphonage and contamination.Replace 4500 feet of asbestos main.	501,500	1,667	2,458	03	Lake	II	2007
3463	1710001	1710001-010	Clearlake Oaks County Water District	Rehabilitate Surface Water Treatment Plant	Funds from this project would be used to install and construct the following: - A 400kW propane back-up generator at the water treatment plant. - A liquid feed chlorine system - A 75,000 gallon backwash tank and recovery system - A HiPox generator to reduce formation of DBPs and UV system - Rehabilitate ozone system - Replace two 432 gpm pressure filters	O	25	C	Surface water treatment plant does not currently have a reliable generator to operate the plant during power outages. Power outages are experienced at least several times a year.A backwash recovery system at the WTP would alleviate pressures on the wastewater system and allow the plant to recycle at least 10% of the volume produced at the plant.The current chlorine gas feed system is dangerous and does not conform to risk management principles or OSHA standards.The District periodically experiences elevated total trihalomethanes and haloacetic acids.The District is experiences turbidity performance inconsistencies with current pressure filters and is concerned about future performance with respect to turbidty requirements to operate plant.	2,100,000	1,667	2,458	03	Lake	II	2009

3468	4710008	4710008-001	City of Mt. Shasta	Distribution Tanks Recoating Project	Recoating of exterior surfaces of Tanks #2 and #3	O	25	C	The exterior of tanks #2 and #3 of the Distribution system have been strongly recommended by California Department of Public health on several occasions, most recently in a letter dated September 26, 2008. The purpose of the tank recoating is to cover the lead based paint coating and seal exterior rust to avoid tank replacement.	300,000	1,675	3,642	01	Siskiyou	I	2009

3469	1410001	1410001-002	CITY OF BISHOP	Development of Well 3	The City of Bishop wants to build a new well on City owned property. The new well will be built to serve as a back up well when either of the two main wells (Well 2 and Well 4) fails. A Request for Proposals for the Environmental Impact Report was released in March, 2007. Also, a one million gallon storage tank and booster station will be constructed to increase the operational and fire flow storage capacity based on the City's current potable water daily demands (Maximum Daily Demand for 2002 4.28 MGD). The construction work includes the installation of a small diameter test well to 1000 feet below the ground surface on the proposed Well 3 site; construction of a well for municipal water supply including casing, pump, motor, and booster station; improvement of well site suitable for a municipal production well including water treatment facilities (chlorination), grading, construction of perimeter fencing and gates, site access, well building, site drainage, well controls, telemetry, and security; provide electricity and communication service to well site; construction of two 12-inch water lines to connect to existing distribution systems.	O	25	C	The City of Bishop owns and operates three wells from which it supplies water to its customers; Well 1, Well 2 and Well 4. Fluoride levels at Well 1 exceed its respective MCL. For this reason Well 1 can only be used as a stand-by well for a limited duration per California Department of Health Services (CDHS). The Arsenic concentration in Well 1 is considerably higher than in the other wells, and is close to the MCL. The bottom 220 feet of the well was recently capped with concrete to plug zones suspected of supplying water containing significant Fluoride and Arsenic. The capping was not successful at bringing Well 1's water quality into compliance. This condition leaves the City's productive wells to Well 2 and Well 4. If either one of the producing wells fail (2 or 4), the remaining well will not be able to supply the required maximum day demand by itself. Well 1 cannot be used for more than 5 consecutive days and/or more than 15 days in a year per CDHS regulations. Since Well 1 cannot be used as a source of drinking water due to its high levels Fluoride, new well locations should be explored.	2,403,000	1,161	3,643	13	Inyo	V	2007
3470	2910001	2910001-006	City of Grass Valley	Water Meter Replacement Project	The City of Grass Valley's Water Meter Replacement Project involves replacing old antiquated water meters with new radio read style water meters (which will improve the City's ability to obtain water meter readings) and their service laterals. This will improve the distribution of treated water to the City's cutomers, reduce the potential for contamination of the City's water distribution system, save the City and its customers approximately $120,000 per year, reduce wasting of water resources, and improve the City's ability to detect leaks.	O	25	C	Approximatley 1,800 water meters in the City of Grass Valley are approximately 20 years old and have exceeded their expected service life of 12 to 15 years. These antiquated water meters pose several problems such as their high cost of meter reading, their need for repair and replacement, there tendancy to show low water usage readings (about 15% lower than actual use per AWWA), their difficulty in showing readings for leak detection, and their potential for allowing undetected contamination of the water distribution system. The City of Grass Valley spends approximately $100,000 each year for monthly readings and $20,000 for repair/replacement of old meters and service lines. In addition, the old water meters are connected to the City's water system with old service lines that commonly brake, rupture, and fail. These failures cause a potential for contaminantion to the City's system, damage to infrastructure, a significant cost to the City and its water customers, and the wasting of our water resources. Replacement of these water service lines will benefit the City and its water customers.	3,115,000	2,328	5,600	21	Nevada	I	2009

3471	0410004	0410004-001	City of Gridley	SCADA System	The City of Gridley will install a SCADA system to improve monitoring and control of the water system. The SCADA system will provide essential data regarding water levels, chlorine levels, fluoride levels, system pressures, and other information to ensure a more efficient and safe water system. The project will include installation of a central radio, a SCADA computer, control panels at each well site, and appurtenant equipment.	O	25	C	The City of Gridley has six wells distributed throughout the city that supply water to the distribution system. The wells are automatically regulated by water pressure in the distribution system. Chlorination and fluoridation are continuously provided at each well site. The sequencing of well operation is currently accomplished by manually adjusting on and off target pressures at each well site.A significant drop in the water table at certain times of year requires a minimum of three water system operators, each at a separate well site, to simultaneously adjust target pressures to achieve proper system operation.The City has one chart pressure recorder located at the Corporation Yard. Pressures at individual well sites can only be read manually at each well site.Chlorine and fluoride levels are checked at each well site once per day. More frequent checks of the chlorine and fluoride levels would improve safe operation of the water system.	690,000	2,058	6,403	21	Butte	I	2009
3472	1110001	1110001-002	City of Orland	Eighth Street Well Construction	A new replacement well will be drilled and put back into service to meet the City's water capacity needs.	O	25	C	The "Eighth Street" well was not producing sufficiently and was having iron bacteria problems. The well was abandoned and destroyed.	450,000	2,615	6,525	21	Glenn	I	2009
3473	1110003	1110003-001	Cal-Water Service Co.-Willows	Willows "City Wide" Water Conservation Program	The city wide water conservation program has two elements. A. Indoor: CWSC intend to replace 4,000 bathroom fixtures (Toilets and Showerheads) over a four month period. This will save 124 acre feet of water per year. b. Indoor: CWCS intends to replace 578 ET units. This will save 18 acre feet of water per year.	O	25	C	CWSC intends to reduce the district total water consumption to match the long term water supply.	1,958,000	2,302	6,680	21	Glenn	I	2009
3474	5110001	5110001-013	City of Live Oak	City of Live Oak Well #5 Nitrate & Arsenic Removal	Treatment of Well 5's arsenic and nitrate is being investigated at a preliminary level. Current strategies call for Well 5's arsenic to be treated in kind with the City's other wells currently in service, namely coagulation-filtration with a manganese dioxide media. Wellhead treatment of arsenic would treat all of the well's water; intermittent backwash waste would be discharged to the sewer. The arsenic treatment system would be skid mounted and housed in a CMU building for protection given the well's close proximity to the high school. Treatment of nitrate requires additional investigation; however, given the current level of nitrates is only slightly in excess of the MCL, one possible alternative would utilize treatment of a sidestream flow by reverse osmosis (RO) and subsequently blended. Well water would initially all flow into the arsenic treatment system; treated flow would then be split -- a sidestream would be treated by RO to remove the nitrate and then returned and blended with the untreated flow to reduce the net nitrate levels in the final treated water. Other treatment schemes are still possible and alternative treatment for mitigating nitrate could be developed pending further investigation.	O	25	C	Well 5 has historically complied with arsenic and nitrate limits since it was originally drilled in 1983. Since the promulgation of the Arsenic Rule, however, the well's average raw water arsenic concentration of 22 ppb became out of compliance with the revised 10 ppb MCL. In addition, Well 5 recently experienced elevated nitrates. Prior to the Spring of 2007, nitrate concentrations from Well 5 have historically been 3-4 ppm; since then, nitrate levels have increased to 10.5 ppm, which is in excess of the 10 ppm MCL.	1,000,000	2,186	7,475	21	Sutter	I	2007

3475	5110001	5110001-015	City of Live Oak	City of Live Oak Apricot Street from N Street to Larkin Road Water Main Replacement Project	The City of Live Oak will replace the existing water main from Well No.4 from N Street to Larkin Road with 12-inch pipe, including all fitting, hydrants, valves and other appurtenant equipment required to connect to the existing distribution system, homes and businesses.	O	25	C	The existing primary water distribution system connecting the City's wells is undersized. The majority of the existing distribution system is 8-inch with the remainder being primarily 6-inch pipe. These mains constitute the backbone of the City's distribution system and currently limit the amount of water that can be distributed through the system for fire suppression. The mains are undersized and cannot meet the demands of Live Oak's growing population.	100,000	2,186	7,475	21	Sutter	I	2009
3476	5110001	5110001-016	City of Live Oak	City of Live Oak Pennington Road East of Highway 99 Water Main Replacement Project	The City of Live Oak will replace the existing Pennington Road water main from Larkin Road to J Street with 16-inch and 8-inch mains, including all fittings, hydrants, valves, and other appurtenant equipment required to connect to the existing distribution system, homes and businesses.	O	25	C	In 2003, a 1.4 MG water storage tank was constructed at the City's Memorial Park. The tank is filled by two City wells on the same site (Well 1A and 2A). Discharge from the tank is through a booster pump station capable of pumping 4200 GPM. The discharge water main from the station to Pennington Road is a 16-inch diameter pipe. The main in Pennington Road varies in size from 6-inch to 10-inch and limits the amount of water that can be distributed by the booster pump station. The Pennington Road water main is in the primary east-west distribution main in the City. The main is undersized and cannont meet the demands of the Live Oak's growing population.	380,000	2,186	7,475	21	Sutter	I	2009
3477	5110001	5110001-017	City of Live Oak	City of Live Oak Pennington Road West of Highway 99 Water Main Replacement Project	The City of Live Oak will replace the existing Pennington Road water main from 350 feet west of DeRee Road to Broadway with 16-inch, 12-inch and 8-inch mains, including all fittings, hydrants, valves and other appurtenant equipment required to connect to the existing distribution system, homes and businesses.	O	25	C	In 2003, a 1.4 MG water storage tank was constructed at the City's Memorial Park. The tank is filled by two City wells on the same site (Well 1A and 2A). Discharge from the tank is through a booster pump station capable of pumping 4200 GPM. The discharge water main from the station to Pennington Road is a 16-inch diameter pipe. The main in Pennington Road varies in size from 6-inch to 10-inch and limits the amount of water that can be distributed by the booster pump station. The Pennington Road water main is the primary east-west distribution main in the City. The main is undersized and cannot meet the demands of the Live Oak's growing population.	395,000	2,186	7,475	21	Sutter	I	2009
3478	1510041	1510041-005	North of the River MWD	Water Storage Security Wall	The project is the construction of a 6 foot high concrete block wall, topped with barbed wire. This wall would completly surround the District's water tanks and pumping facilities.	O	25	C	The purpose of this project is to increase security of the District's water supply and facilities. The water district maintainence yard, and it's two 4.5 million gallon reserviors, is surrounded by a chain link fence. This fence has been repeatedly cut through, and materials stolen and the tanks climbed upon. This plan is to construct a 6 foot high block wall, with barbed wire topping the wall.	320,000	2,025	7,500	12	Kern	III	2009
3479	1710002	1710002-005	Golden State Water Co.-Clearlake System		Install cathodic protection in the treatment plant's clearwell.	O	25	C	Cathodic protection in the plant's clearwell is required to prevent corrosion and maintain the integrity of the vessel.	20,000	2,238	7,544	03	Lake	II	1998
3480	1710002	1710002-002	Golden State Water Co.-Clearlake System		GAC in contactor #2 will be replaced with regenerated GAC.	O	25	C	Recent tests performed on the GAC have shown that GAC requires replacement.	25,000	2,238	7,544	03	Lake	II	1998
3481	3610032	3610032-001	NEEDLES, CITY OF	Additional Reservoir Capacity and Back-Up Power Capability Request	The addition of a three (3) million gallon tank and two (2) mobile generators would allow for sufficient additional water storage capacity, and provide back- up power to service the community until recovery occurs from any exigency that might befall the City.	O	25	C	The City of Needles has existing water storage capacity for 24 - hours. Should a well fail or electricity be down due to microburst, severe flooding, or any of a host of potential causes for longer than 24- hours , the water storage would be depleted and the City would be unable to pump any additional water because the pumps are energized by electricity.	3,950,000	1,770	8,851	13	San Bernardino	V	2008
3482	3610025	3610025-001	JOSHUA BASIN CWD		Construct Surface Water Treatment Plant to minimize overdraft of groundwater basin	O	25	C	Groundwater basin in overdraft	2,200,000	4,370	9,000	13	San Bernardino	V	1998

3483	3610025	3610025-007	JOSHUA BASIN CWD	Medical Center Redundancy Pipeline Project	The project consists of constructing approximately 6,000 linear feet of 12-inch diameter PVC or ductile iron water pipeline within existing desert rights-of-way. The construction will also include various appurtenances, including valves, air-vac valves, blow-offs and fire hydrants.	O	25	C	The District's 96 square mile service area is located in the high desert region of San Bernardino County. The District is part of the Morongo Basin, which includes more than 4,000 square miles and a population of 85,000 with communities from Wonder Valley in the east to Morongo Valley in the west. The only regional medical and trauma center in the 4,000 square mile Morongo Basin is located in the Joshua Basin Water District service area. Currently, that medical center. the Hi-Desert Medical Center, is served water from a single pipeline without a backup system. In the event of a regional earthquake or other disaster, severing of that pipeline would result in significant disruption of the medical center operations. The hospital is located in the same complex as the California Highway Patrol office, the Morongo Basin Sheriff's office and the Morongo Basin Superior Court and their water supply would be similarly affected. The District has proposed this project to provide a redundant waterline supply to the medical center and the other government offices, to enhance the reliability of water service under emergency conditions.	175,000	4,370	9,000	13	San Bernardino	V	2009
3484	3610025	3610025-005	JOSHUA BASIN CWD	Undersize mainline replacement	Replace mains with 8-in diameter pipe	O	25	C	120,000 feet of mainline are undersize (<8in diameter) for fire flow	11,040,000	4,370	9,000	13	San Bernardino	V	2007
3485	3610025	3610025-009	JOSHUA BASIN CWD	Booster Station Rehabilitation Project	The project consists of constructing two package booster pump stations, one to replace the J-Zone station and one to replace the E- and D-Zone stations. The replacement stations will consist of manufacturer provided package pumping systems, housed within simple, prefabricated buildings. Each station will use in-line vertical turbine pumping units. The J-Zone station will have a design capacity of 260 gpm and a total dynamic head (at design flow) of 200 feet. The E-Zone pumps will provide a design flow of 460 gpm and a total dynamic head of 290 feet, while the D-Zone pumps will have a design flow of 550 gpm and total dynamic head of 225 feet. The stations will be constructed on the same site as the existing stations, and the existing stations will be demolished. The stations will have minimal HVAC systems and will be connected to the District's SCADA system for regular monitoring and operation.	O	25	C	The District's water system has been constructed over a significant time period. As such, specific system components are beginning to approach useful life expectancy. Of particular consideration are the District's water booster stations. These stations contain deteriorating and highly inefficient pumping equipment. The District has identified several stations for rehabilitation. In all cases, rehabilitation is focusing on achievement of significantly increased pumping efficiency for District-wide energy conservation, and replacement of aging equipment to eliminate system failure. In addition, the rehabilitation projects have the value-added advantage of decreasing operation and maintenance cost, and providing emergency power facilities to increase system reliability--the area has regularly occurring power outages impacting service to customers. As the service area is within an earthquake-prone portion of the state close to the San Andreas fault, the rehabilitation of the stations will bring the system up to current standards for public service reliability.	225,000	4,370	9,000	13	San Bernardino	V	2009

3486	3610025	3610025-008	JOSHUA BASIN CWD	Reservoir Rehabilitation & Relocation Project	The project consists of dismantling an existing 0.5 MG steel reservoir within the District's "C" pressure zone, and relocating the reservoir to the District's "H" pressure zone. The relocated tank will be co-located on an existing tank site. The relocated tank will be upgraded to include new ladder and safety equipment, and will be connected to the District's SCADA system for monitoring purposes. The District's two-pump J-booster station will have to be moved to make room for the new tank. The booster pumps will be replaced with higher capacity more efficient ones. Minor pipeline alterations will be required at the relocated tank site to reconnect to an existing larger reservoir once the smaller tank is relocated.	O	25	C	Water service pressure, emergency water storage, and backup fire protection water supply within the District's distribution system is maintained by water storage facilities within each pressure zone. The District has a long-term program of maintaining and expanding these reservoirs for system reliability. In the interest of lowering overall system cost and increasing reliability, the District will relocate and rehabilitate one of its existing reservoirs from one pressure zone to another. This project minimizes economic pressure on already strained steel material availability, and maximizes cost effectiveness for District consumers. The relocated reservoir will be upgraded to current design and public safety standards when constructed. Alternatives to this project would include the design and construction of an entirely new reservoir at approximately two to three times the cost. The relocated reservoir will also reduce the energy consumption of the system's booster stations by providing increased storage and allowing pumping during off-peak hours.	225,000	4,370	9,000	13	San Bernardino	V	2009
3487	0410005	0410005-001	Cal-Water Service Co.-Oroville		Treatment plant upgrades: particle counter, liquid alum feeder/mixer, current monitor, SCADA system and gaseous chorine containment.	O	25	C	Surface water treatment plant needs improvements and upgrades to improve operations and reliability. Also need improvements to comply with the Cryptosporidium Action Plan.	220,000	3,928	9,427	21	Butte	I	1998
3488	0410005	0410005-002	Cal-Water Service Co.-Oroville	Oroville "City Wide" Water Conservation Program	The city wide water conservation program has two elements. a. Indoor: CWSC intends to retrofit / replace 5,250 bathrooms with water conservation products (toilets & showerheads) and the extimated water savings is 161 acre feet per year.b. Outdoor: CWSC intends to replace 875 ET units and the estimated water savings is 27 acre feet.	O	25	C	CWSC intends to reduce the districts total water consumption to match the long term water supply.	2,550,000	3,928	9,427	21	Butte	I	2009
3489	5810002	5810002-001	Linda County Water District	Division of fire-water and domestic water systems at Yuba College	The intent of the project is to provide a new dedicated campus domestic water distribution system. The existing water system will remain in service providing water for fire suppression and irrigation uses. The proposed water system will consist of constructing a new pipe distribution network of AWWA approved pipe materials such as C900 PCV or ductile iron pipe with sectional control valves. At each building where the connection is converted to the new pipe system a reduced pressure principal assembly will be installed to protect the water system from potential contamination. The whole system will be fed by a new service connection to the public water system. Project costs will include all the hard construction costs as well as design soft costs and service connection fees to the pubic water system	O	25	C	The original water supply at Yuba College came from 3 wells on the campus grounds. The 3 wells were systematically shut down between 1977 and 1991 and replaced with county domestic water. The existing water system at Yuba College combines both domestic water and fire water in one water system loop around the campus buildings and facilities. The existing water lines are 50-year old AC pipe (transite) with domestic drinking water coming from these lines. Because of the deteriorating condition of the existing pipeline, the college must separate domestic water from these existing pipes due to the inherent health risks associated with 50-year old transite pipelines and domestic water.	950,000	3,975	10,000	21	Yuba	I	2009

3490	4510001	4510001-001	City of Anderson	North-Central Anderson Public Water System Extension	The City of Anderson has engaged the services of the engineering firm CH2MHill to prepare environmental clearance documents (anticipated to be either a categorical exemption or a negative declaration under CEQA and either a categorical exclusion or a FONSI under NEPA) and construction plans, specifications, and estimates to bid the construction of an extension of the City;s municipal water system to serve the properties in North-Central Anderson the City annexed in 2005. The project will consist of the installation of approximately 2,950 linear feet of 12 inch water main, 2,300 linear feet of 10 inch water main, and 1,250 linear feet of 8 inch water main, plus laterals and water meters to service 56 properties currently served by private well water. Upon connection to the City's extended service, the private wells will be abandoned in accordance with City and Shasta County Environmental Health standards.The project will interconnect three isolated pressure zones, the City's main pressure zone to the southwest, the Ox Yoke pressure zone to the north, and well #13 to the east which currently provides fire sprinkler service only to two nonresidential properties. Two presently isolated wells will require replacement pumps and to be added to the City's SCADA system. Along the water main extension, 21 fire hydrants will be installed in accordance with the City standard of spacing hydrants not farther than 300 feet apart, improving fire	O	25	C	The City of Anderson, in response to the requests of area residents and property owners, annexed an area in North-Central Anderson known as "Annexation 04-01 (Alexander, Bellevue, Pinewood and Loop Area)" in February 2005. One of the principal reasons that area residents and property owners desired annexation was to access City water and wastewater systems, as individual leach fields on several small residential lots were performing poorly. Recently, water produced from shallow private wells on these small residential lots have tested positive for fecal coliform. The City and area residents and property owners desire to extend City water service to these properties such that safe drinking water may be made available to these citizens, many of whom are unemployed and poor.	1,217,000	3,077	10,050	02	Shasta	I	2009
3491	1210001	1210001-002	City of Arcata	Klopp Lake Water Line	The scope of work for this project includes the installation of approximately 2500 linear feet of 2" water line, including excavation and bury. Also included is the purchase and installation of a drinking water fountain.	O	25	C	Currently, the Klopp Recreational Lake is used by tens of thousands of visitors a year that come to view birds, launch kayaks, hike and fish. The main parking area is approximately one mile from any potable water source, and the City has receive many requests over the years to install drinking water and restroom facilities. The cost to extend potable water to this location has been prohibitive.	10,000	5,278	16,651	01	Humboldt	I	2009
3492	1210001	1210001-006	City of Arcata	7.5 Kw Solar Power System for Alliance Road Pump Station	A 7.5 kW photovoltaic system would provide almost 100% of the electricity necessary to run the building. The avoided electricity costs would total almost $2,000 a year. Avoided carbon emissions would be 195 tons a year, equivalent to 643,384 miles of driving or planting 3.4 acres of trees . Additionally, comparable lighting retrofits performed in the City resulted in 6% savings of energy and close to $80 in avoided energy costs; as energy costs rise, cost savings are expected to improve.	O	25	C	7.5 kW photovoltaic system and lighting retrofits at the Alliance Road Water Pump Station, $60,000The Alliance Road pump station is one of the most heavily used water pump stations in the City. From this point, water is delivered directly to much of the community. This pump station is also located in an area that receives an excellent solar window, with minimal shading. Lighting retrofits would need to be performed on this building prior to the installation of a solar system to increase the overall system efficiency. Retrofits are not expected to exceed $5,000 and would consist of replacing the magnetic ballasts of the existing florescent lighting structure with digital ballasts. Additionally the circuits in the building would be rewired to allow for task lighting. A 7.5 kW photovoltaic system would provide almost 100% of the electricity necessary to run the building. The avoided electricity costs would total almost $2,000 a year. Avoided carbon emissions would be 195 tons a year, equivalent to 643,384 miles of driving or planting 3.4 acres of trees . Additionally, comparable lighting retrofits performed in the City resulted in 6% savings of energy and close to $80 in avoided energy costs; as energy costs rise, cost savings are expected to improve.	55,000	5,278	16,651	01	Humboldt	I	2009

3493	3310016	3310016-011	Hemet, City of	Substandard Water Line Replacement	Replace approximately 10,000 linear feet of existing 2-inch, 4-inch and 6-inch waterline with 8-inch diameter waterline.	O	25	C	The City of Hemt has approximately 10,000 linear feet of substandard waterlines (2-inch, 4-inch and 6-inch). Some of these lines, many of which are in excess of 60 years in age, are showing signs of fatigue in the form of leakage and/or are now undersized for today's fire flow standards.	3,750,000	8,667	20,047	20	Riverside	V	2009

3499	2710017	2710017-006	Marina Coast Water District		Complete feasibility study of system infrastructure to identify corrective action to solve problem	O	25	C	Pipeline pressure losses in the water distribution system	100,000	8,133	34,600	05	Monterey	II	2001
3500	3310008	3310008-006	Mission Springs WD	1400/1240 Transmission Line	Install 1240 zone transmission tie in to new well 38 and make modifications to existing well 22 to be able to change from the 1240 pressure zone to the 1400 pressure zone. Requires pipeline installation, tie ins, modify well 22 pump and motor, including new conversion piping from 1240 to 1400 pressure zone. This pipeline work is in concert with the District's other preapplication (Well 38) to acheive repalacement of lost production and reduces Well 38 transmission pipeline costs by approximately 1 million dollars by making the changes to the existing well 22 and pressure zone pipeline connections. All pipeline construction and materials will conform to District Standard Specifications.	O	25	C	This project will work in concert with the District's othe preapplication "Well 38" to tie in the new well and make changes to an existing well (well 22) to allow greater flexibilty and savings in pipeline costs to move water into two different pressure zones. The well project is necessary to replace lost production due to having to place our Well 30 on standby to avoid possible violation of MCL for Uranium. The pipeline project complements and goes hand in hand with the other project preapplication.	1,000,000	11,773	38,500	20	Riverside	V	2009
3501	3310049	3310049-004	Western MWD	Arlington Desalter Biodenitrification Treatment	Western Municipal Water District (Western) proposes construction of a fixed-bed biological treatment (FXB) to remove multiple contaminants from groundwater. The FXB will be used in conjunction with the Arlington Desalter. Based on pilot testing performed by Western, FXB:o Will reduce nitrate by 80 to 90 percent. Following FXB treatment, bypass water will have nitrate concentrations of 5 mg/L or less. Nitrate will no longer be the limiting factor affecting the proportion of bypass water within finished water. FXB in conjunction with the Arlington Desalter will increase the amount of local water meeting drinking water standards by 3.7 mgd over existing levels.o Will avoid the need to expand the Arlington Desalter and associated Santa Ana Regional Interceptor (brine disposal line).o Does not create a concentrated waste stream. The removed nitrate is converted to nitrogen and released to the atmosphere.o Does not add chloride or other salt anions and does not exacerbate basin salinityo Reduces perchlorate in the bypass water. During pilot testing, influent water had perchlorate concentrations of approximately 6 µg/L; after FXB treatment perchlorate concentrations were below the detection limit.The FXB is anticipated to be the first full scale biologically active denitrification facility in the nation. The FXB will use an innovative bioreactor to remove multiple contaminants from groundwater. The FXB facility will consist of a	O	25	C	Existing groundwater in the Arlington Basin does not meet standards for nitrates, total dissolved solids/salts, or perchlorate. This local water supply and the Arlington Desalter are not being used at optimal levels due to water quality issues, particularly nitrate. The standard treatment practice for nitrate, ion exchange, exacerbates the existing salinity issue within the basin. The Arlington Basin in Riverside County is a valuable groundwater resource for Riverside County, particularly those residents that use this groundwater, generally the City of Norco and communities eastward to the City of Riverside, including Jurupa Community Services District. Unfortunately, the Arlington Basin is contaminated due to historic agricultural and industrial practices and groundwater exceeds the MCLs for nitrate (as NO3), salts (as total dissolved solids (TDS)), and perchlorate. Raw groundwater has approximately 87 mg/L nitrate (MCL is 43 mg/L), approximately 1,190 mg/L TDS (MCL is 1,000 mg/L and SMCL is 500 mg/L), and between 2 µg/L to 7.3 µg/L of perchlorate. To utilize the Arlington Basin as a local water supply source, the Arlington Desalter was built and began operation in 1990.The water delivered to customers from the Arlington Desalter is a blend of permeate from the desalting process and groundwater (also called bypass water). Due to the high concentration of nitrate in the bypass water, the amount of water produced for customers is	5,825,000	19,311	60,895	20	Riverside	V	2009
3502	3610039	3610039-001	SAN BERNARDINO CITY		Construct new well Cajon Canyon	O	25	C	Replace older low production well	400,000	42,301	173,359	13	San Bernardino	V	1998

3506	3600602	3600602-001	Alpine Covenant Conf. Centre	Alpine Camp and Conference Center	The SCADA system to be installed will provide complete control over Alpine Camp and Conference Center's water system. Wells will be turned on and off based on the level of water in the reservoir or other system parameters. When properly instrumented, other system parameters such as well flow and well water depth can be monitored and historically recorded to provide a graphical representation over time.The computer system and software will allow the operator to make changes in the system operation and control the flow of information to the Lake Arrowhead Community Services District.In addition, replacement of plumbing in the distribution system will improve efficiency and enhance conservation efforts.	O	25	P	This project is purposed to resolve storage monitoring and regulation problems inherent in our present system. A new SCADA system is needed to resolve this problem. Current methods entail visual monitoring and hand controlled regulation of wells and reservoirs.Furthermore, water distribution is compromised by archaic plumbing that frequently ruptures. Current water system plumbing is need of replacement and upgrading for efficient distribution and conservation.	108,862	1	250	13	San Bernardino	V	2009
3507	1000206	1000206-002	HOUGHTON-KEARNEY SCHOOL	Houghton - Kearney Well Treatment	The project will begin with a preliminary design report. The report will analyze the alternative solutions prior to commencing with the design and construction. Potential solutions include treatment of the well using Reverse Osmosis (RO), Electrodialysis Reversal (EDR) or possibly a Chemical Feed System. Additionally, it is recommended that two (2) tanks and a booster pump system be constructed to allow the potable portion of the water to be treated, while the irrigation water is not. The different treatment options will be evaluated during the preliminary design report to make a recommendation. Once the design report is complete, construction documents will be prepared and the project will be put out to bid.	O	25	P	Houghton - Kearney Elementary School's water system consists of a single well that serves approximately 300 users (students and staff). The school is located at 8905 West Kearney Boulevard, Fresno, CA (Southeast corner of Kearney and Westlawn Avenue). The site consists of approximately 8 acres and is comprised of buildings, playgrounds, fields, parking lots and other typical elementary school facilities. The site is approximately five and one half (5.5) miles west of the City of Fresno and approximately five (5) miles East of the City of Kerman. Recent monitoring samples completed in June of 2010 resulted in CDPH requiring additional samples to be taken as the copper and/or lead levels exceeded the action levels.	640,000	4	310	23	Fresno	III	2011

3521	0400016	0400016-004	BERRY CREEK COMMUNITY SER DIST	Berry Creek Community Services District "Well Replacement" , "Additional Storage Tank".	To complete the new well site we are required to develop the well. To develop the well we must test the water for contaminants or bacteria,and determine the static water level and the proper pump size with the installation of a test pump. The 72 hour test would determine the viability of the well, and the proper size pump to be installed. Installation of the pump and any electrical or pump water distribution items necessary to complete the project, would be the last step.We need to add another drinking water storage tank to our facility, in addition to developing the new well. The steps for adding an additional drinking water storage tank are determing the proper location and grading of the site; the constrution of the foundation, the constuction of the storage tank itself, and the installation of any electrical or drinking water distribution items necessary. I have determined the overall cost of the projects, by getting some current bids from contractors in our area and also researching the overall process.	O	20	C	Berry Creek is a small community in the foot hills of the Northern Sierra Mountains. The Community Services District is a non profit, all volunteer organization experiencing a number of impotant issues. The first is we have an aging well system. We recently drilled a new well to replace one that is failing! This was vital, because our wells are working extremely hard to keep a safe water level in our only storage tank! The second issue we are experiencing is the lack of enough storage of treated drinking water. We are requesting the funds to add another storage tank to our facility. I have discussed the discrepancy of the number of connections in our district with Elaine McSpadden our County Rep. The proper number of connections should be , 47 not 36. Elaine McSpadden may be contacted at 530-538-6773. Any questions concerning our facility or operations will be answered by, either Rex Monroe 530-343-5100 our Certified Distribution Operator or Fredrick Smith 530-589-2234 President of the Berry Creek CSD.	199,000	36	99	21	Butte	I	2009
3522	1500252	1500252-002	KERN VALLEY MUTUAL WATER	Consolidation with Erskine Creek	Kern Valley water system proposes to consolidate with Erskine Creek water company. Erskine Creek is willing to consolidate.The system proposes to connect to Erskine Creek via construction and installation of an approximate 1000 ft pipeline; rehabilitation and replacement of the deteriorated distribution system; installation of individual service connection meters; and connection of the existing wells and storage tank to the Erskine Creek water system. The final project will depend on best engineering practices and cost effectiveness.	O	20	C	This water system has two active wells; well 02, and 03. Source water at well 03 has recurring documented TCR failures that resulted in coliform MCL violations within the last three years. Well 03 cannot be taken offline because Well 02 does not produce enough water on it's own to meet the system demand. Both wells together are scarcely meeting current system demand.The system does have a reliable adequate safe water source.	325,000	35	100	19	Kern	III	2008

3532	4500014	4500014-002	LAKESHORE HEIGHTS MUTUAL WATER	Lakeshore Heights Settling Tank Roof Project	We have an old (40+ years) concrete block tank of about 30,000 gallons with an almost flat roof made of wood beams and galvanized tin. It is badly rotted and is ready to collapse. We need a new roof very soon. (This year!) The tank measures 18-1/2 feet wide and 58-1/2 feet long and is 8 feet high. We propose to use 4/12 pitch trusses on 2-foot centers (about 31 trusses) with 5/8 OSB plywood for structure. We would then cover that with white painted tin panels about 30 inches wide. Snow load in Shasta County is 50 pounds per squre foot, and this design will easily meet this requirement. Our best estimate at this time for materials and labor is $12,000.	O	20	C	Our water source is surface water from a small dam. Water is brought to our treatment plant via pipe and first goes to a settling tank before going through filtration. The roof on the settling tank is badly deteriorated and natural debris can get in through cracks and holes in the roof.	12,000	78	225 02	Shasta	I	2009

3536	1100616	1100616-004	Elk Creek Community S.D.	Elk Creek Community Service District "Water Source Modification"	The completion of the relocation for the intake would dramatically improve effluant quality and decrease operating costs. We would raise the intake elevation and obtain better quality water from higher in the lake. The old intake could be used for emergency or extremely low lake levels. We would have to drill an eight inch diameter hole in the dam at the appropriate level to receive better water, without creating any structual problems. This would require a release from the Bureau of Reclamation engineers. We are currently working on obtaining this. Once the new port is drilled, then the appropriate seals and valving could be installed, along with hangers to run approximately eighty feet to our current six inch pipeline.	O	20	C	We need to improve the influant quality by elevating the current intake pipe. The Elk Creek Community Service Distirct is located in western Glenn County. It's source of water is Stony Gorge Reservoir. The Stony Gorge REservoir is a small reservoir, about 50,000 acre feet. Consequently, because of it's small size, it has a tendency to statify during the summer months. As a result, the influant gains a considerable amount of iron due to it's warm lake, and organics due to decomposing algae. The influant is filtered and disinfected with chlorine. When the chlorine is disinfecting the water it is also acting on the smell in the water created by the decomposing algae. Iron in the water is also affected by the chlorine as it turns the water brown. The solution to this is better quality influant. This could be obtained by elevating the intake pipe. The advantage would be that we would have better influant without increased operating costs. The influant problem extends through most of the year, July to November, and contributes to many customer complaints.	240,000	90	300 21	Glenn	I	2009

3537	1100616	1100616-003	Elk Creek Community S.D.	Elk Creek Community Service District "New Wells For Water Source"	This project would entail drilling three wells to obtain potable water at a minimum of one hundred, (100), gallons per minute per well. This would require a geologic survey as well as a current well history study to obtain the :best site". The wells would then require power lines and pumps with appropriate piping to reach our current water mains as well as secure structures to protect the equipment. Depending on the "best site" locations, we may have to buy the property and/or obtain right of ways for new pipelines. Pump controls could be run from our current tank controls or new radio controls.	O	20	C	The Elk Creek Community Service District obtains it's water from Stony Gorge Reservoir. The water in the reservoir has been degrading a little more each year. New erosions in the water shed each year impacts the influent to the treatment plant heavily. The Service District needs to get away from surface water by drilling three wells with the appropriate pumps, piping, and housing structures to support this community. The influent water from Sony Gorge Reservoir contains high levels of iron and organics, and our problems with these seem to get worse every year, starting in July and continuing through November. While we have not had any compliance issues yet, we are concerned that we will have some in the near future. Controlling the elements present in the surface water becomes a constant battle every year during the warm weather when water levels are low and the algae and iron levels are high.	500,000	90	300 21	Glenn	I	2009
3538	3400106	3400106-002	MSA: EAST WALNUT GROVE PWS		Construct 1,000 gpm well and upgrade pipeline distribution system. Involves design and construction.	O	20	C	Provide a new well and upgrade pipelines.	250,000	70	300 09	Sacramento	I	1998

3541	1700554	1700554-007	Lake County CSA 13 - Kono Tayee	CSA #13 (Kono Tayee) Water Storage Tank Replacement Project	This project is for the replacement of two co-located tanks at Tank Site #3, and will include the construction of two seismically engineered concrete tank foundations, two 50,000 gallon capacity anchored bolted steel tanks, associated piping and controls. Disinfection, filling and coordinated crossover from existing tanks will take place along with dismantling and removing of the existing redwood tanks. Security fencing will complete the project.	O	20	C	The Kono Tayee water system serves customers within the County Service Area #13. Tank decay and leakage is occuring at the Tank #3 site. The Tank #3 site consists of two redwood tanks (tanks 3 and 4).This project is to replace the existing redwood tanks with two new bolted steel storage tanks. This need was recognized last year, and funding for tank replacement was diligently sought and denied twice last year through the previous DPH's funding cycle and DWR's Water Use Efficiency Program. The District is once again seeking funding for this much needed tank replacement project.Health benefits include reliable and leak-free storage of drinking water and fire flow.Economic benefits includes construction (engineering, construction materials (piping, tank and controls), and construction labor.Regulatory benefits include compliance with DPH regulations.	350,000	136	333 03	Lake	II	2009

3542	1200553	1200553-009	Weott C.S.D.	Repair/Refurbish main water storage tank	This repair would have the tank completely drained (We can operate without the tank on-line)and using a Confined Entry Team clean, remove any remaining forming materials, sand blast entire interior, make any patching repairs etc. as needed then apply a coating of sealer, an Epoxy paint or something comparable to industry standards. The 2 access hatch doors on top can be replaced with the installation of positive sealing jams and doors. This system improvement will allow us to insure proper chlorination, conserve the water that has steadily increased in loss amounts, remain in compliance with CDH request to have tighter sealing hatches and stabilze our main water tank from further deterioration.	O	20	C	Weott Community Services District (WCSD) has 2 separate source, collection, transmission, filtration and distribution systems including 1 main water storage tank for each. The 95,000 gallon metal tank that is for B system's storage is less than 10 years old and is in good repair. The 67,000 gallon concrete tank that services the A system is almost 70 years old with a new 10 ft lift added to it approximately 30 years ago. The addition of 10 ft in height doubled the previous capacity, but has lead to an ongoing deterioration of the tank. The obvious problem is the cold joint between the old and new concrete and a small amount of the concrete forming materials that were not completely removed after the lift was installed. In several places there is water weeping out at the cold joint, which may or may not be why there is an increasing amount of leaks appearing in the same areas. The old forming wood has been a constant drain, demanding extra chlorine to ensure proper disinfection and system residual. The proper repair would be to drain the tank and using a Confined Entry Team clean, sand blast, make any patching type repairs as needed then apply a coating of sealer, an Epoxy paint or something comparable. Another concern of WCSD and CDH are the 2 access hatches. They are not the right type or application and have been an ongoing problem to have a tight seal. Using thick pieces of foam rubber has been the best we	35,000	150	364 01	Humboldt	I	2009
3543	1200553	1200553-007	Weott C.S.D.	Transmission lines, collectors at sources and new Treatment Plant	Source collection sites:All 5 sites currently collect water, but have been evaluated as operating below their potential in collection amounts, maintenance needs and turbidity levels of water collected. Engineering and subsequent improvements will help in our reduction of turbidity levels and other water supply issuesTransmission Lines:Both A & B transmission lines are failing from the effects of 60 years of corrosion and improper installation. The continued efforts to keep water flowing through the lines and not out of numerous leaks is reaching a level of concern for our ability to supply source water to treatment. There is also a concern for potential intrusion of contaminents into these same leaks during times of low flows.Treatment facility:The treatment facility for both A & B filtration has beeb observed and noted by the CDPH as not being "capable of meeting the requirements of the LT1ESWTR". A treatment facility engineer should evaluate our needs and facility for either improvements or replacement.Overall, there may be a potential for source, filter and treatment consolidation, using Decker Creek solely, as it has the best quality water, cleanest water shed and most dependable flows in summer. WCSD would have to evaluate new engineering before opting for this, as they would have to lower their water production and consumption.	O	20	C	Weott Community Services District (WCSD)has 2 sources. "A" & "B", while a 3rd source (Decker Creek) joins "B" source at the settling tanks. There are a total of 5 collection sites joining to create "A" & "B" transmission lines. In February & December of 2007 WCSD's treated water had less than 95% of all turbidity samples below .51%, with a highest sample of 1.29 NTU's. In 2005 WCSD had a combined total of 11 failed turbidity standards.To help reduce turbidity from the sources, all collection boxes and/or dams need to be substantially improved (including engineering). The extrordinary turbidity collected at these sources can be reduced during high winter flows by proper design and application. Each collection site will require improvements particular to that site. Decker Creek has the best flow and highest quality of water, so dependable collection (currently it has a "hand stacked" rock dam)and a larger transmission line (increase from 2" to 3") would be a good improvement in lowering NTU's both going into treatment and in the finished water. In our last received field inspection report from CDPH (inspection done on 7/7/06), dated 3/16/07, our system "must make upgrades to comply with LT1ESWTR". Now that L2ESWTR enforcement is upon us, there is a real concern about our ability to properly treat our water to compliance guidelines. Both A & B systems are using pressure filtration that was not	2,000,000	150	364 01	Humboldt	I	2008

3544	1200553	1200553-008	Weott C.S.D.	Water Treatment Plant: Improvements/Upgrades	WCSD's water treatment facility needs to have an additional filtration level to continue producing quality water without drinking water violations. Using our existing facility as the main filteration unit we can add at the end of the filtration train either a complete nanofiltration or ultrafiltration unit. This unit can be used when needed in times of high raw turbidity to remain in compliance and if need be could be used continually to meet the higher filtration standards being exposed to us by LT2 and into the forseeable future	O	20	C	In 1989 Weott Community Services District (WCSD) had a new water treatment plant installed to comply with the Clean Water Drinking Act. At the time a pressurized mixed aggregate filtration plant was considerd to be more then adequate for the treatment of WCSD's surface water sources. In 2005, WCSD had 11 failed turbidity standards. In 2006, in a report evaluating our facilities it was noted that the facility must be up graded in order to meet the LT1 standards. In 2007 both February and December had less than 95% of it's turbidity samples below .51. The requirements for quality have gotten harder and harder for us to produce water for. What was once considered okay for consumption is now a violation. These violations are documented and passed along to our customers, who don't want to use bad water.We now have LT2 applications to comply with.	400,000	150	364 01	Humboldt	I	2009
3545	0800532	0800532-003	Big Rock C.S.D.	Replace Water Storage Tanks	The Special District needs to replace the 100,000 gallon Redwood tank with a 215,000 gallon or larger steel tank. The 50,000 gallon Redwood tank must be replaced with a 100,000 gallon or larger steel tank. The aging water distribution lines between them should be replaced. Gated cyclone fences at least 6 feet high and topped with razor wire must be constructed around each tank to ensure security. The telemetry system has to be replaced and upgraded in capability to be monitored by the General Manager and the President in their homes.	O	20	C	The Big Rock CSD currently owns two Redwood storage tanks that are about 300 yards distant from each other on a hillside, which cycle water during the summertime about every four or five days. A 100,000 gallon tank was built in 1971 and is leaking at the rate of about three gallons per minute. It has been tightened, but the number of leaks is continuing to increase. A second and somewhat newer tank holds 50,000 gallons of water. It is in better condition at the moment, but is likewise beginning to show signs of aging. The telemetry system between the two tanks fails on a frequency of about two times per week, whereupon an attendant must climb the hill and restore operation. It also appears that at least one of the lines connecting the tanks is leaking, probably both. Because of boundary growth in the Township of Hiouchi, the Special District must increase the capacity of both tanks to accommodate residential growth, increased irrigation for landscaping, and imminent annexation of the Jedediah Smith Redwoods State Park. Both tanks must be surrounded by gated security fences to comply with the Homeland Security Act.	450,000	113	400 01	Del Norte	I	2007
3546	0800532	0800532-005	Big Rock C.S.D.	Permit and Construct Replacement Infrastructure	The precise scope of construction is not entirely definable at this juncture, for an engineering plan must be developed. However, it is estimated that the Special District owns and operates about 10 miles of water distribution lines, 40 main valves, 15 backflow valves, 10 fire hydrants, 113 meters, two 10 hp submersible river pumps, three pickup lines buried deeply in the river bed, a well head, a 10'x10' chemical treatment building, a 10'x15' tool shed and telemetry building, two access roads to two storage tanks mounted on a hillside that require grading, a turbidimeter, single-phase electrical power, and chemical treatment equipment. All of these assets must be replaced or refurbished.	O	20	C	The Big Rock CSD's water distribution system was installed in 1971 to satisfy the residential, commercial, and fire suppression needs of the Township of Hiouchi. It has been improved to a small extent over the years, but is generally nearing the end of its life cycle. This California Special District must comply with the safe drinking water standards that have become more demanding, the new Homeland Security Act, a water-allocation limit imposed by the California Water Resources Control Board that must be adjusted, and a place-of-use jurisdiction that is increasing in size. In this context, the Special District requires funds to permit and replace all of the existing infrastructure. The leakage rate is approximately 26%.	2,450,000	113	400 01	Del Norte	I	2007

3547	0800532	0800532-004	Big Rock C.S.D.	Engineer a Plan to Replace or Improve the Existing Infrastructure	The Special District's water source is the Smith River, a "wild and scenic" body of water that is not fully allocated, and our allocation limit is a little over 41 million gallons per year. An application with the California Water Resources Control Board is pending to change our place of use, which includes expanding the area of jurisdiction in all directions and annexing the Jedediah Smith Redwoods State Park. Estimated system leakage rate is 26%. Water quality is outstanding during all seasons of the year. An application is underway that would increase our water allocation limit to accommodate projected growth in residential demand and the annexation of the park. Thus, the project must address (a) location and characterization of all existing and abandoned water lines, valves, meters, hydrants, electrical lines, pumps, warning system, storage tanks, generators, well system, and structures, (b) a modest design for replacement or improvements to these assets that ensures adequate water pressure, quality, security, and volume for all customers, (c) an engineering plan that recommends and instructs contractors and regulators accordingly and that articulates the appropriate permitting processes given the Special District's small size, (d) the Big Rock CSD's infrastructure needs for the coming 15 years in 5-year increments, (e) the adequacy and health of the fire hydrants, and a maintenance plan to keep them in	O	20	C	The Big Rock CSD's water distribution system was installed in 1971 to satisfy the residential, commercial, and fire-suppression needs of the Township of Hiouchi. It has been improved to a small extent over the years, but is generally nearing the end of its life cycle. This California Special District must comply with safe drinking water standards that have become more demanding, the new Homeland Security Act, a water-allocation limit imposed by the California Water Resources Control Board that must be adjusted, and a place-of-use jurisdiction that is increasing in size. In this context, the Special District requires funds to (a) analyze the somewhat undocumented history of the infrastructure system and its water-distribution inadequacies, (b) design the necessary improvements, (c) engineer the construction plan to include permitting assistance, and (d) map the entire system using GPS technology.	800,000	113	400	01	Del Norte	I	2007

3554	1710022	1710022-002	Lake County CSA 20 - Soda Bay	Soda Bay Water System Backwash Water Storage Upgrade	Due to the limited size of the facility, the use of a portable tank is preferred. The unit will be located (parked and blocked) on site adjacent to the backwash system. Backwash water will be directed to the unit if additional storage is needed. Since the unit will be portable, maintenance personnel can temporarily relocate to another location within the facility if needed during other maintenance activities.	O	20	C	As a follow-up to a site inspection, DPH issued a letter-form directive (7/9/08) to the Lake County Special Districts Administration for deficiencies at the Soda Bay Water Treatment Facility. Part of the directive addressed the need to expand the filter backwash water storage capability located at the treatment facility. The project includes the purchase and installation of a liquid storage unit, similar to what is commonly known as a "Baker Tank". The unit will be sized to accept approximately 3,000 gallons and remain movable (when empty) within the limited space at the treatment facility.HEALTH BENEFITS will include adequate safe storage volume for the treatment facility's filter backwash liquids.ECONOMIC BENEFITS include procurement of the tank and continued economic benefit through the hiring of pumper truck services to pump and haul the filter backwash liquids.COMPLIANCE BENEFIT includes compliance with the 7/9/08 DPH directive.	200,000	596	1,342	03	Lake	II	2009
3555	1710022	1710022-003	Lake County CSA 20 - Soda Bay	Soda Bay Water Treatment Facility Ozone System Upgrade	The ozone generator project will replace both ozone units at the Soda Bay Water Treatment Facility. The new units will consist of slab mounted ozone generators, piping and controls. The units will be mounted on the existing concrete slabs. Piping and controls will be installed to match the existing piping paths and electrical wiring conventions. Two ozone monitors and alarms will be installed, one "process" monitor, and one "safety" monitor. The old equipment will be removed to make way for the new equipment.	O	20	C	On July 9, 2008, the Lake County Special Districts Administration was issued a letter-form directive from DPH for the Soda Bay Water Treatment Facility. Part of that directive involved the ozone system. Due to its contribution to the water treatment process and the condition of the existing ozone generators, DPH recommended their replacement.The Soda Bay Water Treatment Facility treats surface water from Clear Lake to drinking water standards. Ozone is a part of the treatment process. The existing system is old and is no longer supported by its' manufacturer (no parts or service). The replacement of the two ozone units will insure performance and safe operations for CSA# 20 customers for years to come.HEALTH BENEFIT includes a higher and more reliable level of treatment.ECONOMIC BENEFIT includes construction (engineering, equipment supply, and labor to install), andan additional benefit through a modern manufacturer and supported (ongoing tech service) equipment.COMPLIANCE BENEFIT includes compliance with the DPH directive, better system performance and reliability.	450,000	596	1,342	03	Lake	II	2009

3556	1710022	1710022-004	Lake County CSA 20 - Soda Bay	Sodium Hypochlroite Disinfection System	The project includes the installation of a poured concrete slam, and anchored 3,000 gallon HDPE or fiberglass storage tank, associated pumps, pipes and controls to provide liquid sodium hypochlorite to the treatment process for disinfection. The entire chlorine gas system will be removed to make way for the new system. Once certified by Environmental Health inspectors, the facility will be in compliance with the regulatory directive.	O	20	C	The Soda Bay water treatment facility provides water for the County Service Area #20. The facility treats surface water from Clear Lake to drinking water standards. A portion of the treatment process utilized chlorine gas for disinfection.Lake County Environmental Health conducted an inspection of the facility for the purposes of updating the facility's Hazardous Business Plan. The chlorine gas disinfection system was deemed to be a hazard requiring replacement with a non-hazardous method of disinfection (see Cal-Arp program).HEALTH BENEFIT includes the use of a community-safe disinfection system.ECONOMIC BENEFIT includes construction (engineering, components, and labor for installation) and ongoing benefit (supply and delivery of sodium hypochlorite solution). Secondary Economic Benefit (for the District and Rate payers) will be reduced permit fees from Environmental Health.COMPLIANCE BENEFIT includes continued reliable treatment (disinfection) and Hazard reduction, and complies with the regulatory (LC Environmental Health) directive.	100,000	596	1,342	03	Lake	II	2009

3561	1710021	1710021-003	Lake County CSA 21 - North Lakeport	Water Treatment Ozone Generation Unit	The Ozone Generator project will replace the second ozone generator at the North Lakeport Water Treatment Facility. The new unit will consist of a slab mounted ozone generator, piping and controls. The unit will be mounted on an existing concrete slab. Piping and controls will be installed to match the existing piping path and electrical wiring conventions. Two ozone monitors and alarms will be installed, one "process" monitor to examine ozone concentrations within the treatment process, and one "safety" monitor to examine ambient ozone within the work space. The old equipment and monitors will be removed to make way for the new equipment.	O	20	C	This project's Ozone Generator will replace the second ozone unit at the North Lakeport Water Treatment Facility. The second ozone unit is no longer supported by its' manufacturer (for either parts or service) and is no longer capable of producing/generating ozone at its' rated output. The second ozone unit is close to 30 years old. The North Lakeport Water Treatment Facility treats surface water from Clear Lake to drinking water standards. Ozone is a part of the treatment process. Seasonal water quality determines ozone use. Should raw water conditions develop requiring ozone at or near the rated output of the current ozone generator, quantities would be insufficient to adequately treat the water. DPH regulates and requires the North Lakeport Water Treatment Facility to fully treat all water prior to distribution. In the event of insufficient available ozone, the treatment process would be shut down, and the treatment facility would be unable to supply fully treated drinking water.Compliance Order #02-03-08-002 was issued on May 13, 2008 for failure to provide sufficient source capacity. The treatment facility design and permitted operation includes two ozone units (primary and secondary) to insure ozone supply. The primary ozone unit was replaced in 2006. The replacement of the second ozone unit through this project will insure performance, serviceable units, and safe operations for CSA #21 customers for years to	122,500	1,204	2,868	03	Lake	II	2009

3562	1710021	1710021-004	Lake County CSA 21 - North Lakeport	Sodium Hypochlorite Disinfection System	The Sodium Hypochlorite System project includes the installation of a poured concrete pad, an anchored 3,000 gallon HDPE or fiberglass storage tank, associated pumps, pipes and controls to provide liquid sodium hypochlorite for disinfection. The chlorine gas disinfection system, consisting of high pressure cylinders, piping, and controls will be removed to make way for the new safer system.Once certified by Environmental Health inspectors, the facility will be in compliance with the regulatory directive.	O	20	C	The North Lakeport Water Treatment Facility provides water for the customers in County Service Area #21. The facility treats surface water from Clear Lake to drinking water standards. A portion of the treatment process utilizes chlorine gas for disinfection. Lake County Environmental Health conducted an inspection for the purpose of updating the facility's Hazardous Business Plan. The chlorine gas disinfection system was determined to be a hazard requiring replacement with a non-hazardous method of disinfection (see Cal-Arp program).HEALTH BENEFIT includes the use of a community-safe disinfection system.ECONOMIC BENEFIT includes construction (engineering, components and labor for installation) and ongoing benefit (supply and delivery of sodium hypochlorite solution). Secondary economic benefit (district/Rate payers) reduced permit fees from Environmental Health. COMPLIANCE BENEFIT includes continued reliable treatment (disinfection) and Hazard reduction and complies with the regulatory (LC Environmental Health) directive.	125,000	1,204	2,868	03	Lake	II	2009

3564	0510003	0510003-007	Angels, City of	City of Angels Pressure Filter Project	To complete the installation of a fourth filter a significant amount of infrastructure modification work is required. Only a limited amount of flat area is presently available to locate the fourth filter and to continue to allow roadway access on the west side of the control building. To provide the desired access, the expanded filter building and roadway must encroach upon the existing abandoned clearwell. To provide the adjacent flat area a segment of the existing clearwell must be brought up to grade by installation of a retaining wall and backfilling and paving the area.The fourth filter control valves and facing piping is to be housed within the filter building in a similar manner to the existing filters. Therefore, a control building expansion will be required to incorporate the fourth filter to the existing water treatment system. Piping connections to the existing raw, filtered and backwash drain pipelines are all required. Relocation of existing underground piping and plant instrumentation affected by the building expansion will also be required.A detailed listing of project construction components follows:1. Install 12-foot high reinforced concrete retaining wall, install backfill and pave a segment of the existing abandoned clearwell.2. Construct a 12-foot wide wood frame filter control building addition. Includes reinforced concrete slab and perimeter footing, building finishes and doors.3. Relocate existing	O	20	C	The Department of Public Health (DPH) has notified the City that it is in Non-compliance with its permit conditions and in violation of the SWTR. The existing Water Treatment Plant consists of three major components for treatment consisting of the headworks, flocculation/sedimentation basin and filtration facilities. The current maximum flow rate, based upon SWTR requirements, is 1440 gpm (2MGD).The Water Treatment Plant has experienced demand in excess of 2MGD during the summer months of 2007 and 2008.The SWTR requires compliance with certain reliability features listed in SWTR Section 64659. The existing Water Treatment Plant does not comply with the reliability features due to the SWTR requirement of redundant filter capacity to offset the loss of filter capacity due to backwash or maintenance.The treatment plant currently utilizes three 8' diameter X 30' long filters to produce treated water. Section 64659 of the SWTR will requires a total of four filters (1 redundant). DPH is requiring the City to add a fourth filter or perform a filter loading study to justify higher flow rates. Addition of the fourth filter will increase the plant capacity to 2160 gpm (3MGD). As part of the Water Treatment Plant improvement project constructed in 2001, provisions were made in both piping and control systems to facilitate the addition of the fourth filter at a future date.The work proposed for	1,600,000	1,773	3,441	10	Calaveras	III	2009
3565	1310003	1310003-004	GSWC, Calipatria	GSWC-Calipatria System-Holabird Treatment Plant, Wash Recycling Project	Project scope includes the construction of a second wastewater basin including over excavation, re-compaction, and sub grade preparation; New packaged above-grade duplex pump station; New incline plate clarifier; New precast junction box with slide gates; New piping, suction lines, caisson foundations for equipment, electrical controls and other appurtenances.The plans for the project are completed and the estimated construction start date will be in August of 2009.	O	20	C	The current retention ponds at the Holabird Treatment Plant are not large enough to handle the current backwash flows being generated during plant operation. The up flow clarifiers are also too small. The Washwater recycling project at the Holabird treatment plant is intended to increase the capacity of the plant equipment, ponds, and up flow clarifiers.	1,871,514	873	4,040	14	Imperial	V	2009

3566	2410002	2410002-004	DOS PALOS-CITY	Water Meter replacement proejct	The project would be to replace all the existing meters with new radio read meters. This would provide for correct accounting of the water useage for each customer and will reduce employee time for the reading of the meters. The existing meter boxes will stay in place with the Contractor removing the existing meter and installation the new meter in the existing location. City staff will be trained on the radio read equipment and software to operate the new system.	O	20	C	The water metering system fo rthe community was put inplace to aid in the conservation of water supply and meter the flow of water to customers. The existing meters have aged and no longer provide calibrated readings of the flow to the customers. The replacement of the existing meters with new meters would account for that portion of the water supply that is presently being lost due to the existing meters being out of calibration.	1,005,000	2,566	4,417	11	Merced	III	2009
3567	1710004	1710004-006	Lakeport, City of	Water Distribution System Capacity Improvements	Replace existing 6" main w/ 10" or parallel w/ 8" along Martin Street between Russell and Bevin's;Construct 2 new wells and pumping stations to replace existing wells in creeks;Install 10" main near Clear Lake High School to improve on fire flows.	O	20	C	Potable water availability is compromised during winter months due to restrictions on well operation in Scotts Creek - when creek is flowing, pumping is prohibited. This leaves only two wells available for groundwater. Surface water treatment plant is nonoperational during fall, winter, and spring due to high operating costs. Water availability for fire fighting is limited in the vacinity of Clear Lake High School and Terrace Middle School. Installation of additional water main is needed to ensure adequate fire flows.Water capacity for fire fighting in downtown locations is limited. Increased water main size is needed to ensure adequate fire flows.	2,388,000	2,196	5,200	03	Lake	II	2009
3568	1710004	1710004-007	Lakeport, City of	Security enhancement at well head locations	Install security fence around Scotts Creek well heads to protect from creek debris and vandals; Install security structures and equipment at Green Ranch, including: control station, fence, intruder alarms, security cameras, and flood lights.	O	20	C	Existing well heads are prone to damage from vandals and tresspassers, which threaten water quality and delivery. Well heads located in Scotts Creek are also at risk of damage by floating debris.	135,000	2,196	5,200	03	Lake	II	2009
3569	1710004	1710004-001	Lakeport, City of		Increase CT at well facilities by increasing storage.	O	20	C	CT compliance difficult for wells under the influence of surface water.	600,000	2,196	5,200	03	Lake	II	1998
3570	1710004	1710004-008	Lakeport, City of	Electronic Water Meter Installation	City-wide installation of new electronic water meters.	O	20	C	Outdated and decaying infrastructure. Water meters, city-wide, are antiquated and beginning to fail. Increasing staff time is needed to maintain existing meters and repair those that have broken. Staff resources are also being stretched beyond limits as reading meters currently requires two full days per month per employee, detracting from other pressing issues at treatment facilities and throughout the distribution system.	1,200,000	2,196	5,200	03	Lake	II	2009

3571	1510020	1510020-006	TEHACHAPI, CITY OF	Nitrate Treatment	The project consists of constructing a nitrate treatment plant capable of treating probably around 1000 to 1500 gpm. The City has already prepared a suitable location for the plant at the same site where the City samples for the blending program. The plant and some associated piping should be all that is needed to consistently provide water meeting the nitrate standard to the customers.	O	20	C	The City water system is feed by 7 potable water wells. One of those wells (Synder Well) consistently produces water with nitrate levels above the MCL (Maximum Contaminant Level) of 45 ppm (parts per millions) with a reading of 51ppm.. A second well (Dennison) hovers around this MCL of 42 ppm. Both wells, and one other, have shown a trend for increasing nitrate levels over the last several years of record. In response to these issues, the City minimizes the use of these wells. Furthermore, the City, with a blessing from the California Department of Health Services (CDHS), has instituted a 'blending' program. This program requires this contaminated water to be blended with cleaner water before being delivered to the customers. When actively blending, the City has strict and frequent testing requirements to monitor the quality of the water being delivered to customers. The only individual well in violation has been Snyder, although Dennison is clearly getting close.	3,066,000	2,939	7,218	19	Kern	III	2007
3572	1510020	1510020-007	TEHACHAPI, CITY OF	Nitrate Reduction and Irrigation Conversion	The project would cover two areas; irrigation conversion and Nitrate reduction.Irrigation Conversion; the project would extend the existing ag water line, which is owned by Tehachapi Cummings County Water District(TCCWD), approx. 6000 feet west, which would take in both the Jacobsen Middle School campus, the Tehachapi High School football stadium and the Central Park facility. The Central Park facility is operated and maintained by the Tehachapi Valley Recreation and Parks District (TVRPD). The Jacobsen Middle School campus and the Tehachapi High School football stadium are operated and maintained by the Tehachapi Unified School District (TUSD).Nitrate Reduction; along with extending the TCCWD ag water line, the City's Snyder Well would be tied into the TCCWD system. Which would allow the City to reduce the Nitrate level through pumping the well into the TCCWD system. TCCWD would benefit also by obtaining another source to supplement its water deliveries when SWP water deliveries are being cut back. The Snyder Well pumps approx. 700 gpm and if the Nitrate level can be reduced, it would be of great benefit to the City to have the well available for distribution system pumping. The Snyder Well pumps directly into the distribution system therefore blending the well in not an option.	O	20	C	The first problem that is intended to be solved is a reduction in demand for potable water that is used for irrigation at the school campus as well as the park facility. The City of Tehachapi lies within the water adjudication of the Tehachapi Basin. Our current allowable pumping for the year is approx. 1,850 acre-feet. The uasge in 2008 was approx. 2,150 acre-feet. When the allowable pumping is reached and the City has to over-pump the water, the City has to either lease additional water rights(if they are available) or purchase water from the basin watermaster for groundwater recharge at an approx. cost of $450.00 per acre-foot. So, by converting the school district campus and the park facility to non-potable water, the City could possibly see a reduction in potable water demand of approx. 100 acre-feet per year. Also the school district and the parks district would pay a lower rate for irrigation water.The second problem that is intended to be solved is the lowering of Nitrates in the City's Snyder Well. Currently the Snyder well is in standby and is not operated into the City's distribution system. The Snyder Well exceeds the MCL of 45mg/l for Nitrates.	600,000	2,939	7,218	19	Kern	III	2009
3573	1910160	1910160-001	TRACT 349 MUTUAL WATER CO.		Enlarge our pump stations' pumping capacity and add new IMG reservoir. Project involves: Design to solve problem, and Construction	O	20	C	The demand for water in the highly densified area we serve is outpacing our ability to maintain reasonable system pressure.	950,000	908	7,500	07	Los Angeles	IV	1998
3574	1910160	1910160-005	TRACT 349 MUTUAL WATER CO.	Security Perimeter Fence	Construct 8 ft. high block wall perimeter fence topped with razor tipped barbed wire at 4630 Santa Ana St. facility and 3724 Florence Ave. facility.	O	20	C	Tract 349 Mutual Water Company have security problem with entry of unauthorized person during after working hours and vandalism. Currently the 6 ft. high chainlink fence is not enough to control or prevent it. One of our facility is next to mobile homes where most unauthorized entry and vandalism are coming from.	200,000	908	7,500	07	Los Angeles	IV	2009

3575	4210020	4210020-007	Santa Ynez River Water Cons. Dist. ID#1	Planning to Address System Reliability and Consolidation	This planning study would address the economic viability of consolidating 5 small water systems within the existing Santa Ynez Water Conservation District, Improvement District No. 1 (ID#1), as well as the long term, critical need of reliability regarding ID#1's infrastructure. These water systems would include the City of Solvang with a population of 5,322, Rancho Marcelino Mutual Water Company with 77 homes, Skyline Park & Service Company with 60 homes, Refugio Mutual with 8 homes and Meadowlark Ranches MWC with approximately 45 homes. Currently, ID#1 provides water to two of these water systems and provides standby or emergency water to two of these systems. The project will consist of hiring an engineering firm to work with ID#1's staff to analyze the overall system, including supply, distribution, production, cost, rate analysis, water loss, and Nitrate removal. The result of the project will be; a potential consolidation with 5 water systems; an adequate supply to meet demand and comply with regulations, even in critical drought conditions.	O	20	C	Currently, the Santa Ynez Water Conservation District, Improvement District No. 1 (ID#1) has a number of issues to overcome related to the reliability and delivery of water to its population, as well as the economic viability of bringing its system up to current standards. ID#1 has a service population of 8,298. It additionally provides water to the City of Solvang with a population of 5,322. ID#1 also provides "standby" water for blending to Rancho Marcelino Mutual Water Company for the purpose of Nitrate MCL reduction, so that it may comply with state standards. ID#1 currently supplies 2 to 4 acre feet per month to Rancho Marcelino Mutual Water Company, which has 77 homes located within its development. ID#1 also serves as standby and emergency backup to Refugio Mutual. Within the last fiscal year (2006-07), ID#1 did not need to provide standby or emergency water to Refugio Mutual, but ID#1 has consistently needed to do so for Rancho Marcelino. ID#1's reliability and delivery of water is in jeopardy as source water is decreasing due to production loss, as well as increased drought conditions. Although the system has kept up with demands, it has overriding issues that need to be addressed to ensure reliability for the long term. These issues range from inadequate pressure, corrosive pipes and undersized pipes. ID#1 is	300,000	2,327	8,298	06	Santa Barbara	IV	2007
3576	5210004	5210004-007	City of Red Bluff		Drill and construct a new well near the 3MG reservoir.	O	20	C	Low on source capacity in zone near 3MG reservoir.	200,000	4,336	14,005	21	Tehama	I	1998
3577	1210016	1210016-006	McKinleyville C.S.D.	Back Up Chlorination for North Bank Booster Station	MCSD will install a Sodium Hypochlorite injection system, consisting of a storage/mixing tank, pump, dosage control, residual analyzer and interface to a digital contrl system. A positive displacement feed pump will draw sodium hypochlorite from a storage tank and will inject the chlorine solution at a metered rate proportional to the flow and dosage requirements. The dose will be regulated by a chlorine analyzer and monitored by digital control. Safety and handling equipment will be constructed or installed to meet federal and state regulation.	O	20	C	MCSD purchase its water from a regional supplier chlorinated but must own and maintain backup emergency chlorination equipment.MCSD is not able to provide emergency backup chlorination as required by Califoria Department of Public Health Drinking Water Divission due to unreliable and outdated equipment. MCSD does not have the chlorine residual analyzer necessary to regulate the dosage control nor the interface to it's digital control hardware. MCSDs saferty and handling equipment does not meet state and federal regulation.	30,000	5,042	15,132	01	Humboldt	I	2009
3578	1510019	1510019-002	Shafter, City of		CONSTRUCT NEW WELL TO REPLACE WELL #10. OTHER - DESIGN AND CONSTRUCTION	O	20	C	WATER QUALITY PROBLEMS	250,000	3,863	15,609	12	Kern	III	1998
3579	1910169	1910169-003	WALNUT PARK MUTUAL WATER CO.	New Water Well Completion	As previously stated, our new well has been drilled to 12 hundred feet and is caplable to provided needed water. Our deed is to install a new pump, motor shed for use by this well and conection to our electrical computer system and our water tanks.	O	20	C	Funds needed to complete new water well. Since 1914 this company has drilled 11 previous water wells, only two smaller ones are still oprerable. This new well has already been drilled at a cost of $1,000,000 our need is to complete this well to ensure furture water dilivery to our customers. This well will provide our primery water supply when we completed and we will be able to use the two smaller wells for emergency. We want to ensure that our costomers can count on our water supply for our future.	750,000	2,801	16,180	07	Los Angeles	IV	2009
3580	1610002	1610002-005	Avenal, City of		INTERIOR AND EXTERIOR SURFACES OF THE WATER STORAGE TANDS WOULD BE SANDBLASTED AND CLEANED WITH EXISTING CATHODIC PROTECTION SYSTEMS WOULD BE INSPECTED AND REPLACED AS NEEDED. OTHER - DESIGN AND CONSTRUCTION	O	20	C	NO INTERIOR OR EXTERIOR COATING REPAIRS ON THE 5 STORAGE TANKS WITHIN THE SYSTEM. THE INTERIOR AND EXTERIOR TANK COATINGS HAVE COME TO THE END OF THEIR DESIGN LIFE.	570,000	1,892	16,737	12	Kings	III	1998

3581	3610001	3610001-002	CITY OF ADELANTO	Potable Water Supervisory Control and Data Acquisition (SCADA) Replacement	SCADA system will incorporate such functions as; water level indicators, on-off, chlorine disinfection residual, motor/pump failure alarms, alarm handling, manual and automatic operation of the wells and booster stations. Automatic Seismic indicators, alarms and storage tank valve shut-off triggers. Provide records tracking and trending, report generation. Security intrusion alarms and cameras.	O	20	C	Replace existing 11 year old SCADA computerized system utilized for performance monitoring and operating the City's 15 potable water wells, 3 booster stations and 6 water storage reservoirs. Current system is failing, resulting in false alarms, incorrect water levels, incorrect well operations.Corrective action is to replace said SCADA system with current technology and incorporate security monitoring and alarms at wells, booster stations and reservoirs. Utilize solar electricity power at sites. In Sept 2008, we experienced a break-in into a storage reservoir; no contamination occurred.	800,000	4,862	19,500	13	San Bernardino	V	2009

3585	1910011	1910011-009	GSWC - BELL, BELL GARDENS	GSWC – Bell/Bell Gardens - Bissell Plant Modifications	This project was slated to receive funding under CDPH's Proposition 50 Project (project number P50-1910011-025). The letter of commitment was signed in July 2007. GSWC had just received the draft funding agreement from CDPH when notification was received that Proposition 50 funds had been frozen. Construction has already started on the project, and significant monies have been spent.The project involves abandoning well 1 per DWR standards, constructing well 3, and adding manganese removal treatment at the wellhead. Construction of well 3 commenced in December 2008, and water quality data indicate that manganese removal treatment is required.	O	20	C	Golden State Water Company (GSWC) lost Bissell well 1 as a source of supply due to volatile organic chemcial (VOC) contamination. The company's original intent was to install granular activated carbon (GAC) at the wellhead. However, an investigation showed that the well, which was constructed in 1951, was in poor condition and was nearing the end of its useful like. Therefore, GSWC decided to abandon well 1 and construct a new well, well 3, which would be sealed in the upper zones to avoid VOC contamination. This meant constructing a deeper well which would likely need manganese removal treatment, based on water quality data obtained from an additional onsite well, well 2.	4,149,921	7,488	24,311	15	Los Angeles	IV	2009
3586	1510006	1510006-006	East Niles CSD	Arsenic Treatment for Well 21	Install arsenic treatment	O	20	C	Arsenic level in Well 21 exceeds federal MCL of 10 ppb	1,600,000	7,338	25,500	12	Kern	III	2007

3588	0710004	0710004-012	City of Brentwood		TV the wells and check for any holes or cracks in the sleeve.	O	20	C	Investigate and rehabilitate Wells 7 & 8 that occasionally have water quality problems.	150,000	15,776	45,892	04	Contra Costa	II	2006
3589	0710004	0710004-019	City of Brentwood		Purchase and install 5 emergency generators at the above locations.	O	20	C	Provide emergency power to the wells.	600,000	15,776	45,892	04	Contra Costa	II	2006
3590	0710004	0710004-014	City of Brentwood		Replace approximately 3500 outdated leaking inaccurate and unreliable meters.	O	20	C	replace old and unreliable water meters with new ones.	1,400,000	15,776	45,892	04	Contra Costa	II	1998
3591	0710004	0710004-007	City of Brentwood		Sealing of shallow wells to eliminate the possibility of contamination.	O	20	C	Abandon the sub-standard private wells that may cause contamination to the aquifer where city uses for domestic water supply.	1,150,000	15,776	45,892	04	Contra Costa	II	1998
3592	5110002	5110002-022	City of Yuba City	A - Street Waterline Replacement	Replace 500 linear feet of badly deteriorated 4-in diameter main distribution pipe on A Street, between Clark Avenue and Cooper Avenue with an 8-inch ductile iron distribution line in order to provide dependable service to our customers.	O	20	C	This replacement project would qualify as a water conservation project due to the multiple leaks. The 4-inch distribution main on A Street between Clark Avenue and Cooper Avenue is in urgent need of replacement. The existing pipe is over 80 years old and failing, with approximately ten repair clamps to stop leakage in a 500 foot section of pipe. The City standard would require 8-inch pipe to increase water flow. Due to the size and condition of these pipes the City could not meet fire flow demands in the event of an emergency. Constantly repairing these pipes is also a drain on the City's maintenance budget.	115,000	13,550	51,504	21	Sutter	I	2009

3593	5110002	5110002-018	City of Yuba City	Brown and Fippins Waterline Replacement Project	Construct approximately 1,250 linear feet of water mains and an 8-inch diameter distribution main, 20 water services, and related appurtenances in Brown Avenue from Bridge Street to Kimball Avenue and in Fippins Avenue from Bridge Street to Jones Street and connect house plumbing from back-lot water mains to the new water services.	O	20	C	This area has experienced low water pressure, increased turbidity, and pipe line corrosion. The 8-inch diameter water mains will replace aging 4-inch cast iron back-lot water mains that are in poor condition and do not provide adequate fire flow. The larger size pipe will provide clean, dependable water and improve fire flows to the area. The back-lot location of the pipe and meters makes access for repairs more difficult and creates problems for the meter readers. The new pipe will move everyting to the more accessible in-street location.	375,000	13,550	51,504	21	Sutter	I	2009
3594	5110002	5110002-017	City of Yuba City	Reservoir Repairs & Equipment Upgrades	Replace old inefficient, original equipment pump motors to premium, efficient, energy saving motors, mixers, and VFD as described above. The City will also repair and recoat the steel storage tanks at the Rowe Avenue Reservoir and the Sam Brannon Reservoir.	O	20	C	Green Project - Reservoir Equipment Upgrades and repairs. 1) Upgrading four old inefficient pump motors to premium efficient pump motors would result in considerable energy savings that would result in the reduction in the City's Carbon Footprint:Motor #1: The Water Treatment Facililty's backwash pump;Motor #2: Booster pump motor at Rowe Avenue Booster Station;Motor #3: Booster pump motor at Sam Brannon Street Booster Station;Motor #4: Replace #6 Low Lift pump motor that was originally installed in 1971.2) To eliminate erratic flow and pressure fluctuations in the system that are currently causing false fire alarms and improve electrical efficiency, the City needs to install one Variable Flow Drive (VFD) at the Sam Brannon Reservoir and the Garden Highway Reservoir;3) Installing mixers at both Rowe Avenue Reservoir and the Sam Brannon Reservoir would prevent disinfectant by-product formation in the system.4) Storage tanks at the Rowe Avenue Reservoir and at the Sam Brannon Reservoir are in need of repair to prevent damage due to exposed steel, which could leed to catastrophic failures and result in the City's inability to maintain adequate system pressure and fireflows.	498,000	13,550	51,504	21	Sutter	I	2009
3595	5110002	5110002-031	City of Yuba City	Upgrade One Highlift Pump and Install Hydro Pneumatic Tank	Upgrading a highlift pump to 9 MGD will increase the current pump capacity by 3 MGD, and together with installing a Hydro Pneumatic tank at the WTP will prevent the erratic flow and pressure problems and relieve water hammer.	O	20	C	Community growth and the addition of new storage tanks has resulted in reduced capacity to fill Reservoirs. The system is experiencing water hammer and eratic flow and pressure swings resulting in false fire alarms. Water hammer has resulted in increased pipe failures and leaks in the distribution system. Installing a Hydro Pneumatic tank at the WTP and upgrading the existing 6 MGD highlift pump to 9 MGD will allow for a smoother change when pumps are started and reduce water hammer and pressure swings throughout the system. I	425,000	13,550	51,504	21	Sutter	I	2009
3596	5110002	5110002-020	City of Yuba City	C - Street 10-inch Waterline Replacement	Remove 700 linear feet of current, unrelaible 4-inch cast iron water main and replace with 10-inch diameter ductile iron distribution main and related appurtenances on C Street between McRae Way and Second Street in order to bring water system up to current City standards.	O	20	C	Water quality is compromised in this area due to deteriated condition of the 80+ year old pipes. Providing a more dependable water service should encourage commercial development in the area and provide new jobs. C Street and Second Street are located in the historic down town shopping district. This area has experienced low water pressure, increased turbidity, and pipe line corrosion. A 10-inch diameter water main will repalce aging and inadequate 4-inch cast iron water mains that are in poor condition and do not provide adequate fire flow. The larger size pipe will provide clean, dependable water and improve fire flows to the area.	189,000	13,550	51,504	21	Sutter	I	2009

3597	5110002	5110002-027	City of Yuba City	Woodbridge Avenue Waterline Replacement	Construct 275 linear feet of 8-inch diameter ductile iron distribution main and related appurtenances on Woodbridge Avenue between Montery Avenue and Franklin Avenue and remove failing existing 4-inch pipe in order to provide our customers with a dependable water supply and meet the fire flow demands in the event of an emergency.	O	20	C	This pipe replacement would qualify as a water conservation project due to the repeated leaks. The aging 4-inch cast iron water main on the section of Woodbridge Avenue, between Monterey Avenue and Franklin Avenue is in very poor condition. Several leaks in this area have been repaired. The pipe needs to be replaced before it completely fails. Replacement of these old pipes in various areas would greatly decrease the City's maintenance costs.	63,250	13,550	51,504	21	Sutter	I	2009
3598	5110002	5110002-021	City of Yuba City	Forbes Avenue 14-inch Waterline Replacement	Replace 2,000 linear feet of 8-inch diameter pipe with a 14-inch diameter distribution main to relieve velocity issues, and provide residences and businesses on Forbes Avenue between Cooper Avenue and Plumas Street with a dependable water source.	O	20	C	This area of Forbes Avenue provides a vital loop for the downtown business area fire flow. However, this area experiences low pressure during peak day and peak hour events, especially during the summer months. Bringing this 8-inch diameter main line up to the City standard of 14-inch diameter pipe would encourage commercial development and provide needed jobs due to the City's ability to provide dependable water pressure year round, especially in the event of a fire.The Yuba City Water Master Plan identified the need for a 14-inch diameter pipe due to the existing pipeline of 8-inch diameter pipe having flow velocities that exceed design standards of seven feet per second.	480,000	13,550	51,504	21	Sutter	I	2009
3599	5110002	5110002-032	City of Yuba City	Water Treatment Plant Solar Panels	Install solar panels for the purpose of providing clean electricty for the operation of the Water Treatment Facility.	O	20	C	Green Project - Solar panels at the water treatment facility would improve electrical reliability and reduce demand during peak energy periods, reducing demand on the PG&E grid. This project would reduce the City's dependance on traditional sources of electricity and would reduce the City's carbon footprint. The City could install the panels in the sedimentation basins, which would reduce algae growth and improve problem the City sometimes has with drinking water having an unpleasant taste and odor.	600,000	13,550	51,504	21	Sutter	I	2009
3600	5710001	5710001-008	City of Davis	City of Davis Treated Surface Water Distribution Facilities (Cr+6)	Design and construct local facilities to distribute treated surface water supplies delivered by the regional WDCWA to city customers. The distribution system improvements will include: 46,000 feet of transmission and distribution pipelines (varying in size from 12 to 42 inch diameter), one 4- million gallon terminal water storage tank to dampen regional surface water deliveries into the city water system, new booster pump facilities to pressurize surface water deliveries into the distribution system, SCADA system control improvements, and deployment of an advanced metering system (AMR/AMI) to better manage, monitor, and report system-wide water use and reduce peak demands. These improvements will transition the city from total reliance on local groundwater supplies to a conjunctive use operation with year-round treated surface water supplies augmented by groundwater during peak demand periods. The City of Davis was established in 1917, meaning some of the existing water distribution system infrastructure is aging and needs to be replaced. The required modifications to the distribution system will serve two purposes: (1) upgrade old infrastructure, and (2) facilitate efficient distribution of treated surface water deliveries to city customers.	O	20	C	Replace old well capacity (high in: total dissolved solids, nitrate, total and hexavalent chromium, selenium, manganese, boron, and other constituents) with a new treated surface water source to comply with water quality regulations, provide water that is more aesthetically acceptable to customers, and improve future water supply reliability.The city has identified that a conjunctive use water supply portfolio represents the least costly alternative to: (1) provide potable water supplies that meet all current and future water quality regulations; (2) meet all of the city's wastewater discharge requirements issued by the RWQCB (including elimination or reduction of salts and other constituent levels), (3) provide customers with water quality that does not require water softeners and/or home treatment devices, and (4) diversify water supplies so that the City does not rely 100% on local groundwater resources which have declining water quality, and are not able to meet current and future water quality regulations or demands, and will cause long term subsidence effects.	22,000,000	16,339	68,420	09	Yolo	I	2012

3601	0410002	0410002-001	Cal-Water Service Co.-Chico	City water conservation program.	The city wide water conservation project has two elements.a. Indoor: CWSC will replace / retrofit 40,323 bathrooms and the projected water savings is 1,237 acre feet per year.b. Outdoor: CWSC will replace 6,721 ET controllers and the projected water savings is 206 acre feet per year.	O	20	C	CWSC intends to reduce the district water consumption to match long term supply.	19,213,050	26,882	100,086	21	Butte	I	2009
3602	1910036	1910036-008	CALIFORNIA WATER SERVICE CO. - ELA	East L.A. "City Wide" Water Conservation Program.	The program has two "full service" elements that encompass a "City Wide Water" Conservation Program. Element A: A team of trained plumbers will retrofit 19,979 residential homes / 39,959 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 1,226 acre feet per year. Element B. A team of specialist will retrofit 6,660 residential yards with modern ET controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 204 acre feet per year. .This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 months or less. The program will employ 75 to 100 people for 12 months.	O	20	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply and MWD is requesting that we reduce our consumption by 20 percent. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 1,430 acre feet per year or 50.0 / 75.0 gallons per day, per person.	19,379,873	26,639	151,300	22	Los Angeles	IV	2009
3603	3610039	3610039-035	SAN BERNARDINO CITY	Construct Devil Canyon Well No. 8	The project consists of the development of a new groundwater production well in the Devil Canyon portion of the SBMWD service area. The well is anticipated to produce water at a rate in the range of 1,500 gpm to 2,000 gpm, and it will be approximately 700 feet deep and equipped with on-site chlorination facilities. Water quality in the vicinity, and up-gradient, is generally good, and the SBMWD does not anticipate water quality to be an issue with this well. The well site is near the San Bernardino County Flood Control District's Devil Canyon spreading basins. These basins effectively capture natural runoff from Devils Creek and State Water Project water purchased by SBMWD for direct recharge of the surrounding aquifer. The combination of natural geology, proximity to the spreading basins and good water quality make the proposed location ideal.The well will be constructed on a site currently owned by SBMWD to the standards of AWWA, the State of California , Department of Water Resources, and the State of California , Department of Public Health. SBMWD discussed the project and requirements with the CDPH District Engineer and has received their support for this project. An existing pipeline fronts the property and so no new pipelines are included in this project.Construction is expected to last approximately 1 year and will generate approximately 30 full and part time jobs during that duration.	O	20	C	Construct Devils Canyon Well #8Setting:The City of San Bernardino Municipal Water Department's (SBMWD) service area is located at the crossroads of the Interstate 215 and Interstate 10 freeways. The City of San Bernardino is the county seat of San Bernardino County and has an estimated population of 205,010, making it the 18th largest city in California and the 101st largest city in the United States. In addition, the City of San Bernardino is part of the Riverside-Ontario-San Bernardino Metropolitan area, the 14th largest in the nation, commonly referred to as the "Inland Empire". According to 2007 census information, the average San Bernardino family household is 3.83, with a median family income of $41,010, which is $19,364 below the 2007 national average and less than the statewide MHI. Approximately 25% of City residents are considered to be at or below the poverty level. SBMWD's service area encompasses approximately 45 square miles. The SBMWD serves most of the City of San Bernardino, portions of Loma Linda and Redlands as well as unincorporated areas of the County. SBMWD produces its water supply from 57 groundwater production wells located throughout its service area. The wells range from 50 to 1,300 feet deep and have production capacities of 50 to 3,500 gallons per minute (gpm). Water is delivered to SBMWD customers with a series of pump stations, storage reservoirs with a total	1,500,000	42,301	173,359	13	San Bernardino	V	2009
3604	2500514	2500514-001	MJUSD-South Fork Elementary School		Redesign and build wellhead to raise it above grade to reduce potential for contamination. Add water treatment to system to remove hard water and eliminate calcium deposits.	O	20	P	The wellhead is presently below grade, producing the potential for contamination. Hard water results in calcium deposits on fixtures.	21,895	1	35	01	Modoc	I	1998
3605	1502753	1502753-001	TEHACHAPI CHURCH OF THE NAZARENE		Interconnect to another public water system or provide adequate disinfection contact time.	O	20	P	Coliform contamination of well. Unconfirmed E. coli.	100,000	1	119	19	Kern	III	1999

3606	2100538	2100538-002	TOMALES HIGH SCHOOL	Shoreline Unified School District- Tomales High School	Research, design, install a new distribution system. Project will include engineering, design, installation or treatment and control systems, installation of new distribution system and monitoring. Project to include approximately 5,000 feet of 8 inch water line.	O	20	P	Research the feasibility of consolidating three of the school district's public water systems; Tomales High School (2100538), Tomales Elementary School (2100560) and Shoreline School Dist. Bus Garage (2100577). Consolidate and develop new sources, and install new storage tanks. Consolidation is considered to solve the following problems: general inadequacy of water availability, Tomales High School: high sulfur levels complicate chlorine residual monitoring and aesthetic issues, Tomales Elementary School: possible compromised well or well seal masked by preventative chlorination, Shoreline School Dist. Bus Garage: maintenance on severely worn distribution facilities including historic redwood tank, rusting pressure tank and valving and lines. Consolidating with the Bus Garage will require crossing Shoreline Highway (Hwy. 1) at the town of Tomales. Secondary MCL's are violated in the primary wells at the high school. Sulfur creates aesthetic problems and difficulties in maintaining adequate chlorine residuals in the distribution system. The LPA supports consolidating either two or all three of the water systems.	750,000	1	227	18	Marin	II	2007
3607	3600602	3600602-002	Alpine Covenant Conf. Centre	Alpine Camp and Conference Center Water System Improvements	The SCADA system to be installed will provide complete control over Alpine Camp and Conference Center water system. Wells will be turned on and off based on the level of water in the reservoir or other system parameters. When properly instrumented, other system peremeters such as well flow and well water depth can be monitored and historically recorded to provide a graphical representation over time. The computer system and software will allow the operator to make changes in the system operations and control the flow of information to the Lake Arrowhead Community Services District.In addition, replacement of plumbing in the distribution system will improve efficiency and enhance conservation efforts.	O	20	P	This project is purposed to resolve storage monitoring and regulation problems inherent in our present system. A new SCADA system is needed to resolve this problem. Current methods require visual monitoring and hand controlled regulation of wells and reservoirs.Furthermore, water distribution is compromised by archaic plumbing that frequently ruptures. Current water system plumbing is in need of replacement and upgrading for efficient distribution and conservation.	108,862	1	250	13	San Bernardino	V	2011
3608	4900694	4900694-001	Wright Elementary School	Consolidation	Connect	O	20	P	Small school wants to connect to City	400,000	11	441	18	Sonoma	II	2002
3609	1300549	1300549-001	IMPERIAL VALLEY COLLEGE	Imperial Valley College Water Pipeline	This project will include the construction of approximately 19,000 linear feet of 18-inch water pipeline along Aten Road in the City of Imperial. The project, once completed, will permanently intertie the Imperial Valley College with the City of Imperial. This project will result in the consolidation of water system CA1300549 in to CA1310006. The consolidation will result in the decommissioning of the Imperial Valley College water treatment facility.	O	20	P	This project will consolidate the Imperial Valley College water system into the City of Imperial's water distribution system. Imperial Valley College's water treatment facility will soon need significant upgrades in order to adequately supply water to the College. The College lacks the means to generate funding to upgrade and maintain its system. In addition, the College lacks the available space required to expand its treatment facility. Consolidation into the City system will provide the following benefits 1) eliminate the College as the water treatment provider, 2) Increase system reliability, 3) Enhance fire protection.The proposed project includes installing approximately 19,000 linear feet of 18-inch waterline along Aten Road. The waterline will connect to the City's water distribution system at the intersection of Aten Road and Legakas Road. The pipeline will terminate at the College. The City has recently constructed a 2 MG reservoir and booster station near the connection point.	3,000,000	23	5,000	14	Imperial	V	2009

The only access roadway and site work area surfacing is compacted aggregate base. A hard surface provided by asphalt will allow for more effective snow removal and provide all weather access. As the water treatment plant is relied upon during winter months to provide more of the City's water supply, more expedient and continuous access to prevent any possible interruption to water supply operations is needed. A sprinkler irrigation system is needed to dispose of excess backwash waste water by installing either a permanent or a movable set irrigation system on the adjacent parcel (which is owned by Plumas County) below the plant.A replacement 250,000 gallon finished waster storage reservoir is needed.This scope of work includes expansion of the plant SCADA System, supplementing the simple data logger and dialup system with the capability of accessing all real-time operating data as well as historical archived information through a Virtual Private Network feature. Software and hardware additions are needed and a DSL or other high-speed phone connection to the City offices from the water treatment plant is required. The above proposed additions are all necessary to insure the safety of the water supply and facilitate reliable performance and	680,000	2	100 02	Plumas	I	2009

3630	4600018	4600018-006	Sierraville P.U.D.	Sierraville Public Utility District drinking water tank installation	Removal of abandoned bolted steel water tank. Construction of new pad and a 200,000 gallon welded steel water tank, including piping. Drilling of a groundwater well and associated piping to integrate into the distribution system. Possible land acquisition for new well.	O	15	C	The District needs a new drinking water storage tank to offset demand during peak water usage periods, to handle normal use during drought years, and to keep pace with population growth. The District has had three new hookups within the past year, and anticipates a spurt of growth in the next few years. The growth will be overflow population from the Town of Truckee, 25 miles away, where median home prices hovering around $500,000 have outpaced the incomes of middle class families. The additional tank also would allow much-needed repairs to be made to the existing tank. As for the well, the district is functioning solely off of a spring, and there is a danger of contamination and a possibility that it would reduce production. For the safety of our customers, we would like to develop an alternate, reliable source.	800,000	102	200	02	Sierra	I	2009

3645	4000568	4000568-004	SAN SIMEON CSD	New Storage Tanks	construct and add storage tank for the fire flow requirements	O	15	C	Additional storage is required to meet fire flow requirements	600,000	206	499 06	San Luis Obispo	IV	2007
3646	4210009	4210009-003	Cuyama Community Services District		New water lines need to be put in to replace the old lines.	O	15	C	Water lines are old, corroded and deteriorating. Leaks are frequent.	2,000,000	253	820 06	Santa Barbara	IV	2001
3647	1510051	1510051-007	LEBEC COUNTY WATER DISTRICT	Upgrade Water Mains in Commercial Areas	The existing 6-inch main can be parralleled by 3,500 lineal feet of 8-inch pipe. The project includes analysis of the existing pipe network and construction of new mains as required to deliver adequate fire supply	O	15	C	Water capacity in the commercial areas of the District is limited by a single 6-inch diameter pipe. Current Kern County Development Standards require that pipe sizes be 8-inch diameter or greater for stubs longer than 800 feet.	400,000	243	830 19	Kern	III	2009
3648	4110028	4110028-002	Pillar Ridge MHP (Former El Granada MHP)	Pillar Ridge Water Treatment Improvements	The proposed project will include installtion of iron and manganese removal systems both at the existing groundwater treatment facilities. The project will also include remediation work to the wells, and in-situ treatment at each wellhead. Mainlines in the distribution system will also be rehabbed to remove any iron bacteria growth present.	O	15	C	The water system has experienced high levels of iron and manganese in the water distribution system and groundwater supply wells. Iron has been regularly sampled to be over 10 times the MCL of 300 ppb while Manganese has often reached levels over 5 times the MCL of 50 ppb. These levels are in violation of the California Code of Regulations, Title 22, Chapter 15, Section 64449-(a).	500,000	228	1,000 17	San Mateo	II	2011
3649	2310010	2310010-003	Hopland Public Utility District		Add additional storage tanks and force main to reservation.	O	15	C	Need additional storage to connect to and serve the Pomo Indian Reservation which approx. 4 miles east of Hopland.	3,000,000	479	1,020 03	Mendocino	II	1998
3650	2310010	2310010-002	Hopland Public Utility District		Replace old distribution lines.	O	15	C	Approx 60% of main lines are steel lines which have been in the ground since 1950.	1,000,000	479	1,020 03	Mendocino	II	1998
3651	1910050	1910050-001	COMMERCE-CITY, WATER DEPT.	CITY OF COMMERCE - WATER SYSTEM IMPROVEMENT	Here are the major aspects of this project:1. Acquire property for new well, booster station & reservoir $750K to $1.0mil (City match)2. Construct one new potable well & install 100gpm oump & discharge piping $1.5mil.3. Construct treatment facilities (if necessary) $1.5mil4. Construct one new 1-million gallon reservoir complete with new booster station, electrical panel and controls $2.5mil5. Abandon two existing wells, demolish reservoir and sell off property $500mil (or convert to other municipal uses).	O	15	C	The goal of the project are: replacement of 2 obsolete and non-operating stations in the Commerce Water System, construc/install/operate 2 new wells, increase storage capacity and reduce dependence on imported water. Reducing our reliance on imported water will add additional water supply to Southern California Region and other cities which depend on such water to meet their increasing residential/commercial demands.The above project will allow us to be somewhat self-sufficient and have a reliable supply of water, utilize existing adjudicated water rights, and minimize (if not eliminate) the need for purchaing MWD water. Again, allow other communities in greater need or reliance on imported water to avail themselve of MWD water, especially under the current and prolong water shortage (and proposed water rationing).	6,000,000	974	1,333 22	Los Angeles	IV	2009

3656	4510002	4510002-004	Mountain Gate C.S.D.	clear well replacement	replace 3 warnout corroded and unrepairable water storage tanks with 1 larger one in their place .remove and scrap the old ones.	O	15	C	2007 master plan shows 4 0f the districts water storage tanks are past their usefull life and unrepairable.the loss of 1 tank will make it impssible to maintain required reserves or mintain adiquate contact time for disenfection	1,200,000	664	2,500 02	Shasta	I	2009

3657	3710036	3710036-002	Borrego WD	Pump house rehabilitation and facilities surveillance project	The pump house rehabilitation and facilities surveillance project proposes to replace eleven dilapidated pump house buildings, oleander hedges and chain link fences with modern, tightly sealed metal structures surrounded by security fencing and desert native landscaping. The new buildings will be expanded to include all electrical panels and mechanical valves associated with the pump operation into one tighly sealed, insulated structure. The new security fencing will feature an enclosed area large enough to provide adequate space for pump maintenance and portray a sense of safe and secure water to our customers. The facilites will also be equipped with state-of-the-art video surveillance devices which will be tied into the District's existing SCADA system. In addition to the eleven well locations, the project will include fencing and surveillance for two booster stations and six reservoir facilities. The 2000 census report for the geographic area of Borrego Springs reflects a median household income of $37,045 which is below 80 percent of the statewide Median Household Income and therefore qualifies the entire Borrego Springs area as a disadvantaged community.	O	15	C	Security Project	886,584	2,017	2,535	14	San Diego	V	2007
3658	3710036	3710036-006	Borrego WD	Borrego Springs Water Supply Augmentation Project	The project consists of constructing a well field, a booster station and a transmission system in an adjacent groundwater basin for the purpose of extracting and delivering a new water supply for the water district's customers. Four production wells, each with a capacity of about 250 gpm, will be constructed into a shallow aquifer with a total depth of each well of about 200 feet. Additionally, two groundwater monitoring wells will be constructed in the shallow aquifer to evaluate the long-term impacts of pumping from the shallow aquifer.The extracted water will be delivered into the water district's existing distribution system, a distance of about 9 miles, via 12-inch and 6-inch diameter transmission pipelines.	O	15	C	The community's sole source aquifer has been in a constant state of depletion since 1945. The rate of declining groundwater levels in the basin has more recently increased to about 3 ft/yr. The continued depletion will eventually result in a significant water shortage and a disruption to the economically disadvantaged community. The continued depletion could also lead to the introduction into the district's wells of groundwaters containing nitrate and salinity concentrations that exceed primary and secondary drinking water standards.	7,775,000	2,017	2,535	14	San Diego	V	2009

3659	2910002	2910002-006	City of Nevada City	Water Storage Tanks Upgrade	The three welded steel storage tanks provide a total of 3.03 million gallons (full) of treated water, which well exceeds the minimum recommended quantity of 700,000 gallons for this system size. All tanks are on the same hydraulic gradient and float off the main system. The Canada Hill tank of 1.14 MG is located near the water treatment plant southeast of the City. The largest Sugarloaf tank of 1.38 MG capacity is located in the north central part of the City. A smaller forestry tank of 0.51 MG capacity is located in the southwest area of the City. All of the tanks are in serious need of level controls, such as altitude valves, and remote sensing and reporting devices for effective reliability, operations, and security. In addition, all of the tanks are in need correction of corrosion problems. These improvemts will consist of constructing altitude valves to control stored water levels and to eliminate spillage of chlorinated finished water into nearby drainages; to construct SCADA (system control and data analysis) systems to monitor tank conditions and to transmit control data to the water treatment plant for operator information; and to drain, clean and repaint to correct corrosion damage to the tank interiors. The tanks were constructed in 1978, and are in need of upgrading/rehabilitation.	O	15	C	The City distribution system is supplied by the water treatment plant, which supplies the three steel storage tanks, upon which the distribution system relies for pressure and stored finished water. The CDPH annual Inspection Report has recognized deficiencies of all three storage tanks, and has required upgrades. Deficiencies include lack of automated level controls, which allows spillage of chlorinated water outside the tanks, lack of automated monitoring of tank levels and security, need for correction of corrosion of the steel tanks.	362,000	1,205	3,001 21	Nevada	I	2009

3663	3410045	3410045-001	CalAm - Arden		Connect Ethan Way to City of Sacramento. Involves design and construction.	O	15	C	General system improvement. Lack of supply reliability with largest source out of production.	250,000	1,202	4,069 09	Sacramento	I	1998
3664	0910003	0910003-006	Placerville, City of - Main	City of Placerville Northside Waterline Replacement Project	Construction of approximately 5,000 feet of 6- and 8-inch replacement pipeline constructed in accordance with current California Waterworks Standards.	O	15	C	In many areas within the older portions of Placerville, customers are served from old 2-, 3-, and 4-inch iron distribution pipelines that are approximately 70 to 100 years old and were not constructed in accordance with current California Waterworks Standards.	1,000,000	3,399	4,926 09	El Dorado	I	2009
3665	0910003	0910003-007	Placerville, City of - Main	Country Club Drive Hydropneumatic Pump Station Bypass Project	Construction of approximately 1,000 feet of new 6-inch pipeline (along with the associated valves, metering, and other appurtenances) necessary to serve the existing ridge-top customers from an intertie with the El Dorado Irrigation District (EID) potable water system. The intertie would be located upstream of an existing EID pressure reducing station.	O	15	C	The City currently uses a hydropneumatic pump station to serve existing customers located on the top of a ridge. The hydropneumatic pump station is old and in a deteriorated condition.	300,000	3,399	4,926 09	El Dorado	I	2009

3666	0610004	0610004-007	City of Williams	Williams Ground Storage Tank	The City proposes building a single one million gallon ground storage tank with a booster pumps with enclosed building, plus associated piping, to be tied to our distribution system allowing for treatment, pressure equilization and fire protection.	O	15	C	The City of Williams is required to reduce excessive levels of Manganese and Iron in order to comply with State and Federal regulations allowing our water system to obtain permits for several of our water wells. To do so, we need to add filtration treatment, currently this will require filtration at each of our wells due to the current layout of our distribution system. At this time the City has just one storage tank of 100,000 gallons which also serves as our sole ability to regulate distribution system pressure, as well as fire protection capacity which is greatly needed. It is also believed that the City can reduce it's energy demand and stress on the wells due to the ability to utilize smaller, more efficient motors, rather than the large 100 horsepower ones currently in use. A large storage tank will also allow the City to "blend" water from several sources.	2,530,000	1,324	5,250	21	Colusa	I	2009
3667	0610004	0610004-005	City of Williams	Williams Water Well	Project will cover drilling of test well to insure volume and quality. New production well with pump, motor , variable speed drive unit, radio telemetry, and SCADA control. About a three hundred square foot building to encompass controls and chemical/ disinfection equipment. Necessary Safety equipment for handlers and public. Iron and Manganese filtration will be required by the Dept. of Public Health due to groundwater supplies containing excessive levels of these contaminates. Permit of approved supply requirement.	O	15	C	Install new water well and appurtenances along with Iron and Manganese treatment in an effort to obtain a higher quality and quanity of water to meetState and Federal standards, and insure greater level of fire protection than current supplies afford.	1,400,000	1,324	5,250	21	Colusa	I	2009
3668	0610004	0610004-006	City of Williams	City of Williams SCADA system	This project will apply SCADA system to three of our five water wells, single elevated storage tank and proposed ground storage tank with booster station, so that they may be monitored for such parameters as flow, pressure, chlorine (to reduce TTHM and DBP) well pump motor operation,filtration, and unauthorised entry. Additionaly, This will be used for monitoring data collection.	O	15	C	The City's growing water system requires additional treatment for removal of very high levels of Manganese and Iron which exceed State regulatory MCL's. More oversite and control are required to properly monitor filter processes, along with the ability to collect data for CDPH regulatory permit requirements. Currently, the water system relies on constant attention that staff cannot perform due to a lack of personel the City can employ. Should we aquire a much needed filtration system, SCADA control will be a necessity. The SCADA would also be tied with video and motion alarms to help meet Homeland security needs and reduce vandalism.	61,000	1,324	5,250	21	Colusa	I	2009

3669	3110003	3110003-001	Foresthill Public Utility Dist	Foresthill Public Utility District Water Supply Reliability Project	The Foresthill PUD is located in the rural community of Foresthill CA, along the Foresthill Divide. The community's sole water supply is from the District's water treatment plant (WTP). The treated water is stored in three tanks totaling 1.3 million gallons of available storage at the WTP. Current maximum day demands exceed 2.3 million gallons per day.In the event of a problem at the WTP that interrupts water production, the District staff must instigate emergency measures to curb demands and conserve water until the problem is solved. The threat of wildland fires within the service area further increases the threat to the water supply. Additional treatment and storage capacity would increase the system's reliability and also enable fire fighting forces to minimize the size of wildland fires and minimize the loss of property and damage to the American River Watershed.The proposed project includes the addition of a 2 million gallon storage tank and addition of a redundant filter at the WTP.	O	15	C	FHPUD serves approximately 2,200 customers with treated water of which 2,100 are residential and about 90 are commerical customers. The project is needed to address water supply reliability and to ensure compliance with Safe Drinking Water Act drinking water standards. Additional water filtration is needed to ensure water quality is maintained during buildout in the District service area.	6,000,000	1,919	5,500	02	Placer	I	2009
3670	2310006	2310006-001	Millview County Water District		Drill new wells and raw water river crossing.	O	15	C	District's raw water source drys up in summer. Supplementary raw water intake from river is in poor location.	200,000	1,489	5,500	03	Mendocino	II	1998
3671	2410006	2410006-003	DELHI CWD		INSTALL WELL HEAD TREATMENT TO REMOVE NITRATES.	O	15	C	ONE OF THE DISTRICT'S FIVE WELLS HAD A HIGH NITRATE RESULT IN 1996.	400,000	2,254	5,548	11	Merced	III	1998
3672	2310001	2310001-002	Fort Bragg, City of		Replace 4000 L.F. of raw water transmission line and upgrade pumps and pumping station.	O	15	C	Deteriorating main transmission line (raw water), inefficient pumping system.	540,000	2,791	6,963	03	Mendocino	II	1998
3673	3610053	3610053-001	WESTERN HEIGHTS WATER COMPANY		Construct new well	O	15	C	Two inactive high nitrate wells, and one old inactive well in water system	765,335	2,225	7,120	13	San Bernardino	V	2001
3674	1510041	1510041-001	North of the River MWD		A new water line to transport this water to a point where it can be blended with better quality water. OTHER- Design and Construction.	O	15	C	Some water supply wells have unacceptably high nitrate and TDS. Well-head treatment is too expensive.	1,600,000	2,025	7,500	12	Kern	III	1998
3675	4010005	4010005-001	OCEANO COMM SERVICES DIST.	SELENIUM	Drill a new well in another area of the District	O	15	C	2 wells exceed the selenium MCL but are blended to comply with the standards.	920,000	1,987	7,600	06	San Luis Obispo	IV	2006
3676	3610044	3610044-003	DWP - BIG BEAR LAKE/MOONRIDGE	Menlo Drive Mainline Replacement	The Menlo Drive mainline replacement involves replacing 3,400' of 4" and 6" existing mainline with 8" mainline to increase fire-flow in this portion of our service area. Big Bear Lake and vicinity is prone to wildfires and recent increases in fire-flow requirements have left many portions of our water system with deficient fire-flow. This is one of many pipeline replacement projects we have planned to correct this situation.	O	15	C	Menlo Drive mainline is inadequate to meet current fire-flow standards. This project will replace the existing four and six inch mainline with an eight inch mainline increasing fire-flow in this section of our service area. No public notification was required.	347,820	10,366	8,839	13	San Bernardino	V	2009
3677	4010011	4010011-008	MORRO BAY WATER DEPARTMENT	Morro Bay City Water Meter Replacement Program	The proposed water meter replacement project will replace aging water meters throughout the water system to reduce water losses. This project will help reduce wasted water as well as reduce costs of operating the distribution system by accurately metering delivered water.	O	15	C	The City of Morro Bay distributes water to about 5400 service connections and the total metered water collected from the service meters is less than the total water production from the City's water sources. Total water loss exceeds 10%, much of this loss has been attributed mainly to inaccurate water meters.	3,000,000	5,425	10,270	06	San Luis Obispo	IV	2009
3678	2910006	2910006-006	Nevada ID - Loma Rica		Add 3.0 MG storage tank. Involves design and construction.	O	15	C	Inadequate system storage for diurnal demands and emergency reserves.	1,800,000	4,783	11,814	21	Nevada	I	1998

3688	3410704	3410704-015	SCWA Mather-Sunrise		Rehabilitate water system mechanical and electrical facilities.	O	15	C	Poor water system mechanical and electrical facilities.	85,000	4,330	15,903	09	Sacramento	I	1998
3689	3410704	3410704-001	SCWA Mather-Sunrise		Install additional distribution main to provide adequate fire flow capacity to the northeast part of the service area.	O	15	C	A well was abandoned and one was shut down. Also, all mechanical and electrical systems need rehab work. Many fire hydrants and distribution system valves are in poor repair and service line main connections are badly corroded.	165,000	4,330	15,903	09	Sacramento	I	1998
3690	3410704	3410704-005	SCWA Mather-Sunrise		Rehabilitate treatment facility.	O	15	C	Inadequate mechanical and electrical system.	300,000	4,330	15,903	09	Sacramento	I	1998
3691	1510021	1510021-005	Wasco, City of	Remote Service Valves for Metered Service Connections	The City is requesting $1,165,625 in Safe Drinking Water State Revolving Funds to purchase and install 4,700 RSVs. An RSV will be added to the new and existing water meters and will vary in size from ¾-inch to 1-inch depending on the size of the existing service lateral. This phase of the water meter project is ready to start; plans and specifications are ready to advertise. The RSV will be installed immediately downstream of the meter and will be connected to the MIU. Operation signals for the RSV will be transmitted to and from the MIUs via an RF signal operating in a frequency range of 902-928 MHz. The preferred RSV has a minimum anticipated service life of twenty years. Adding an RSV to the meter/MIU installation allows the connection service valve to be closed, opened or throttled from a remote location. RSVs improve water conservation by immediately enforcing service disconnections and water conservation ordinances. RSVs conserve energy, cut pollution, and lower operating costs because the need for field personnel and vehicles is eliminated. The engineering study completed for the project showed that, over a 20-year period, the operating cost would be $687,000 with RSVs compared to $4,577,000 for systems without RSVs. The requested funds support the existing water system and not the community's future growth needs.	O	15	C	The City of Wasco operates the local water utility supplying water to 19,126 residents (CA DOF, 2009) via 5,504 service connections. The utility lacks an efficient means of controlling water usage. Every month, water service must be manually shut off or restarted at roughly 300 connections. One employee and vehicle are dedicated full-time to complete this task. In the coming weeks, the City will launch a metering project to bring it in compliance with California Water Code Section 526 (a) (1). The project will install 3,800 water meters at existing non-metered residential service connections. Each meter will include a meter interface unit (MIU) to continually collect data for billing and monitoring purposes. The final phase of the project will equip each meter with a remote service valve (RSV). The RSV can automatically turn off, turn on, or restrict water flow at specific service connections without dispatching field staff to do the job. Engineering studies conducted for the water meter project found that meters equipped with an RSV yield the highest energy efficiency, the least air pollution, and the lowest operating cost compared to systems that are not fully automated. The City of Wasco lacks the funds needed to purchase and install the remote service valves. We are a disadvantaged community with a median household income (MHI) of $38,535 (City-Data.com).	1,165,625	4,588	19,448	12	Kern	III	2009

3698	1910105	1910105-002	PARAMOUNT - CITY, WATER DEPT.	Water Well 15 Aresnic and Manganese Treatment Plant Project	We are seeking to build a wellhead treatment plant for the new well that will treat groundwater in order to meet state and federal standards for Iron, Aresnic, and Manganese. Based on the final well design memo generated for the development of the new well elevated concentrations of iron (Fe), manganese (Mn) and arsenic (As) were detected. The respective MCLs for Fe, Mn and As were variously exceeded in groundwater samples from Zone Nos. 1 through 5.	O	15	C	The City of Paramount had initiated the constuction of a new water well to better meet the community's water supply needs. Currently, this economically disadvantaged community is only able to pump 76% of its groundwater rights. Well drilling has been completed and water quality samples indicated that the new well was yielding water that exceeded the MCL for Iron, Manganese, and Aresnic. The design memo for the new well is recomending that a secondary treatment plant be built in conjunction with the new well to address the water quality issues.	3,000,000	7,454	58,087	07	Los Angeles	IV	2009

3705	1910152	1910152-005	SOUTH GATE-CITY, WATER DEPT.	Water Reservoir and Booster Station at Well 28	The City will construct a 2.8 MG capacity above ground steel welded reservoir with four booster pumps and building. This project is important to the local community as it will provide the source to provide additional water storage and chlorine contact time and provide fire flow capacity to the northeast portion of the City. The reservoir will serve an area in the City that has a high density of residential homes. The City is requesting full funding of this projects as other venues of funding have been exhausted.	O	15	C	The City will construct a 2.8 MG capacity above ground welded steel reservoir, including four energy efficient booster pumps and building.	6,000,000	16,500	96,375	22	Los Angeles	IV	2009
3706	1910152	1910152-001	SOUTH GATE-CITY, WATER DEPT.	Well 13, 14, 18, 24, 25 Rehabilitation	Water supply production of these wells has decreased dramatically since installation, thus requiring rehabilitation. Work includes cleaning the well perforation and replacement pump motors to a high efficiency pump motor. Therefore increasing water supply and decreasing energy consumption.	O	15	C	Wells are approximately 50 years old and require cleaning, rehabilitation, and replacement of pump motors.	7,500,000	16,500	96,375	22	Los Angeles	IV	2009

3707	1910152	1910152-004	SOUTH GATE-CITY, WATER DEPT.	Manganese Filtration Facility - Well 13 and 27	These two wells are major water suppliers for the City and both have reached manganese levels above the maximum contaminant level. These levels need to be reduced to meet state and federal regulations. This project is essential to health and public safety and to ensure fire suppression capabilities. Without treatment these wells will need to be placed on inactive status. These wells supply water to approximately 105,000 residents in South Gate. This project requires full funding.	O	15	C	These two wells are major water suppliers for the City and both have reached manganese levels above the maximum contaminant level. Without treatment these wells will need to be placed on inactive status.	5,000,000	16,500	96,375	22	Los Angeles	IV	2009
3708	1910034	1910034-007	DOWNEY - CITY, WATER DEPT.	Downey Groundwater Wells	The City of Downey overlies the Central Groundwater Basin (Central Basin). The Central Basin is located in the southeast (Gateway) region of Los Angeles County which covers over 227 square miles and includes 23 incorporated cities, and includes a population of 2 million people. This adjudicated groundwater basin has 72 active pumpers, 307 active extraction wells, with a five year average annual groundwater production of 194,800 acre-feet.The Project consists of the design and construction of three deep aquifer storage and recovery (ASR) groundwater wells and associated treatment processes, pipelines and appurtenances. The wells will be constructed on city-owned property previously identified, analyzed, and selected as part of the City's 2003 Groundwater Master Plan. The sites will conform to all EPA and Department of Health Services requirements. The new wells will be equipped with variable drive motor/pump assemblies and result in significant energy savings to the City, which also means a significant reduction in the carbon footprint required to power the wells. These new deep aquifer wells will also provide a reliable source of drinking water that will be free of harmful contaminants.The three new aquifer, storage and recovery wells will also include the ability to inject high quality water into the wells at times when excess imported water supplies are available. The ASR wells will be designed to produce over 3,000 gallons of	O	15	C	The City of Downey currently produces and serves an average of 15.1 million gallons of groundwater per day to a population of 111,607 people. Groundwater is the only source of drinking water currently utilized by the City. The groundwater is produced through twenty wells, many of which were constructed during the 1940s and 1950s and have lost significant production capacity and efficiency due to their age, motor/pump configurations, and the electrical equipment installed at the time of their construction. The City is spending significant sums of money on maintenance and rehabilitation of these wells, to little avail as the age of the wells has made such efforts increasingly futile. Furthermore, although the groundwater is of high quality and does not require any type of treatment prior to distribution, the older wells that pump from the shallower aquifers are potentially threatened by near-surface groundwater contamination which may lead to their closure and/or to require the installation of wellhead treatment.The appearance of man-made contaminants in the upper groundwater aquifers, and the current and forecast reductions in the maximum contaminant concentration levels set by the EPA led to the inactivation of one well, and the City to develop the Groundwater Master Plan (Plan). The Plan identified 13 of 20 wells that were susceptible to future surface and shallow aquifer contamination. Contaminant sources	11,750,000	22,332	113,379	16	Los Angeles	IV	2009
3709	5410016	5410016-003	CWS - Visalia	Visalia City Wide Water Conservation Project	The program has two elements. a. Indoor: Replace and upgrade 62,301 bathrooms with water savings products (toilets & showerheads) and this will save 1,911 acre feet per year. b. Outdoor: Replace 10,384 ET controllers and this will save 319 acre feet per year. 3717	1910067	1910067-024	LOS ANGELES-CITY, DEPT. OF WATER & POW	City T/L South Unit 4	(DRAFT for PM Review)City Trunk Line South Unit 4 (CTLS 4) is one of 6 units of the City Trunk Line South (CTLS), which is needed to replace the existing City Trunk Line. CTLS is 8,805 feet of 54" and 60" diameter welded steel pipe. The project route is along Magnolia Boulevard between Coldwater Canyon and Whitsett Avenue, along Whitsett Avenue between Magnolia Boulevard and Moorpark Street. This project includes the installation of the following: 1 vault, 10 butterfly valves, and 2 jacks/tunnels. The jacks/tunnels account for 1,600 feet of the total project length. This project does not include any connections.	O	15	C	The City Trunk Line South (CTLS) was identified in the Trunk Line Condition Assessment Program in 1996 as a high priority trunk line, at risk and in need of replacement fo the following reasons:CTLS is an old pipeline that has a history of leaks, breaks and soon will be exposed to higher pressures. Trunk line breaks are disruptive to customer service and costly to repair, and the potential for future failures increase annually as the pipe gets older and its condition degrades. The pipeline needs to be replaced to ensure a reliable water supply for the City. The Department of Water and Power will be able to move water between the Stone Canyon Inlet Line and the Franklin Reservoir Inlet using the Magnolia Trunk Line. The CTLS allows for continous supply to Stone Canyon during a planned or an emergency pipe outage.	53,209,000	686,422	4,071,873	15	Los Angeles	IV	2009
3718	1910067	1910067-029	LOS ANGELES-CITY, DEPT. OF WATER & POW	Water System Security Upgrades Project: Type B Facilities	LADWP is seeking funding support for security upgrades at its Type B facilities. The objectives of these security upgrades are to (1) prevent or restrict unauthorized access to critical points or facilities in the water supply system and (2) to enable security staff to effectively and promptly respond to possible access threats. LADWP management has identified 97 Type B facilities. The list of facilities includes tanks, chlorination stations, fluoridation stations, reservoirs, and other miscellaneous facilities. Planned security upgrades consist of a combination of video camera installation, access control and intrusion detection, and physical hardening. Each Type B facility will be outfitted with a network video system and access control and intrusion detection. A typical installation would involve an intrusion alarm with video, which would include sensors for tank level, hatch intrusion, video surveillance, and perimeter intrusion sensors. The data that is collected would be transmitted to the Los Angeles Water System Data Access and Control (LAWSDAC) security center. LAWSDAC is the LADWP's remote monitoring system. Sites will be linked to LAWSDAC via a wireless, encrypted radio link tot he nearest LADWP facility access to the Supervisory Control and Data Acquisition (SCADA) network and a wireless, Internet link to the nearest LADWP facility with a corporate network for video. Equipment for the typical installation includes 4	O	15	C	As the financial center of the Western United States, the worldwide hub of the entertainment industry, a center of national and international tourism, and home to one of the world's largest and busiest airport and port complexes, the City of Los Angeles (City) and its water infrastructure are high visibility targets for potential acts of terrorism. The Los Angeles Department of Water and Power (LADWP) provides essential water services to thousands of business, residential, governmental, and cultural locations with an infrastructure system spread throughout Los Angeles, Inyo, and Mono Counties. The LADWP water distribution system, which serves roughly 4 million people, encompasses a service area of more than 464 square miles; over 250 pumping plants, wells, tanks, reservoirs, and treatment facilities; 300 pressure-regulating stations; a 400-mile-long Aqueduct system with associated watershed; over 7,100 miles of distribution piping; and over 58,000 fire hydrants. Following the terrorist attacks of September 11, 2001, the LADWP retained a private consultant to prepare an in-depth security vulnerability analysis on all aspects of its facilities and operations. The LADWP Report on Security & Terrorism Threat Assessment (S&TTA) identified security strengths and weaknesses, deficiencies, and possible security improvements that could be made to better secure the City's water system.	11,949,491	686,422	4,071,873	15	Los Angeles	IV	2009

3719	1910067	1910067-025	LOS ANGELES-CITY, DEPT. OF WATER & POW	City T/L South Unit 5	(Draft for PM Review)City Trunk Line South Unit 5 (CTLS 5) is one of 6 units of the City Trunk Line South (CTLS), which is needed to replace the existing City Trunk Line. CTLS 5 is 7,289 feet of 60" diameter welded steel pipe.(This footage includes both Trunk Line Construction work as well as contractor work). The project route is along Moorpark St. between Beeman St. and Coldwater Canyon Boulevard; along Coldwater Canyon Blvd. between Moorpark St. and North of Hacienda Blvd. This project includes the installation of the following: 6 butterfly valves, and 2 jacks/tunnels, and one pipe hanging. The jacks/tunnels account for 865 feet of the total project length. This project includes two connections, one to the City Trunk Line South Unit 4 and another to the existing City Trunk Line.	O	15	C	The City Trunk Line South (CTLS) was identified in the Trunk Line Condition Assessment Program in 1996 as a high priority trunk line, at risk and in need of replacement fo the following reasons:CTLS is an old pipeline that has a history of leaks, breaks and soon will be exposed to higher pressures. Trunk line breaks are disruptive to customer service and costly to repair, and the potential for future failures increase annually as the pipe gets older and its condition degrades. The pipeline needs to be replaced to ensure a reliable water supply for the City. The Department of Water and Power will be able to move water between the Stone Canyon Inlet Line and the Franklin Reservoir Inlet using the Magnolia Trunk Line. The CTLS allows for continous supply to Stone Canyon during a planned or an emergency pipe outage.	34,793,200	686,422	4,071,873	15	Los Angeles	IV	2009
3720	1910067	1910067-027	LOS ANGELES-CITY, DEPT. OF WATER & POW	MWD LA-30 Connection (Venice)	Construction of approximately 1,400 feet of 48-inch-diameter welded steel pipe and appurtenances, using both open trench and pipe jacking construction methods, in Sepulveda Blvd between Venice Blvd and approximately 420 feet south of Venice Blvd, in Venice Blvd between Sepulveda Blvd and approximately 190 feet east of Bentley Ave, and in Bentley Ave immediately north and south of Venice Blvd. The project will include construction of a regulator station and modifications to an existing valve for pressure regulating capabilities; both will include pressure relief systems.	O	15	C	Installation of a connection to the Metropolitan Water District's Sepulveda Feeder to supply water to western portions of the City of Los Angeles during an emergency or planned outage.	10,000,000	686,422	4,071,873	15	Los Angeles	IV	2009
3721	1910067	1910067-026	LOS ANGELES-CITY, DEPT. OF WATER & POW	Tujunga Well Field Treatment Project	In May 2008, Mayor Antonio R. Villaraigosa released a report titled "Securing L.A.'s Water Supply." This plan described a multi-faceted approach for creating sustainable water sources in the City of Los Angeles. Among the long-term strategies identified in the report was accelerated clean-up of contaminated groundwater basins. The Tujunga Well Field Treatment Project (Project) was specifically identified as a component of that strategy. As previously mentioned, contaminant plumes have drastically curtailed production capacity at the Tujunga Well Field. Of the system's twelve wells, only two to three are currently operational. Though some wells contain a mixture of difficult-to-remove contaminants, two wells that are currently out of service lend themselves to treatment by granular activated carbon (GAC) adsorption. Furthermore, the treatment of these wells may have a positive influence on water quality and allow additional wells to be brought on-line. The Project will use GAC adsorption in order to bring the aforementioned two wells on-line. It consists of the installation of sand separators and approximately twenty GAC vessels which measure twelve feet in diameter and 16 feet in height. The Project, the first phase of an overall initiative to bring the Tujunga Well Field back into service, will produce between twenty-four and thirty-six thousand acre-feet (AF) of water annually, with deliveries scheduled to	O	15	C	The San Fernando Valley Groundwater Basin (Basin) is the City of Los Angeles' primary local water source. However, groundwater contamination in the Basin has reduced the Los Angeles Department of Water and Power's (LADWP) ability to fully utilize this resource. Over forty-seven percent of the LADWP's production wells in the Basin are now out of service due to poor water quality. The primary contaminants in the Basin include the industrial solvents trichloroethylene (TCE) and perchloroethylene (PCE), as well as other contaminants from historical agricultural or industrial practices such as nitrate and perchlorate. The Project site, the Tujunga Well Field, is located in the Basin near the intersection of Interstate I-5 and State Highway 170. The system includes 12 permitted production wells and associated facilities to provide up to 100 cubic feet per second of flow (approximately 73,000 acre-feet per year) for distribution within Los Angeles. Contaminant plumes have curtailed production in the Tujunga Well Field to two to three wells. Contamination prompted the issuance of a public notice for Exceedance of a Chemical MCL, specifically noncompliance with the Volatile Organic Compound Primary Drinking Water Standard.	6,500,000	686,422	4,071,873	15	Los Angeles	IV	2009

3722	1910067	1910067-020	LOS ANGELES-CITY, DEPT. OF WATER & POW	Formosa Avenue Trunk Line	The Formosa Avenue Trunk Line will provide supply and system reliability, and redundancy necessary for operations.The project will install approximately 10,600 feet of 36-inch diameter trunk line. The proposed trunk line will provide supply to the Sunset Boulevard Trunk Line between Cahuenga Boulevard and Cynthia Street when rehabilitated or replaced. Additionally, the proposed trunk line will improve the water system by providing an additional distribution loop.	O	15	C	Drinking water standards require adequate supply and redundancy to maintain pressurized flow in peak and emergency conditions. An existing transmission line, built in 1916, is scheduled for reconstruction. In advance of this reconstruction, the proposed project will add the necessary alternate supply to provide both short term and long term peak, emergency supply during construction at the transmission line, and as a permanent redundancy.	20,397,200	686,422	4,071,873	15	Los Angeles	IV	2009

3734	4010022	4010022-007	LOPEZ PROJECT	Lopez WTP - Filtered Water Standpipe	The Filtered Water Standpipe Project involves the installation of a hydraulic control weir with a free water discharge condition at the existing LWTP clearwater reservoir. The weir will consist of a 48-inch diameter welded steel standpipe supported by a concrete slab on grade. The standpipe will have an approximate 20-foot vertical height and will serve to raise the hydraulic grade line, under all plant flow conditions, to above the physical elevation of the back-pressure sustaining valve. The raise in hydraulic grade line will create enough pressure in the system to eliminate the gravity flow and, thus, eliminate the excessive air entrainment conditions, the risk of contamination at the clearwater reservoir, and a stable steady flow, allowing the pressure sustaining valve to perform better and will reduce air entrainment at the membrane filtration filtrate piping.	O	10	C	The Lopez Water Treatment Plant (LWTP) is a six MGD treatment plant that treats surface water from Lopez Reservoir and then wholesales the water (in accordance with 'take or pay' contracts between the Lopez Project and it's contractors) to the City of Arroyo Grande, City of Grover Beach, City of Pismo Beach, community of Oceano, community of Avila Beach, and County Service Area 12. The LWTP treatment process was recently upgraded to pre-oxidation with potassium permanganate, coagulation, flocculation, and dissolved air floatation (DAF), chlorine dioxide disinfection, low-pressure membrane filtration, followed by additional free chlorine disinfection. The upgraded treatment process has been in operations since 2007.Since the new treatment process has been in operation, the plant has experienced excessive vacuum and air entrainment conditions at the clearwell reservoir and at the pressure sustaining valve just upstream of release into the Lopez distribution system. When the LWTP is operating at low flows, the pressure drops at the outlet into the clearwell reservoir, creating gravity flow and suction into the pipeline instead of pressure flow. this configuration results in unstable flow and mixing, as well as creating a risk for contaminants in the air to enter into the treated water prior to its distribution to the public.	200,000	31	0	06	San Luis Obispo	IV	2009

3735	4010022	4010022-006	LOPEZ PROJECT	Lopez WTP - Sludge Drying Beds Rehabilitation	The Sludge Drying Beds Rehabilitation Project involves demolition and reconstruction of the existing 40-year old LWTP sludge drying beds. Reconstruction will include installation of new drying bed underdrains, valves, decant structures, HDPE liners, filtration media, access ramps, and possible divider walls. The HDPE liner will prevent water leakage between beds and divider walls will provide quick drying and flexibility during peak operations. This rehabilitation project will closely follow the construction of two new sludge drying beds at the LWTP. The new drying beds, coupled with the rehabilitated existing drying beds will provide the functionality, capacity and flexibility needed to handle the LWTP's new treatment process solids residuals.	O	10	C	The Lopez Water Treatment Plant (LWTP) is a six MGD treatment plant that treats surface water from Lopez Reservoir and then wholesales the water (in accordance with 'take or pay' contracts between the Lopez Project and it's contractors) to the City of Arroyo Grande, City of Grover Beach, City of Pismo Beach, community of Oceano, community of Avila Beach, and County Service Area 12. The LWTP treatment process was recently upgraded to pre-oxidation with potassium permanganate, coagulation, flocculation, and dissolved air floatation (DAF), chlorine dioxide disinfection, low-pressure membrane filtration, followed by additional free chlorine disinfection. The upgraded treatment process has been in operations since 2007.Treatment solids residuals from the DAF process and neutralized cleaning solutions from the membrane filtration process are currently sent to two 40-year old sludge drying beds at the LWTP site. Water percolates through the sand media, is collected by underdrains, and is discharged into a water course below the Lopez Terminal Reservoir spillway. Solids concentrate accumulate at the bottom of the drying beds, dry, and are periodically removed. Typically, the LWTP operates one bed in drying mode and one in operation mode.Over the past two years of operations with the new treatment process, the LWTP sludge drying beds have consistently been required to operate beyond their maximum capacity. Treatment	850,000	31	0 06	San Luis Obispo	IV	2009
3736	3610006	3610006-001	WATER FACILITIES AUTHORITY-JPA	Devil Canyon Azusa Pipeline Emergency Interconnection	The Project is a multi-agency benefit project for Water Facilities Authority (WFA), Three Valleys Municipal Water District (TVMWD), and Inland Empire Utilities Agency (IEUA). WFA, as the lead agency, serves treated imported water to approximately 430,000 residents in the Chino, Chino Hills, Montclair, Upland, and Ontario communities. In addition, the Project will provide water supplies to residents in TVMWD's service area consisting of Azusa, Glendora, Claremont, La Verne, San Dimas, Covina, West Covina, Pomona, Walnut, Diamond Bar, and Rowland Heights. The Project includes construction of water system improvements along Benson Avenue, 18th Street, and Miramar Avenue in the Cities of Upland and Claremont. The system includes two connections to the San Gabriel Valley Municipal Water District conveyance pipeline that conveys State imported water to Los Angeles County water agencies. Construction includes approximately 7,700 linear feet of 36" pipeline and appurtenances together with two booster station and two automated control valves. One connection will deliver raw water to the WFA's WTP and to TVMWD's WTP with use of existing facilities. The other connection will release imported raw water to the San Antonio Channel for conveyance to IEUA's Chino Basin groundwater recharge facilities. Lastly, the Project will provide facilities for conveyance of treated water from WFA's	O	10	C	The Project will provide an emergency interconnection from the San Gabriel Valley Municipal Water District, Devil Canyon-Azusa Pipeline to the Water Facilities Authority's 81 MGD Treatment Plan to provide imported water when the Metropolitan Water District's Rialto Feeder is out of service. The feeder has been taken out of service for maintenance for periods as long as one week. During peak summer demands, such interruption may be catastrophic. The Project also includes a pipeline that will deliver treated water to Three Valleys Municipal Water District providing for multi-agency benefits.	7,400,000	8	0 13	San Bernardino	V	2009
3737	1510040	1510040-004	Kern County Water Agency		Upgrade existing surface water treatment plant from 45 MGD to 90 MGD to supply water to member water agencies.	O	10	C	Growth in Bakersfield area has led to overall degradation of groundwater, including oilfield, pesticide and nitrate contamination buildup, often requiring wellhead treatment or well abandonment.	34,000,000	3	0 12	Kern	III	2003

3738	4010022	4010022-005	LOPEZ PROJECT	Lopez WTP - 18 Inch Distribution Line Pigging	The 18-inch Lopez Distribution Line Pigging Project consists of the cleaning of an existing 5.5-mile stretch of 18-inch diameter steel distribution pipeline to remove aluminosilicate deposits from the inner wall of the pipeline. Cleaning will be performed via pigging with foam pigs, modeling the distribution system's previous successful pigging project. Insertion and retrieval fittings have already been installed and all inline butterfly valves within the stretch have been replaced with gate valves to accommodate the pigging operation. The pigging will also require an extensive water treatment operation to treat turbid water before discharging it into the ocean. Cleaning this stretch of pipeline will result in increased flow capacity and efficient delivery for the distribution system.	O	10	C	The Lopez Water Treatment Plant (LWTP) is a six MGD treatment plant that treats surface water from Lopez Reservoir and then wholesales the water (in accordance with 'take or pay' contracts between the Lopez Project and it's contractors) to the City of Arroyo Grande, City of Grover Beach, City of Pismo Beach, community of Oceano, community of Avila Beach, and County Service Area 12. Its pipeline distribution system is approximately 40 years old and has experienced capacity problems in recent years. Flow testing performed in 1983 revealed a maximum flow rate of 7,253 gpm. Flow testing performed in 1998 revealed that the maximum flow rate had decreased to 5,492 gpm. Visual pipeline inspections have revealed that the major cause of this capacity reduction is due to aluminosilicate deposits on the inner walls of the pipes, with deposits reaching 0.375 inches thick in some areas. Testing performed on the deposits pointed to pigging as the most effective way clean the distribution pipeline. The District determined that the distribution system would best increase its capacity by pigging two main stretches of distribution pipeline, one of which was successfully pigged in 2003.The remaining stretch of distribution pipeline, a 5.5-mile stretch of 18-inch diameter steel pipeline, still requires cleaning. Until it is cleaned, a large portion of the distribution system will experience flow capacity problems and inefficient	325,000	31	0 06	San Luis Obispo	IV	2009
3739	5610046	5610046-002	UNITED WTR CONS DIST		Develop groundwater guardian program to promote well head protection by involving all affected parties including agriculture, urban interests and the public. 3740	4010022	4010022-009	LOPEZ PROJECT	Lopez WTP - Carbon Dioxide pH Suppression System	The Carbon Dioxide pH Suppression System Project involves the new installation of an approximately 100,000 gallon carbon dioxide storage tank and an automated feed system at the LWTP. The feed system will consist of feed panels, piping, pH monitoring equipment, vaporizers, diffusers and a PLC for integration with the existing LWTP SCADA system for monitoring and control. The system will add carbon dioxide to the water prior to treatment, resulting in the production of carbonic acid (H2CO3). The carbonic acid will reduce the pH of the water and, thus, will significantly reduce the tendency for calcium carbonate to precipitate and form scale on the LWTP process components.	O	10	C	The Lopez Water Treatment Plant (LWTP) is a six MGD treatment plant that treats surface water from Lopez Reservoir for the City of Arroyo Grande, City of Grover Beach, City of Pismo Beach, community of Oceano, community of Avila Beach, and County Service Area 12. The LWTP treatment process was recently upgraded to pre-oxidation with potassium permanganate, coagulation, flocculation, and dissolved air floatation (DAF), chlorine dioxide disinfection, low-pressure membrane filtration, followed by additional free chlorine disinfection. The upgraded treatment process has been in operations since 2007.Since the new treatment process has been in operation, LWTP's process components – piping, valves, feed strainers, water quality monitoring equipment and membrane filter elements – have experienced a significant calcium carbonate (CaCO3) scale build up. This scale build is a result of the combination of the naturally high pH, hardness and alkalinity of the surface water from Lopez Reservoir and the new treatment process. The scale build-up has caused plant shutdowns, frequent process component maintenance and inefficient operations.	1,095,000	31	0 06	San Luis Obispo	IV	2009

3741	3600175	3600175-002	Barstow Dagget Airport	Barstow/Daggett Reservoir and Booster Station	Demolish existing booster station and reservoir. Construct replacement reservoir to meet current American Water Works Association standards. Construct booster station to meet current building code. Booster station will include high efficiency motors to reduce energy consumption.	O	10	C	The booster station plumbing fixtures are failing due to corrosion and age. Its pumps are inefficiency and unreliable. The design of the station poses a health and safety risk to all that work on it due to electrical and mechanical design deficiencies. The existing reservoirs' concrete shell is failing due to structural fatigue creating numerous leaks. The risk of total structural failure in a modest seismic event is highly probable.	750,000	29	25	13	San Bernardino	V	2009

3743	3400130	3400130-002	GREGG WATER CO		Construct a new 250,000 gallon storage tank for emergency water supply. Involves design and construction.	O	10	C	Wells and small private systems that are unreliable with poor water quality and cannot provide adequate emergency supply.	250,000	19	40	09	Sacramento	I	1998
3744	5800821	5800821-001	NICHOLS POINT MOBILE HOME PK	Well Replacement, Main Replacement and Service Replacement	The project is comprised of the following divisions: Drill larger well and install larger pump. Consolidate with existing well and pumb system. (Existing is believed to be a six inch at approximately 220 feet deep. Provide and install minimum four inch main. Provide and install 5000 gallon water tank, with connections for fire departments. (or size according to fire Department requirements) Remove and abandon and remediate existing septic Tanks and leach fields. Provide and install new sewer system and connection to Wheatland sewer system and plant. Connect tennants to new sewer system.	O	10	C	The Health Department in Yuba County sent me the information for use of our water Company. The system is old and needs replacement. The City of Wheatland, Ca, could use extra water and this would be available for them to acquire or consolidate with. The well is small and needs to be replaced with a larger one. The mains are old, even tho the water is still of good quality. The mains need to be upgraded. The service lines also need replacement. There are five septic tanks and systems on the property. In order to insure the future purity of the water system, these need to be removed and the community needs to be connected to the Public Sewer System of the City of Wheatland. The City of Wheatland has some very high connection fees that need to be paid before they will allow us to hook up to the City Public Sewer System.	825,000	26	40	21	Yuba	I	2009

3763	3610017	3610017-005	HAVASU WC	Meeting fire flow & CT compliance	Havasu Water Company has completed the majority of an engineered response to bring the company into compliance. The compliance requires an additional 100,000 gallon tank, a 75 HP fire pump and a short 12' pipe to connect the system. This preliminary design was presented by Metropointe Engineers to the San Bernardino County Fire Marshall approximately 2 years ago. Due to the estimated cost of $175,000, HWC could not qualify for financing.Fire flow pump (est. 2009 price) incl sales tax----------$51,000Delivery, installation, testing---------- 7,750Enlarge water main extension---------- 25,000100,000 gallon bolted galvanized tank---------- 85,000Gravel guard, pad preparation---------- 7,500and connection to fire flow pump.Funds Requested---------- $176,250	O	10	C	Havasu Water Company is not in compliance with the County of San Bernardino minimum fire flow requirements of 1,750 gpm. HWC was grandfathered in over 30 years ago and has one 100,000 gallon fire supply tank available. A letter from the San Bernardino County Fire Marshall is available. Since Havasu Water Company had to abandon its old 50,000 gallon tank, there is not any way to annually clean the remaining 100,000 gallon tank without putting its water customers out of service for several days.Havasu Water is also hard pressed in the winter months to meet the required CT because of inefficient storage.	176,250	211	350 13	San Bernardino	V	2009
3764	3610017	3610017-003	HAVASU WC	Meeting County Water Fire Flow Compliance	Havasu Water Co. has completed the majority of an engineered response to bring the company into compliance. The compliance requires an additional 100,000 gallon tank, a 75 HP fire pump and a short 12" pipe to connect the system. This preliminary design was presented by Metropointe Engineers to the SB County Fire Marshalll approximately 2 years ago. Due to the estimated cost of $175,000, HWC could not qualify for financing. Fire Flow Pump (est. 2009 price) incl sales tax ----------$51,000Delivery, installation, testing ----------7,750Enlarge water main extension----------25,000100,000 gallon bolted galvanized tank---------- 85,000Gravel guard, pad preparation----------7,500and connection to fire flow pumpFunds Requested----------$176,250	O	10	C	1. Havasu Water company is not in compliance with the County of San Bernardino minimum fire flow requirements of 1,750 gpm. HWC was grandfathered in over 30 years ago and has one 100,000 gallon fire supply tank available. A letter from the San Bernardino County Fire Marshall is available. Also lack of adequate fire supply mandates that all new home connections install a 1" meter versus a 5/8" meter. This increases the individual's monthly water bill by $78.86 a month.2. Since Havasu Water Company had to abandon its old 50,000 gallon tank, there is not any way to annually clean the remaining 100,00 gallon tank without putting its water customers out of service for several days.	176,250	211	350 13	San Bernardino	V	2009
3765	5700712	5700712-001	DUNNIGAN WATER WORKS	Dunnigan Safe Drinking Water and Fire Protection water supply	Extending drinking water service and fire protection water, to the two (2) neighborhoods of Dunnigan that are currently consuming unsafe drinking water and without adequate fire protection water, will require:(1) 42,500' of 8" main(2) 34,450' of 10" main(3) 1"meters x 300(4) fire hydrants x 40(5) 500,000g storage tank (6) pumping station (7) a new Well +or- 650' (8) proper abandonment of 300 shallow wells.	O	10	C	This area is an older section of the Dunnigan community with shallow wells and septic tank systems at each of the +or- 300 homes. The nitrate levels in the upper water tables (30'-50') exceed mcl limits. These residential wells of 75'-175' have very high nitrate levels, many exceeding mcl limits. None of the wells have disinfection.The nearest Fire Protection water for many of the homes in these two (2) Dunnigan neighborhoods is up to 1/4 mile away at various irrigation district outlets.	8,757,100	68	400 09	Yolo	I	2009

3766	5010026	5010026-009	City of Modesto, DE Hickman	Water Main and Service Replacement - Hickman	The Hickman Water System will require the replacement and upsizing of water mains and service. Water mains and services will be moved out of the easement areas and installed in the street for easy access. Fire hydrants will also be installed. Adequate water flows will result due to appropriate sized water mains. This will improve water quality and bring sufficient water pressures and volumes for fires and household use. With new piping, water conservation will improve by eliminating water leaks. A total of 8,500 feet of water mains will be upgraded. There are 115 meter services that will be replaced during the infrastructure improvements. All meter services will comply with State mandates.	O	10	C	The Hickman Water System infrastructure is aging and in desperate need of major upgrades. The Hickman system is a stand alone system with only two wells. Staff spend many hours fixing leaks, maintaining system, and spending money on street repairs and property damage to customers due to leaks. The water system has insufficient water quantity due to limited water delivery restricting new growth, including residential, industry and school expansions. With the low pressure issues, outdated water mains and services, the Hickman area has limited fire protection; especially during peak hours.There are over 8,500 feet of water main that needs to be upgraded to meet the needs of this community and provide adequate volumes of water for building, industry, schools and fire protection. Well pumping is restricted due to wellhead treatment for DBCP. Also one of two wells cannot be overdrawn due to manganese contamination.	675,000	192	565	10	Stanislaus	III	2009
3767	1510052	1510052-001	NORTH EDWARDS WD		REPLACE OF EXISTING METERS, AND UPGRADE WELLS 1 AND 2 FACILITIES AND FOUNDATION.	O	10	C	DISTRIBUTION SYSTEM IMPROVEMENTS	75,000	222	597	19	Kern	III	1998
3768	3600220	3600220-002	CSA 42 Oro Grande		Enhance ability to operate and montior unattended sites throughout water distribution system.	O	10	C	Unreliable telemetry system	25,000	140	700	13	San Bernardino	V	2000
3769	3600220	3600220-006	CSA 42 Oro Grande	County Service Area 42 Water Mainline Replacement	Install 1,400 linear feet of 8" PVC water mainline and reconnect 40 residential service connections.	O	10	C	This is a water main line replacement project. Two streets in County Service Area 42 (CSA42) need the old 6" steel water lines replaced with new 8" PVC water lines. The purpose of replacement is to reduce water quality problems, replace failing main lines and increase fire flow for the community.	71,000	140	700	13	San Bernardino	V	2009
3770	5010033	5010033-002	City of Modesto, DE Grayson	Water Main and Service Replacement - Grayson	The Grayson water system will require the replacement and upsizing of water mains and service. Water mains and services will be installed in the street for easy access. Fire hydrants will also be installed. Adequate water flows will result due to appopriate sized water mains. This will improve water quality and bring sufficient water pressure for fires and household use. With new piping, water conservation will improve by limiting water leaks.Over 9,000 feet of 8" water main will be replaced. There are 176 meter services that will be replaced during the infrastructure improvements. All meter services will comply with State mandates.	O	10	C	The Grayson Water System infrastructure is aging and in need of major upgrades. Grayson is an isolated small community that depends on two wells for the entire water supply. Staff spend many hours fixing leaks, maintaining the system, and spending money on property damage to customers due to leaks. The water system has insufficient water quantity due to limited water delivery restricting new growth, including residential, industry and school expansions. With the low pressure issues, outdated water mains and services, the Grayson area has limited fire protection; especially during peak hours. This is very expensive water to produce because of wellhead treatment for nitrates. Leaks can drain the storage tank limiting fire fighting ability. There is over 9,000 feet of water main that needs to be upgraded to meet the needs of this outlying community.	775,000	275	1,100	10	Stanislaus	III	2009
3771	5000433	5000433-001	OID-OAKDALE RURAL WATER SYSTEM #1		INSTALL ELECTRICAL GENERATOR. INSTALL PRESSURE TANK. OTHER = DESIGN AND CONSTRUCTION. 3772	1010020	1010020-004	Laton Community Services District	Electronic Water Meter Reading Project	The project includes installing 500 5/8-inch x 3/4-inch water meters with data transmitting capabilities and a laptop to recieve water consumption data for billing and water system management purposes. Further, it is estimated that 250 meter boxes, lids and meter stops will be removed and replaced with new meter boxes, lids and water stops. The installation of these meter reading and transmitting devices will significantly reduce the amount of District staff time devoted to meter reading and will free up staff time for other needed operation and maintence activities.	O	10	C	As the District's production production and distribution system ages, there is more demand on the District's personnel to perform operation and maintenance activities. The periodic reading of the meters reduces the amount of time District staff has to devote to operation and maintenance duties.	400,000	454	1,236	23	Fresno	III	2009
3773	3610007	3610007-003	BASELINE GARDENS MWC		Recoat tank	O	10	C	Interior coating failure on storage tank	100,000	424	1,300	13	San Bernardino	V	1998
3774	1210020	1210020-004	Fieldbrook Glendale C.S.D.	Rock Pit Rd and Old Railroad grade water line extension	The project will include an 8 inch main line extension up both Rock Pit and Rail Road Grade. These pipelines will be looped together and will include appropriate appurtenances, including fire hydrants, valves and service connections with water meters. Twenty existing residential dwellings will be served.	O	10	C	This area of the community is on private wells or take water directly from creeks or intermittent surface waters. These sources of supply generally don't meet drinking water standards. Groundwater supply's are extremely limited, with the wells generally running dry in late summer and early fall. In addition, these waters are typically high in iron and manganese. Surface waters are subject to contamination and the potential for contamination is increased because the use on site sewage disposal systems (septic tanks and leach fields). In addition, these surface waters typically dry up in the summer and remain that way until winter rains arrive. The area served by this project also currently does not have fire protection and this main line extension will correct this deficiency.	1,400,000	531	1,670	01	Humboldt	I	2009
3775	3610060	3610060-001	SBDNO COUNTY SERVICE AREA W-1		Design and purchase a small package surface water treatment plant to utilize Morongo pipeline water allotment	O	10	C	Mojave Water Agency Morongo Basin pipleine aqueduct water available but untreated surface water	100,000	506	1,670	13	San Bernardino	V	2000
3776	5610021	5610021-002	WARRING WATER SERVICE INC		Repair and upgrade the reservoir.	O	10	C	No additional storage for emergency situations.	100,000	483	1,700	06	Ventura	IV	1998
3777	4010023	4010023-003	Golden State Water Company - Edna	Edna - Drill and Equip New Well	A new well needs to be drilled and equipped to ensure a secure and consistent source of supply for our customers. Further, if a source with low selenium can be found, then the ion exchange treatment could be terminated and the issue dealt with by blending, further saving money for our customers.	O	10	C	Groundwater levels in the area of our current two wells in this area of fragmented aquifers have dropped considerably in recent years due to competition with large agricultural users. Another of our wells was taken out of service due to surface water influence and contamination. This results in a precarious situation where there is absolutely no margin for error in the source of supply for this small system. Also, the current wells have developed erratic levels of selenium that frequently exceed the MCL, necessitating the use of expensive ion exchange equipment to treat the water.	2,500,000	599	1,940	06	San Luis Obispo	IV	2009
3778	4010023	4010023-004	Golden State Water Company - Edna	Edna - Main from Treatment Plant to Edna Reservoir	This project would install 2,800 feet of 12 inch main and sufficient yard piping to connect the treatment plant directly to the reservoir, thereby substantially reducing the amount of head the wells have to pump against. It would also install additional booster capacity at the reservoir to facilitate higher pressures in the upper reaches of the system and improve fire flow.	O	10	C	Current system configuration has wells pumping to a treatment plant consisting of iron and manganese filters followed by ion exchange for selenium. Then the water goes directly into the distribution system, and the reservoir fills from the system. This means the wells are pumping against a significant amount of head, leading to lowered pumping rates, excessive wear on pumps and treatment equipment, and increased maintenance costs for our customers.	2,000,000	599	1,940	06	San Luis Obispo	IV	2009

3779	5710007	5710007-004	Esparto C.S.D.	Updating of Water System Grid to Provide Constant Equal Pressures .	The project is for the installation of approximatly 4,140 feet of 12 inch water main to complete the piping required to complete the USDA Project, it also includes all fittings, valves and fire hydrant replacements. It includes the installation of 800 feet of 1 inch HDPE service piping and approximatly 80 feet of 1 1/2 inch HDPE service piping, also 84 service saddles and meters. This also includes the costs for the backfill and road reconstruction required after the Project.	O	10	C	With Daly use trough out the Day we experiance complaint and have found them to be as much as a 10 psi differance in pressures in differant sections of town. We are conserned that if there is a fire in one area of town there may be a critical Pressure loss in another section of town. We are in a situation of just completing a Project Funded by a Ferderal USDA Loan but had to cut part of the project because of a Lack of funds. We are hoping to get some grant funding to finish the remainer of the Project because having to go back to our customers a year after we raised the rates approximatly 54%. This system needs major upgrading as the maintenance and upgrading through the years has been minimal at best.	497,080	688	2,000	09	Yolo	I	2009

3783	4910028	4910028-007	Sweetwater Springs CWD - Monte Rio	Monte Rio 2009 Schoolhouse Improvements	This project constructs a storage tank at the schoolhouse site with a capacity of approximately 65,000 gallons at the top of Bonita Terrace, installs a booster station, and connects with replacement reservoir at Upper Schoolhouse site. This project fits well with CIP-PHASE IV-A, PROJECT 2 distribution system improvements in the Monte Rio Terraces that will start construction in May 2009 and is funded separately.	O	10	C	This project is constructing a storage tank to fit in with current project replacing and improving distribution system in Monte Rio Terraces. It will improve system pressure, provide adequate water flow at all times, and provide adequate fire flows. There are no violations at this time, but the system does suffer from inadequate flow and pressure.	638,000	1,061	3,000	18	Sonoma	II	2009
3784	4010901	4010901-001	SLOCSA #10A - Cayucos	CSA 10A (Cayucos) - New Storage Tank	The New Storage Tank project involves the construction of a new 400,000 gallon storage tank at a location just south of the community of Cayucos. The new tank will be an above ground welded steel tank connected to the existing distribution system. The project will require property acquisition and the upsizing of various reaches of the pipeline distribution system. A project to upsize these lines will be performed prior to or at the same time as installation of the new storage tank. The additional storage supplied by this tank will upgrade the CSA 10A distribution system so that it meets current demands and fire flow regulations, providing a safer community for the residents of Cayucos.	O	10	C	County Service Area 10A (CSA 10A) currently consists of a water treatment plant, a 210,000 gallon water storage tank and a pipeline distribution system that serves a portion of the community of Cayucos. The existing storage tank and pipeline distribution does not have adequate storage capacity to meet both the current demand and existing fire flow regulations. According to required storage calculations completed for the CSA 10A Water System Master Plan (2003) and the CSA 10A Storage Needs Calculation Addendum (April 2007), current storage is currently deficient by 281,000 gallons. In order to meet current and future storage requirements, CSA 10A needs to add 396,000 gallons of storage. Since Cayucos is susceptible to fire, earthquakes and landslides, this project is a high priority for public safety.	698,000		3,150	06	San Luis Obispo	IV	2009

3785	4010901	4010901-002	SLOCSA #10A - Cayucos	CSA 10A (Cayucos) - Waterline Upgrades	The Waterline Upgrades Project involves the upsizing of existing water distribution pipelines in CSA 10A to meet existing demands and existing fire flow regulations. The Project will include upsizing 2,631 feet of existing pipe along Shearer Avenue from 4-inch to 10-inch PVC pipe. The project will also include upsizing 392 feet of existing pipe along Chaney Avenue from 6-inch to 8-inch PVC pipe. Pipeline reaches chosen for upsizing were determined based on fire flow simulation modeling and the future addition of a new 400,000 gallon storage tank, which will be constructed either at the same time as this project or shortly thereafter. The upsizing of these waterlines, coupled with the installation of a new storage tank, will upgrade the CSA 10A distribution system so that it meets current demands and fire flow regulations, providing a safer community for the residents of Cayucos.	O	10	C	County Service Area 10A (CSA 10A) currently consists of a water treatment plant, a 210,000 gallon water storage tank and a pipeline distribution system that serves a portion of the community of Cayucos. The existing storage tank and pipeline distribution does not have adequate storage capacity to meet both the current demand and existing fire flow regulations. Several reaches of the pipeline distribution system have reached their design life and are undersized to accommodate the existing conditions. Fire flow demand simulations have shown that these undersized pipelines create large head losses, minimizing flows to many reaches of the distribution system, especially those at higher elevations. Since Cayucos is susceptible to fire, earthquakes and landslides, this project is a high priority for public safety.	635,000		3,150	06	San Luis Obispo	IV	2009
3786	5510008	5510008-012	LAKE DON PEDRO C S D	Infrastructure Meter Replacement	Contract out the installation of 1500 meters to increase the reporting accuracy of our water sales. We have already received two bids on the project. With the required funding in place, this project can be started immediately.	O	10	C	The infrastructure in our community is over forty years old. A random number of meters were tested several years ago to reveal that their accuracy is very poor. Many meters have failed altogether and most are underreporting. The new meters were purchased and are onsite, but funding has been unavailable for their installation. We are also facing our fourth year of constrained revenues due to the economic downturn in our isolated, rural community which has resulted in three years of unbalanced budgets. The installation of these meters will help recover additional funds that are truly due to the district and enable us to proceed with some of the projects that are required to ensure our water supply and water quality.	75,000	1,442	3,600	11	Tuolumne	III	2009
3787	5510008	5510008-001	LAKE DON PEDRO C S D		INSTALL TWO NEW FILTER VESSELS WITH SURFACE WASH FACILITIES.	O	10	C	INADEQUATE CLEANING OF FILTER MEDIA DURING BACKWASHING, INTERIOR STRUCTURAL DAMAGE TO THE FILTERS COULD CAUSE VESSEL FAILURE.	180,000	1,442	3,600	11	Tuolumne	III	1998
3788	1910117	1910117-004	MONTEBELLO-CITY, WATER DEPT.	Northern System – Transmission Main Rehabilitation	Project :There are two options for this project. The Option I consists of locating the leak, repair of the transmission pipeline and relining of the transmission main including laying of a temporary pipeline along the present alignment surface. The Option II is installation of a replacement transmission water main in a public right of way where the new water main would be accessible for future maintenance. Option I of the project would be the investigation of the existing pipeline alignment to determine if the repair and relining option is feasible. If so then that option would be engineered including installation of a temporary bypass water line while repairs are made. Option II of the project would be implemented if Option I is not feasible. Option II would be to install approximately 11, 000 feet of new transmission water main in public street right of way. Should Option I not be viable, the City will apply for funding for Option II. Benefits:The repair and/or replacement of the transmission main would secure for the foreseeable future the supply of water from the MWD connection to the Hillside Reservoir at Iquana/ Liberty Avenue. Project Cost:The estimated overall cost of this project is as follows:OPTION IInvestigation location of leak $ 25,000Leak repair $ 10,000Lining of water main $400,000Temporary bypass water main $150,000Subtotal = $585,000Construction	O	10	C	Existing Condition:The City of Montebello Northern Water System with approximately 1,200 metered services, the majority of which are residential services has as its sole source of supply a connection with the Metropolitan Water District of Southern California (MWD). To transport the water supply to its principal storage reservoir and pumping station is a large diameter water main exists in an inaccessible right of way between an abandoned landfill (OII) and the Gas Company's Montebello underground gas storage facility. The water main has had a continuous leak for several years. Because of the inaccessible location of the pipeline the leak possess a risk factor for the City. No public notification is required.	772,200	1,627	3,944	22	Los Angeles	IV	2009

3789	2410012	2410012-005	HILMAR COUNTY WATER DISTRICT	Hilmar County Water District meter replacement project	Hilamr County Water DistrictWater Meter Replacement ProjectThe project would be to remove and replace about half of the existing water meters within the district. The new meters would be a radio read model and the district would install softwate to read those new meters along with the recently installed new meters to this format.	O	10	C	Hilmar County Water DistrictWater Meter Replacement ProjectPresently the district has close to 1600 meters in operation to cover their existing customers. the meters where installed in the early 1990's and the life of the meters is coming to an end. The District has seen a reduction in the billed flow compared to the flow from the wells. TheDistrict wouldlike to replace these aging meters and install new radio read meters to have a more efficent operation. The use of meters has been shown in the district to lead to water conservation and witht he meters getting older the measured flow is less than is delivered to the customer.	280,000	1,566	5,000	11	Merced	III	2009
3790	3610009	3610009-002	BIGHORN - DESERT VIEW WATER AGENCY	Meter Accuracy and Reliability	Install new meters on all property connections. Install new meters on all production and booster facility pumps. Install datalogging equipment at selected facilities. Project costs to include meters, miscellaneous parts and labor.	O	10	C	Old, inaccurate meters within the system result in lower per capita usage registration which reduces revenues and fails to adequately record per capita usage. Accurate registration insures the customers are correctly billed, and metrics for statewide conservation assessments can be established. Production well meters require upgrade and telemetry for accurate monitoring and recordation of groundwater production from the various groundwater subbasins tapped by wells owned by multiple agencies. Accuracy in production and consumption figures is vital for future water planning.	200,000	1,903	5,000	13	San Bernardino	V	2009
3791	1910108	1910108-003	BELL GARDENS-CITY, WATER DEPT.	Rehabilitation /Reactivation of Water Well No. 3F	Project :Rehabilitation /Reactivation of Water Well No. 3F would be videoed and cleaned as needed and test pumped. A new electric motor driven pumping unit would be installed along with a control system with pressure tank and a new chlorination system. The well site facilities would be made secure to protect it from being vulnerable to external intrusions of force. After installation and pump testing the well would be used to provide water to the City Water system. Benefits:Provide Bell Gardens water system with its groundwater rights and reduce the cost of importing MWD water.	O	10	C	Existing Condition:The City of Bell Gardens Water System Well No. 3F has been inactive since 1997-98. The Well did supply prior to that time a large portion of City water system supply needs. Water Well No. 1 now supplies about 80% of the water supply needs. The balance of the supply needs is obtained via a Metropolitan Water District of Southern California (MWD) connection, which supplies imported water. The City has 1,914 acre feet of groundwater pumping rights in the Central Basin of which it only uses 800 acre-feet. With MWD planning a rationing program in effect the City is looking to reactivate Well 3F to use the available groundwater rights and to reduce its use of MWD water. The City has also adopted the MWD Model Conservation Ordinance and is notifying all of the residents and other users of water in the City of the need to conserve water and to reduce the usage of the MWD water supply which comes from the Colorado River and the State Water Project (Department of Water Supply). No public notification is required.	488,800	1,589	5,247	15	Los Angeles	IV	2009

3792	1910108	1910108-004	BELL GARDENS-CITY, WATER DEPT.	Closure of Gaps in Water System To Improve Circulation/Quality	Project :This project is to install water mains to close the remaining gaps and eliminate the dead ends while improving water circulation. Install water mains to close gaps in the existing water system and thus eliminate dead ends and to improve circulation in the water system and thereby improving water quality and comply with health department disinfection requirements in the water system. Benefits:By eliminating the gaps in the Bell Gardens water system and the existing dead ends, the quality of delivered water will improve.	O	10	C	Existing Condition:The City of Bell Gardens Water System owns a public domestic water service system, which serves about 30% of the area of the City through 1,460 metered service connections. Customers range from single family residences, multiple residential through commercial and industrial services. Within the water system, as constructed prior to 1990, when the system was acquired by the City, there are a number of dead ends water lines, which restrict circulation of water and water quality. The City has within available funding, installed new water mains to close gaps to improve water circulation in the distribution system. Several water line gaps remain. Each gap in the water line means there are two dead ends in the water system. No public notification is required.	528,000	1,589	5,247	15	Los Angeles	IV	2009
3793	2810002	2810002-010	Calistoga, City of		Relocate pump station to area not impacted by floods.	O	10	C	Present booster pump station is in floodway, has been flooded a number of times.	100,000	1,491	5,302	03	Napa	II	1998
3794	0310003	0310003-004	AWA Sutter Creek		Extend life of canal through improvements or replace with 8 mile pipeline.	O	10	C	Amador Canal is vulnerable to contamination and periodic structural failures	6,000,000	1,654	5,458	10	Amador	III	1999
3795	1910018	1910018-004	Bellflower Municipal Water System	Water Reservoir & Booster Pump Station #2	As most of the BMWS is supplied from service connections to BSMWC, additional distribution storage would be most beneficial if implemented within the BSMWC system. Therefore, the operational and fire storage may be omitted from the BMWS Water System Improvement Program. The City of Bellflower originally determined that approximately 15 MG of additional above-ground storage capacity was required for reliable service to City water purveyors, 11.4 MG of which was specifically for 'emergency' storage. The City has since sold the water system to BSMWC. As the City no longer owns this backbone transmission system, the City's storage capacity for the (former) Peerless Water Company distribution system will require reassessment. The majority of the City's supply water will come from BSMWC which relies heavily on local groundwater sources (5000 AF of 6000 AF total 2007 production). Secondary power supply to BMWS wells and investment in similar upgrades for BSMWC wells will allow the City to take full advantage of groundwater.	O	10	C	BACKGROUND - In January 2007, the City acquired the assets of the Peerless Water Company for the sum of $5.8 million. On March 21, 2007, the California Department of Health Services (DHS) made their first site visit and inspection of the water system since 1999. Their engineering report identifies a number of problems, including:a. The water pressure in portions of the system must be limited due to the deteriorated condition of the piping (paragraph 2.4.1).b. Wells 2, 3 and 8 exceed the secondary MCL (Maximum Contaminant Level) for manganese (paragraph 2.6.1.2).c. Well 8 exceeds the secondary MCL for iron (paragraph 2.6.1.2).d. The System Operations Plan does not address sequestering treatment of manganese and iron (paragraph 2.5.2).e. Wells 2, 3 and 8 require the City to initiate proper testing of manganese and iron (paragraph 2.6.1.2).f. Unregulated Chemicals Monitoring Regulation (UCMR) monitoring is deficient. A round of monitoring for hexavalent chromium should have been completed by December 31, 2002. g. The Stage 2 Disinfection Byproducts Plan due to DHS was not submitted by the October 1, 2006 deadline. The plan must be implemented by October 1, 2007 (paragraph 2.6.2.3).h. Wells 4, 5, 6, 7, 9, 11, 12, 14, 15, and 16 (total of 10) are inactive and must be rehabilitated or destroyed in accordance with County Health Department regulations (paragraph 3). i. Wells	3,000,000	1,819	5,967	16	Los Angeles	IV	2009

3796	1910147	1910147-005	SATIVA-L.A. CWD F	Well Replacement and Treatment Plant Construction	The Sativa Los Angeles County Water District (SLACWD) purchased the property adjacent Well #4 at $71,900.00. The area of the property is 150 feet X 50 feet. Demolished dwelling cost $8,550.00 and the installation of 10 feet security fencing at the cost of $29,500.00 and abandonment of Well #4 ($61,000.00).SLACWD has secured a Budget Estimate from Layne Christensen Company for the construction of the new well at the cost of $589,000.00 to include piping installation to existing 10,0000 gallon hydro-pneumatic pressure tank, check valves,gate valves,etc., meter and treatment system, (chlorination system), in addition to Supervise Control and Data Acquisition (SCADA) system. The new pump house and upgraded electrical system is estimated to cost $91,000.00.Purchase of property, demolition of dwelling, security fencing and abandonment of Well #4 was funded by SLCWDRequesting funding for construction of new well, pump housing , system components, etc. needed is $689,000.00.	O	10	C	Our well distribution system is more than 68 years old and recently Well #4 had to be abandoned because of the violation of organic contaminants such as volatile organic compounds (VOC's) and inorganic contaminants such as arsenic, radioactive materials, iron and manganese. All of these chemicals exceeded the Maximum Contaminant Levels prescribed by United States Environmental Protection Agency and California Department of Public Health Services (CDPHS).In 2007, after expending thousands of dollars trying to bring Well #4 into compliance with CDPHS, we sought advice from the CDPHS and Water Replenishment District (WRD) of Southern California, Chief Hydro-Geologist, Mr. Ted Johnson. Since we were unable to meet the compliance of CDPHS (The above mentioned contaminants). Mr. Ted Johnson suggested that we abandoned Well #4. Hence a new well is being constructed adjacent to Well #4 in order to meet the customers demands.	695,000	1,488	6,813	22	Los Angeles	IV	2009
3797	5710005	5710005-003	City of Winters		Replace existing distribution and transmission lines with new mains. Replace all pipes with leaded joints and replace service lines where mains are replaced.	O	10	C	Aging steel pipes; delivery and pressure problems occur.	1,500,000	1,900	6,875	09	Yolo	I	1998

3799	4010017	4010017-003	Golden State Water Company - Los Osos	Los Osos - Rosina Blending Project	In this project, raw water from lower and upper aquifer wells needs to be brought together at one site so that the water can be blended to reduce nitrate. Sufficient yard piping needs to be installed to connect this blending station to the distribution system, and additional piping needs to be installed so that an IX exchange system can be brought in at a future date and treat even more of the high nitrate water for use. This will require about 1,300 feet of raw water main and sufficient yard piping to accomplish this goal.	O	10	C	Salt water intrusion in the lower portion of this stratified aquifer is necessitating a shift to pumping from the upper portion of the aquifer. However, the upper portion is badly contaminated with nitrates from the ubiquitous septic systems in the area. Therefore, blending or other treatment of the high nitrate water must be conducted before it can be used.	1,500,000	2,687	8,682	06	San Luis Obispo	IV	2009

3800	1510018	1510018-012	ROSAMOND CSD	SemiTropic-Rosamond Water Bank Authority - Phases 1B & 1C	The Semitropic-Rosamond Water Bank (SRWB) will create 800,000 acre-feet of storage in two groundwater bank facilities located in Wasco and Rosamond, CA. This makes it the 13th largest storage project in California. The primary purposes of the Project are to improve water quality, to enhance water supply reliability and flexibility in a cost-effective and environmentally sound manner, to help reduce the rate of aquifer overdraft, to allow continuation of agricultural uses on Project lands, and encourage conjunctive use, where appropriate. The Project will supply the needs of RCSD, of the Antelope Valley and of other regions in Southern California through facilities that are of sufficient size and scope to be both cost effective and environmentally sound.In essence, the Projects act as both an underground storage reservoir and natural water treatment plant. Surplus State Water Project and Central Valley Project supplies will be stored in wet years for later recovery and use in dry years. Water recovered from the Rosamond Water Bank meets drinking water quality requirements and water recovered from the Semitropic Water Bank meets drinking water standards, with the exception of Arsenic. An arsenic treatment plant will be developed at Semitropic to reduce Arsenic to acceptable levels. As surface water is cycled through the groundwater bank facilities, the quality of the water is dramatically improved for the end user, reducing	O	10	C	RCSD, like most water agencies in California, is striving to maintain both the quality and reliability of the water supply used to serve its customers. Rosamond receives its water supplies through a system of wells in its service area, which RCSD operates, and from imported State Water Project supplies as a customer of the Antelope Valley-East Kern Water Agency (AVEK).RCSD is in the process of acquiring additional water systems, including a local high school. These systems have high arsenic levels which exceed the MCL of 10 ppb. RCSD also has two groundwater wells that exceed or are in close violation of the acceptable arsenic level. Also in two of these systems the uranium exceeds 30 µg/L. As is the case in much of California, the reliability of RCSD's imported supplies has fluctuated drastically in recent years. In 2009, RCSD expects to receive less than 15% of its requested amount of imported supplies from AVEK. Previously, in 2005 and 2006, significant amounts of surplus State Water Project water were available that could have been stored for the current drought and it is expected that, while we are currently in a drought, additional wet years will occur in the future. RCSD requires 30,000 AF of storage capacity to store wet year water for use when it is needed. Surface water reservoirs are not a viable option in this part of the Mojave Desert, therefore, the water needs to be stored under ground in a "groundwater bank".Water quality	20,000,000	4,593	10,633	19	Kern	III	2009

The well will be connected to our SCADA system and have disinfection on site. There will be a covered wellhead and a small disinfection bilding inclosed by a chainlink fenced and paved area.	O	10	C	This well #14 would replace a well that has high Manganese in its discharge. The impacted well #9 is at present out of service. Without a well with equal capacity this zone will have insufficient production capability to meet system demands. A test well has been completed and is caped and ready to complete. Capping an abandoned well would be included in this project.	725,000	4,951	16,146	05	Monterey	II	2009

3804	1010004	1010004-003	Coalinga-City	Palmer Reservoir	Construction of an above-ground 3 million gallon (MG) steel potable water storage tank and the repair of an existing 2.8 MG steel potable water storage tank along with all related tank site location and necessary piping and valves. Integration of SCADA system elements of the new reservoir into the City's existing SCADA system	O	10	C	In 2003 in order to reduce the amount of disinfection by-products in the distribution system, chloramination facilities were constructed at the treatment plant.After treatment, the drinking water is pumped from the clear well of the treated water pumping station into a 27-inch diameter pipeline in Palmer Avenue. The water surface elevation of the treated water pumping station is approximately 500 feet. Approximately 2 miles west of the water treatment plant, the flow tees at Calaveras Avenue. Water destined for the Pleasant Valley State Prison and the Coalinga State Hospital flows south in a 12-inch diameter pipeline in Calaveras Avenue. Water destined for the community of Coalinga and the other miscellaneous users mentioned above, continues west another 1.5 miles to the 2.8 MG Palmer Avenue Reservoir. The high water level elevation of the Palmer Reservoir is 1033 feet. The treated water leaving the Palmer Reservoir flows southwesterly through approximately 8 miles of 27-inch and 24-inch transmission mains to the 7.6 MG Derrick Avenue Reservoir. The water flow rate into Derrick Reservoir is controlled by rate-of-flow control valves. Water then flows from the Derrick Reservoir into the City through a 30-inch diameter transmission main. The Derrick Reservoir, with a high water elevation of 841.5 feet, serves to pressurize the City of Coalinga community water system.Water, going to the Pleasant Valley State	10,000,000	3,488	16,800	23	Fresno	III	2009
3805	3610013	3610013-002	CITY OF LOMA LINDA	Loma Linda Water Zone 2A Transmission Main	Install a 20" diameter water transmission line from existing water well to existing 3.2 million gallon reservoir. 3809	1910042	1910042-002	PICO RIVERA - CITY, WATER DEPT.	The Rehabilitation of Water Supply Wells #1, #3, #4, and #5	The City of Pico Rivera recently completed a comprehensive Water Master Plan (July 2009) of its water supply and distribution system, which evaluated the City's ability to meet State and Federal drinking water regulations and provide a reliable water system to its customers. As result of the study, the City must complete several major capital and operational improvement projects over the next several years. In January 2009, the City adopted a three-year water rate case to support current operations, but only a limited amount of pay-as-you go capital projects. Critical to maintaining and upgrading our water system is the ability to obtain certain Grant Funds to construct the necessary high priority projects in a timely manner. Indentified in the water master plan and capital improvement program are well rehabilitation projects necessary to maintain reliable water groundwater supply.The project will initially include a comprehensive inspection program of all four water supply wells, including detailed survey, testing, and video inspections. Based on the results of the inspection program and the age of each of the four wells, as a minimum it is anticipated that the following rehabilitation improvements will be necessary at each supply well:1. Re-case the existing well by installation of well liner.2. Air Burst well3. Dual air swab well (mechanical re-development, airlifting, and swabbing,	O	10	C	The City's main water supply system consists of a total of 10 groundwater wells, a few of which are inactive and several which are active, but in need of rehabilitation. Several years ago, the City conducted a video inspection program on three existing wells (Wells #2, #11, and #12) and identified significant problems including, deterioration of well casings, plugging of screens, and severe casing alignment issues. The City implemented three well rehabilitation projects to rectify these problems. The City now needs to implement a second phase of this program and conduct well video inspections and rehabilitation work on four wells (#1, #3, #4, and #5) Wells are listed in order of priority. It is anticipated that based on the video inspection program and previous well inspections, all four wells will need to be rehabilitated in some manner (i.e. recasing, gravel pack, sanitary seal, etc.)Without an inspection and well rehabilitation program, the City will be at risk for losing between 30-50 percent of its water supply in the near term (5-10 years.) The City is concerned with the risk that would be incurred with the full collapse of an existing supply well and the replacement costs to construct a new well, given the City's current available funds in the water capital improvement program; this could be a major obstacle.	600,000	9,335	39,000 07	Los Angeles	IV	2009
3810	1910042	1910042-004	PICO RIVERA - CITY, WATER DEPT.	Fire Protection and Pipeline Upgrade Project	The City of Pico Rivera recently completed a comprehensive Water Master Plan (July 2009) of its water supply and distribution system, which evaluated the City's ability to meet State and Federal drinking water regulations and provide a reliable water system to its customers. As a result of the study, the City must complete several major capital and operational improvement projects over the next several years. In January 2009, the City adopted a three-year water rate case to support current operations, but only a limited amount of pay-as-you go capital projects. Critical to maintaining and upgrading our water system is the ability to obtain certain Grant Funds to construct the necessary high priority projects in a timely manner.The Fire Protection and Pipeline Upgrade Project was recommended in the Water Master Plan and is critical to meeting the standards set forth by Los Angeles County Fire District-Eastern Division and the Uniform Fire Code for needed fire flow and minimum residual pressure requirements in residential and commercial areas. Approximately 6,000 lineal feet of new 8-12 inch ductile iron water main is necessary to replace undersized water mains, generally 4 and 6-inch in diameter, to ensure adequate fire flows can be satisfied.	O	10	C	There are existing areas of the City that do not meet fire flow requirements, under the standards set forth by Los Angeles County Fire District-Eastern Division and the Uniform Fire Code and minimum residual pressure requirements in residential and commercial areas. Residential fire flows were evaluated at 1,500 gallons per minute (gpm) and commercial fire flows at 4,000 gpm. The problem is undersized water mains which can not convey the required fire flow at a minimum pressure of 20 psi.	1,400,000	9,335	39,000 07	Los Angeles	IV	2009

3811	1910042	1910042-005	PICO RIVERA - CITY, WATER DEPT.	Fire and Operational Storage Upgrade Project	The City of Pico Rivera recently completed a comprehensive Water Master Plan (July 2009) of its water supply and distribution system, which evaluated the City's ability to meet State and Federal drinking water regulations and provide a reliable water system to its customers. As result of the study, the City must complete several major capital and operational improvement projects over the next several years. In January 2009, the City adopted a three-year water rate case to support current operations, but only a limited amount of pay-as-you go capital projects. Critical to maintaining and upgrading our water system is the ability to obtain certain Grant Funds to construct the necessary high priority projects in a timely manner.The proposed project includes the construction of a new 1.5 MG steel reservoir at the City's Plant II site to replace the smaller existing reservoir. The City's goal is, as a minimum, to upgrade the system storage to assure that a minimum required fire storage capacity of 960,000 gallons would be available in the City's storage tanks. By constructing a new 1.5 MG reservoir the City would increase its available storage capacity to nearly 2 MGs City-wide. The City will be conducting a reservoir preliminary design study to evaluate siting and piping issues associated with the new reservoir locate at its existing Plant II site. Upon completion of the siting study, the City would prepare final plans and	O	10	C	The City is supplied by a continuously pumped water system through a combination of 10 groundwater supply wells and three booster pump stations, the latter located adjacent to three above-ground water storage tanks. The City currently only maintains a total of 750,000 gallons of above-ground water storage in three steel water tanks (Plant I 0.8 million gallons (MG), Plant II 0.48 MG, and Plant III 0.19 MG). The fire storage requirement for the City is approximately 960,000 gallons based on a maximum fire flow of 4,000 gallons per minute and four-hour duration, as recommended by the Los Angeles County Fire District-Eastern Division. The required fire storage exceeds the available above-ground water storage capacity. Furthermore, the City adopted new storage criteria, consistent with industry standards (American Water Works Association) to provide 25 percent of the maximum day demands for operational needs, fire storage, and emergency storage equal to 50 percent of an average day. The City is currently approximately 4.7 MG deficient in above ground storage and must increase its storage capacity to provide reliable fire protection for its customers. The City's lack of redundant power on its well systems and the potential risk of losing well supplies during a seismic event, make it critical to maintain sufficient above-ground water storage.	2,500,000	9,335	39,000 07	Los Angeles	IV	2009
3812	3610055	3610055-004	YUCAIPA VALLEY WD ID-A&2	potential MTBE contamination; drill replacement wells	Drill ejection and/or replacement wells.	O	10	C	Potential MTBE contamination of major wells. Need replacement source.	1,500,000	2,312	40,654 13	San Bernardino	V	2000
3813	5010028	5010028-004	Ceres, City of	City of Ceres Online Rapid Response Analysers	A variety of online analysers are vital to the operation of a system such as the City of Ceres, which suffers from an ongoing list of chemical and mineral contaminents including arsenic, uranium and nitrates produced in systemic spikes which threaten public health. Specifically:Well Number 1 at Smyrna requires online implemetation of real time Nitrate analysers and alarms.Well number 22 at Rockerfeller requires online implemetation of real time coliform bacteria and uranium analysers and alarms.Well Number 16 at Mitchell & Hatch requires online implemetation of real time Nitrate analysers and alarms.Costs associated with this project include:Hardware in the form of the specific analysers, Construction costs associated with the integration of this hardware, Software and alarm integration with the existing system, and Project management costs.	O	10	C	The City of Ceres runs a water system currently comprised of some fifteen active producing wells which are mixed into a large city-wide distribution system. These wells have hiustorically suffered from a variety of contaminent issue, primarily with regard to arsenic, nitrates and coliform. The levels of these chemical contaminants require continuous monitoring in order to ensure safe drinking water throughout the system. At present, the momnitoring equipment at city disposal is unable to monitor real time spikes in the levels of these contaminents, making it essentially impossible to thwart ongoing level increrases which threaten public safety on a regular basis. It is hoped that a more real-time state of the art system of monitoring may be implemented to insure drinking water quality through out the city, and to allow the system operators to more rapidly pinpoint contaminent sources for containment or treatment upgrade.	150,000	10,617	40,943 10	Stanislaus	III	2008
3814	3410017	3410017-010	CalAm - Parkway		A/E Parkway main replacement. Involves design and construction.	O	10	C	General system improvement. Inadequate distribution system pressures due to groundwater contamination.	680,000	13,332	45,187 09	Sacramento	I	1998

3817	3410017	3410017-004	CalAm - Parkway		Sky Parkway backbone main. Involves design and construction.	O	10	C	General system improvement. Inadequate distribution system pressure with the loss of supply due to groundwater contamination.	550,000	13,332	45,187 09	Sacramento	I	1998

3818	3610038	3610038-008	RIALTO-CITY	Water SCADA System	The project will be to upgrade the current SCADA system that is more than 20 years old and not very dependable. This will allow the City to operate its system and meet its daily demands on a timely basis with little to now down time. This system monitors our treatment system that provides potable water to some 48,000 residents.	O	10	C	Current Supervisory Control and Data Acquisition System (SCADA) is failing to operate as required thus compromising the water quality standard as prescribed by Department of Health Services and the Regional Water Quality Control Board . The system drops off line and fails to communicate with the wells and reservoirs requiring the City to operate on a manual mode again compromising the water qualtiy.	550,000	11,923	48,418	13	San Bernardino	V	2009
3819	3610029	3610029-014	MONTE VISTA CWD	Zone 4 Pressure Relief Station	The project involves the construction of a new pressure relief station including installation of all valves and appurtenances, installation of SCADA panel, connections, and construction of drainage facility.	O	10	C	The work involves the addition of a pressure relief station to Pressure Zone 4 of the domestic distribution system. Without this station, the zone is vulnerable to swings in system pressures and pressure surges which can result in failure of the distribution system infrastructure. This project will protect several miles of distribution pipelines and increase water supply reliability.	60,000	11,595	51,014	13	San Bernardino	V	2009
3820	3610029	3610029-024	MONTE VISTA CWD	Hydroturbine No. 3 Rebuild	The District receives flows of treated imported water to its Pressure Zones 1 and 2 from the Water Facilities Authority (WFA) at District Plant 4. Incoming pressure is about 175 psi and flow can vary up to over 15 million gallons per day. In conjunction with regulating flow, the District can reduce pressure and recover energy with hydroelectric turbines through implementation of this project to rebuild and recommision the hydroturbine. The on-site generators are 480V 3-phase generators which provide energy to the Plant No. 4 facilities and/or to Southern California Edison (SCE).	O	10	C	This project is intended to meet the "green" infrastructure (energy efficiency) project threshold stipulated in the American Recovery and Reinvestment Act of 2009. After over a decade of service, Hydroturbine No. 3 failed and has been out of operation for some period of time. When in operation, this facility through its hydroturbine reduces high pressure from a jointly operated imported water treatment plant from about 175 psi to about 40 psi and converts the pressure difference into energy that is made available to the energy grid via Southern California Edison. This project seeks to recommission Hydroturbine No. 3. It is an energy efficiency and socially responsible project that seeks to help accomplish the State's vision to reduce greenhouse gas emissions to meet Assembly Bill 32 goals.	250,000	11,595	51,014	13	San Bernardino	V	2009
3821	3610029	3610029-023	MONTE VISTA CWD	State Street Metering Facility Modifications	The work involves the construction of a low flow bypass system to address the station's deficiencies under low flow conditions and includes bypass piping, valves, meter, site work, SCADA, and required appurtenances.	O	10	C	The work involves the modification of an existing metering station which is utilized to deliver surplus water supply to the City of Chino Hills (adjacent water system). The station delivers up to 24 millions gallons per day (MGD) to the City. However, under low demand periods (3 MGD or less), the station exhibits shortcomings and does not operate as intended. This project will address those shortcomings.	65,000	11,595	51,014	13	San Bernardino	V	2009
3822	3610029	3610029-025	MONTE VISTA CWD	Aquifer Storage and Recovery Well No. 2 with Ion Exchange Treatment	This project will address the deficiencies in District Pressure Zone 3 system by constructing a new well capable of both production and injection at an existing District site. An ion exchange treatment system will be included so as to ensure and maintain water quality. There also exists at the site a storage tank which will be rehabilitated and placed into service.The District has the ability to implement this as either a design-bid-build or design-build project, having recent and relevant experience with both delivery methods.	O	10	C	The nitrate levels of the groundwater in the Pressure Zone 3 portion of the District domestic water distribution system is significantly above the State MCL. There is also a water supply need and storage deficiency within this zone which subsequently also serves adjacent Pressure Zone 4. These water quality, supply needs, and storage deficiencies leave about 6,000 service connections vulnerable to inadequate ability to handle maximum day demand needs and/or fireflow needs. This projects addresses these issues by placing a clean water source and supply within the zone rather having to rely on importing into the zone.	4,400,000	11,595	51,014	13	San Bernardino	V	2009

3828	3910004	3910004-001	Lodi, City of	City of Lodi Surface Water Treatment Facility	The City of Lodi Surface Water Treatment Facility Project will include:1. An eight million gallon per day (8 mgd) facility to treat Mokelumne River water. The facility will be located on 13 acres of land the City currently owns immediately adjacent to the Mokelumne River. The facility functions will be divided into two main structures for “clean” and “dirty” activities. The Operations Building (“clean”) will include areas for laboratory work, administrative offices, staff support areas and public interaction areas as well as the membrane filtration. The Support Building (“dirty”) will include areas for chemical handling, solids dewatering, service pumps, maintenance workshop, and storage and warehouse areas. Site improvements include roadways, parking and landscape areas to support the treatment facility and improve the area to compliment the nearby Lodi Lake Park.2. Raw water supply will be via 240 feet of 48-inch diameter pipe and 2,500 feet of 30-inch diameter pipe.3. Membrane filtration system was selected as the treatment process for the treatment facility because membranes provide a positive barrier to pathogens, increased flexibility to meet future regulations, smaller and more easily expanded footprint, and greater opportunities for automation.4. Disinfection will be by the chlorination to meet EPA and California Department of Public Health regulations log removal/disinfection of pathogens and to maintain a	O	10	C	The City of Lodi currently uses 26 wells to provide groundwater as the sole source of supply to our 63,000 residents. A 2004 study showed the City uses 17,011 Acre Feet per Year. The ground water elevation has decreased an average of .39 feet per year from 1927 to 2004.The City is also experiencing potential ground water contamination issues related to PCE/TCE. PCE and TCE have been detected in samples taken in soils and groundwater. Three major plumes of contamination have been discovered. While no operating wells are out of compliance with any drinking water standards, the contamination is a serious threat. The City of Lodi began remediation activities including soil vapor and groundwater extraction and treatment in 2004. The remediation efforts are anticipated to last 30 to 50 years. In October 2003 the City of Lodi entered into an agreement with the Woodbridge Irrigation District to purchase 6,000 acre feet of Mokelumne River water per year. The purchase is intended to supplement the City’s water supply to meet long term water demands and to reduce the City’s dependence on the groundwater aquifer.	40,000,000	18,679	63,395	10	San Joaquin	III	2009
3829	3310021	3310021-009	Jurupa Community SD	High School Well Renovation	This project includes renovation of an existing well which would require redevelopment, including the addition of a sanitary seal and re-equipping. The project would provide the benefit of providing an additional source of raw water to the Roger D. Teagarden Ion Exchange Plant and provide a more diverse and reliable water supply for Jurupa Community Services District. This project will yield approximately 600 more acre-feet per year of water and will create 12 new jobs.	O	10	C	An existing well located at Jurupa Valley High School within the Jurupa Community Services District (JCSD) is not currently used because it requires redevelopment including addition of a sanitary seal and re-equipping. This project is needed in order to increase the raw water supply to the Roger D. Teagarden Ion Exchange Plant, which will increase the service area potable water supply.	975,000	24,684	68,297	20	Riverside	V	2009
3830	3310021	3310021-012	Jurupa Community SD	Selby Street Water Service	Jurupa Community Services District (JCSD) is evaluating the feasibility of providing water and sewer service to approximately 70 to 80 homes and businesses located in the Eastvale area. The proposed project includes installation of approximately 3,250 feet of domestic water pipeline, which will help provide residents of a disadvantaged community with more reliable, higher quality drinking water service. This project will create 14 new jobs.	O	10	C	Homes in the disadvantaged area of Eastvale are currently served water through private domestic wells, which have experienced high nitrate levels in the past. The project is needed to help provide approximately 70 to 80 homes and business in this disadvantaged area with more reliable, higher quality drinking water service.	600,000	24,684	68,297	20	Riverside	V	2009
3831	3310021	3310021-010	Jurupa Community SD	Geordie Way Water Service	The proposed Jurupa Community Services District project will construct 1,100 to 1,400 feet of water pipeline to provide potable water service to residents currently served by private well systems in the Glen Avon area. The project will benefit residents in a disadvantaged community. This project will create 12 new jobs.	O	10	C	The proposed project will construct 1,100 to 1,400 feet of water pipeline to provide service to residents currently served by private well systems in the Glen Avon area of Jurupa Community Services District. Owners in this area have reported that wells have run dry during summers. The project would provide a more reliable water supply for residents in a disadvantaged community.	350,000	24,684	68,297	20	Riverside	V	2009

3832	1910079	1910079-003	LYNWOOD-CITY, WATER DEPT.	Water System Circulation Improvements – Phase I	Project :To mitigate the marginal low water pressures and low levels of chlorine residuals, this project will install larger diameter water mains in principal streets of the northern areas to replace smaller diameter water mains. The Phase I of this solution is the installation of 3,000 feet of 12-inch diameter water main in Martin Luther King, Jr. Boulevard from Long Beach Boulevard westerly to Loraine Street. Benefits:The Benefit to the water customers of the City of Lynwood is to improve water pressure and provide a more standard chlorine residual.	O	10	C	Existing Condition:The water pressures and chlorine residual are marginal in the northern section of the City of Lynwood Water System, particularly in the panhandle area north of Abbott Road at State Street/Long Beach Boulevard and the panhandle section along Alameda Street north of Martin Luther King, Jr. Boulevard. This appears due to several factors mainly small diameter water mains. No public notification is required.	792,000	9,035	73,212	22	Los Angeles	IV	2009
3833	1910079	1910079-002	LYNWOOD-CITY, WATER DEPT.	Water System Circulation Improvements – Phase II	Project :To mitigate the marginal low water pressures and low levels of chlorine residuals, this project will install several sections of 12-inch diameter water mains in principal streets of the northern areas to replace smaller diameter water mains and close the gaps in the existing system. The Phase II of this proposed solution is as follows: installation of 720 feet of 12-inch diameter water main in Butler Avenue and Bellinger Street;installation of 500 feet of 12-inch diameter water main in Alameda Street West at Lynwood Road;and installation of 1,600 feet of 12-inch diameter water main in Lynwood Road from Alameda Street West to Bellinger Street. These larger water mains will permit the greater use of water Well No. 19 to serve the northern area.Benefits:The Benefit to the water customers of the City of Lynwood is to improve water pressure and provide a more standard chlorine residual.	O	10	C	Existing Condition:The water pressures and chlorine residual are marginal in the northern section of the City of Lynwood Water System, particularly in the panhandle area north of Abbott Road at State Street/Long Beach Boulevard and the panhandle section along Alameda Street north of Martin Luther King, Jr. Boulevard. This appears due to several factors mainly small diameter water mains. No public notification is required.	744,480	9,035	73,212	22	Los Angeles	IV	2009
3834	1910001	1910001-007	City of Alhambra	Garvey Reservoir Recoating Project	An epoxy coating will be applied to the walls and floor of the steel tank after removal of any corrosion. These areas will then be prepared for the application of the epoxy. Cathodic protection will be reinstalled in the tank to help reduce the amount of future corrosion. The new epoxy lining will extend the life of the tank an additional 30-35 years. The exterior of the tank is structurally sound which will also extend the life of the tank. Water quality will thus be maintained. This project is one of several infrastructure improvement projects to complete the systemized preservation of the City's eleven steel reservoir tanks.	O	10	C	Garvey Reservoir tank was originally constructed in 1980. A recent inspection revealed that the steel walls and floor is exhibiting advanced corrosion. This tank does have cathodic protection installed to inhibit corrosion, however, due to the age of the tank, and with no appreciable upgrades since installation, the steel is corroding. This in turn can significantly affect the water quality. In order to maintain compliance with drinking water standards to provide safe drinking water, the recoating of the tank walls and floor is necessary.	1,500,000	17,740	92,158	16	Los Angeles	IV	2009
3835	3310012	3310012-015	Elsinore Valley MWD	Brine Tanks Relocation for Several Wells Facilities	In three locations the tanks will need to be relocated from inside the building to the outside and piping reconfigured. At two locations, the salt tanks located outside will be replaced because they have been damaged by sun light and weather. Proper covers and necessary fences will be provided for weather protection and safety of the tanks.	O	10	C	This Capital Improvement Project entails relocating or replacing the five (5) polyethylene brine storage tanks located at five ground water wells sites. The tanks are used to store salt, which is utilized to generate sodium hypochlorite for disinfecting the ground water for potable use. The brine tanks located inside the bulidings release salt dust during high pressure filling of the tanks by the salt supplier. This dust can not be effectively controlled and its deposit is resulting in corrosion of other expensive electrical and electronic equipment inside the building. Therefore, the salt storage tanks must be relocated outside the buildings to prevent damage to electrical equipment. At other facilites, uncovered salt storage tanks located outside the buldings have been damaged by sun light and weather and need replacement of tanks with covers on top.	300,000	36,817	121,420	20	Riverside	V	2009

3836	3310012	3310012-014	Elsinore Valley MWD	Water System Pressure Reducing Vaults Safety Upgrades	The goal of the project is to improve the PRV stations to a level that will provide desired safety, vault access and reliability to properly operate and maintain the stations and to eliminate confined space entry, where possible by building above ground vault stations.	O	10	C	This project proposes to replace pressure reducing valve (PRV) stations in the California Oaks Community. There are twelve (12) California Oaks PRV stations that need to be assessed for replacement and safety improvement. Each valve is currently located within a vault below the sidewalk, covered by a heavy steel lid. In addition to confined space entry safety concerns, many of the PRV stations have a number of substantial deficiencies which include rusted valve covers and hatches, rotted framing, and inadequate operator accessibility. Accumulation of moisture in vault also inhibits accessibility to PRV & related maintenance tasks.	700,000	36,817	121,420	20	Riverside	V	2009
3837	3310012	3310012-012	Elsinore Valley MWD	Terra Cotta Well Equipping Project	The Terra Cotta Well project consists of two construction phases; the drilling and equipping phases. The drilling phase, consisting of installing the well casing and developing and testing the well, has been completed. The well equipping phase consists of constructing the wellhead facilities including the mechanical, disinfection and electrical equipment, and constructing the adjoining park improvements. The project is a joint use project between EVMWD and the City of Lake Elsinore. The project also involves constructing a passive park on the site. The park will consist of a low water use landscaping area, walkways, benches, and educational signs regarding drought tolerant landscaping and water conservation practices. EVMWD's Board of Directors adopted the Mitigated Negative Declaration on December 14, 2006 and filed the Notice of Determination on December 20, 2006. The engineering documents have been finalized and the project is ready for immediate construction bidding.	O	10	C	In accordance with the recommendations of the Elsinore Valley Municipal Water District's (EVMWD) Water Resources, Urban Water, and Groundwater Management Plans, the proposed Terra Cotta Well will maximize the use of EVMWD's local water resources while reducing dependence on imported water from the State Water Project and Colorado River Aqueduct. In addition, this dual-purpose well will be capable of injecting water in the groundwater basin during low demand periods or when replenishment water is available, and extracting water during periods of high demand, thus providing enhanced control of peak demand management and depleting aquifer. The anticipated production is 1,200 gallons-per-minute or 1432 acre-feet per year operated over a 9 month period.EVMWD's current potable water supply is comprised of 61% of imported water from the State Water Project in combination with Colorado River water, and 39% of local water supply including groundwater and surface water. The purpose of the project is to augment a local water supply for EVMWD. Energy production is a significant source of greenhouse gas emissions. Approximately 19% of electricity and 30% of natural gas (non-power plant) consumed in California are used to deliver, treat, and dispose of water. Long-distance water conveyance, such as that from Northern to Southern California, accounts for a	3,100,000	36,817	121,420	20	Riverside	V	2009
3838	1510031	1510031-001	Bakersfield, City of	Stine 60" Raw Water Pipeline Project	The project will construct a 4.5 mile 60" diameter raw water transmission pipeline on Stine Road/ canal right of way corridor. This pipeline will supply a 40 million gallon per day drinking water treatment plant. Use of the pipeline will protect the raw water supply and ensure security by bypassing an open conveyance system.	O	10	C	This project will protect and provide a raw water supply to a new drinking water treatment plant. The construction of this project will eliminate current water supply problems due to groundwater contaminants called volitale organic compounds (VOC's) or naturally occuring contaminants such as arsenic and lead.	9,560,000	32,703	132,736	12	Kern	III	2009

3841	3710006	3710006-007	Escondido, City of	Reed Reservoir Project	The existing Reed Reservoir is a 140-ft diameter by 24-ft high above ground steel tank. The tank was constructed in 1954 with a nominal storage capacity of 2.75 million gallons. The Reed Reservoir is the only reservoir in the pressure zone which it serves by gravity flow. The reservoir also functions as the forebay for the East Grove Pump Station, which pumps to a higher pressure zone.This project will replace the existing 2.75 million gallon tank with two 2.5 million gallon partially buried circular prestressed concrete tanks and associated piping. The new tanks will maintain the same water elevations as the existing tank. The old tank will be demolished as a part of this project.	O	10	C	The Reed Reservoir is a 140-ft diameter by 24-ft high above ground steel tank. The tank was constructed in 1954 with a nominal storage capacity of 2.75 million gallons. In December 2001, an evaluation of the Reed Reservoir was performed by an engineering consultant, Tetra Tech, Inc. The evaluation included numerous inspections of the tank interior and exterior. The consultant determined that Reed Reservoir is unstable for design seismic loading. The existing Reed Reservoir shell plates are overstressed and must be strengthened. The inspections revealed extensive corrosion of the internal shell and structural members. The coal tar coating has deteriorated so much that little to no protection is provided from corrosion. It was determined that rehabilitating the existing reservoir would cost the same as constructing a new reservoir; therefore it was recommended that the City construct a new reservoir.A corrosion consultant performed Ultrasonic Thickness (UT) testing on the shell and roof of the tank. Testing indicated pit depths of approximately 100 mils deep on the North Side of the tank, which is approximately 40% wall loss. The second larger area of corrosion was on the South Side of the tank where pit depths measured approximately 90 mils. The evaluation noted that the corrosion indications at that location corresponded with a small buckle in the tank shell. The UT testing of the roof showed evidence	7,800,000	25,828	140,000	14	San Diego	V	2009
3842	3910001	3910001-002	California Water Service - Stockton	Stockton "District Wide" Water Conservation Program	The program has two "full service" elements that encompass a "City Wide Water" Conservation Program. Element A: A team of trained plumbers will retrofit 32,250 residential homes / 64,500 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 1,979 acre feet per year. Element B. A team of specialist will retrofit 10,750 residential yards with modern ET water controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 330 acre feet per year. This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 months or less. The program will employ 75 to 100 people for 12 months.	O	10	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 2,237 acre feet per year or 50.0 / 75.0 gallons per day, per person.	19,600,000	43,689	171,777	10	San Joaquin	III	2009
3843	3010062	3010062-001	City of Garden Grove	Sodium Hypochlorite Systems	Covert all chlorine gas systems to bulk sodium hypochlorite systems.	O	10	C	The City's vulnerability assessment recommends the use of a less harzrdous disinfectant instead of chlorine gas, which is utilized currently.	500,000	34,077	172,781	08	Orange	V	2007

3844	3610039	3610039-036	SAN BERNARDINO CITY	Gilbert Street Well Perchlorate Treatment Project	The San Bernardino Municipal Water Department's plan of action includes, but is not limited to the following:1. Request water quality data (perchlorate concentrations) for up gradient wells of adjoining agencies including East Valley Water Department (EVWD).2. Request source evaluation studies (if completed) from EVWD. This may be limited to interviews of EVWD staff if documentation is not available.3. Evaluate the lateral distribution of perchlorate based on this data and knowledge of past agricultural land use.4. Perform modeling simulations to evaluate flow pathways and travel times from the source area to City production wells.5. Expand on the identified alternatives, identify other potential alternatives, and prepare a technical memorandum for the proposed alternatives.6. Prepare a construction bid package of the CDPH approved alternative.7. Retain a contractor to construct the facilities.	O	10	C	While conducting normal triennial sampling for perchlorate, the Gilbert Street Well perchlorate concentration was reported at 4.8 parts per billion (ppb) or 80 percent of the maximum contaminant level (MCL) of 6.0 ppb. Subsequent test runs of the well to atmosphere (not into the distribution system) have indicated an upward trend in perchlorate concentrations which has shut down the well since July 2008.	750,000	42,301	173,359	13	San Bernardino	V	2009
3845	1910043	1910043-004	GLENDALE-CITY, WATER DEPT.	Hexavalent chromium full treatment facility (Cr+6)	This project involves implementing improvements to protect public health by removing chromium 6 from contaminated wells. This will be accomplished by completing construction of a 1,200 gpm of treatment capacity at the GWTP.The City of Glendale has managed a comprehensive research effort over the past five years to develop and demonstrate chromium 6 removal technologies. This project proposal is based on the sound science derived from this previous work. A 1,200 gpm full-scale treatment plant is planned to remove chromium 6 from Wells GN-2 and GN-3. The treatment approach will likely employ the reduction-coagulation-filtration process, and the scope of construction involves pipelines, treatment equipment, controls, operations lab, and related facilities, at an estimated cost of $8.5 million. The demonstration facilities have all of the necessary environmental and regulatory permits and approvals to proceed without interruption. This project would benefit from the previous environmental work for the demonstration facility. This will allow early completion of the environmental review for the full treatment facility.A design/build contractor is currently under contract for the demonstration facilities. The city intends to expedite design and construction of the 1,200 gpm facility by using the existing contract vehicle.The necessary technical, managerial and financial support is in place to	O	10	C	The problem relates to protection of public health from groundwater supplies contaminated with chromium 6 in concentrations that exceed primary drinking water MCLs.The Cities of Los Angeles, Burbank and Glendale rely on groundwater in the San Fernando Valley of Los Angeles County that has been contaminated with chromium 6 and VOCs. The VOC contamination was addressed by a Superfund project that included construction of the Glendale Water Treatment Plant (GWTP) and eight wells. Chromium 6 concentrations are increasing in the groundwater which has not been addressed.There is no MCL for chromium 6, but it is currently regulated under the total chromium MCL of 50 ug/L. The California OEHHA was poised to release a draft PHG for chromium 6 with indications that it will be approximately 0.06 ug/L. This was later deferred. CDPH will be obligated to set the MCL as close to the PHG as technically feasible.Wells GS-3 and GN-3 produce water approaching or exceeding the current chromium MCL and both are operated at reduced capacity because of chromium 6 concerns. EPA estimates that within a few years four of the eight wells will exceed this standard. Two wells, GN-2 and GN-3, are forecasted by EPA to reach 170 ug/L; GS-3 has exceeded the MCL, and GS-4 is forecasted to reach 50 ug/L. Additionally, continued pumping of the wells is a critical part of the Superfund project strategy to contain	6,500,000	33,275	207,157	15	Los Angeles	IV	2009
3846	1510003	1510003-004	CWS - Bakersfield	Bakersfield "City Wide" Water Conservations Project	The city wide water conservation project has two elements.a. Indoor: CWSC will replace / retrofit 102,000 bathrooms and the projected water savings is 3,129 acre feet per year.b. Outdoor: CWSC will replace 16,867 ET controllers and the estimated water savings is 517 acre feet per year.	O	10	C	CWSC intends to reduce the district total water consumption to match the long term water supply.	49,369,875	63,641	208,867	12	Kern	III	2009
3847	5010010	5010010-014	Modesto, City of	S. Ninth Street Water Main Replacement	This project involves installing water mains on S. Ninth Street. The main will be installed per City of Modesto Standards. The main will bring safe drinking water to businesses and residences with better pressure and more reliablity. Currently, the water supply is insufficient for any future development in the industrial and commerical area due to fire flow and demand requirements.	O	10	C	This commercial and industrial area is unable to grow or improve due to the lack of sufficient water supply for domestic, industrial or fire flow uses. Old, substandard and undersized water mains restrict property owners from remodeling, building new businesses or residences in the already economically deprived area.	850,000	68,497	212,000	10	Stanislaus	III	2009

3848	5010010	5010010-010	Modesto, City of	Modesto-Salida Water Transmission Main	This project would consist of a single water transmission main from the Modesto contigious service area to the Salida water system service area. The current alignment is for Kiernan Avenue (SR 219) but alternate alignments are being explored. The pipeline would be ductile iron. The water transmission main would not only provide additional water when needed but would also be used as a source of safe drinking water in which to blend with the contaminated well water. There are limited connections between Modesto and Salida and very few treatment options at each well site due to property size. This pipeline would be a relatively simple and efficient solution to an identified risk in the Salida water system.	O	10	C	The water system in Salida is owned and operated by the City of Modesto, however, there are only 2 water main inter-ties between Modesto and Salida. Those inter-ties are 12 inch and less. Salida has 8 wells all with varying levels of Arsenic and currently four wells are at risk with contaminate levels of 7 ppm or higher. In June 2009, the City of Modesto Capital Planning began modeling the Salida system with a variable presuming those four wells were to go offline due to contaminates. Preliminary findings indicate there is a real demand for more water for the Salida system when these wells are offline.If one well exceeds the MCL and is forced to shutdown, the remaining wells will need to increase production to compensate for the loss. The unknown factor is whether this will lead to an increase in contaminates in the remaining wells due to increased pumping. If this were to occur, it would not only lead to a chain reaction of pumps going offline, but it would be crippling to the Salida system.	2,500,000	68,497	212,000	10	Stanislaus	III	2009
3849	5010010	5010010-012	Modesto, City of	Ninth Street Bridge Water Main	This project would provide a dedicated water transmission main from the existing 16-inch main along S. Morton Boulvard at Ninth Street continue south along the underside or through the Ninth Street Bridge across the river and connect to the existing 12-inch main along River Road.	O	10	C	Modesto south of the Tuolumne River is an economically deprived area with no new prospects for safe drinking water for domestic and industrial use. This area currently experiences unacceptable fire flows and extremely low water pressures most of the time.This project would provide a dedicated water transmission main from Modesto north of the Tuolumne River through/along side the Ninth Street Bridge to Modesto south of the river. North Modesto has enough water to supply more water to South Modesto, but the infrastructure to supply is not enough.	1,250,000	68,497	212,000	10	Stanislaus	III	2009
3850	3710010	3710010-005	Helix Water District	Helix 1A Pump Station Replacement	This Project replaces 4 existing pumps with 3 new pumps and rehabilities an existing underground pump station including piping, electrical, and sitework. The existing pumps are near the end of their service life. The three new pumps will be 2,400 gallons per minute rated at 250 horsepower each. The piping improvements include new inlet and outlet piping and a new bypass pipeline with a pressure control valve. The new bypass will allow the pump station to pump closed-system (without a tank) to provide water customers service during shutdowns or emergencies. Sitework improvements include upgrades to a pressure reducing valve vault, a flow meter vault, and installation of a new isolation valve vault. Electrical improvements include a new electrical cabinet and electrical switchgear to allow a temporary generator connection to provide water to customers during a power outage.These infrastructure inprovements are needed to bring the pump station up to the current design requirements and standards.	O	10	C	This Project replaces 4 existing pumps with 3 new pumps and rehabilities an existing underground pump station including piping, electrical, and sitework. The existing pumps are near the end of their service life. Infrastructure inprovements are needed to bring the pump station up to the current design requirements and standards.	640,000	55,497	263,642	14	San Diego	V	2009

3851	3710010	3710010-003	Helix Water District	Pipeline Project 1818 El Canto/Toledo	This Project is an infrastructure improvement project that replaces Helix's old cast-iron pipelines with new pipelines. This Project replaces 6,850 feet of cast-iron pipe with 6,850 feet of PVC pipe in the unincorporated area of the County of San Diego in the Casa de Oro community. The existing cast-iron pipe was installed in 1948, 1951, and 1952. Pipelines will be replaced within several streets including El Canto Dr., Toledo Rd., Ramona Dr., Pinto Pl., and Madrid Way. Existing cast-iron pipes break and leak requiring the distribution system to be shut down and water deliveries to customers are impacted until repairs can be made. The old cast-iron pipelines on this project have had four recent breaks in 1991, 2003, 2006, and 2007. The Project will replace old cast-iron pipe with PVC pipe that is less prone to failure and more reliable. These infrastructure improvements are also needed to bring the pipelines up to the current design requirements and standards.	O	10	C	This Project is an infrastructure improvement project that replaces Helix's old cast-iron pipelines with new pipelines. Existing cast-iron pipes break and leak requiring the distribution system to be shut down and water deliveries to customers are impacted until repairs can be made. The Project replaces 6,850 feet of cast-iron pipe. The old cast-iron pipelines on this Project have had four recent breaks in 1991, 2003, 2006, and 2007. 3853	3710042	3710042-004	San Diego County Water Authority	Fencing and Barricades at Critical Facilities	Harden walls, perimeter fences and gates around critical facilities; install vehicle barriers at office buildings, operations control center, and at critical water facilities to deter vehicles from driving up walkways and entrances. This project is rated in 4th position in Prop 50, Chapter 3 and is ready to go.	O	10	C	The need for vehicle barriers that deter vehicles from driving up walkways and entrances to the San Diego County Water Authority office building, operations control center, and critical facilities, and beefing up fencing and gate access to critical water conveyance facilities was identified in Vulnerability Assessments submitted to the USEPA. Increasing the physical protection system at critical water facilities lowers the risk and reduces vulnerability to a terrorist attack.	200,000	102	3,140,000	14	San Diego	V	2009
3854	3710042	3710042-007	San Diego County Water Authority	Microwave Communication System	Install a microwave communication system with a network of five microwave towers, fiber optic lines, private leased lines, switches, and routers that ensures alternate routes to move data back to the operations control center and out again to the flow control facilities. This project is rated in 4th position in Prop 50, Chapter 3 and is ready to go.	O	10	C	The need for redundancy in the San Diego County Water Authority water control communication system was identified in Vulnerability Assessments submitted to the USEPA. Mitigating consequences of a terrorist attack, earthquake, or other natural disaster involves increasing the redundancy of the communication system that controls the flow of water in the county. Over 100 flow control facilities communicate the status of the aqueduct system over land-based phone lines. A microwave communication system would provide redundancy in the event that the primary system fails.	1,750,000	102	3,140,000	14	San Diego	V	2009

3855	1900904	1900904-002	ACTON CONSERVATION CAMP # 11	Add additional storage tank to meet needs of current population	Add additional 100,000 gallon water storage tank to serve current and future expanded camp population. 3862	1900764	1900764-003	HENNINGER FLATS	Replace chlorination system and structure enclosing the system	Replace current chlorination system with modern system, including a secured structure to enclose the system.	O	10	N	Henniger Flats is a historic, recreational site serving approximately 300 campers and hikers weekly in high season. The water is supplied from a spring located in a cement and metal structure. The current chlorination system has been consistently failing.	200,000	1	25	16	Los Angeles	IV	2009
3863	3600193	3600193-001	Park Moabi	Moabi Regional Park Water System Improvements	The project aims to seek the consultation with a hydro-geologist to evaluate the current wells in order to diagnose production issue and advice of adaptation to exist well or the possible addition of a new well location as needed to improve production and reduce contaminant input levels. The project will construct the new well and/or all other recommendation to rehabilitate the existing wells. Additionally the project with consult with engineers to provide design plans, specification and recommendation to construct a new treatment facility for the water system in order to remove the minerals and metal deposits as noted in recent testing of the current system and likely to be present in any new well. The project shall then construct the treatment facility based the plans via a pubic bid and shall be constructed with new and efficient technology to remove the current noted minerals and metals as well as remove any new deposits that may be found in the future and ensure a healthy viable source of water to supply the Park Site for many years. The project shall also construct modification to the existing system to tie the new well and treatment facility to the system as well as to improve flow dynamics and for fire purposes, this shall include improvement to the old water system and service including replacement and adding piping, isolation valves and looping for pressure and service	O	10	N	The water system at the park site is over 40 years old and although newer wells been installed recently as the system has expanded and newer connections have been made the system still relies upon the original design and equipment installed and haphazardly modified over the years. In addition, current wells that services the system are not providing adequate flow during peak demand and limit future growth. Additionally, the current well, although planned in locations intended to remove chances of contamination, all contain contaminants based upon the composition of the local aquifer and are affected by the river water quality; this applies even to the newer well of approximately five years old. Minerals and contaminants from years of local industrial uses have resulted in the entire local aquifer containing contaminants as it percolates down from those sites. The current discovered contaminant levels may likely increase over the decade or new contaminants may be additionally leached into the system. The project aims to evaluate the current wells, possibly locate a new well as needed to improve production and reduce contaminant input levels, provide engineering and installation of new treatment facility for the water system in order to remove the minerals and metal deposits as noted in recent testing of the current system and likely to be present in any new well. The treatment facility will be designed with	800,000	159	25	13	San Bernardino	V	2009
3864	1900764	1900764-002	HENNINGER FLATS	Tank Replacement	Destroy current cement block tank and install a new secured tank in its place to meet AWWA standards.	O	10	N	Henniger Flats potable water is fed from a horizontal spring which flows through primitive filtration systems and then into a 6,500 cement block tank which is in bad disrepair, leaking and exposed to the elements. Currently, we have bypassed this tank and the water flows directly to other tanks at a lower part of the facility. The tank should be destroyed and a new tank erected in its place.	200,000	1	25	16	Los Angeles	IV	2009

3872	3600756	3600756-002	Oak Glen Chstn Conf Centr	Oak Glen Christian Conference Center Fire Suppression Upgrade	We will install a complete 6" fire line on our 46 acre mountain situated conference center. This will include fire hydrants, pumps, generators, piping and engineering required to construct an adquate system.	O	10	N	We are a conference center serving over three thousand inter city individuals anually. Our water system was installed over fifty years ago and as you may imagine our fire suppression system is non existant. We need to install a complete fire suppression system for our three hundred bed facility. With the recent fires in our area a fire suppression system is imperative. This will include a complete domestic water system upgrade for our antiquated system.	2,500,000	1	180	13	San Bernardino	V	2009
3873	3600756	3600756-001	Oak Glen Chstn Conf Centr	Oak Glen Christian Conference Center Tank Restoration	We will replace the steel lid with new and repaired sections and epoxy the inside and outside of the steel reservoir including the floor with health department recommended coatings. We will also provide proper drainage around the exterior of the tank. This will require the removal and reinstalling of security fencing.	O	10	N	Our 216,000 gallon tank reservoir needs repairs to the steel lid and repainting inside and out. This tank is fifty years old and because we are a not for profit entity funds for these repairs are not available in house. We serve over three thousand inter city individuals in our conference center anually with meals, shower and bath facilities, drinking water and recreation facilities including a swimming pool.	55,000	1	180	13	San Bernardino	V	2009
3874	0900112	0900112-001	CANDLELIGHT VILLAGE WATER SYST	Source and Storage Capacity Expansion Fire Suppresion and Lot Metering	This project will include drilling for at least one more well, the installation of two 15,000 gal storage tanks, the laying of about 4000 feet of water line. Installation of fire hydrants to areas not covered by hydrants now, and installaion of dry hydrants into the reservoirs in the park, and the installation of 45 meters on each space. The cost of installing the pipe will be a little higher than normal as street grading would have made this less expensive. Since not all street grading has been completed, it will cost about$50,000 more than if all grading had been completed. This project will also allow the present staff of 4 to stay employed during the installation. I would estimate this project at approximately 6 months to 1 year.	O	5	C	This system is for a mobilehome park. Part of the park is for mature adults only. The old section of the park was built in the 1960's and has no fire hydrants in it. There is also no metering of the old park and the supply piping will need to be modified to accept meters. The new section is already set up to accept metering with a minimum of modification. This project was originally intended to be funded by the construction of new areas in the Mobilehome Park. Since all bank financing has stopped for any kind of construction funding, we will have to fund the improvements to the water facilities from this source. This is a dry area and we are trying to design everything for low water usage and individual metering, with adequate back up for dry years. We are in a rural area with no public water system near us, so we need to be self sufficient.	300,000	20	35	09	El Dorado	I	2009

3875	4900893	4900893-001	West Water Company (PUC)		Storage tank with high service pumps and water mains, meters	O	5	C	System consists of 63 foot deep well with 2,500 gallons of storage. System has no disinfection and experiences low pressures under peak demands.	750,000	16	50	18	Sonoma	II	2004
3876	0707501	0707501-002	ANGLER S RANCH #3	Installation of usage meters and pump replacement	Meter installed at the pump house to monitor total water pumped.Meters installed at each residence to monitor individual property owner use.Submersible pump installed in place of surface pump to eliminate cavitation problem due to dropping water table.	O	5	C	Installation of water meters will encourage water conservation as we would change our billing from a flat rate to charging by volume.Having a main meter, and a meter at each residence will allow us to find and repair any leaks in the water main. Property owners will be encouraged to find leaks on their properties if we start charging for water volume used.Submersible pump will eliminate water volume problem caused by water table dropping below 20 feet.	80,000	30	60	04	Contra Costa	II	2009
3877	4200822	4200822-002	SANTA RITA WATER CO		install individual user water meters	O	5	C	No individual user meters to monitor consumption, having same would promote water conservation	20,000	20	66	06	Santa Barbara	IV	1999

3889	4000568	4000568-008	SAN SIMEON CSD	Well field SCADA/Telemetry Repair	This project involves replacing outdated and unreliable telemetry equipment associated with the District water supply system. This includes wellhead control and status monitoring, emergency alarms, groundwater level reporting, reservoir level reporting, and emergency alarm reporting to District staff.	O	5	C	This project is intended to address reliability issues that have occurred due to age and reliability of SCADA and telemetry facilities. Equipment failures, loss of communication, antiquated equipment and unsupported proprietary equipment are main concerns. Recent failures have caused District reservoir to run dry, leaving the community without water for sanitary needs or fire protection.	110,805	206	499	06	San Luis Obispo	IV	2009

3890	2800521	2800521-004	CIRCLE WATER DISTRICT	Circle Oaks Water Source Augmentation	Drill a test well in a location determined by geological survey. Drill production well, seal well to 50' below the surface. Provide motor and pump to allow 100 GPM to be supplied to filter plant, provide pump control equipment to allow automatic pump control from the plant based on demand, and provide buried piping to the treatment plant. This project has already been engineered by Brelje & Race, Consulting Civil Engineers, and is estimated at $207000.	O	5	C	Circle Oaks water is provided by a single 150 foot deep well and springs. The well is capable of 90 GPM and the springs 28 GPM. The spring source has been interrupted after past earthquakes although this has resolved in 1-2 weeks. If the springs are interrupted, the well can produce enough water to adequately supply the District with 189 homes built out of 330 lots. If any event, seismic or otherwise, would interrupt the single well source, Circle Oaks would have insufficient water for basic customer needs. In addition, if lot owners were to build on all the remaining vacant lots, the single well would be insufficient to reliably supply adequate water for the District.Circle Oaks is in urgent need of a second well capable of supplying 100 GPM to provide a reliable supply of water for customers and fire protection. This would also allow the system to recover faster in the event of heavy customer use in hot weather and after depletion after a fire.	207,000	190	500 03	Napa	II	2009
3891	4910020	4910020-003	Sonoma County Water Agency		Install early warning systems in three locations to detect contamination before water is delivered to Agency customers.	O	5	C	Pollution threats to raw water quality from watershed sources.	1,615,000	136	500 18	Sonoma	II	1998
3892	5700797	5700797-001	MONROE/LEINBERGER CENTER	Yolo County: Monroe well Upgrade	We intend to do the follwing:1) Redo all piping so it comply's with city needs2) Add a new PGE transformer and meter so the well is off of Monroes Elerctrical system3) Generator for Power loss. 4) Upgrade all Controls for well. Currently it is a hard start would like to change to soft start.5) Well pump Modifications as needed for optimal efficiency at new operating pressure range.6) 2-way flow measurement meter suitable for secure continuous monitoring7) Specialty valves i.e. backflow prevention, pressure sustaining, Etc.8) Security and access improvement, so city can enter Well area. By doing this we hope to improve the cities system and will provide our detention center with other Wells, making the water service to our inmates a more reliable water system.	O	5	C	Yolo County (County) and the City of Woodland (City) are interested in interconnecting water systems between the City and the County's Monroe Detention Center. The purpose of the interconnection is to improve the overall reliability of both water systems through regionalization. To improve each water system, system components and operating parameters such as the County's existing well's constuction features, the well pump's sizing and performance characteristics, discharge piping configuration, storage capacity, type and location of valves, and electrical controls are currently being evaluated. Water quality data for both water systems is also being evaluated to determine an optimal blending plan. Interconnection capital improvement items will include:1) Specialty valves i.e. backflow prevention, pressure sustaining, etc.2) 2-way flow measurement meter suitable for secure continuous monitoring3) Pipeline installation and interconnection fittings/valves4) Well pump modifications as needed for optimal efficiency at new operating pressure range5) Electrical control and monitoring improvements, including SCADA equipment compatible with city SCADA system6) Security and access improvements7) PGE service meter and transformer8) Generator for back up power for wellThe well Has no outstanding violations	475,000	4	500 09	Yolo	I	2009
3893	1900803	1900803-007	El Dorado Mutual Water Co.	LA County Intertie With El Dorado	Basically this would be a connection to 4 other water companies. The connection to LA County Water would require a vault on 10th street W., and would be a one way connection - we would buy water from them in case of an emergency. The other 3 Mutuals (Westside, Shadow Acres, White Fence Farms) would be a 2 way connection, and would benefit us all in case one of us has an emergency. A total of 4 vaults including engineering, valves and meters.	O	5	C	We have no guaranteed emergency backup and only one well. AVEK is our only backup, and although they have always helped us out, the written agreement is that they can shut down our connection at any time. This written agreement is also true with the 3 Mutuals that border us.	260,000	223	648 15	Los Angeles	IV	2009

3894	1900803	1900803-006	El Dorado Mutual Water Co.	2 Vertical Pressure Pumps With Variable Frequency Drive	Two new vertical pumps and a variable frequency drive with an electrical system upgrade (including wiring, panels, sensors etc.) would increase efficiency, reduce cost, provide increase flow to other agencies in case of emergency, and provide a consistant regulated pressure to customers.	O	5	C	Our existing 2 Pressure pumps are old and inefficient. They cycle using an old mercury based relay pressure sensor. If we were to ever intertie with our 3 nearby mutual water companiesand need to supply them with emergency water, the existing pumps could not keep up. The relay method used now wastes electricity with the startup surge and the water hammer is hard on the system pipes connected to the pumps.	100,000	223	648	15	Los Angeles	IV	2009
3895	1900803	1900803-009	El Dorado Mutual Water Co.	Security System - El Dorado Water Co. Yard	For a security system we would install an infrared video camera system. The video would be stored on hard drive at the site, internet accessible, and dial maintenance cell phone if suspicious movement was detected. A seperate system that would monitor the pressure tank, holding tank, motors, chlorinator and electrical system would also alert maintenance.	O	5	C	Our water yard faces a busy 5 lane road - it has a lot of visibility. The site is unmanned both day and night.	60,000	223	648	15	Los Angeles	IV	2009

3899	4210021	4210021-001	Golden State Water Company - Tanglewood	Tanglewood - Reservoir and Booster Station	Construct new 0.36 MG storage tank, new booster station with standby power, and transmission pipelines from well to tank.	O	5	C	This small system is currently supplied by two wells, one of which is not useable due to very high nitrate and well construction issues. This well is scheduled to be destroyed, leaving essentially one well and a purchased water connection. The purchased water is both expensive and unreliable in drought years. There is currently no storage capacity in this system, so no advantage can be made of off peak pumping for reduced energy costs, and there is no storage available for fire flow should the need arise.	2,500,000	456	1,498	06	Santa Barbara	IV	2009
3900	4210021	4210021-002	Golden State Water Company - Tanglewood	Tanglewood - Tanglewood Well #3	A new, deep well needs to be constructed that will draw water from an aquifer uncontaminated by nitrates, and that will provide a more reliable and less expensive source of water for our customers.	O	5	C	This small system is currently supplied by two wells, one of which is not useable due to very high nitrate and well construction issues. This well is scheduled to be destroyed, leaving essentially one well and a purchased water connection. The purchased water is both expensive and unreliable in drought years.	2,000,000	456	1,498	06	Santa Barbara	IV	2009
3901	3310030	3310030-001	Pine Cove Water District	PCWD Test Well Drilling Project	Test wells will be drilled to find sufficient water sources for use in the future or in times of severe drought. We already have C.E.Q.A. approval for 12 test holes to be drilled. Drilling new test wells will ensure us of a sufficient water supply in times of drought as well as for future use. Since we have no access to an outside water source, we need to be diligient and forward thinking in order to provide a continual supply of potable water to our customers.We will be drilling 8 inch wells with the hopes of getting 15 GPM from each one. As a small water district in a remote location, we are dependent on ground water to provide water to our customers. When precipitation is lacking, as it has been in recent years, it becomes critical that we continue to drill new wells to find new water sources.	O	5	C	The Pine Cove Water District is located at an altitude of 6500 ft. in the San Jacinto Mountains. Our only access to water is through wells. With the continuing drought that California is experiencing, this could prove to be a very large problem. Therefore, it is imperative that we drill test wells to be sure that we have water for future use. We are not able to buy water from another agency should we experience a shortage. While we encourage conservation amoung our customers, we feel it is necessary to continually look for new water sources as well as conserve. Being a very small water district, we are limited by our budget. This project would help us identify water sources for the near and distant future.	160,000	1,078	1,500	20	Riverside	V	2009

3907	3710041	3710041-002	Majestic Pines Community SD	Whispering Pines Reservoir replacement	Project would involve the design, engineering, construction and hooking up of a 350,000 gallon steel reservoir on our existing Whispering Pines Reservoir site. We are hopeful that this can be done without destroying the existing reservoir thereby enabling us to utilize this structure for storage of additional fire suppression water. The old structure could be isolated from the distribution system and only be used for fire fighting purposes. If this turns out to be impossible, the old structure would be destroyed and utilized as a material storage for things like sand and gravel.The new structure would be built on the eastern portion of the property and plumbed into the distribution system with about 100 feet of 6-8 inch mainline. The existing structure is in need of replacement since it has deteriorated over the years to the point where repairs are difficult and short lived. Though we have never been cited for it's condition due to any water quality or contamination issues, it's replacement was requested by our CDPH inspector in our last two inspections. The potential for water quality problems may exist even though we take precautions to avoid these sort of issues.	O	5	C	Existing reservoir was constructed in the 1940's or 1950's. Concrete construction with hypolon liner. This structure began to leak slightly about 18 months ago and we have looked into re-lining it. Based on the age of this structure and its current condition, it seemed more prudent to replace it instead of just repairing the liner. On the past two CDPH inspections, this problem has been sited and a request for replacement was made. We have been working with an engineering firm to put together a preliminary engineering report for the project but the cost for this would deplete most all of our reserve funds. The cost for a liner replacement would be almost the same amount. At this point, replacement of the liner appears to be the most logical course of action to correct the leakage problem. This does nothing about the condition of the structure which is in very bad repair.While we have never been cited for the condition of our reservoir, there is the potential for problems in the future. It would be impossible for us to maintain adequate service to a large portion of our customers indefinitely should this reservoir have some sort of failure making it unusable. Financial reserves were significantly depleted during the construction of our new well and treatment facility completed in 2007. This project was vital to our system since our supply was diminishing due to existing wells being over used. This well and treatment plant project was completed	500,000	671	1,964	14	San Diego	V	2009
3908	3710041	3710041-003	Majestic Pines Community SD	Kentwood Treatment Plant Evaporation Pond	This project would involve the planning, design and construction of a proper evaporation pond at our Kentwood Treatment plant replacing the existing unlined structure.Project would consist of the excavation of the old pond and properly disposing of materials saturated with oxidized iron material. The next phase would be the re-compaction of soils disturbed during the previous phase and the shaping of a new evaporation pond. Steel reinforcement rods (rebar) would then be installed in a manner to make the structure solid and secure. Concrete would then be "sprayed" (shotcrete) on the site thick enough to cover the rebar and provide enough coverage to enable the use of equipment in the pond whenever the need arises in the future.A major cost in the construction of this project will be the disposal of materials removed from the site. Since this is something we have had to build twice in the past ten years, the engineering costs for this should not be extreme.	O	5	C	Our existing backwash evaporation pond at the Kentwood Treatment facility is not lined. This means that the oxidized iron filtered out of our well water at this site could possibly seep back into the ground. Our other two newer treatment facilities have concrete lined evaporation ponds to stop this from happening.Our Kentwood facility was constructed in the 1960's and has been updated over time to make it a more effective filtration system. While it is an older system, it functions quite well and with the upgrades made over time, we have been able to remain in compliance with safe drinking water requirements. In our last two or three inspections made by the CDPH, the issue of the lack of lining in this backwash evaporation pond was brought up and a request for correction was made. The condition of this facility has not resulted in any violations in drinking water standards, but it is an issue that needs to be corrected as per CDPH requirements.	150,000	671	1,964	14	San Diego	V	2009
3909	4110020	4110020-003	Palo Alto Park Mutual Water Company	Solar Power for Water System	This project will consist of installation of 144 solar panels, inverters and storage facilities at the yard of the existing facility in East Palo Alto, California.	O	5	C	The water system is entirely dependent on PG&E electrical power. We consume an enormous amount of engery. This secondary source would be helpful, save money and energy thus ensuring a more efficient and economically operating water company.	252,564	652	2,500	17	San Mateo	II	2009

3912	0310003	0310003-009	AWA Sutter Creek	Small Diameter Pipeline Ditch Conveyance Conversion Project	The project would pipe the existing 23 mile canal to continue unfiltered-raw water service intended for agricultural uses. Piping the canal would continue to sustain the current service by maintaining pressures and reliability. Additionally, piping the canal would improve water quality and reliability to all customers. The water would be protected from accidental or deliberate contamination as well as fecal or E.coli from individual septic systems, livestock or wildlife and blow-outs between Lake Tabeaud and the Tanner Water Treatment Plant. This would be an enhancement to the protection of the water service over the open ditch system for those residences which depend on the canal as there only water source. The project would combine both a gravity and pumped piping system which would be joined near the Harmon Siphon several miles east of the Tanner Water Treatment Plant. The project would also consider preliminary planning and design together with estimated costs to provide treated water to a high concentration of residential homes in the mid section. This area is about a 10 mile segment. The remainder area of service on both sides is agricultural uses. The Agency further believes that a weighted review of the 2000 census area, qualifies the service area as a low	O	5	C	The Amador Canal conveyance system is a 23 mile open ditch system from Lake Tabeaud to the Tanner Water Treatment Plant (WTP) in Sutter Creek. The source is the Mokelumne River via Lake Tabeaud. The system was originally built in the 1850's to convey raw water to goldrush era miners in Amador County. Currently the Amador Canal serves 127 customers unfiltered–raw water. This ditch system is monitored, controlled and maintained by Agency staff walking the ditch in all weather conditions with no connection to the Agency's telemetry systems. Maintaining the quality, reliability including sufficient pressure to provide service to these customers is a continual effort. The existing low flows and warm weather induce additional issues with debris, algae, color and odor. Additionally, there is continual opportunity for accidental or deliberate contamination as well as fecal or E.coli from individual septic systems, livestock or wildlife. Added to these issues are blow-outs, un-planned and planned outages. All of which create high maintenance and operation costs which burden is passed on to existing low income users. The canal system is exposed to health risks associated with the use of un-filtered-raw water in homes for the 127 customers which 61 is the only water source available. These 61 customers are out of compliance with the 1996 Amendments to the Safe Drinking Water	4,700,000	1,654	5,458	10	Amador	III	2007
3913	3110026	3110026-002	Nevada ID - North Auburn		Install temporary shoring, patch cracks and holes, relocate system pumps, and replace roof. Involves design and construction. 3914	3110026	3110026-003	Nevada ID - North Auburn		Add 3.0 MG storage tank. Involves design and construction.	O	5	C	Inadequate system storage for diurnal demands and emergency reserves.	1,700,000	2,724	6,320	21	Placer	I	1998
3915	4010014	4010014-005	CAMBRIA COMM SERVICES DIST		Provide alternate temporary routing of the pipeline during construction and replacement of at least 300 ft. of pipeline.	O	5	C	Needs to upgrade distribution mains for earthquake safety.	150,000	3,993	6,500	06	San Luis Obispo	IV	1998

3916	4010014	4010014-009	CAMBRIA COMM SERVICES DIST	Water System Supervisory Control and Data Aquisition Installation	The use of overhead land-lines for remote monitoring and alarms has proven to be unreliable in Cambria due to falling trees during storms. Such failures can come at the most critical times, which would be particularly true during a major fire. Past failures of the land-lines have also resulted in tanks not filling properly and low distribution system pressures. This project will install pre-purchased SCADA radios, while also installing and providing ancillary sensors, wiring, conduits, and control cabinets. The SCADA system will be installed in accordance with the District's SCADA master plan, which was designed to monitor pumping stations, emergency generators, well fields, and storage tanks.	O	5	C	The water master plan adopted by the Cambria Community Services District Board of Directors on September 25th, 2008 included a recommendation to install wireless Supervisory Control and Data Acquisition (SCADA) equipment on its water distribution system. The new SCADA system will replace an existing obsolete system, which only monitors a small portion of the overall warer system. Because the existing SCADA system relies upon overhead wires, it has proven to be unreliable due to falling trees that often occur in the area during storms. This existing system would similarly fail during a wildfire event. Past communication failures of the existing system have resulted in low distribution system pressures, as well as tanks not filling properly.	253,000	3,993	6,500	06	San Luis Obispo	IV	2009
3917	4010014	4010014-004	CAMBRIA COMM SERVICES DIST		Seawater desalination plant with beach wells	O	5	C	Needs to improve source capacity for maximum demand conditions.	10,000,000	3,993	6,500	06	San Luis Obispo	IV	1998

3920	2610001	2610001-003	MAMMOTH CWD	Mammaoth Community Water District: Wells #15 and #20 Rehabilitation	Mammoth Community Water District proposes to chemically treat and physically remove encrustations in the well casings of supply wells #15 and #20. Rehabilitation of wells #15 and #20 in the above manner would improve both production and reliability of both wells. This project is "shovel-ready" in May of 2009.	O	5	C	Due to aging infrastructure, Mammoth Community Water District (MCWD) water supply wells #15 and #20 are exhibiting a declining efficiency and loss of production capacity. Production losses are impacting the ability of MCWD to meet current water supply demands. Wells #15 and #20 supply more than 25% of MCWD water demand. Due to continuing drought conditions, MCWD surface water supply is expected to be restricted. Loss of well #15 and/or #20 well capacity would cause severe short term water supply shortage and would result in non-compliance with Department of Public Health requirements to maintain reserve capacities.	200,000	3,666	8,214	13	Mono	V	2009
3921	2610001	2610001-008	MAMMOTH CWD	MCWD: Filter Replacement at Lake Mary Treatment Plant	Mammoth Community Water District proposes to replace the existing filter media with Best Available Technology filter media consisting of a graded gravel base layer, two graded sand layers and an anthrocite coal layer. This project would ensure production and reliability of the Lake Mary Water Treatment Plant while reducing energy consumption.	O	5	C	The Mammoth Community Water District (MCWD) Lake Mary Treatment Plant is exhibiting more frequent and longer backwashes through aging filters. The reduction in effectiveness of the filter media results in higher energy consumption for water quality maintenance in order to comply with State Drinking Water regulations for reduction in water turbidity. The Lake Mary Treatment Plant supplies at least 40% of MCWD water demand. Loss of Lake Mary Treatment filtration capacity would cause a severe short term water supply shortage and would result in non-compliance with Department of Public Health requirements to maintain reserve capacities.	100,000	3,666	8,214	13	Mono	V	2009

3922	2610001	2610001-010	MAMMOTH CWD	MCWD: Groundwater Treament Plants Arsenic Removal	To achieve compliance with the arsenic MCL rule, MCWD has retained the services of HDR engineering to evaluate the best available treatment option for arsenic removal. To achieve compliance with the Lead and Copper MCL rule, MCWD proposes to add aeration systems to adjust the ph of the plant effluents. The Department of Public Health has initially approved this treatment alternative. To achieve the most cost-effective and timely implementation, MCWD will incorporate both the ph control and the arsenic removal improvements into a single design and construction contract.	O	5	C	The Mammoth Community Water District (MCWD) Groundwater Treatment Plants #1 and #2 are experiencing treatment failures resulting in arsenic levels as high as 13 ppb. The California Department of Public Health (CDPH) requires arsenic maximum contaminant levels (MCL) to be below 10 ppb at all times. Per CDPH requirements, MCWD has announced Teir II public notification of the exceedence of the arsenic MCL. Additionally, MCWD customers have seen a continued exceedence of the Safe Drinking Water Act (SDWA) Lead and Copper Rule. CDPH has mandated that MCWD implemant the results and recomendations of a recent Corrosion Control Study to achieve SDWA compliance for the Lead and Copper Rule. MCWD has already given Teir II public notification to District customers regarding non-compliance with the Lead and Copper Rule.	5,600,000	3,666	8,214	13	Mono	V	2009
3923	2610001	2610001-005	MAMMOTH CWD	Mammoth Community Water District: Lake Mary Treatment Plant Filter Replacement	Mammoth Community Water District proposes to replace the existing filter media with Best Available Technology filter media consisting of a graded gravel base layer, two graded sand layers and an anthrocite coal layer. This project would ensure production and reliability of the Lake Mary Water Treatment Plant while reducing energy consumption. This project is "shovel-ready" in summer of 2009.	O	5	C	The Mammoth Community Water District (MCWD) Lake Mary Water Treatment Plant is exhibiting more frequent and longer backwashes through aging filters. The reduction in effectiveness of the filter media results in higher energy consumption for water quality maintenance in order to comply with Safe Drinking Water regulations for reduction in water turbidity. The Lake Mary Treatment Plant supplies at least 40% of MCWD water demand. Loss of Lake Mary Treatment filtration capacity would cause a severe short term water supply shortage and would result in non-compliance with Department of Public Health requirements to maintain reserve capacities.	100,000	3,666	8,214	13	Mono	V	2009
3924	2610001	2610001-006	MAMMOTH CWD	MCWD Well Rehabilitation: Wells #1, #15 and #20	To improve production and reliability of the MCWD supply wells, #15 and #20 require chemical treatment and physical removal of encrustations in the well casings. Supply well #1 requires a new variable frequency drive motor.	O	5	C	Due to aging infrastructure, Mammoth Community Water District (MCWD) water supply wells #1, #15 and #20 are exhibiting a declining efficiency and loss of production capacity. Production losses are impacting the ability of MCWD to meet current water supply demands. The three wells supply more than 25% of MCWD water demand. Loss of well #1, #15 and/or #20 would cause severe short term water supply shortage and result in non-compliance with Department of Health requirements to maintain reserve capacities.	300,000	3,666	8,214	13	Mono	V	2009

3925	0310012	0310012-014	AWA Buckhorn Plant	Buckhorn WTP CIP Process Improvements	Design and construct plant modifications at the Buckhorn water treatment plant including a new CIP tank. New piping, valving and plant controls would be installed to support the tank and system.	O	5	C	The Buckhorn water treatment plant uses membrane filtration. Membranes are cleaned with a clean-in-place (CIP) process. The Buckhorn water treatment plant is equipped with one CIP tank. The CIP tank is used to mix batches of caustic and acid solutions which are circulated through the membranes. The membrane manufacturer recommends back-to-back caustic and acid washes on each rack of membranes. The only way that this can be done with one CIP tank is to waste the caustic solution, which is reusable on other racks, prior to mixing a batch of acid solution. In order to reuse solution, the plant membranes are cleaned sequentially with the caustic solution, and then with the acid solution. This method requires twice as many rack shutdowns and doesn't allow for back-to-back cleaning. The second tank was not installed because it was believed that CIPs would only have to be done every 6 months. Currently CIPs are completed every 2 -3 months. If an activated carbon system is installed at the plant to control disinfection by-products, CIPs may have to be completed even more frequently. This new project will help the plant improve the membrane cleaning process and support the control of disinfection by-products.The improvements will reduce by 50% the number of shutdowns and start-ups needed to operate the Buckhorn Water Treatment Plant. This improvement allows for compliance with Section	500,000	2,558	8,508	10	Amador	III	2009
3926	0310012	0310012-011	AWA Buckhorn Plant	CAWP Distribution System Improvements	A new 12" distribution main (approximately 2.6 miles in total length) is proposed from an existing distribution system storage tank that is located higher in elevation that the existing tank that feeds this area (approximately 340 feet higher). A significant portion of the pipeline would be installed within existing right-of-way (approximately 9,800 linear feet). A smaller portion of the pipeline (4,100 linear feet) would likely be installed along parcel lines of lands in private ownership. Easement discussions with private land owners have not begun, but easements are not expected to be difficult to obtain. In order to keep system static pressures within a reasonable range of 60 psi to 80 psi, several pressure reducing stations would be installed. The Agency will obtain the necessary encroachment permits with Amador County Public Works and all trenches within the County right-of-way will be reconstructed to current standards. Above-ground system markers will be installed every 100 feet for the portion of the main installed on lands in private ownership. However, before the design plans are started, a significant number of fire flow tests will be conducted and a system model will be created, to verify and support the improvements needed for this project.This project will provide significantly increased static and residual system pressures in compliance with Section 64602 of Title 22, as well as flushing velocities in	O	5	C	Several subdivisions (Meadow Pines Estates, Foster Ranch Estates, and Vanver Acres) and other unnamed subdivisions within a localized portion of the Central Amador Water Project ('CAWP') service area (formerly Pioneer CSD) experience significantly low distribution system water pressures, with static pressures ranging from 25 to 39 pounds per square inch ('psi'). During simulated fire flow testing, the residual pressures drop to between 9 to 25 psi. Fire flows range from 155 to 289 gallons per minute. These customer service pressures will drop below the Section 64602 of Title 22 required minimum distribution system of 20 psi during any fire flow demand, and distribution system required minimum pipeline flushing velocities of 2.5 feet per second cannot be provided without sucking air into the system and contaminating the drinking water violating Section 64575 of Title 22. Also, the Fire Code and Fire Department requirements of 1,500 gpm of fire flow protection is not being provided to the community as there is effectively minimal to no fire flow available in the summer. The Agency's ability to meet demands in an emergency, including drought and fire situations would be significantly improved with the implementation of this project.There is an important public health problem associated with water outages including subjecting the distribution system to backflow and contamination that would be significantly reduced	3,810,000	2,558	8,508	10	Amador	III	2009

3928	2910004	2910004-009	Nevada ID - E. George, Banner Mountain		Replace with standard water main materials. Involves design and construction.	O	5	C	Inadequate system reliability due to routine failure of substandard pipeline materials.	440,000	5,238	12,939	21	Nevada	I	1998

3929	3410018	3410018-013	Rio Linda/Elverta Community Water Dist	RLECWD – Hydro-pneumatic Tanks Replacement Project	The Rio Linda/Elverta Hydro-pneumatic Tanks Replacement Project consists of replacing the existing tanks with new ASME code certified tanks equipped with Pressure Safety Valves and automatic air-pad systems. Final plans and specifications for this project will be completed by June 2009.	O	5	C	The Rio Linda/Elverta Community Water District (District) maintains nine hydro-pneumatic tanks throughout their system to maintain pressures. A recent inspection and stress analysis by the former General Manager has indicated that five of the tanks are not ASME certified Pressure vessels and are not protected by Pressure Safety valves. Additionally, the tanks are beyond their useful life and are corroded internally. It has been recommended to replace the existing hydro-pneumatic tanks with new ASME code certified tanks at an estimated cost of $500,000. The District has completed the required 218 process and has approved an ordinance (No. 2009-02) which provides for a surcharge fee to pay for the proposed construction loans.	500,000	4,483	13,386	09	Sacramento	I	2009
3930	3410704	3410704-016	SCWA Mather-Sunrise	Mather Housing Filter Upgrade	The proposed project will replace the filter underdrain laterals and install new greensand media.	O	5	C	The greensand media filter at the existing "Mather Housing" manganese removal treatment plant has deteriorated and need to be replaced. Presently, the filter underdrain system has plastic laterals that are broken, and thereby allowing large amounts of filter media to pass to the treated water storage tank. Moreover, the greensand media used for filtration is aged and in need of replacement.	300,000	4,330	15,903	09	Sacramento	I	2009

3933	1910191	1910191-004	NORWALK - CITY, WATER DEPT.	Norwalk Park Well No. 10 and Transmission Main Project	Design and construction of the City's Norwalk Park Well No. 10 and Transmission Main Project. Its anticipated to provide assurance of water supply reliability, emergency fire suppression to the water distribution system, during and after a major seismic event.	O	5	C	During the past several years, the City has experienced increasing problems with the integrity of its water system infrastructure. Improvements are needed in order to safeguard the quality of the drinking water supply being served to the City's constituents. Inadequate water supply and pressure restrict development in the economically depressed Norwalk Park neighborhood in the center of town. Additionally, both a federally funded study and a County study indicated that the City's ability to provide water would be severely compromised in the event of a major earthquake. Inadequate storage limits the City's fire suppression capability. In order to obtain a State loan, the City would have to increase rates over 50%. The City has already passed a rate increase in 2008	2,600,000	5,401	22,000	15	Los Angeles	IV	2009
3934	1910143	1910143-005	SAN FERNANDO-CITY, WATER DEPT.		Recondition well column and casing. Clean well screens and replace pump/motor. 3936	3710026	3710026-007	Valley Center MWD	Country Club Reservoir - Cover/Liner Replacement	This 10.0 MG Reservoir is the larger of two reservoirs supplying water to this pressure zone. The project consists of the design and construction of a hypalon liner and replacement cover. The project will include removal and disposal of the existing roof structure, along with block walls and interior columns that support the existing roof structure.A hypalon liner will be designed and installed over the floor and side slopes of the reservoir to eliminate the existing leakage. The existing cover will be replaced with a new floating hypalon cover. The project also includes minor modifications to the inlet/outlet structure, installation of mixing equipment and ancillary site improvements, such as valving and remedial pavement.	O	5	C	Placed into service in 1975, the Country Club Reservoir is a 10 million gallon, in ground, asphaltic cement lined reservoir with a concrete column and steel truss supported corrugated metal cover. The reservoir cover and support structure is experiencing severe corrosion due to the high humidity, chlorine off-gassing and exposed steel. Several truss components have corroded to the point where portions of the supports are missing and have dropped into the water below, causing water quality concerns. The corrugated metal cover has received numerous repairs to eliminate leakage. The structural integrity of the cover is also jeopardized by the corrosion that has occurred. Further, the under drain system is indicating minor leakage, which is a result of the deteriorating asphaltic cement liner.Installation of a new liner and replacement of the cover is needed before this degradation affects the water quality.	2,015,000	9,726	25,572	14	San Diego	V	2009
3937	3710026	3710026-006	Valley Center MWD	Pfau Pump Station Replacement	The Pfau Pump Station Replacement project consists of replacing the two existing 100 HP Horizontal Centrifugal Pumps with four 50 HP Vertical Multi-Stage Pumps coupled to premium efficient motors. With this replacement pump efficiency increases from less than 50% to just more than 80%. This station's average energy consumption is 600,000 KWH per year for an annual cost of $97,000. With the new pumps, annual energy consumption and costs are expected to be reduced to 375,000 KWH and $60,000, respectively, while pumping more water. Also included in the replacement is the installation of Supervisory Control and Data Acquisition (SCADA) equipment to monitor and trend real time station efficiency, allowing District operators to make better decisions on operating schedules and pump selection. The pumps and controls were pre-purchased in April 2009, with delivery scheduled for November 2009. Installation will be by District forces, with consultants providing station integration into the District SCADA system.	O	5	C	The Pfau Pump Station was originally constructed in 1968 with two 100 HP horizontal Centrifugal pumps. The design efficiency of these pumps is less than 50%. The pump station operates with a pressure reducing valve on the discharge line to keep the pumps within the design operating parameters, thus further reducing the overall station efficiency.	250,000	9,726	25,572	14	San Diego	V	2009
3938	1910077	1910077-004	GSWC - FLORENCE/GRAHAM	Perchlorate removal for Converse Well #1	It is proposed to add ionic exchange process to removal perchlorate. The perchlorate level at this well is barely above the MCL, thus it is expected the ionic exchange process should run longer before the media become exhausted. The well has a pretty good yield at 1000 gpm. The urgency to bring this well back online is apparent. The Florence-Graham System last year lost 3 productive wells out of the 7 wells due to perchlorate and VOC contamination. To treat this well can improve the water shortage for this system	O	5	C	This well has perchlorate contamination. The detected level before the well was shut down was up to 5.8 ppm. Due to concern of perchlorate MCL violation, the well was placed offline since October of 2008. Very recently, a well profile analysis was performed at this location by BSST Ink, Inc. Perchlorate was detected at various depth with concentration up to 6.2 ppb	1,000,000	9,729	31,340	15	Los Angeles	IV	2009

3939	3410010	3410010-008	CalAm - Suburban	Sacramento "District Wide" Water Conservation Program	The program has two "full service" elements that encompass a "City Wide Water" Conservation Program. Element A: A team of trained plumbers will retrofit 45,000 residential homes / 90,000 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 2,761 acre feet per year. Element B. A team of specialist will retrofit 15,000 residential yards with modern ET water controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 920 acre feet per year. .This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 to 24 months and employ 75 to 100 people.	O	5	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 3,721 acre feet per year or 50.0 / 75.0 gallons per day, per person.	27,585,000	9,874	33,314	09	Sacramento	I	2009
3940	3410021	3410021-008	San Juan Water District	Water Main Replacement Projects	Bentley to Folsom Oaks - replace 329 feet of 8 inch mainline and appurtenances with 12 inch mainline.Park Vista - replace 746 feet of 8 inch mainline and appurtenances.	O	5	C	The Park Vista and Bently to Folsom Oaks mainlines are old, leaky, and unreliable. They need to be replaced. The Park Vista line would cause serious soil erosion and environmental damage if it breaks.	400,000	10,240	33,792	09	Sacramento	I	2009
3941	3410021	3410021-009	San Juan Water District	Four inter-tie pipelines from GravityZone to Sierra Zone	The four inter-tie pipelines will total about 4,275 feet in the following manner:Excelsior Road 12" - 1,050 ft.Peerless Avenue 12" - 1,200 ft.Oak Avenue 12" - 1,400 ft.Gravity Zone transmission main connection to Cooperative Transmission Main 30" - 625 ft.They will be constructed of pvc or ductile iron.	O	5	C	With the installation of four 12" to 30"inter-tie pipelines from the Gravity Zone to the Sierra Zone, the Sierra Pump Station can be decommissioned, and the zone will be fed completely by gravity pressure. The electrical energy formerly required to operate the pump station will no longer be required, and will be available for other uses in the community. The lower water pressure to the Sierra Zone will result in meaningful water conservation.	820,000	10,240	33,792	09	Sacramento	I	2009
3942	1910062	1910062-005	LA VERNE, CITY WD	Groundwater Treatment Facility - Pomona Basin	The City proposes to construct a 1,000 gpm ion exchange treatment facility and related piping at its main water operations yard. The treatment system will also require limited piping to provide discharge of wastes from the treatment system. The City proposes to rehabilitate and exsiting concrete line and connect it to the City's existing industrial waste (brine) line. This concrete line is in very close proximity to the proposed treatment facility and the city's existing brine line.	O	5	C	La Verne overlies three groundwater basins, each of which is affected by nitrate and perchlorate contamination. Blending with imported surface water supplies is the current method of treatment, but is limited due to demands. This proposed ion exchange project will enhance the city's ability to produce and treat local groundwater supplies and reduce its dependence on imported surface water supplies. The ion exchange will allo the city to produce more groundwater and production will not be limited by demand, as is currently the case with blending operations.	2,500,000	8,516	34,046	15	Los Angeles	IV	2009

3944	3110004	3110004-003	City of Lincoln	Catta Verdera 30" & 36" Transmission Pipeline and Metering Station	The Catta Verdera 30" & 36" Transmission Pipeline & Metering Station (Project) includes the construction of the following major components:- Construction of approximately 10,000 feet of 30-inch transmission pipeline from an existing 30-inch stub-out on a PCWA-owned 42-inch transmission line about 200 feet north of the City's 5 million storage tank, in a northerly direction along the easterly edge of the Catta Verdera development, the westerly edge of the PCWA Whitney Reservoir, following PCWA's Caperton Canal access road to the Metering Station site in the City Park/old City Pond/City Open Space area. Appurtenaces along the 30-inch pipeline include air relief and pipeline drain valves aligned into existing canal spill/drainage ways. The access road along the 30-inch pipeline and Caperton Canal will be designed as a 12-foot wide EVA with access for service and fire vehicles. Fencing along the EVA will be required in the Whitney Reservoir area.- Construction of a metering station capable of SCADA flow control from 0 – 20 mgd with pressure reduction from a hydraulic grade of about 900 ft to about 600 ft. The design and materials of construction, security, fencing, landscaping will be similar to the existing PCWA-City metering station at the City's 5 million gallon tank.- Construction of approximately 4,000 feet of 36-inch transmission pipeline from the metering station in a westerly direction through City Open Space to the	O	5	C	The Catta Verdera 30"& 36" Transmission Pipeline and Metering Station Project (Project) is required primarily to: - Continue to meet City water demands from its wholesale treated surface water supply; - Provide a second pipeline and metering station to provide wholesale deliveries to the City; and- Provide a high pressure gravity supply to the only booster-fed portion of the City's distribution system.In 2006 the City purchased about 8,700 acre-feet of treated surface water based on a wholesale water agreement with the Placer County Water Agency (PCWA). The City's point-of-delivery is through a metering facility to the City's 5 million gallon storage tank. The metering station, per PCWA, has a capacity of about 17 mgd due to limitations in the hydraulic grade available to the two 30-inch pipeline segments feeding the metering facility from northerly and southerly directions. The maximum day delivery to the City in 2006 was 15.2 mgd, and as a result, PCWA notified the City that its demands were approaching the capacity of their delivery system. The PCWA-City agreement identifies the PCWA commitment to meet the City's maximum day demands. Since 2007, the City has coordinated its design team effort with PCWA for a new 30" transmission line and metering station to increase City deliveries beyond the 17 mgd limit. Downstream of the metering station, a 36-inch pipeline will convey treated water to the junction	6,000,000	16,238	38,000	02	Placer	I	2009

3949	3710029	3710029-005	Olivenhain MWD	Design of Alternative Raw Water Pipeline	Olivenhain Municipal Water District is planning on constructing a new raw water pipeline from the San Diego County Water Authority's Second Aqueduct to the David C. McCollom Water Treatment Plant, allowing for continuing raw water supply to the District's treatment plant after introduction of Lake Hodges water into Olivenhain Reservoir. This pipeline would effectively bypass the Olivenhain Reservoir, allowing for continuing local water treatment while forgoing the need for costlier upgrades to the plant itself, and protect water quality water for the District's customers.This project includes all design services for the raw water pipeline. These services include an alignment study; field reconnaissance, data collection, and utility research; surveying, mapping, and right-of-way support; execution of a geotechnical investigation; utility potholing; preparation of a preliminary design report to define the preferred pipeline alignment, define the size of proposed pipeline, perform hydraulic calculations, and establish the basis of design for connection to SDCWA's Pipeline 5 and and use of Olivenhain's Flow Control Facility; completion of final design survey; preparation of construction drawings and specifications; preparation of an opinion of probable construction cost; development of a traffic control plan; submittals; provision of technical assistance in order to obtain permits and regulatory	O	5	C	Olivenhain Municipal Water District and the San Diego County Water Authority have reached a tentative settlement agreement on water quality issues in regard to Lake Hodges, whereby Lake Hodges water would be introduced into the Olivenhain Reservoir. The District's David C. McCollom Water Treatment Plant, which was designed to treat raw water, is dependent upon Olivenhain Reservoir as a source, and is not capable of treating water contaminated to the level as that found in Lake Hodges. Lake Hodges is a highly impaired body of water. Sampling of Lake Hodges indicates that Lake Hodges water contains 78 contaminants, including minerals such as arsenic, cyanide and lead; organics that include MTBE, vinyl chloride and zylene; and a number of pesticides including aldicarb, aldrin, carbaryl and diazinon. Samples collected from Lake Hodges by the City of San Diego also indicates that water in Lake Hodges exceeds maximum contaminant level (MCL) standards. These include aluminum, chloride, iron, manganese, and sulfate. Lake Hodges was listed as 303(d) impaired body of water by the US Environmental Protection Agency in 2002 and 2006, and documented sewage spills into Lake Hodges between 2001 and 2006 totaled 44,270 gallons according to the SDCWA's 2008 Watershed Survey.A study completed by CH2M Hill for Olivenhain in September 2006 indicated that it would cost the District a minimum of $40 million to treat the	212,500	23,109	63,000	14	San Diego	V	2009

3950	3310021	3310021-014	Jurupa Community SD	High School Well Renovation	The High School Well Renovation Project will recover poor quality groundwater that is high in nitrates and total dissolved solids and provide a new local source of raw water supply. With treatment, this groundwater will be able to be used for drinking water purposes, yielding approximately 600 acre-feet per year of potable water for the Jurupa Community Services District. The project includes renovation of an existing well, which requires redevelopment, addition of a sanitary seal, and re-equipping. In addition, the project will include approximately 400 feet of 18-inch diameter pipe to connect the High School Well to the existing raw water supply line and treatment facilities. The project will provide an additional source of raw water for the existing Roger D. Teagarden Ion Exchange Plant and provide a more diverse and reliable water supply for the District. Renovation of this well, which is located at the Jurupa Valley High School site, will yield approximately 600 more acre-feet per year of treated domestic water and create 12 new jobs. The High School Well Renovation Project is identified as JCSD Project J-8 in the Integrated Regional Water Management Plan prepared by Western Municipal Water District (2008 Update).	O	5	C	An existing well located at the Jurupa Valley High School site within the Jurupa Community Services District (JCSD) service area is not usable for drinking water purposes because it has poor water quality that does not meet drinking water standards. Its groundwater is high in nitrates (approximately 140 mg/L, which exceeds the primary MCL of 45 mg/L) and total dissolved solids (approximately 940 mg/L, which exceeds the secondary MCL of 500 mg/L). The well requires redevelopment, needs a new sanitary seal, and must be re-equipped to serve as a drinking water supply well. A supply pipeline is needed to convey the raw water to the treatment facilities. Groundwater treatment for nitrate and salinity removal is required for municipal use. The High School Well Renovation Project is needed to increase the raw water supply to the existing Roger D. Teagarden Ion Exchange Plant, which will treat the water to meet drinking water standards and increase the local potable water supply.	1,075,000	24,684	68,297	20	Riverside	V	2009

3958	3410029	3410029-004	SCWA Laguna/Vineyard	Replace and Upgrade Arsenic Treatment System and Media Filter at Dright Road and Lakeside Water Trea	The proposed project will replace the existing greensand media in the existing four filter vessels at the Lakeside and Dwight Road treatment plants with Filtronics media. The Dwight Road WTP has a single filter with a treatment capacity up to 1500 gpm and the Lakeside WTP has three filters with a total treatment capacity up to 4500 gpm. The Filtronics media would be placed in the same vessels as the greensand media. The filtration rate through the vessels with the Filtronics media at both plants will be the same as the greensand media – approximately 6.4 gpm per square foot. The use of the proprietary Filtronics media will eliminate the need for adding hydrochloric acid because pH adjustment is not required with the Filtronics media. A pilot study using the Filtronic media material was conducted at the Dwight Road WTP and the result shows that both arsenic and manganese were removed to levels below their corresponding state MCL requirements without feeding hydrochloric acid. A full-scale coagulation/filtration treatment process using the Filtronics media has been used at Rio Cosumnes Correctional Center. The results have demonstrated the treatment process using the Filtronic media material is effective and reliable. The proposed project will help minimize the operational and maintenance problems caused by the use of hydrochlorica acid, and will significantly enhance on-site worker safety. The	O	5	C	The four municipal wells supplying raw groundwater to the Dwight Road and Lakeside Water Treatment Plants have been found to contain arsenic at levels exceeding the state MCL of 10 ug/l, and manganese at levels exceeding the state secondary MCL of 50 ug/l. These two WTPs employ oxidation, coagulation and filtration processes for the removal of arsenic and manganese. At the Lakeside Treatment Plant, hydrochloric acid is fed at the raw water pumped from wells, then sodium hypochlorite and ferric chloride are fed prior to filtration through three greensand filters. The use of hydrochloric acid at the wells feeding the Lakeside treatment plant is necessary for arsenic removal. However, the use of the hydrochloric acid has created many operational and maintenance difficulties: It is highly corrosive and eats away at plumbing, fittings, screws, bolts, concrete, underground piping, is expensive and requires scrubbing of off gases during delivery; it requires calibration of the pH analyzers on weekly basis; and last the acid is very hazardous to staff who have contact it. The levels of arsenic contained in the treatment effluent at the Lakeside Treatment Plant typical range from 5 to 10 ug/l. Due to the arsenic exceedence at the Dwight Road plant, its single well and greensand filter have been taken out of service. .	170,000	41,974	153,701	09	Sacramento	I	2009
3959	1910039	1910039-012	SAN GABRIEL VALLEY WATER CO.-EL MONTE	Addition of storage reservoir at Plant B14	Construct a second water storage reservoir. 3961	3710014	3710014-008	Oceanside, City of	Peacock Hills Service Area Pressure Regulating Station	The project consists of installing a new pressure-regulating station facility. The work generally includes furnishing labor, equipment, materials, and services to construct an aboveground concrete masonry unit building on a belowground reinforced concrete slab and wall structure to house pipe lines, telemetry (SCADA) equipment, electrical and instrumentation equipment, CLA-VAL regulating valves, butterfly and gate valves, air and vacuum valves, manual air release valves, bridge and jib cranes, and other appurtenances. The pipeline work includes installing and testing CML&C steel pipe and fabricated steel fittings and connections to the existing City of Oceanside facilities. The work also includes upgrading the existing pressure-regulating vault and converting it into a meter vault facility including magnetic flow meters, valves, electrical upgrades, and roof and wall retrofits. Other items of work include by-pass piping and appurtenances, grading, trench and structure excavation and backfill, site improvements, and excavation safety measures.	O	5	C	The Peacock Hills Service Area Pressure Regulating Station (Station) is located on the east side of the City's Guajome Reservoir site at 1398 Temple Heights Drive. The purpose of the Station is to reduce pressure in the aqueducts prior to discharging into the two reservoirs and to maintain minimum pressure to the Peacock Hills Service Area. This Station was constructed in 1978 and houses the City's number 2 and number 3 aqueducts, which are both 24-inch steel pipelines. The aqueducts originate at the Weese Filtration Plant and terminate at the two Guajome Reservoirs. Outside the east side of the Station is a 12-inch pipeline that comes from both aqueducts and serves the Peacock Hills area. The Station is undersized, inadequately ventilated, poorly lit, and has no facilities such as stairs, landings, or lifting devices to facilitate proper maintenance. It is difficult for staff to access and maintain. The facility needs to be expanded and upgraded to current regulations. Furthermore, the steel pipes that are inside and outside the Station have extensive metal surface loss and pitting and need to be replaced.	1,800,000	42,423	178,806	14	San Diego	V	2009
3962	3710014	3710014-009	Oceanside, City of	Weese Water Treatment Plant Improvements	Construction of flocculation and sedimentation basins and improvement to the solids handling process to dispose of the additional sludge that will be produced.	O	5	C	The City of Oceanside's Weese Water Treatment Plant is currently a direct filtration facility. The City is receiving more imported water from the State Water Project than previously so it is necessary to convert the facility to a conventional filtration plant with sedimentation basins.	18,000,000	42,423	178,806	14	San Diego	V	2009

3963	3710014	3710014-007	Oceanside, City of	Wellhead Facilities for Wells 10 and 11	This project to Construct the wellhead facilities for wells 10 and 11, located at 3550 Mission Ave. includes piping, mechanical, well pumps, electrical, controls, civil work, landscaping, and installing a 20" piping, casing and conduit across Highway 76 by jack and bore and tying into existing 20" piping on the north side of Highway 76. Upon completion of the wellhead installation, the City of Oceanside's Mission Basin Groundwater Purification Facilty can be operated at its design capacity of 6.37 mgd.	O	5	C	The Mission Basin Groundwater Purification Facility, located at 215 Fireside Drive, was originally constructed and put into operation in 1994. The original facility produced 2.2 million gallons per day (mgd) of potable water from brackish groundwater by use of a reverse osmosis treatment process. A subsequent expansion project was to bring the capacity of the plant up to 6.37 mgd. This expansion consisted of three additional production wells, nine monitoring wells, a high and low pump station, an additional reverse osmosis train, and other infrastructure-related work. All work was satisfactorily completed with the exception of the production wells, which when drilled did not produce sufficient quantities for production. In October 1998, a joint participation agreement between the City of Oceanside, San Diego County Water Authority (SDCWA) and the Metropolitan Water District (MWD) for participation in the Groundwater Recovery Program (GRP) was executed. As part of the GRP study, SDCWA has drilled 11 exploratory wells to map the Basin for possible future use. As part of the drilling project, Oceanside had the SDCWA analyze up to five sites with an emphasis on three that can replace the poorly performing well sites 6, 7 and 8. Three of the sites are within a mile of the Mission Basin Groundwater Facility with one being on the plant site. Well Sites 10 and 11 have been drilled by the SDCWA and have shown to	2,400,000	42,423	178,806	14	San Diego	V	2009
3964	3710010	3710010-007	Helix Water District	Chlorine Contactor Valve Rehab	This project comprises the removal of five large valves inside of a 1.8 million gallon (MG) chlorine contactor for the replacement of defective actuators and seats. Due to the criticality of this facility, the work will require the shutdown of the treatment plant for the removal of all five valves and installation of several temporary bulkheads within 24hours. Once the valves are removed, a complete rehabilitation of the valves will begin. Valves will be pressure tested and seats replaced as needed. The new actuators will be installed after pressure testing of the valves to avoid possible damage to the actuators. The replacement actuators are custom and factory-sealed for submerged service. After the actuator installation, the valves will be sand blasted and a protective epoxy coating applied to all metal surfaces. As a final precaution, the valves will each have a cathodic protection system installed to provide further protection from future corrosion issues. Upon completion of the valve rehabilitation phase of the project the final scheduling, and planning for the reinstallation will occur. The plant will be shutdown, contactor drained for the valve installation. The temporary bulkheads will be removed and all five valves reinstalled complete with cathodic protection.	O	5	C	Background, The 106 MGD conventional treatment plant with ozone as a primary disinfectant utilizes a chlorine contactor after biological filtration to inject chlorine/ammonia at the influent of the contactor for chlorimine disinfection residual in the distribution system. Should ozone go offline for any reason the ammonia feed point is automatically switched to the contactor effluent and free chlorine is applied to the contactor influent for CT disinfection compliance. Should the functionality of contactor become compromised the free chlorine addition point referenced above would need to be moved upstream of the filters which would adversely influence the biologically active filters and the formation of disinfection byproducts. This chlorine contactor contains five submerged butterfly valves used to drain, isolate/bypass or change the operation mode. These valves range in size from 36 to 84 inches in diameter. Staff discovered significant leakage of two of the valve seats. Investigations also revealed that the valve actuators are not sufficiently water tight and risk corrosion and eventual damage to the actuator internal gearing and components which could lead to valve failure and subsequent plant shutdown affecting over 250,000 customers. New replacement actuators have been furnished and await installation. When complete this project will insure the plants ability to supply	300,000	55,497	263,642	14	San Diego	V	2009

3968	3710042	3710042-013	San Diego County Water Authority	Treatment Facilities in Semitropic-Rosamond Water Bank	The primary purposes of the Project are to improve water quality, to enhance water supply reliability and flexibility in a cost-effective and environmentally sound manner, to help reduce the rate of aquifer overdraft, to allow continuation of agricultural uses on Project lands, and encourage conjunctive use, where appropriate. Treatment facilities in Semitropic-Rosamond Water Bank allows the Water Authority to address its region's vital water requirements by enabling the withdrawal from the bank as necessary of up to 40,000 acre-feet of stored water supply. The Project will enhance the needs of the San Diego region through facilities that are of sufficient size and scope to be both cost effective and environmentally sound.In essence, the Projects act as both an underground storage reservoir and natural water treatment plant. Surplus State Water Project and Central Valley Project supplies will be stored in wet years for later recovery and use in dry years. Water recovered from the Antelope Valley Water Bank meets drinking water quality requirements and water recovered from the Semitropic Water Bank meets drinking water standards, with the exception of Arsenic. This Project will develop an arsenic treatment plant at Semitropic to reduce Arsenic to acceptable levels for introduction back into the California Aqueduct before delivery to end users. As surface water is cycled through the groundwater bank facilities and returned to	O	5	C	The San Diego region typically experiences water shortages during periods of drought that are exacerbated by regulatory issues in Northern California concerning the Sacramento-San Joaquin Bay-Delta. The Water Authority's Regional Water Facility Master Plan identified a need for at least 100,000 acre-feet of carryover storage in order to meet reliability goals in dry years. A project for 100,000 acre-feet of carryover storage at San Vicente was included in the Water Authority's Capital Improvement Program in 2004. A subsequent evaluation of the demand and supply analysis based on the 2005 update of the Urban Water Management Plan identified a need for approximately 95,000 acre-feet of additional carryover storage. This evaluation looked at a three-year dry cycle scenario during which demands are high and imported supplies are constrained by preferential rights. Based on that scenario, the Water Authority executed an agreement with Semitropic-Rosamond Water Bank (Semitropic-Rosamond) that would allow water to be delivered and stored during above normal hydrology and extracted from the basin and delivered to the Water Authority either by wheeling through various facilities, exchanges, or a reduction in demands on the Water Authority. Semitropic-Rosamond is a joint powers authority formed by the Semitropic Improvement District of the Semitropic Water Storage District, Valley Mutual Water	13,500,000	102	3,140,000	14	San Diego	V	2009
3969	3710042	3710042-009	San Diego County Water Authority	SDCWA Water Efficiency Improvements for End Use Systems	This project will help our region partially offset impacts from SWP and MWD shortages. We are requesting consideration for both federal funds (Federal Economic Recovery, Water Efficiency Funds) and state Category E funding (with forgiveness of principal). The project will implement control technology and distribution system improvements downstream of points of connection. These upgrades, coupled with specialized field services, aim to achieve a minimum 20% water savings at participating large landscape areas on dedicated landscape meters.The proposal meets the "shovel-ready" criteria. Requested funds will enable the expansion of a successful ongoing pilot program, increasing the number and geographic diversity of participating project sites. When fully implemented, total yield from sites funded by this grant will approximate 2,200 AFY. The program is currently being implemented as a pilot in partnership with San Diego Gas & Electric. A contractor was selected via an RFP to deploy irrigation control technology and deliver irrigation management services with a targeted minimum savings of 20% per site. The contractor delivers turnkey services (marketing, site enrollment, audit & installation, ongoing irrigation management, and reporting). To date, 14 large landscape sites are enrolled, spanning a combined area in excess of 85 acres, with nearly 60 dedicated landscape meters.	O	5	C	The San Diego County Water Authority (SDCWA) is located within the service area of the State Water Project (SWP) system. The SWP is presently experiencing severe water quantity problems resulting from drought conditions, and environmental protection actions necessary to safeguard the Delta ecosystem, and infrastructure limitations (namely the lack of conveyance facilities to circumvent the Delta and the need for additional system storage and conveyance). These conditions restrict the SWP's ability to reliably deliver water to State Water Contractors. Our dependence on imported supplies (as high as 90%), and our location at the furthest reaches of the SWP and Metropolitan Water District (MWD) distribution systems underscore our region's vulnerability to systemwide shortages. Regional and local agencies like SDCWA and its 24 member agencies must mitigate for these shortages through measures identified in our regional Drought Response Plan and Water Conservation Program. Any savings derived from these initiatives ultimately accrue to the local and regional distribution systems to help offset near-term water shortages. This proposal requests funding for a water efficiency program targeting the landscape sector, which has high potential for immediate water savings.	3,850,000	102	3,140,000	14	San Diego	V	2009

3980	1910041	1910041-006	THREE VALLEYS MWD	Martin Cienega Groundwater Treatment and Rising Water Mitigation	This multi-purpose project seeks to produce local groundwater from a basin that has historically exhibited water quality and rising water challenges. It is located within the Six Basins area, which includes cities in both Los Angeles and San Bernardino counties. The proposed project is specifically located within the Pomona Basin portion of Six Basins, overlying the cities of Claremont and Pomona. This project will enhance local water supplies by recovering groundwater with high levels of nitrate and contaminated with volatile organic compounds (VOCs). In addition to offsetting a like amount of imported surface water, extractions by this project will help mitigate the adverse impacts of rising groundwater in the immediate vicinity of the Martin Cienega located just west of the downtown area of Claremont. Groundwater captured by this system will improve the overall water quality in the immediate vicinity of the project and will prevent further migration of tainted groundwater to another area of rising water (Palomares Cienega) located downgradient, at the southern end of the Pomona Basin. The proposed project is the first phase of a recommended program covering distinct areas within the Six Basins. In a report entitled Mitigation Alternatives to Rising Groundwater Study (May 2006), the Martin Cienega – referred to as Area 2 – is	O	3	C	The Six Basins area straddles the Los Angeles-San Bernardino county line and includes six groundwater basins overlying the cities of Claremont, Pomona, La Verne, and Upland. The basins have experienced water quality problems in the past primarily due to high nitrate levels and volatile organic compound (VOCs) concentrations. Certain areas within the Six Basins have also historically exhibited rising water conditions. Areas called “cienegas”, wherein high groundwater or artesian conditions are prone to occur, were identified many years ago but did not generally cause great concern when the area was primarily agricultural. Now these cienegas pose adverse impacts whenever high groundwater conditions occur because the region is much more urban. Additional extraction capabilities within targeted areas of the basins will allow the use of the local groundwater supply, reduce the potential adverse impacts of rising groundwater, and minimize the potential migration of large quantities of groundwater from affecting other downgradient areas that may be susceptible to the same rising water conditions. The Pomona Basin, within the Six Basins Area, is one such targeted area for extraction. With the nitrate and VOC contamination observed at existing area wells, the project will certainly require appropriate treatment.	10,500,000	11	0	07	Los Angeles	IV	2007

3981	1910128	1910128-011	COVINA IRRIGATION CO.	Baldwin Park Well #3 Pump to Waste	The proposed project is to bring this active source up to current standards by the inclusion of additional piping necessary to deliver the water produced to a nearby flood control channel untill water quality is acceptable. The project will include water quality monitoring equipment and an additional flow meter to account for water loss. This project is (and has been) considered a high priority by CDPH following routine inspections.	O	0	C	This well was constructed in 1951 and does not include any provision for pump to waste upon start up, since piping only exists to deliver the water produced directly to the adjacent reservoir.	150,000	12	0 15	Los Angeles	IV	2009
3982	1910128	1910128-008	COVINA IRRIGATION CO.	Baldwin Park Reservoir Roof Replacement	The current roof is made of corrugated steel, which is approximately 60 years old and beyond economical repair. Similar material and construction is recommended.	O	0	C	The roof covering this reservoir is in disrepair and has been identified by CDPH in a recent inspection as a priority needing to be addressed. Although no positive bacteriological sample results have been observed from the reservoir, the wells supplying it have had some positive results and replacing the roof would help ensure water quality leaving the facility.	1,250,000	12	0 15	Los Angeles	IV	2009
3983	4310027	4310027-013	Santa Clara Valley Water District	Water Treatment Plant I/O Cards and Trunk Cables	The project will replace the treatment plants' I/O modules with current technology.	O	0	C	The input/output modules that are part of the Supervisory Control and Data Acquisition (SCADA) system and used to operate the treatment processes at the Distrct's three water treatment plants are obsolete and no longer supported by the manufacturer. If they failed, depending on which treatment processes are impacted, treated water quality may be negatively impacted and the treatment plants may have to be shut down to repair/replace the I/O modules.	6,002,000	25	0 17	Santa Clara	II	2009
3984	5710012	5710012-007	WOODLAND-DAVIS CLEAN WATER AGENCY	WDCWA Water System Consolidation Project: Regional Treated Water Pipelines (Cr+6)	WDCWA will construct approximately 10 miles of water pipelines to convey treated surface water from a new regional water treatment facility to the cities of Woodland and Davis. Surface water will largely replace groundwater supplies. This will allow the cities to consolidate water systems, comply with current and pending NPDES requirements for selenium, boron, and TDS, and nearly eliminate nitrates and other harmful constituents in drinking water. For example, groundwater wells indicate nitrate levels of between 2-40 ppm; Sacramento River water contains less than 1 ppm.To pay for the project and related project elements, the Woodland City Council recently adopted water rates that will triple water bills over a seven-year period ending in 2016. Davis is considering similar rate increases. SRF funding could help to lessen the projected rate impact on water users.The project partners have long studied water quality treatment and supply options to address increasing nitrate contamination, along with other constituents. Objectives include improving water quality, improving water supply reliability, and maintaining compliance with drinking water and NPDES discharge requirements. Many years and millions of dollars later, it has been concluded and confirmed by independent experts that developing a new surface water supply to largely replace groundwater is the safest, most cost-effective	O	0	C	This application replaces Record ID 3984 submitted in 2010.Woodland and Davis, small urban communities located in the largely agricultural Yolo County in California, rely entirely on groundwater for drinking water supplies. Drinking water quality in both cities is threatened by aging water systems and degrading groundwater supplies. Nitrate levels are increasing and there are elevated levels of TDS, selenium, arsenic, iron, manganese and boron. Selenium, boron and TDS passed through to the wastewater treatment plant (WWTP) will fail to meet pending NPDES discharge requirements. Nitrates, in particular, are a current public health concern. So, too, are chromium 6 levels, which are among the highest in the Central Valley.Given the heavy agricultural operations in Yolo County, it is not surprising that both cities struggle to comply with MCLs for nitrates. Addressing Nitrate in California’s Drinking Water, a study by UCD’s Center for Watershed Study, documented similar problems in other agricultural communities. In Davis and Woodland, it is only through extraordinary efforts, such as abandoning wells, reducing production at problem wells and adding new wells, that violations of nitrate MCLs have been avoided. In fact, elevated nitrate levels have been the primary cause of well shutdowns and reduced production in both cities. In both Woodland and Davis, each of the wells destroyed due to elevated	36,000,000	30,677	0 09	Yolo	I	2012

3985	4310027	4310027-014	Santa Clara Valley Water District	Rinconada Water Treatment Plant Chemical System and Standby Power Upgrade	Chemical System:The project will replace and upgrade the existing phosphoric acid and caustic soda system at the treatment plant to continue to comply with EPA's Lead and Copper Rule minimzing risks of water quality violations. The project will replace the 48-inch flow meter and backwash pump adjustable speed drive to improve plant reliability and to extend the useful life of the plant.Standby Power:The project is designed to provide a reliable standby power source at the plant. The project design and construction includes following:1. Relocation of existing equipment to a permanent location2. Construction of new concrete platform for the existing engine-generator, fuel storage tank, step-up transformer; and new concrete stairs and sidewalk.3. Electrical and control system installation for relocated equipment4. Installation of new double-containment fuel oil piping and accessories 5. Installation of sound barrier6. Restoration of landscaping	O	0	C	Chemical System:The Rinconada Water Treatment Plant's existing corrosion inhibitor facilities (caustic soda and phosphoric acid) do not meet the current seismic and fire codes and District Operations design requirements. The existing 48-inch diameter main treated water effluent flow meter is obsolete and inaccurate. The existing adjustable speed drive for the backwash pump is failing and no longer supported by the manufacturer. If the backwash pump adjustable speed drive failed, the filtration process would be negatively impacted, potentially affecting the treated water quality.Standby Power:The existing trailer mounted engine-generator and associated equipment were installed on a temporary/rental basis when California faced sporadic energy shortages throughout the state in 2001. The Board authorized staff to prepare the District to address electrical reliability against planned rolling blackouts and unplanned outagesTemporary installation is difficult to operate and maintain. An uninterrupted power supply is critical for operation of the plant to meet contractual water delivery.	6,370,000	25	0 17	Santa Clara	II	2009
3986	5710012	5710012-004	WOODLAND-DAVIS CLEAN WATER AGENCY	WDCWA Water System Consolidation Project: Regional Water Treatment Facility (Cr+6)	WDCWA will construct a new regional water treatment facility to provide high-quality surface water for municipal use in Woodland, Davis and UC Davis. Surface water will largely replace groundwater supplies. This will allow the cities to consolidate water systems, comply with current and future NPDES requirements for selenium, boron, and TDS, and nearly eliminate nitrates and other harmful constituents in drinking water. For example, groundwater wells indicate nitrate levels of between 2-40 ppm; Sacramento River water contains less than 1 ppm.The 40 mgd regional water treatment facility is expected to cost $137 million (April 2012). To cover its share of costs, the Woodland City Council recently adopted water rates that will triple water bills over a seven-year period ending in 2016. Davis is considering similar rate increases. The cities combined have approximately 31,000 water connections. SRF funding would lessen the projected impact on water users.The water treatment process will include physical-chemical pre-treatment, filtration and disinfection. The pre-treatment will remove the majority of the sediment, some of the disinfection byproduct, and condition the water for effective filtration. Filtration is intended to remove bacteria and viruses that escape pretreatment. Primary disinfection and other treatments will inactivate Giardia and viruses that are common to surface water. Oxidants will be added in	O	0	C	This application replaces Record ID 4056 submitted in 2010.Woodland and Davis, small urban communities located in the largely agricultural Yolo County in California, rely entirely on groundwater for drinking water supplies. Drinking water quality in both cities is threatened by aging water systems and degrading groundwater supplies. Nitrate levels are increasing and there are elevated levels of TDS, selenium, arsenic, iron, manganese and boron. Selenium, boron and TDS passed through to the wastewater treatment plant (WWTP) will fail to meet pending NPDES discharge requirements. Nitrates, in particular, are a current public health concern. So, too, are chromium 6 levels, which are among the highest in the Central Valley.Given the heavy agricultural operations in Yolo County, it is not surprising that both cities struggle to comply with MCLs for nitrates. Addressing Nitrate in California's Drinking Water, a study by UCD's Center for Watershed Study, documented similar problems in other agricultural communities. In Davis and Woodland, it is only through extraordinary efforts, such as abandoning wells, reducing production at problem wells and adding new wells, that violations of nitrate MCLs have been avoided. 3989	4310027	4310027-009	Santa Clara Valley Water District	Rinconada Water Treatment Plant Computer Room Retrofit	The project will ensure that the computer equipment in the computer room of the Rinconada Water Treatment Plant is adequate anchored and cooled. Work will include replacing/upgrading the HVAC system, placing conduits and cables overhead to improve air flows to the equipment, seismically anchoring the essential equipment in the room, and designing and implementing a plan to relocate the equipment during the construction. Work will also include providing access per ADA requirements to the room, if required by the Town of Los Gatos' building codes.	O	0	C	The computer equipment that is used to control and monitor the treatment processes at Rinconada Water Treatment Plant and the treated water and raw water transmission and distribution facilitites is not adequately anchored. The HVAC system in the computer room is not properly designed to cool the computer equipment in the room. If the compuer equipment failed due to inadequate anchorage or cooling, the Rinconada treatment plant may be subjected to plant shutdown, and the remote control and monitoring of the District's pipelines and pump stations may be interrupted jeopardizing the operations of these facilities.	1,538,000	25	0 17	Santa Clara	II	2009

3990	5710012	5710012-006	WOODLAND-DAVIS CLEAN WATER AGENCY	WDCWA Water System Consolidation Project: Regional Raw Water Pipelines (Cr+6)	WDCWA will construct approximately 5.2 miles of dual 36-inch or 42-inch pipelines, size to be determined based on an NPV analysis, to convey untreated surface water from a new Sacramento River intake to a regional water treatment facility, which is to be located east of Woodland on the south side of I-5. Once treated, surface water will largely replace groundwater supplies. This will allow the cities to consolidate water systems, comply with current and pending NPDES discharge requirements for selenium, boron, and TDS, and nearly eliminate nitrates and other harmful constituents in drinking water. For example, groundwater wells have nitrate levels of between 2-43 ppm; Sacramento River water contains less than 1 ppm.To pay for the project and related project elements, the Woodland City Council recently adopted water rates that will triple water bills over a seven-year period ending in 2016. Davis is considering similar rate increases. SRF funding would help to lessen the projected rate impact on water users.The project partners have long studied water quality treatment and supply options to address increasing nitrate contamination, along with other constituents. Objectives include improving water quality, improving water supply reliability, and maintaining compliance with drinking water and NPDES discharge requirements. Many years and millions of dollars later, it has been concluded and confirmed by	O	0	C	This application replaces Record ID 4040 submitted in 2010.Woodland and Davis, small urban communities located in the largely agricultural Yolo County in California, rely entirely on groundwater for drinking water supplies. Drinking water quality in both cities is threatened by aging water systems and degrading groundwater supplies. Nitrate levels are increasing and there are elevated levels of TDS, selenium, arsenic, iron, manganese and boron. Selenium, boron and TDS passed through to the wastewater treatment plant (WWTP) will fail to meet pending NPDES discharge requirements. Nitrates, in particular, are a current public health concern. So, too, are chromium 6 levels, which are among the highest in the Central Valley.Given the heavy agricultural operations in Yolo County, it is not surprising that both cities struggle to comply with MCLs for nitrates. 3991	5710012	5710012-003	WOODLAND-DAVIS CLEAN WATER AGENCY	WDCWA (New Regional Surface Water Treatment Facility)	Design and construct a new Regional Water Treatment Facility with a maximum 52 MGD capacity that meets both current and anticipated future drinking water quality regulations, is more aesthetically acceptable to customers, and reduces consumer costs associated with water softeners and home water treatment devices. The water treatment process is expected to include physical-chemical pretreatment, filtration, and disinfection. Physical-chemical pretreatment will remove the majority of the sediment load and a portion of the disinfection byproduct precursors ahead of the filtration process and in general, to condition the water for effective filtration. A supplemental purpose of pretreatment is to accommodate periodic addition of an oxidant and/or PAC in response to unusual Sacramento River water quality conditions. The filtration process may involve granular media filtration or membrane filtration, and is intended to remove most of the particulate matter and a portion of the bacteria and viruses that escape the pretreatment process. Using GAC as a component of the granular filter media provides the added benefit of removing a portion of the DOC and algae related taste and odor compounds. Filtration will be followed by primary disinfection. Primary disinfection and other treatment processes are intended to inactivate Giardia and viruses that are commonly found in surface water supplies and comply	O	0	C	Need to treat new surface water source (Sacramento River) that will become available in 2016 to replace groundwater supplies in Davis and Woodland that are past useful life expectancies and high in the following water quality constituents: total dissolved solids, nitrates, total and hexavalent chromium, selenium, manganese, and boron. Arsenic is also a problem, limiting well development potential especially if the MCL is further reduced.	124,800,000	30,677	0 09	Yolo	I	2011
3992	5710012	5710012-002	WOODLAND-DAVIS CLEAN WATER AGENCY	WDCWA (New Regional Raw Water Conveyance Pipeline)	Design and construct approximately 4.5 miles of dual 42-inch raw water transmission pipelines to convey untreated surface water from the WDCWA's regional Sacramento River Intake Structure to its new Regional Surface Water Treatment Facility. Pipelines will be either cement lined and coated steel pipe or ductile iron pipe, and will be cathodically protected against external corrosion.	O	0	C	Need to convey untreated surface water from the WDCWA's regional Sacramento River Intake Structure to its new Regional Surface Water Treatment Facility.	26,400,000	30,677	0 09	Yolo	I	2011

3993	1910128	1910128-007	COVINA IRRIGATION CO.	Mortar Re-lining of S.B. Rd Transmission Line	Most of the 4.5 miles of this line has already been relined in the past, with the remaining .75 miles having yet to be addressed. This portion, which is at the extreme west end of the Company's transmission system, is subject to the highest pressure and often in excess of 110 psi. The solution is to apply a 3/8" mortar lining to the pipe in-place, which has proven effective with the other portions of the line.	O	0	C	This 28" transmission line is riveted steel and is approximately 65 years old. There have been several leaks and even a line failure over the past several years, resulting in down time and costly repairs. Since Covina Irrigating Company is a wholesaler, the reliability of the Company's infrastructure has become more critical as imported water supplies have become increasingly scarce.	250,000	12	0 15	Los Angeles	IV	2009
3994	1910041	1910041-001	THREE VALLEYS MWD		INSTALL A REGIONAL NITRATE REMOVAL PLANT.	O	0	C	HIGH NITRATE WELL WATER IN REGION. (NO REPORTED VIOLATIONS SINCE WELL WATER IS BLENDED WITH AVEC SURFACE WATER TO MEET THE STANDARDS)	5,000,000	11	0 07	Los Angeles	IV	1998
3995	1910087	1910087-011	Metropolitian Dist. of So. Cal.	Frank E Weymouht Treatment Plant Inlet Conduit Relocation and Rapid Mix Facilities	The project will relocate the Weymouth plant inlet conduit and washwater return line and add rapid mix systems to each treatment module. The scope of the project includes construction of a new plant inlet (13-foot by 15-foot concrete box) conduit, which is an initial element of the Weymouth Oxidation Retrofit Program; a connection to the Upper Feeder; four new connections to the existing treatment modules; new rapid mix facilities for each module; and new washwater return piping and pumps. The project also includes relocation of return washwater piping and sulfuric acid feeds, modification to existing chlorine injection facilities, yard piping, chemical trenches, grading and fencing for a Southern California Edison switchyard, electrical duct banks, piping connections, and other appurtenant work.	O	0	C	: Untreated water currently enters the 520-mgd Weymouth treatment modules through one of two 10-foot by 15-foot reinforced concrete box conduits which pass below the Administration Building. Constructed in 1939, the conduits were originally designed to industry standards at that time. Current seismic practice indicates that the conduits lack adequate lateral bracing and are highly vulnerable to seismic lateral loads. In the event of an earthquake, this condition could lead to their rupture, which would significantly impact plant operations. Failure of these conduits may halt water flow into the treatment modules, and would inundate the building basement. Relocating the inlet conduit will eliminate this seismic vulnerability.At the end of the inlet conduit, raw water enters the plant’s existing rapid mix facility, where coagulant is fed in a single dose to the entire plant flow. The rapid mix facility is located adjacent to the Administration Building; in order to relocate the inlet conduit, the rapid mix system must also be moved. Since the Weymouth plant has eight flocculation and sedimentation basins with several different configurations, and two different filter designs, a modular rapid mix system is recommended. A modular rapid mix system would allow the coagulation process to be optimized for the different basin configurations, and would provide operational flexibility to address varying source water quality likely	20,000,000	647	0 16	Los Angeles	IV	2009

3996	4310027	4310027-011	Santa Clara Valley Water District	Rinconada Water Treatment Plant and Vasona Pumping Station Voice-Data Modifications	The proposed project consists of improvement to the system and related data and communication equipment, such as, the upgrade of the voice, data and SCADA cable infrastructure, the telephone system, the data system, as well as network routers and switches.Project related activities at the two sites include upgrading to fiber optic for data and SCADA systems and voice cables between buildings. Existing spare conduits will be used where available. Where spare conduit is not available, trenches will be dug for placement of conduit and cable. At the RWTP, trenching may be done to install conduit between the Maintenance Garage and the Belt Press Building on the east side of the plant. At the VPS, trenching will be done to install conduit between the Meter shop, the Pilot Plant and the Pump Plant.Build out of the RWTP communication room includes installing a partition and two walls to seal off the room, repairing the floor, and installing new lighting. The communication rooms at both sites will also receive a new air-conditioning unit and related electrical upgrades. The communication rooms will also be upgraded to accommodate a new floor rack-mounted communication system. New cable and conduits will be installed and tested and the old system will be switched over to the new system.	O	0	C	Except for minor improvements, the communications infrastructure for telecommunications, data and the System Control And Data Aquisition (SCADA) systems, at the Rinconada Water Treatment Plant (RWTP) and the Vasona Pump Station (VPS) exist as they were installed in the 1960's. The cabling systems are outdated and in need of upgrading. This infrastrure provides for all of the communications within and outside of the water treatment plant. The SCADA network controls all of the water transmission in the water treatment processes. In order to maintain an efficient and viable system in concert with other facilities operated and maintained by the District, the proposed project will upgrade the voice, SCADA and data transmission systems at RWTP and VPS to current standards.	1,942,000	25	0 17	Santa Clara	II	2009
3997	3600108	3600108-001	Glen Helen Regional Park	New storage tanks	Construct 400,000 gallon and 1,000,000 gallon storage tanks	O	0	C	Inadequate storage capacity for fire fighting	1,000,000	4	25 13	San Bernardino	V	2006
3998	3510007	3510007-002	Hollister/Sunnyslope WTA	Ridgemark Na&Cl Compliance Lime Softening Water Treatment Facility	The project will address Ridgemark area wastewater salinity concentration limits in the RWQCB Waste Discharge Requirement (WDR) Permit. This project will include implementation of a Lime Softening Water Treatment Facility (2 million gallons per day). The lime softening project will be comprised in two major components: water treatment process to remove hardness and lime sludge treatment and disposal. The major elements of the water treatment facility will be lime application system, solids contact tanks, filtration, disinfection systems, and distribution pump station. Paste lime slaking system will convert a quicklime into a form of hydrated lime, which will be used in the process. Lime slaking system will include quicklime storage silos, a volumetric feed system, a reactor chamber, water supply unit, and a control system. Following by lime injection, soda ash will be added to the process. Soda ash will be stored in tanks. Solids conact tanks will provide rapid mixing, flocculation and sedimentation, which will allow chemicals to react with the ions in the water and precipitate calcium and magnesium hardness. The process will require two sedimentation tanks to handle large amounts of lime sludge. Softened water will be recarbonated by using carbon dioxide system, which will include carbon dioxide storage tanks, evaportation unit, and injection system. Following pH adjustment, water will be filtered	O	0	C	Existing potable water quality has a high concentration of total dissolved solids (800 milligrams per liter) and high concentration of total hardness (400 milligrams per liter). Lime softening will improve potable water hardenss so that home water softeners use can be significantly reduced. This will enable the District to meet the requirements of the Central Coast Regional Water Quality Control Board (RWQCB) permit. Beyond meeting WDR, this project will provide the higher water quality to the community, reduce overall salt impact on the groundwater basin, and reduce water softeners use in the SSCWD area. The reduction in salt load to the groundwater basin is critical to protecting beneficial groundwater use in the San Benito groundwater basin. The basin is a major water supply for the greater City of Hollister area and supports the vibrant agricultural economy in the region. The project is the first in a series of water quality projects to better protect the basin and reduce salinity loads to a relative closed groundwater basin where salinity has been building over time.The lower salinity wastewater effluent will support the development of recycled water use providing a more robust water supply for the region and limiting the need for future imports of water.	17,020,000	2	25 05	San Benito	II	2009

4031	3600345	3600345-002	West End Mutual (Willow Wells)	West End Mutual Water grant funding Sept. '08	Our secondary well which is a sealed well, and works in tandem with our primary well, was installed in 1958 as was everything that goes with it (pump, etc.). While we do have another well we need to have 2 working wells in good repair to service our customer base. Additionally, our tanks were installed, at our cost, in 1999 and are in need of internal inspection. We are planning on installing, at Geo-Monitor's request, sample testing points (4) in our system to provide accurate and timely tests throughout the system each month. While our 1958 well seems to currently be in good working order, we are nearing the end of it's life cycle and are concerned about it's actual working condition. At the very least we need to inspect both the sealed well itself to determine it's condition and present needs as well as inspect our tanks for any problems that may be festering there.The sample points are mandatory. However this is the least expensive of our concerns.Back in 2007 we had a leak near the well site which was repaired for the second time and has so far held up to the conditions here in the desert. However, this was not redone as part of the system upgrade of 1999. We already know the pipe is too thin and is in sub-standard repair. Apparently we have already put in a pre-app for a leak and our distribution system. I have tried to research who put in the pre-app but have not yet found out who this person is. So, I am only guessing	O	0	C	Our secondary well which is a sealed well, and works in tandem with our primary well, was installed in 1958 as was everything that goes with it (pump, etc.). 4036	3700933	3700933-002	PALOMAR MOUNTAIN MUTUAL WATER CO.	Palomar Water System Improvement, Reliability and Security Project	Project will replace the old and failing remote water line with a reliable 4" line, replace old tanks with a new one doubling the storage capacity and installing a remote portable generator for reliable water supply especially in winter when wells are not accessable.	O	0	C	system is old and failing with non-standard, undersized iron lines partially exposed to mountain extreme elements. Lines and tanks are leaky and eperience frequeing failures resulting in lengthy water outages due to the fact that the line crosses remote and hard to access areas, especially in the winter snows, The well site is inaccessible in the winter except by snow mobile. It cannot meet fire demand and has no back up power.	834,973	196	70 14	San Diego	V	2009
4037	4900673	4900673-001	Athena Terrace Mutual Water Company	Replace old redwood storage tanks with concrete tanks	The two redwood storage tanks, built 40 years ago, are now surrounded by homes and yards, making access for demolition and construction very difficult. The two old tanks and their concrete pad would need to be demolished, and two new concrete tanks poured in the same location. Special small-sized demolition equipment would have to be used, and the debris hauled down a hill to a debris box. This process would take at least a few weeks to complete, and our system would have to create a temporary water source while the work is done. A temporary plastic storage tank with temporary plumbing would be necessary. The tanks would need updated electric and plumbing when completed.We are a small water system with 22 homes. The cost of this project is quite high for this small number of families.	O	0	C	Our system has two 12,000 gallon redwood storage tanks that are 40 years old. They need to be replaced. They leak, they have steel bands that are rusting through, and inlet/outlet pipes that are rusting off. The inside of the tanks get a slime on the walls. The roof of each tank is sagging down, and the redwood at the bottom of the tanks is deteriorating. I have had to increase our chlorination levels to pass the monthly water quality tests.	40,000	22	74 18	Sonoma	II	2008
4038	1200587	1200587-002	Briceland C.S.D.	Briceland CSD Transmission Line and Storage Improvement Project	Project would require planning and feasibility studies and an engineering assessment. The project itself would require trenching and laying of suitable water line to a point on the existing distribution system. At that point a new totalizing meter and pressure reducing mechanism. Acquisition of property or permission of the property owner to install these devices may be necessary. The placement of additional storage would require a survey to identify treatment facility boundaries, engineering assessments and the construction and plumbing required to tie into existing storage.	O	0	C	During the heavy rains at the end of March 2012 our main transmission line broke on two occasions resulting in a loss of service to the entire system. The break was the result of earth movement on a steep section of land which for more than twenty years had been stable. This section of land is now suspect for future slippage and we are seeking an alternate route for our transmission line under our access road. This new route would be about half a mile in length and require the installation of a new meter and pressure reducing mechanism at the new junction with the town distribution system. At the present time we have a 260' section of above ground 3" PVC pipe to avoid the effects of earth movement. Increased storage capacity would allow us to hold hold sufficient storage in the event of storage loss or high turbidity event. Our turbidity issues have been addressed in another application.	200,000	26	75 01	Humboldt	I	2012
4039	3301528	3301528-001	OAK HAVEN ASSOCIATION	Distribution System Replacement	Replace Distribution System.	O	0	C	System was put in in 1976. Pipes and equipment are aging and deteriorated.	75,000	40	78 20	Riverside	V	2002

4040	3200509	3200509-003	Clio Public U.D.	installation of new water tank and transmission lines	This project will include the installation of a new, larger (100,000 gallon) water tank to replace our current 12,000 gallon tank. Our currrent tank would then be used as a backup or removed from the premises. In all probability the new tank will have to be placed in a close, but different location than our present tank. Reasons are twofold. First, the new tank will most likely not fit in the current location. Second, the current tank is located next to a stream which is subject to flooding. Relocating the tank will necessitate some repiping from our main line, through our valve system and chlorinator. In addition to the new tank, we are seeking funds to replace our water line from the tank to town, approximately 1.5 miles. Presently the existing line is not buried deep enough and is subject to breakage and freezing. Currently our tank and transmission lines are either on Sierra Pacific Industries or United States Forest Servive land. The existing tank easement may need to be altered to provide room for a larger tank	O	0	C	Install a new 100,000 gallon tank to replace our existing 12,000 gallon tank. Including replacement of old (approx. 35 years) water transmission line from the tank to town (approx. 1.5 miles). The reasons for this are twofold. First, to supply adequate back up in case our flow is interrupted to the tank. Second, have an adequate water supply to our fire hydrants in case of a fire emergency. Our present tank does not have enough capacity to meet the fire flow obligation for the required time limit. That could result in a catastrophic loss of lives and homes if a wildfire came through our town. A new tank would most likely be placed at a different location than our present tank. The current location would not have enough space. In addition it is presently located beside a stream bed which is susceptible to flooding. Moving the tank woud necessitate some re-piping. We are seeking funds for all phases of our project from planning, EIR's engineering to actual construction. We are a very small district(48 residential hookups) and our only source of income is derived from monthly water bills. We have just enough money to maintain at the present level of service. This project is not being undertaken as a result of any drinking water standard, regulation or DHS directive violation.	600,000	47	79	02	Plumas	I	2007
4041	1500550	1500550-001	WEST VALLEY MUTUAL WATER COMPANY		Working into chlorinating the system or possibly rerouting water routes to eliminate dead ends.	O	0	C	Dead ends in the distribution system causing bad water samples during warm summer months	15,000	40	79	19	Kern	III	2004

4043	0400013	0400013-007	MERRY MOUNTAIN MUTUAL	Tank to Tower	This project is to install a tower on our high ground and to replace a failing 95 year old 65K gal tank. The 65K tank has been springing small leaks and they are appearing more rapidly lately. The tank is 24' tall. We are concerned about catastrophic failure. We look to convert the pump house to a maintenance shop. The wells that service this pump house are #1 and #4. Well # 3 used to also but tested positive for fecal coliform and total coliform enough times that we had to abandon the well. This well had production of 60gpm. Well #1 is 40gpm. Well and #4 is 20gpm. Well #1 was drilled in 1965 and probably close to the end of its usable life. This well has tested positive for total coliform in the recent past. To keep this pump house in operation we will need to drill another well to replace the aging #1 well. Well #4 doesn't put out enough water at 20gpm to keep the tank full all by itself. The 95 year old tank needs replaced soon. With these things in mind we look to replace a pump house, tank and well with a water tower and well in a high ground location. We look to build a 100' to 110' tower that will hold 30k to 40k gallons of water. With that height we would have pressure equal to what we now put out of our pressure tanks. For the new well we are looking for a well output minimum of 40gpm. We may have to drill two to achieve this. We would like to fence the tower with chain link fencing. This set up would cut electrical bills in	O	0	C	We currently have a storage tank that was put in 45 years ago. The storage tank was 40 to 50 years old when it was installed. So the tank age is 95-100 years. The tank is 68k gal running over and normally operates at a 65k capacity. This tank is fed by two wells, #1 which is over 40 years old and #4 which is 3 years old. Well #1 is 40 GPM and well #4 is 20 GPM. Well #1 tested positive for total Coliform twice in 2009, in previous years also. We expect tank failure in our future and as leaks seem to continue to appear and odd looking buckles in the metal tank we feel it will be sooner than later. When our development is fully built out, we will have 159 connections. Our terrain varies a little over 100', so we use pump houses to build that pressure. As we can either put in another tank in that location, we are pumping mostly up hill. We would like to instead use a high point of our property to drill a new well and put in a water tower. The electrical savings would be 1/2 of the current system, also being able to eliminate all the components that boost water pressure, i.e... pressure tank, system pressure pumps, tank pressure pump, all the circuitry and plumbing the house has in it. We would be looking at 30-50k gallon tower and a new well. So, we would replace an old well and a very old tank and put up a new Tower which would be at least 50% but probably closer to 60% more efficient than the current pumping station. We "kill" two birds with one	145,000	77	100	21	Butte	I	2011

4047	3205003	3205003-001	GOLD MOUNTAIN CSD	Upper Site Storage Tank Construction	The District has set a goal fire flow of 750 gpm in addition to peak hour potable demands throughout a large part of the system. In order to meet this flow capability, constructing parallel lines or replacement of existing lines with larger diameter lines will need to occur. This, in conjunction with storage located above 5,250 feet AMSL, will provide such flows, eliminate the need for the distribution system booster pumps and provide for significant fire fighting support. The District has estimated that approximately 20,000 lineal feet of existing line will need reinforcing and seven (7) new pressure reducing stations will need to be constructed. Supervisory Control and Data Acquisition (SCADA) and FM radio telemetry will also be required. In addition, the construction of 1,000,000 gallons of storage to meet the storage requirements. This will include two new welded steel tanks, utilizing the existing welded steel tanks as emergency backup and peaking supply for the lower pressure zones. The construction of tanks at the higher elevation will increase significantly reliability of the distribution system which currently relies on a series of seven booster pump stations for the transmission as well as distribution pressures throughout the system. The possibility of system pressures dropping below	O	0	C	The Gold Mountain Community Service District's water system was designed and approved with predicted well water yields that were sufficient for this small community. However, currently, the two existing wells that the District owns and uses produce approximately 30 to 35 gallons per minute (gpm), though one well is currently inoperable due to an equipment failure. This diminution of flow has left the District in a difficult position. The existing summer time peak flows far exceed the production capacity of the District, presenting a declining water storage tank volume condition, which can only be overcome by pumping of the existing wells around the clock (i.e. 24/7). This, with the inability to adequately and efficiently manage water throughout the distribution system, due to the numerous (seven) pump stations, and a complete lack of a transmission system, present the operations staff with a daunting if not near impossible scenario. Typically, a water system, especially a small system, is designed to be able to manage water production, treatment and storage separate from the distribution system. For example, the water sources (i.e. wells or effluent from a water treatment plant) will pump directly via a transmission system to the storage facility. From the storage facility, which is typically a structure located at the highest elevations of the system, the	1,500,000	41	100 02	Plumas	I	2007
4048	1502670	1502670-003	Fairview Water Company, LLC	Interconnection between Fairview Water Co and Stallion Springs Water system	Construction of an emergency intertie with the Stallion Springs CSD (SSCSD) consisting of about 1.5 miles of 8" pipeline, a pressure regulating station(SSCSD to Fairview) and a booster pump station (Fairview to SSCSD).	O	0	C	Fairview Water Company LLC serves a rural community within the Cummins Valley Water basin. The water company currently has no provision for emergency source of supply in case of well system and or source of supply failure. The Water Company is proposing an emergency intertie pipeline with another local water purveyor so that the two districts can mutually supply water in an emergency. (Paul if your system intends to utilize the emergency supply intertie for contaminant mitigation you should include a section that outlines your current well contaminant issues)	400,000	84	100 19	Kern	III	2008
4049	2310012	2310012-002	Irish Beach Water District	New well connection lines; power, source, distribution	This project addresses source water needs for the district that have not been otherwise available until new and successful wells were drilled and developed. The project is to connect one well to electric power and provide piping to storage and extend the watermain to connect to the source. The distance to connect is approximately 3250 feet. Trench utilities include source lines, distribution lines, power and control lines.	O	0	C	This project is to replace, in part, source water that would have been otherwise provided under a surface water permit from the Water Resources Control Board. Our existing permit was revoked and wells have been drilled and tested with adequate capacity, but need to be connected to power and water lines that will allow the water to go to storage and then in to the system.	320,000	190	106 03	Mendocino	II	2009

4053	5000099	5000099-001	DEL RIO EAST HOA WATER SYSTEM		THEY PROPOSE TO DRILL A NEW WELL. CITY OF MODESTO HAS PUBLIC WATER ABOUT 1000 TO 2000 FEET FROM THIS SYSTEM. THEY SHOULD CONNECT TO THE MODESTO DEL RIO SYSTEM.	O	0	C	BACK-UP WELL IS CONTAMINATED WITH DBCP IN EXCESS OF MCL	75,000	55	110 10	Stanislaus	III	1998

4054	4000765	4000765-001	VARIAN RANCH	Source water replacement and new pipeline	Project will include a planning phase consisting of well site selection, test well(s) to confirm best location of new well, water quality testing to confirm groundwater is not under the influence of surface water, design of the disinfection system and a 1.5 mile transport pipeline to deliver water to the current distribution system, and any required environmental reviews prior to construction. The construction phase will include drilling and completing the final well, installing the required pump and booster pumps necessary to transport the water 1.5 miles, installing a pump control system, a disinfection system, a pump house structure for safety and security, and trenching and installing the 1.5 mile 6" PVC pipeline and any required air evacuation devices.	O	0	C	The current system groundwater aquifer is running dry and has rising arsenic levels. Both active wells pull from the same aquifer which has a documented sustainable 5 feet per year average decrease in static water level. At the same time the source arsenic level is increasing and is approaching the MCL of 0.01 mg/L per the Primary Drinking Water Standards and now requires quarterly monitoring. The community drinking water system requires a new water source from a more reliable groundwater aquifer. The proposed new well site is located in an aquifer that is recharged by nearby Lopez Lake and periodic releases into the nearby Arroyo Grande creek.	925,000	49	120 06	San Luis Obispo	IV	2011
4055	5400940	5400940-002	SIERRA KING HOMEOWNERS ASSN	Sierra King Water System: Critical Repairs, Corrections, and Expansion	PROJECT DESCRIPTION Upgrade the existing, aged Sierra King water system to provide adequate water supply, storage, distribution, and fire protection to the present users on developed properties. Improve ability and efficiency of maintenance activities. Expand the system to serve anticipated needs by planned development in the subdivision. Exact equipment and priorities to accomplish this are being determined by a study now being arranged with a water-system engineer. • Replace: • The two defective, leaking, 40-year-old 10,000-gallon pressure tanks. • Underground main valves and pipe in the paved road to allow isolation of sections for maintenance without draining the entire system. • Three existing drains/hydrants. • Add: • A well(s), as the closest neighboring system is too far away for consolidation. • Storage tank(s). • Hydrants for fire suppression.	O	0	C	Infrastructure of the Sierra King water system is aged, inadequate, and breaking. It does not provide a dependable domestic water supply to existing homes, and increased demand is being made of it by new homes within the subdivision. A temporary emergency moratorium on adding homes has been instituted due to problems with the system, and a volunteer board is struggling to find solutions and funding to address several critical issues. System: • Serves 75 lots within 3 tract units in a steep area; none are commercial. 42 developed homesites are using water; 33 are as yet undeveloped (5-6 of those are expected to request water in the immediate future (as soon as the moratorium is dropped). • 1 well pumps directly into • 2 10,000-gallon galvanized storage tanks on the same site. From there, a booster pump fills • 2 10,000-gallon pressure tanks, one at the well site. • A second booster pump (20+ years old) at the well-site pressure tank (1430′ elevation) distributes water to homes in the upper tracts AND fills the upper pressure tank (at 1680′) via a single pipe line.	1,500,000	40	120 12	Tulare	III	2007

4056	5200534	5200534-002	PASKENTA COMM. SERVICES DIST.	Paskenta CSD Water Treatment and Storage Improvements	The project includes preparation of a Preliminary E-ngineering Report that will identify the most cost effective solution. At this time, the anticipated solutions include the following; 1. Construction of a slow-sand filtration unit to pre-treat water from Thomas Creek during periods of elevated source water turbidity; 2. Construct a raw water conveyance pipeline from Digger Creek such that higher quality source water may be utilized during storm events. The length of such a pipeline would be approximately 3/4 mile. 3. Construct or install a packaged water treatment plant that is capable of adequately treating high turbidity source water; 4. Construct a much larger treated water storage tank such that the existing treatment plant may be shut down for the duration of the high turbidity events. The cost estimate for the project includes preliminary engineering, environmental documentation, and preparation of final plans and specifications. Also included in the cost estimate are costs associated with easement acquisition, project management, and labor compliance considerations.	O	0	C	The source water for Paskenta CSD is Thomas Creek. Treatment includes coagulation, flocculation, filtration, and disinfection. The existing treatment plant capacity is approximately 100 gpm. Treated water is stored in a 40+ year-old 250,000 gallon bolted steel tank. The system serves 67 active connections. Source water from Thomas Creek is subject to elevated turbidity levels during storm events sometimes exceeding 300 NTU. The existing water treatment plant cannot meet the turbidity standard under the Surface Water Treatment Rule when Thomas Creek is carrying storm related turbidity loads. The water treatment plant must be shut down during storm events and the system must rely on stored water to meet customer's needs. Water levels in the tank fall to dangerously low levels leaving the community without adequate fire protection and the possibility of running out of water entirely. System operators routinely struggle to adequately treat the source water by shutting down the WTP during the worst of a storm event, then reduce the flow rate through the plant during the aftermath of the storm event. The system has nearly run out of stored water on several occasions.	2,000,000	67	120 21	Tehama	I	2011

4069	2700766	2700766-004	STRAWBERRY RD WS #06	Replace 30+ year old Storage Tanks for Small Water System	The plan is to contract with a reputable contractor who will provide equipment, materials and labor to extend the cement foundation to accommodate at a minimum three (3) 10,000 poly storage tanks. They will drain the one 15k tank and dispose of the tank, install two of the three 10k poly storage tanks and connect to the system. After completing the first phase, they will drain and remove the last 10k steel storage tank and install the remaining 10k poly storage tank. The installation of new float switch assembly and a system manager, along with the complete connections to the existing system will be accomplished. Backhoe service to create an access road for the crane truck and footings for the new tank foundation extension, a disinfection cycle and bacteria analysis will also be necessary. Tank delivery, disposal of the two old steel tanks and sales tax have been built into the projected cost.	O	0	C	The Strawberry Water System provides water to 27 households. Currently there are two storage tanks (one 15,000 and one 10,000 gallons). Both tanks are more than 30 years old and are aged. The tanks have developed holes that have been repaired on several occasions and due to the loss of the protective coating, have developed rust. When the Water Co-op was first formed, the water storage capacity met the standards for distribution because there was no foilage/growth and there were a few less houses. However with the growth and new fire protection standards, the Co-op suffers a lack of necessary protection due to the insignificant volume of water stored at any given time (less than 1,000 gallons per household).The Monterey County Health Department insists that the storage tanks be replaced. In fact, this has been a major issue when the Health Department conducts their annual review of our system. Within the last four years, the Co-op has replaced both the pump and motor (twice) for the well totaling in excess of $21,000. Taking into consideration the housing crisis as well as the high energy costs nationwide, the Co-op's reserves have been depleted.	40,000	27	150 05	Monterey	II	2008

4079	0510019	0510019-001	Wallace Community Services District	Surface Water Ready Treatment Facility	This refurbishment project will consist of the following elements.a. Design a modified Water Treatment Plant that will treat surface water as well as ground water.b. Procure and install an ultra-filtration system, sized appropriate for near term needs, but expandable to meet future needs.c. Install input line from the holding lake to the treatment plant.d. Reconfigure the existing treatment system to operate in conjunction with the ultra-filtration system.e. Document the system with "as-built" drawings, operations manuals and Maintenance & repair manuals.	O	0	C	The District currently provides potable water service to approximately 100 residences utilizing groundwater sources. The State of California and County of Calaveras have consistently urged the District to operate from reliable surface water. While the source of surface water has not yet been obtained (two sources are within 1/2 mile of the Water Treatment Plant (WTP), the WTP can and must be re-built to treat ground water and/or surface water.	1,698,000	75	220 10	Calaveras	III	2009

4080	5601104	5601104-002	CASITAS MUTUAL WATER COMPANY	Distribution System Upgrades and Fire Hydrants	Project DescriptionThis project will replace the overall water system of the Casitas Mutual Water Company. This will include the following items:1. Replacement of 2500 linear feet 8" CL150 C-900 PVC pipe line.2. Replacement of 2500 linear feet 6" CL150 C-900 PVC pipe line.3. Replacement of eleven (11) gate values.4. Install two 75,000 gallon water storage tanks including tank plumbing, grading, site prep.5. Upgrade existing well pump, motor and controls.6. Replacing pipe under Highway 33 using existing bridge.7. Replacing pipe to box culvert at existing crossing.8. Reconnection of eighty four (84) service connections.9. Installing ten (10) wet barrel fire hydrants.WITHIN THE LAST FIVE YEARS, THIS COMMUNITY WAS DEVASTATED BY A MAJOR FLOOD. DUE TO THIS FLOOD, SEVERAL OF THE SEPTIC SYSTEMS WERE RENDERED USELESS. HOME OWNERS WITHIN THE CASITAS MUTUAL WATER COMPANY CHOSE TO INSTALL A MAIN SEWER LINE AND INSTALL INDIVIDUAL SEWER LINES ON THEIR OWN PROPERTIES. THIS WAS A VOLUNTARY ACTION AT THEIR OWN COST TO PROTECT OUR AQUAFIR.	O	0	C	The water system problems that this project is intended to address are as follows:1. This project is intended to upgrade the existing system to provide sufficient volume & pressure so that we can install fire hydrants for fire protection that will be used by the fire department in emergencies. At this time, we are not in compliance with current fire department requirements because we have no fire hydrants to service our community. Our rural community interfaces with wild lands and open space and poses an extreme wild fire danger. We have no fire hydrants.2. This project will alleviate the problem of insufficient volume and water pressure for the homes that Casitas Mutual Water Company services. Eleven of the 84 homes are using a two inch main line and are located at a higher elevation than our pump station. To correct this problem we would need to upgrade to a six inch main with two 75,000 gallon storage tanks, which would be located on property within our water company. The two tanks will be located at a higher elevation so that gravity flow will eliminate the need for an additional pump station.If additional funds are available, we would like the upgrade to include solar panels at the tank storage area to offset electrical costs.	1,300,000	84	229 06	Ventura	IV	2009
4081	4200870	4200870-002	CASMALIA COMM. SERVICE DIST.	Distribution System Rehabilitation	The project will consist of distribution system repairs to replace portions of the delivery system and approximately 60 service laterals. A distribution system evaluation needs to be done to determine if the main is in serviceable condition. Costs include plan; specifications and estimates; construction; construction contingencies; and construction engineering.	O	0	C	The distribution system is in dilapidated condition, leaks continuously, and breaks frequently. They have frequent water outages due to distribution system failure. There are approximately 60 water service laterals that need replacement from the main to the meter.	400,000	55	234 06	Santa Barbara	IV	2007

4088	3100058	3100058-004	DUTCH FLAT MUTUAL	DFMWC - Security	This project is to provide an adequate fence and security lighting system for the water plant and storage facilities. Currently this is the only available water source for the community so protection is very important.The water treatment plant has a 6 foot secutiry fence surrounding it.The area which contains the 150,000 gallon storage tank does not have an adequate security fence (currently 4 strand barb wire fence and gates). Neither area has an all-weather security lighting system which will operate when the power fails (for example - longest loss of power in 2008 - 10 days in a row).We would like to install approximately 950 linear feet of chain link fence with two gates.We would also like to install a security/emeergency lighting system for both the water treatment plant and all storage tanks.	O	0	C	Water security improvements needed.	34,250	94	290 02	Placer	I	2008
4089	3100058	3100058-003	DUTCH FLAT MUTUAL	Dutch Flat - Drought Contingency	THe DFMWC daily winter use is approximately 19,000 gallons per day. Summer use may be as high as 91,000 gallons/day. Approx 80% of this 71,000 gallon difference is for the irrigaion of landscaping, small gardens or small orchards or approximately 9 million gallons or 27 acre feet per year.The DFMWC drought contingency planning effort would consist of four tasks: a. Development of preliminary conservation measures for existing customers. b. Distribution of information to customers. c. Assistting customers to install high efficiency irrigation systems by subsidising the system design and installation. d. Preparation of a long term drought management plan.Installation of turbidometers. The current treated water turbidity monitoring is conducted at the clear well stage. Grap samples are collected at the other 3 in-line filters. The current turbidometer is over 10 years old. We would like to replace the turbidometer and three others to comly with turbidity monitoring compliance requirements.	O	0	C	A combination of monitoring (control replacement) and feasibility study - drought planing.High water demand in the summer through early fall is causing the plant to operate near peak capacity. If this increase in usage continues will need to repace non-existant/obsolete controls on the four in-line filters.Threee in-line filters have no controls at this time - the last does. We would like to reduce usage and upgrade controls to meet current requirements.	21,890	94	290 02	Placer	I	2008
4090	3110028	3110028-001	Northstar C.S.D.		Develop groundwater storage. Involves study, design and construction.	O	0	C	Inadequate water supply. Need additional wells.	250,000	1,737	300 02	Placer	I	1998
4091	3110042	3110042-004	Tahoe Swiss Village Utility	Tahoe Swiss Village Utility/Tahoe Park Water-Skyland Nielsen #3110049 intertie	TSVU proposes to intertie the two water company's: Tahoe Park Water/Skyland-Nielsen (TPSN) to the north would require obtaining an easement over United State Forest Service (USFS) land and working within a power line easement. A surveyor would have to describe and easement over approximately 1800 linear feet. The proposed infrastructures would require approximately 1800 feet of pipe with valves, one hydrant within USFS land. Additionally, there would be a 6" Cla-Valve #90-20 pressure reducing valve that would be a permanent intertie. With a 10 psi drop in pressure from either water system the automatic valve would open and allow water to flow to the failed system.	O	0	C	Tahoe Swiss Village Utility TSVU is in the middle of tow adjacent small water company's that each have only one source of supply for their customers.Madden Creek Water to the south and Tahoe Park Water-Skyland-Nielsen to the north. Tahoe Park Water is agreeable to TSVU applying for this preapplication and request for economic stimulas funds under this program. An intertie between these three systems would enhance the public health and safety with potentially backup sources for all three companies combined. Each of the three companies historically has had to issue boil water orders. The companies have had water outages lasting several hours to more than a day. Skyland-Nielsen has one well source of supply, one unfiltered lake source and 60,000 gallons of storage. Presently, TSUV has two groundwater sources, one unfiltered surface water source and four water tanks with a total capacity of 93,000 gallons. With the combination of these resources for potable water supply the public health and safety will benefit substantially.	396,000	378	300 02	Placer	I	2009

4092	3110043	3110043-002	Madden Creek Water Company	Madden Creek = Tahoe Swiss Village Intertie	upgrade main and connect to neighboring water co.	O	0	C	system has insufficient/no backup water supply	440,000	154	300 02	Placer	I	2009
4093	3110042	3110042-007	Tahoe Swiss Village Utility	Tahoe Swiss Village/Madden Creek DPHS#3110043	TS proposes to intertie the two water company's:Madden Creek to the south would require within TSVU's service area the installation of approximately 1000 feet of 8" pipe with valves, three hydrants, 13 new water lateral with meter pits. The proposed improvement would abandon 1000 feet of aging and problem "five leaks" 4 inch old steel main in the TSVU service area. This improvement would be installed within the county road ways. Additionally, there would be a 6" Cla-Valve #90-20 pressure reducing valve that would be a permanent intertie. With a 10 PSI drop from either system the valve would open and allow water to flow to the failed system. The cost of this intertie would be approximately $366,000.	O	0	C	Tahoe Swiss Village Utility (TSVU) is in the middle of two adjacent small water company's that each have only one source of supply for their customers.Tahoe Park Water-Skyland to the north and Madden Creek to the south. Madden Creek is agreeable to TSVU applying for this preapplication and request for economic stimulas funds under this program.An intertie between these three systems would enhance the public health and safety with potentially backup sources for all three companies combined. Each of the three companies from time to time has had to issue boil water orders, they have had water outages lasting several hours to days.Madden Creek has one well source of supply and one 100,000 gallon storage tank. Presently, TSVU has two approved and one unfiltered surface water source. For storage TSVU has four tanks with a total capacity of 93,000 gallons.With the combination of these resources for potable water supply both of the water company customers will benefit	366,000	378	300 02	Placer	I	2009
4094	3700071	3700071-002	HEAVENLY OAKS	Heavenly Oaks Well Project #4Special Funding	Drill a new well.We currently have 2 working wells. Well number 2 produces 25 gallons per minute of low quality water, high in Iron and high gross alpha. While well number 1 produces high quality of water but it only produces 11 gallons per minute. Well Number 3 (off line) is also high in UraniumThe plan is to drill Well Number 4 next to well Number 1. The new well will be much larger and we hope will produce enough water to supply the water system without relying on Well 2. If we can attain +20 gallons per minute from well 4 then we can ellimate the need for well 2.	O	0	C	The water system has had a High Gross alpha count on more than one occasion. Our moving average gross alpha for the trailing 4 quarter is above the MCL. We are currently sampling every quarter. This is a great burden on the low income residents that are serviced by the water system.	150,000	102	300 14	San Diego	V	2009
4095	4300517	4300517-001	Chemeketa Park Mutual Water Company	New large storage tank	Our current storage system capacity is about 180,000 gallons for a community of approximately 320 people. Processed water is pumped to the storage facility at the highest point in the community and distributed by gravity. The primary proposed new tank site for processed water would be proximate to Moody Creek, one of the two creeks from which we draw our raw water. The site is within several hundred feet of our existing intake dam, filter plant and pumphouse. Finished water would be pumped to this new tank. This tank's contents would then be pumped to the existing storage facility as required and distributed via our existing distribution system. The proposed tank would more than double our system storage capacity.The project will require (estimates in parentheses):. EIR's ($50K). Soils testing and engineering ($100K). Mechanical engineering ($250K). Road access and clearing ($200K). Foundation ($240K). Piping and trenching ($100K). Tank, glass-fused steel, 200K gal, including erection ($1.6M). Control system & alarm ($160K). Electric drop ($50K). Certification by DHS ($20K). Project management ($120K)Preliminary estimated total cost $2.89MInitial estimate is based upon the experience of our water operator with a similar installation for Aldercroft Heights County Water District, and is subject to change.	O	0	C	Our system has insufficient primary storage capacity (~180kgal) to deal with more than one house fire at a time to protect our 143 residences. This was demonstrated by a two-alarm house fire that occurred here in January 2007, which temporarily reduced our stored volume by 35 to 50%. Maximum recovery rate for our filter plant is on the order of 70,000 gal/day; several days were required to restore us to capacity. Large winter storms may require suspension of filter plant operation and substantially increase recovery time. Summer drought conditions reduce available raw water supply, also increasing recovery time. Even under optimal supply conditions, multiple simultaneous house fires would quickly deplete our system.As a mountain community within the Urban Wildland Interface, we are vulnerable not only to individual house fires, but to ignition by wildfire. We are committed, along with sister communities in this area, to reduce our vulnerability to wildfire by reducing available fuel sources, such as dry brush and dead timber, but at this time a wildfire could easily overwhelm our current storage capacity.Our water quality is excellent and not an issue; community safety is now equated with fire protection.We have a site available for an additional large storage tank that will provide the increased capacity we require. This project would enable design, procurement and installation of this storage facility.	2,890,000	143	320 17	Santa Clara	II	2009

4096	4300517	4300517-002	Chemeketa Park Mutual Water Company	Replace aging storage tanks	Our system serves 143 households; typical daily consumption is from 60 to 70kgal, peaking in late summer. During dry years, both voluntary and mandatory conservation have been instituted. We pump from the filter plant to our current storage facility at the high end of our community, and distribute to our members using gravity feed.Total current main storage capacity is 160kgal from 3 steel bolted tanks, one of which (40kgal) is designated a fire emergency tank; two 60kgal tanks provide daily supply. The two 60kgal tanks, which were quite used when purchased, are at the end of their service life. We believe they originally may have been painted with lead-based paint. One tank's roof has deteriorated, allowing incursion of debris and chipped paint. We plan repairs and are contemplating installation of liners as stopgap measures, but these will not suffice long-term. We must replace these tanks, but the community has already borne large expenses and taken on debt to improve and optimize our sources and our filter plant.The requested funds would replace the two worst tanks. Our request presumes that the existing pads and some of the plumbing could be retained; the new tanks would have the same capacities as those being replaced. However, no engineering studies have been performed yet.	O	0	C	Our main storage tanks are at the end of their service life and are deteriorating. One tank has a failing roof, allowing entry of debris and chipped paint. e need to replace at least two of our three primary tanks.	180,000	143	320	17	Santa Clara	II	2011

4098	3301879	3301879-001	Sharondale Mesa HOA	Sharondale water service Line Replacement	1" copper pipe will be installed to replace leaking 1" plastic service lines. 1" corporation stops will be installed at the distribution pipeline to do away with the unvalved connections.	O	0	C	Existing 1" plastic service lines are leaking in street creating substantial damage to street as well as loss of water. Plastic service lines need to be replaced with 1" copper pipe.	350,000	220	330	20	Riverside	V	2008
4099	3700866	3700866-001	DEL DIOS MUTUAL WATER COMPANY	Water tank, Fire hydrants and distibution	To comply with the Rancho Santa Fe Fire Protection District's laws and ordinances, the Fire Department is recommending the following:Install 4250 LF of 8" water mainInstall 4280 LF of 6" water mainInstall 16 fire hydrantsInstall a 500,000 gal welded steel tank	O	0	C	The community of Del Dios, served by the Del Dios Mutual Water Company, lost 27 homes in the Witch Creek Fire of 2007. In this fire and previous fires, the system has run out of water to fight the fires. The recommendations for the upgrading of our system come from the Rancho Santa Fe Fire Protection District that service the community of Del Dios.	2,558,513	156	330	14	San Diego	V	2009
4100	1500251	1500251-002	RIVERKERN MUTUAL WATER COMPANY	Emergency Power Generator Installation	This project involves sizing, purchasing and installing emergency electrical generation equipment with sufficient capacity to drive existing water pumps and pressure systems during power outages.Emergency power generation is a less costly alternative than acquiring additional land and installing new tanks at an elevation high enough to produce adequate water pressure during power outages.	O	0	C	Power outages currently result in no water for drinking or flushing toilets for residents in this community. Depending on cause and duration of power outages, boiling notices and corrective water treatment are sometimes required.On July 26, 2010, the town of Riverkern was encircled by the "Bull Fire", and six houses burned to the ground. Loss of power and water pressure during the fire made fire-fighting efforts more difficult. While an emergency power generator probably would not have saved more homes, it would definitely have made surviving homes livable much sooner after the fire.This project involves installing an emergency power generator of sufficient size to drive pumps and pressure systems during power outages.	20,000	102	336	19	Kern	III	2011

4101	5100107	5100107-006	Sutter Co. WWD#1 (Robbins)	Water Main Replacement Project	The Sutter County WWD#1 is responsible for providing water service to the Community of Robbins. The water system currently operates one active ground water well, one backup ground water well and one storage tank that provides the Community's residents with potable water. Water is distributed through a system of mains ranging from 3" to 12" in diameter. The current system is comprised of approximately 4 miles of water piping and valves, and 94 lateral connections. The active ground water well incorporates treatment for iron and manganese. The system provides municipal drinking water to approximately 336 year-round residents. Robbins lacks the fiscal resources to fund the infrastructure improvements necessary to continue providing a safe, reliable water supply.The project will replace 6,800 lineal feet of aging galvanized pipe with PVC C900 to current adopted County standards. The distribution pipe size will be increased to allow better fire flow capacity. The improvements will also include the addition of thrust blocks, gate valves and fire hydrants at 500-foot spacing. The distribution line increase will not result in additional service opportunity; it is only to provide for the fire supply needs. Replacing the mains will increase reliability of service, improve water quality, and increase flow capacity for fire protection.	O	0	C	Portions of the Robbins water distribution system are nearly 60 years old and nearing the end of their service life. The aging sections of the distribution system are experiencing frequent leaks, restricted flows due to increased internal scale and rust, and poor water quality resulting from iron bacteria and iron/manganese getting into the water supply. This is leading to costly repairs and many failures. Many portions of the system have dead-end lines leading to secondary water quality issues. Public safety is also a concern due to a lack of fire hydrants in some sections of the community. In many areas, existing water mains run through private property without associated easements.	1,207,500	94	336	21	Sutter	I	2011
4102	3702354	3702354-003	WARNER SPRINGS ESTATES	Warner Springs Estates/Stone Ridge Water Distribution	Removal of 2" pipe lines and installation of 6" pipe lines will be done on four streets containing approximately 56 lots: Ironwood, Manzanita, Octillo and Octillo Court. This will involved digging trenches, pipe installation, appropriate replacement of valves, updating turn-off systems, engineering and a project manager, plans, permits obtained, resurfacing of effected streets, disposal of construction materials and hazardous waste, as well as other costs resulting from contracted/sub-contracted professionals. It may be possible to install a looping system on these streets; however, professional engineering and other consultations will determine the project. Providing water storage trucks during construction/installation in these areas may be necessary.	O	0	C	Warner Springs Estates/Stone Ridge was constructed approximate 35 years ago. At that time, present codes were not in place and four streets/areas in the community--Ironwood, Manzanita, Ocotillo and Ocotillo Court--do not have adequate water line connections to individual homes. This affects approximately 56 lots out of 300. The other water line connections are 6" pipes; these four streets have 2" pipes. Should a fire occur on one of these streets and two or more fire boxes be turned on, it is predicted that the resulting drop in water pressure would prevent use of a fire hose. The four streets have a total of 12 fire boxes out of 78 installed througout the community. Each fire box is equipped with a 50' hose. Use of other community fire boxes would not be possible due to this constraint. There are three fire agencies in our immediate area: Sunshine Summit Volunteer Fire Department, located approximately 1 mile to the north; U.S. Forest Service in Oak Grove, 6 miles to the north; and CAL FIRE in Warner Springs, 8 miles south. The first responder would be the volunteer fire department, depending on availability, which would be true of the other two agencies. It is critical that residents be able to operate their nearest	400,000	227	340	14	San Diego	V	2007

4103	2100508	2100508-001	MUIR BEACH COMMUNITY	Muir Beach CSD Upper Water Tank	Construct a new Water Tank, increasing the storage capacity to 200,000 gallons, at the same site as the existing tank. The new tank should be made of concrete.Muir Beach currently gets all of its water from a groundwater source in the valley, where it is pumped up to two water storage tanks, and is then available to residents through the distribution. The Upper Tank site is at the Muir Beach Overlook and is the highest elevation point in Muir Beach.Our storage tanks are obviously a vital part of the system. As it is right next to the ocean, and the air is always wet due to the fog, the tank must be durable enough to handle the adverse weather conditions. Moreover, since Muir Beach is near the San Andreas fault, the Water Tank must be able to withstand seismic events.	O	0	C	Muir Beach CSD currently has a 150,00 gallon Redwood Tank that is over 40 years old and is near the end of useful life.	450,000	148	350 18	Marin	II	2009
4104	3110029	3110029-001	Alpine Springs County Water District		Replace the redwood tank with a steel tank. Involves design and construction.	O	0	C	Redwood tank that is source of contamination to the drinking water.	500,000	670	380 02	Placer	I	1998

4108	2310013	2310013-002	Point Arena Water Works	Pumping Equipment, Replace the 15 HP submersible pump at Garcia River	Acquisition of 15H.P. submersible pump to operate as a backup pump should the currently installed 15H.P. submersible pump at the Garcia Well 02 (which is the only source of water for the system) fail. It would take a minimum of two to three days to have a new pump located, shipped, and installed. To be able to continually provide water service, Point Arena Water Works, Inc.	O	0	C	Replace a 15H.P. submersible pump at the Garcia River. The pump is located on a raised pad 250 feet northwest of the old existing well, which floods during the winter time. When the river floods, it is impossible to get to the pump because the field is under water. The fields flood three or four times per year. Replace water heater on fire pump.	13,700	210	465 03	Mendocino	II	2007
4109	3103835	3103835-001	LAKEVIEW HILLS COMMUNITY ASSOC		Replace water line infrastructure to 150 residents.	O	0	C	Water sytem was designed as a dual system (irrigation and domestic) due to older and leaking infrastructure domestic lines lose water pressure; therefore increasing risk of cross connection with irrigation system.	3,000,000	146	499 02	Placer	I	2002
4110	4910020	4910020-009	Sonoma County Water Agency	SCADA System Security Enhancement	The Sonoma County Water Agency (SCWA) is a wholesale potable water provider to 700,000 people (including transients and tourists) in two counties (Sonoma and Marin) through nine public water system contractors. SCWA operates a Supervisory Control and Data Acquisition (SCADA) system that serves as the computer-based machine interface that controls the related mechanical and electrical assets of the water system, based on real-time feedback and pre-programmed data.The SCWA EPA-approved Vulnerability Assessment (VA) identified the SCADA system as a significant critical asset vulnerable to cyber terrorism and recommended security countermeasure improvements. The VA documented numerous existing SCADA security measures but also identified the weaknesses that increase the cyber terrorism risk to water system operation:o A router connects the SCADA LAN to the SCWA business network and Internet used by more than 200 employeeso Use of short passwords and lack of password renewal systemo Remote computer equipment used to access SCADA may not always be secure This project proposes to implement water system security countermeasure improvements recommended by the VA that have not as yet been implemented:o Disconnect the SCADA LAN from the SCWA business LAN and restrict access to only those operators who are responsible for SCADA operation o	O	0	C	Water security improvements needed.	50,000	136	500 18	Sonoma	II	2008

4111	4910020	4910020-011	Sonoma County Water Agency	New Upgraded Infra-red Motion Detection Cameras	The SCWA EPA-approved Vulnerability Assessment (VA) identified the need to purchase and install new upgraded infra-red motion detection cameras to significantly improve detection and delay potential threats. Early warning technology in the form of infra-red motion detection cameras will assist in detecting threats more effectively, delaying or discouraging adverse intrusions, and responding rapidly and reversing the effects of adverse tactics.These upgraded cameras would be video surveillance cameras for areas of particular concern, such as the Headquarters/SCADA center, vehicular access points, pump stations, reservoir hatches, chlorine storage, fuel storage, and other high security areas. Cameras would use the existing SCADA connectivity to report to the SCADA Control Center.	O	0	C	The Sonoma County Water Agency (SCWA) is a wholesale potable water provider to 700,000 people (including transients and tourists) in two counties (Sonoma and Marin) through nine public water system contractors. The SCWA EPA-approved Vulnerability Assessment (VA) identified the need to purchase and install new upgraded infra-red motion detection cameras to significantly improve detection and delay potential threats. The VA reported that history has proven that terrorists can be expected to thoroughly research targets well before attacks occur and SCWA should not rely on the government alert level to predict with certainty when attacks may occur or when security measures are increased. The SCWA water system and SCADA system operate continuously. The SCADA system gathers data, monitors a multitude of process parameters, operations, and alarms, and maintains water reliability. Cameras are connected to the SCADA system and provide monitoring and early detection of intrusions and threats. SCWA's nine public water system contractors depend on SCWA to provide a continuous supply of potable water to serve 700,000 people. The reliability and security of the water system are critically important to SCWA's operations. Terrorism could result in intrusion and other detrimental adversarial tactics. The mechanical and electrical assets of the water system could be breached	50,000	136	500	18	Sonoma	II	2009
4112	4910020	4910020-008	Sonoma County Water Agency	Emergency Mobile SCADA	The Sonoma County Water Agency (SCWA) is a wholesale potable water provider to 700,000 people (including transients and tourists) in two counties (Sonoma and Marin) through nine public water system contractors. SCWA operates a Supervisory Control and Data Acquisition (SCADA) system that serves as the computer-based machine interface that controls the related mechanical and electrical assets of the water system, based on real-time feedback and pre-programmed data.The SCWA EPA-approved Vulnerability Assessment (VA) identified power and the SCADA system as the most significant critical assets to water system security. The VA found these assets vulnerable to terrorism and adversarial tactics and recommended security countermeasure improvements. This project proposes to implement one of the recommended improvements that has not yet been implemented.SCWA has the ability to operate its system from the operations center and main administration building. There are redundant power supplies (generators) and protections against power surges (uninterrupted power supplies). However, the VA indicated that in the event SCWA's operations center became nonfunctional, radio communications to its main administration building would not likely be maintained. Global processing, remote control, and monitoring of system activity would be compromised by	O	0	C	Water security improvements needed.	150,000	136	500	18	Sonoma	II	2008

4113	4910020	4910020-007	Sonoma County Water Agency	New Upgraded Infra-red Motion Detection Cameras	The Sonoma County Water Agency (SCWA) is a wholesale potable water provider to 700,000 people (including transients and tourists) in two counties (Sonoma and Marin) through nine public water system contractors. 4116	4810010	4810010-002	SID - Gibson Canyon	Bascherini Reservoir Concrete Bottom Lining-Phase 2 (No. G.1.a)	This project will first remove the deteriorated existing tar bottom liner and aquatic vegetation. Next equipment will be used to re-grade the bottom and remove the excess earth spoils. Fiber reinforced concrete will be pneumatically placed over a 40 mil. high density polyethylene geomembrane. Concrete lining the bottom would not only reduce the seepage losses, it would reduce the aquatic growth and thereby reduce the THM potential in the distribution system. This would maximize the water source for the District's current and future potable water customers. Due to its depth, large size and time restriction, this is a very labor intensive project.	O	0	C	Surface water from the Putah South Canal is pumped from the Eldredge Pumping Plant to this reservoir on its way to serve Gibson Canyon, Pleasants Valley and the Uhl Lateral. It has a surface area of 2.2 acres and a capacity of 21.1 acre feet of water. In 1992 the reservoir was manually cleaned and the sides were concrete lined with fiber reinforced shotcrete. Concrete lining the bottom would not only reduce the seepage losses, it would reduce the aquatic growth and thereby reduce the THM potential in the distribution system. This would maximize the water source for the District's current and future potable water customers. Due to its depth, large size and time restriction, this is a very labor intensive project.	2,000,000	159	518	04	Solano	II	2009
4117	3400172	3400172-002	TOKAY PARK WATER CO	Pipelines	Replace piples and valves.	O	0	C	Pipes are too old and cause emergency, costly repairs.	950,000	190	525	09	Sacramento	I	2002

4118	3600260	3600260-004	Smiley Park Country Club	Smiley Park Corrosivity Treatment System	A recommended treatment to reduce corrosivity is an aeration system which allows dissolved CO2 to be released resulting in raising the pH and, hence, reducing the corrosivity. An aeration system is preferred over treatment system that add chemicals to the water because there is little maintenance required by an aeration system. Chemical addition relies on precision, testing, and repeatability of chemical feed systems. Smiley Park Water System has only a part-time employee to handle maintenance. Each well requires a separate aeration treatment system, sized for its rate of production. We propose to install two aeration treatment systems - one for our existing well and a second for a new well which is planned to be drilled in 2008. Each unit will cost approximately $15,000 for a well producing 20 gallons per minute.	O	0	C	Smiley Park Country Club is a private community in the San Bernardino Mountains near Running Springs. This is a community of 165 building sites (125 currently have water connections) in an area of 265 acres. Smiley Park maintains a private water system which is monitored by the county. We maintain our own wells, distribution system, and water quality program. Smiley Park Water System currently has only one well to serve its customers (125 connections, 300 residents). We are planning to drill an additional well within the next year if funds are available. We have monitored copper levels within the homes of our customers since 1993 as required by regulation. Beginning in 1997 and every year following with the exception of 2003 and 2004, the test results have exceed the action level (1300 micrograms/liter). The current tests for 2007 show 1800 ug/l for the 90th percentile. We have further tested the source water in Smiley Park for several years and have found the water to be moderately corrosive with a pH which is slightly acidic. To reduce the corrosivity of the water supplied to the homeowner we need to treat the source water.	30,000	106	530	13	San Bernardino	V	2007
4119	1909006	1909006-005	WEST VALLEY COUNTY WATER DISTRICT	West Valley CWD - Meters	The proposed project is to purchase and install 250 electronic read meters.	O	0	C	The system needs to comply with state metering requirements.	115,000	274	530	22	Los Angeles	IV	2012
4120	3600260	3600260-003	Smiley Park Country Club	Smiley Park Tank Monitoring System	We propose to install an automatic, digital tank level monitoring system which will indicate when the tank is both very low and when it is close to overflow. The digital information will be sent wirelessly to allow monitoring. In additon, during overflow, the wireless signal will automatically shut off the well pump to prevent overflow. A wired system which would require burial in a trench is not feasible due to the distance to the pump and the topology of the area (steep hills and canyons).	O	0	C	Smiley Park Country Club is a private community in the San Bernardino Mountains near Running Springs. This is a community of 165 building sites (125 currently have water connections) in an area of 265 acres. Smiley Park maintains a private water system which is monitored by the county. We maintain our own wells, a 100,000 gallon storage tank, distribution system, and water quality program. Smiley Park Water System currently has one well to serve its customers (125 connections, 300 residents). The well feeds a 100,000 gallon storage tank to provide gravity feed to its customers. The well is located approximately one-quarter of a mile distant from the storage tank. Currently in order to determine the level of water in the tank to maintain sufficient supplies and pressure to customers and to prevent overflow of the tank, we rely on visual inspection. When the tank is close to overflow, the well pump must be shut-down. Smiley Park Water System has only a part-time employee to handle maintenance of the system including the visual inspection of tank levels. This employee is only on site during the normal work week (Monday through Friday). We need to install an automatic tank level sensor with a remote control of the well pump when overflow conditions exist.	10,000	106	530	13	San Bernardino	V	2007

4121	3110023	3110023-005	North Tahoe PUD - Carnelian Woods	Carnelian Woods Well Building Rehabilitation	This project will reconstruct and enlarge the existing well building. The new well building will use fire resistive construction including walls, doors and roof. Standby power in the form of a self contained engine/generator set will be housed within the structure to provide continuous pumping capability in the event of commercial power loss due to fire or other natural or manmade conditions. Remote control valving operated over the District's radio based Supervisory Control and Data Acquisition (SCADA) system will be provided in order to allow operator intervention during a disaster without placing operating personnel at risk.The building will also be designed for emergency use or future regulatory requirements to chlorinate this source. Process control and monitoring equipment for disinfection capability will be included in the SCADA system.	O	0	C	The Carnelian water system consisting of 407 connections is reliant on a single well source. This well, constructed in 1971, is housed in a wood framed structure which is in a location vulnerable to wildland fire. The service area has limited backup water supply from an adjacent privately owned water system in the event of loss of the well. In the event of catastrophic wildfire the availability of a backup supply cannot be relied upon.	269,250	273	600 02	Placer	I	2008

Detail design for Cherry Rock Trap Cleaning.	O	0	C	Moccasin Reservoir Dredging: water quality improvement needed.	2,293,939	200	600 04	San Francisco	II	1999

4173	4500210	4500210-002	LASSEN PINES MUTUAL WATER CO	LPMWC Emergency Generator Replacement/Installation	The project will entail the placement of a new 85KW-100KW, 3 or 4-tier generator and automatic transfer switch in an existing block building built with LPMWC funds for that purpose...except that part of the cost of installing will entail the installation of a roll-garage-type door to place, and later to access the generator.The primary cost is the cost of the generator and automatic transfer switch (roughly $55,000). The hook-up costs are expected to be roughly $30,000, including necessary permits and compliance costs. The remaining $5,000 is needed for demolition and removal of the existing generator, wiring and outdoor facility in which it is now housed.	O	0	C	Lassen Pines Mutual Water Co. (LPMWC) is dependent upon a WWII surplus generator to provide emergency power to the three (3) pumps used to retrieve water from the company's three wells during PG&E power outages.LPMWC is located at 4,200 ft elevation in eastern Shasta County and experiences frequent weather related power outages each winter...along with fire and other outages during the summer season.The current generator is frequently breaking down and parts for this vintage generator are very difficult to find, and are costly when they are found. During the past winter, the generator was broken down for approximately three and a half months, during which time LPMWC was required to rent a backup generator for emergencies...also very costly.Without generator backup, LPMWC would be unable to provide water to the 500 or so residents of the LPMWC service area. So far, however, with patchwork fixes and backup generator rentals, the Company has never been in that situation. Being an hour (in good weather) from the closest main city (Redding) capable of providing emergency backup generating capability, it is, under the current circumstances, only a matter of time, however.	90,000	155	600	02	Shasta	I	2011

4179	3810001	3810001-030	San Francisco Regional Water System		INSTALL TWO CONTROL VALVES ON EACH PIPELINE AT THE PULGAS VALVE LOT. INSTALL A BYPASS AROUND INDIVIDUAL VALVES TO REGULATE LOW FLOWS.	O	0	C	Controls inadequate at Pulgas valve lot.	775,000	200	600	04	San Francisco	II	1998
4180	3810001	3810001-081	San Francisco Regional Water System		The problem is in the process of being analyzed and remedial measures will be taken to reduce the risk of damage from slope failure thereby protesting the pipeline from damage.	O	0	C	Calaveras Pipeline is exposed to possible damage due to the large steep unstable slope next to the east side of pipeline. The pipeline is above grade and is exposed to possible damage from failure of the slope.	460,000	200	600	04	San Francisco	II	1999
4181	3810001	3810001-165	San Francisco Regional Water System		Extend the San Andreas Pipeline to the Sunset Reservoir.	O	0	C	San Andreas Pipeline	20,000,000	200	600	04	San Francisco	II	2002

4182	3810001	3810001-170	San Francisco Regional Water System	Pulgas Balancing Reservoir Structural Rehabilitation and Roof Replacement	The project consists of the seismic retrofit of the reservoir walls, installation of a new steel frame roof, and repair of concrete cracks and exposed reinforcing steels. The project scope also includes the design and installation of a new ventilation system and sampling ports, replacing utility piping, and upgrading the electrical system. Upon completion, the project will provide a structurally sound, seismic-resistant reservoir that will be in compliance with the latest California Waterworks Standards. It will also improve the water quality in the reserovir, and allows the SFPUC to better profile various water quality parameters within the reservoir.	O	0	C	Although the San Francisco Regional Water System has about 600 retail customers, it is a wholesale water system that serves a total of 2.4 million customers in the counties of Alameda, San Mateo, Santa Clara, and San Francisco.The Pulgas Balancing Reservoir is seismically vulnerable, has sanitary defects (holes in roof), and requires general rehabilitation of miscellaneous structural, mechanical, and electrical systems. During the shutdown to enable inlet/outlet construction, a general condition assessment was conducted that documented the areas of general structural deterioration on the interior of the reservoir. The project is intended to respond to the concerns described in the Engineering Report of the 2004 Drinking Water Supply Permit for the Regional System. On Page 22 of the Engineering Report, the CDPH describes that "the Pulgas Balancing Reservoir is a relatively new facility but contains numerous small holes on its roof and coliform bacteria have been periodically detected in this reservoir. The SFPUC has not corrected this deficiency because the Pulgas Balancing Reservoir is considered a critical facility and can only be removed from service for short periods when system demand is low. Nevertheless, the SFPUC should develop a plan and schedule to seal the holes on the roof of the Pulgas Balancing Reservoir...." In addition, improvements to dechloramination facilities	10,000,000	200	600 04	San Francisco	II	2009
4183	3810001	3810001-093	San Francisco Regional Water System		Construct, replace or extend feeder mains/distribution mains.	O	0	C	Improvement in DIM in-City distribution system.	100,000,000	200	600 04	San Francisco	II	1999
4184	3810001	3810001-091	San Francisco Regional Water System		A new pump station will meet the CDD's standards for reliability and efficiency. The station will be equipped with back-up pumps, emergency power and SCADA compatability.	O	0	C	Bay Bridge Pump Station: Needs to be relocated, at present time it interferes with seismic retrofitting of the bay bridge. Also needs a new pump station.	6,830,000	200	600 04	San Francisco	II	1999

4200	4210022	4210022-002	Golden State Water Company - Lake Marie	Lake Marie - Lake Marie Well #4	This small system is currently only supplied by two wells; one of those wells has serious structural issues, such as a hole in the casing, and needs to be replaced. A new well will be drilled, equipped, and connected to the treatment and distribution system in replacement of the damaged well.	O	0	C	This small system is currently only supplied by two wells; one of those wells has serious structural issues, such as a hole in the casing, and needs to be replaced.	2,200,000	211	630 06	Santa Barbara	IV	2009
4201	3200104	3200104-004	Grizzly Lake RID-Delleker	Rehabilitate existing pipeline to bring water from Phillipini springs	What we would like to do is bring water from Phillipini springs to our district to better serve our customers. In order to do that we either need to rehabilitate or reconstruct the existing pipeline that has been out of service for at least ten years. We will also need a lift station, a redundant power source, an equalization basin, emergency disinfection equipment, flush hydrants, engineering fees, several easements through private and public land, and all.	O	0	C	We have abundant non-surface influenced water available from the existing springs. The nearest city to us has a treatment plant designed to treat Lake Davis water for their drinking water supply and we aren't connected to it. With testing and some engineering we could provide enough water from the Fillipini spring to cover future growth and fire protection.	500,000	199	657 02	Plumas	I	2011
4202	5610006	5610006-005	YERBA BUENA WATER COMPANY	New well and storage tank	2 new 250,000 gal tanks to be installed at a site within the existing ybwc easement area. 1 new well to be drilled (300-400 ft deep), including well house, operating equipment and distribution lines.	O	0	C	YBWC has over 240 service connections, including multi-unit housing complexes and youth camps serving up to 500 children at one time. All water is obtained from 3 wells pumping from a single aquifer. Our consultants have advised that a new 300-400 ft well located approx 600 ft west of existing wells could provide an additional source of water for this community. The storage tanks need to be replaced due to age and corrosion and the most cost effective approach is to replace and relocate tanks at a higher elevation, which will also improve water pressure throughout the community and add to fire protection. Sites for the new well and tank are available within ybwc's existing water easement.	500,000	240	690 06	Ventura	IV	2009

4205	3000825	3000825-001	South Midway City Mutual Water Co.	Water Productioni System Improvement Project	Finish the installation of hydro-pneumatic pressure tank; well re-hab; site security improvements (entry gate, pump enclosure and fencing); install emergency back-up power and solar power system.	O	0	C	Aged infrastructure/equipment and insufficient site security	120,000	64	717 08	Orange	V	2007

4206	3000825	3000825-002	South Midway City Mutual Water Co.	Security Improvement Project	Currently, we are seeking funds to make improvements to the "Production" side of our operation with our "Water Production Security Improvement Project". Following, is a prioritized list of improvements, including estimated costs and total: 1. Re-hab existing in-active (south) well, including new pump and motor, to bring on line as an alternate for emergency/maintenance repairs on active (north) well. $150,000. 2. Re-hab existing active (north) well, including pull and check pump, switch over to product (water) lube from oil lube, perform any needed clean up of well, and replace 25 year old electric motor with energy efficient model. $100,000 3. Install emergency, back-up power system, including diesel powered generator and electrical improvements. $50,000 4. Install monitoring system (SCADA), including computer/telephone. $25000. 5. Make site security improvements, including installation of new automatic facility entry gate, (wrought iron, track, controller, and (Knox Box), pump enclosure, and fencing. $25,000.	O	0	C	We hope to achieve improved water production security by replacing aged infrastructure/equipment, installation of emergency back-up power system, and by making site security improvements. Unfortunately, we do not have sufficient reserve fudns to achieve this goal. In the year 2000, when the current Board of Directors took over management of the Water Co., we owed more than $40,000 in operational costs to various agencies. Today, all operational costs are paid in full and we are building our reserve funds as rapidly as possible, but because of our aging infrastructure and inadequate reserve fund, we are seeking grant funding to make these critical improvements to maintain operational stability. To date, we have successfully applied for and received grant funding through OCHCD for our "Water Distribution System Improvement Project". The project includes design and construction of approx. 4000 ln ft of 6" pvc water main with appurtenances, emergency interconnect with city of Westminster, and installation of new hydro-pneumatic pressure tank. The project approx. 75% complete and we are continuing to pursue additional grant funding from OC to complete the project.	350,000	64	717	08	Orange	V	2007
4207	1500231	1500231-001	VICTORY MUTUAL WATER COMPANY	Nitrate correction project of Victory MWC/intertie with East Nile CSD	A treatment or intertie with East Niles CSD is needed to solve the nitrate problem.	O	0	C	Victory MWC has one well with nitrate problem.	1,500,000	172	740	19	Kern	III	2008
4208	1610006	1610006-001	Stratford PUD	Stratford PUD	Two 50,000 gallon above ground storage tanks along with a pressure pump and a stand-by generator.	O	0	C	We recently drilled a new well due to the constant water level drop in our area, We completed the project in June of 2004. However the problem we have come across is that the well is producing a large of air along with the water. Our only source of pressure is a 30,000 gallon elavated storage tank, due to the small growth and having exhausted all of our funds in the const. of the new well we are now looking for funding for the above ground storage. With the addition of two 50,000 gallon above ground tanks i believe we can solve two of our problems. 1.) Storage for fire protection 2.) Dentention time for the air in the water to vent. With the tanks we would also need a pressure pump and stand by generator for power outages	200,000	294	837	12	Kings	III	2008
4209	5400542	5400542-004	DUCOR CSD	Well Abandonment, install Meters, and Gate Valve Replacement	CSD proposes to replace all defective and non-functional water meters, properly abandon old north well, and replace defective gate valves	O	0	C	North well is no longer usable and must be properly abandoned. All existing meters in the community have stopped functioning and are not being read. Community needs new meters to monitor use and conserve diminishing groundwater supply. CSD also needs to replace water system gate valves.	277,500	125	850	12	Tulare	III	2009
4210	4910010	4910010-001	Sonoma County CSA 41-Fitch Mountain		Install 30,000 gal tank on an easement near the top of the mountain. Install a higher head pump at the booster station and extend the water line up to the new tank.	O	0	C	Too much air is dissolved in the water at the booster pump station.	60,000	335	900	18	Sonoma	II	1998
4211	1010042	1010042-003	MALAGA COUNTY WATER DISTRICT	SCADA	INSTALL SCADA SYSTEM. OTHER - DESIGN AND CONSTRUCTION	O	0	C	WELLS OPERATE INDEPENDENTLY AND DO NOT HAVE AVAILABLE REMOTE MONITORING OR CONTROL. POTENTIAL PROBLEMS DUE TO LOSS OF POWER OR MECHANICAL FAILURE.	100,000	472	900	11	Fresno	III	1998

4212	3310040	3310040-002	Fern Valley WD	Tahquitz Pines Water Project	We have a serious capacity problem that not only effects our operation, but also the agencies that we have agreed to support in the event of an emergency (CDF and the Red Cross). Our local well and system is shut down and we are currenly using city water. We need to drill a new and deeper well (ours is currently dry). We will need to drill down to at least 500-600 feet. We will also need to put in a larger water storage tank, estimated to be at least 60,000 gallons by the local fire agencies for our acreage (22 acres) and 65 buildings, which include 2 conference centers with full kitchens, bathrooms and meeting centers. We also have extra offices that can be used as a control center with wireless data networks. We will also need to install a new submersible pump in the well. We will also need to trench and install new water lines from the well to the storage tanks. We will also need to run electrical to the well pump and to the pump house that boosts the pressure of the water in the system. We need two booster pressure tanks to work in conjunction with the booster pump to supply between 30-60 psi. A monitoring system needs to be put in place to monitor the level of water in the tanks, the flow of water from the pumps and the outgoing flow. Such a monitoring system must be capable of	O	0	C	We are a not-for-profit conference center and camp at about 5600 feet elevation. The local area has been getting drier and drier over the last 5-10 years. Our current and only well is dry at 320 feet. We only have 7900 gallons of storage with 2 tanks and we cannot keep them full. We are a conference center and can have 200+ people at any given week or weekend throughout the year. At present we are drawing water from the Fern Valley Water district and they are at Stage 1 water alert. The surrounding water districts are at Stage 2. We need a deeper well and larger tank for fire control of our 65 buildings and our surrounding neighbors and to insure that we do not drain the local resources. We need a new well at about 500 feet, well pump, electrical to the well, trenching and lines run from the new well to the storage tanks (60,000 gallons at minimum), switching station to switch from our supply to support the city and visa versa, storage tanks and booster pumps to insure the correct water pressure and a backup generator in the event of a disaster and power loss. Install a monitoring and control system to monitor and store the data for all water flow and useage throughout the year. Several years ago the CDF used our facility while they remodeled their offices. During such time they cleared out all of dead trees and declared our site a Fire Safe	185,000	1,174	900	20	Riverside	V	2007
4213	1910075	1910075-008	LOS ANGELES CO WW DIST 21-KAGEL CANYON		REPLACE 3000 FT OF 4" DISCHARGE MAIN.	O	0	C	THE EXISTING DISCHARGE PIPELINE FROM THE DISTRICT NORTHERLY WELL (NO. 5) IS AGED, UNDERSIZED, AND IN NEED OF REPLACEMENT. THIS WELL HAS THE HIGHEST PRODUCTION, LOW NITRATE LEVEL, AND IS NECESSARY FOR SUCCESSFUL NITRATE BLENDING WITH OTHER SOURCES.	340,000	249	998	16	Los Angeles	IV	1998
4214	1910244	1910244-003	GREEN VALLEY CWD	Solar Powered Water Tank Circulator	A Solar Powered Water Tank Circulator would be installed at each of the six water storage tanks.	O	0	C	The District's water storage tank systems are designed so that the water enters and exits the tank near the bottom through the same pipeline. During periods of low water use, the water at the top of the tank is not always used. By mixing the water in the tank, stagnation should be prevented, and the residual chlorine should not be lost as fast so the chlorine usage should be lower and the chance of formation of disinfection by-products lessened. Thermal stratification should be reduced over and above the mixing effect of normal inflow and outflow. Less tank cleaning should be required because side walls and bottom is being constantly disinfection.	180,000	485	1,000	15	Los Angeles	IV	2007
4215	1910244	1910244-002	GREEN VALLEY CWD	Security Vulnerability Protection	We are a rural isolated community completely surrounded by the Angeles National Forest. All of our well locations are secured by a well house and chain link fence. Our water storage tanks and booster pump stations are located throughout the town some in very isolated areas. Securing these areas would deter vandalism and make these are as less vulnerable to terrorist acts. The proposed fencing installation would be at three of the tank locations and at one booster pump station. The installation would be approximately a total of 2,300 lineal feet of 6' chain link with razor wire on top with a set of double gates at each site.	O	0	C	Security Project	77,000	485	1,000	15	Los Angeles	IV	2007

4216	1910244	1910244-006	GREEN VALLEY CWD	Nitrate Removal	In the future, to install nitrate removal units on wells that begin to have nitrate in excess of the MCL. At the present time it does not appear feasible to construct a centralized community treatment unit so "well head" treatment units would be proposed for any wells that are out of compliance. The usual method of treatment for small systems such as this is ion exchange. There is no sewer collection system for disposal of the brine developed as treatment takes place so a method for temporary storage and removal will be provided. An engineering report would be developed which would indicate a more detailed description of the necessary treatment system and its construction cost.	O	0	C	The dwelling units within the Green Valley County Water District all use on site sewage treatment and disposal units (septic systems). As all the water wells in the valley are clustered in the lower valley area, the possibility exists that the well water could experience increased levels of nitrate over the years. In fact one of the wells had an elevated level of nitrate (72 mg/l) for a short period of time. The District received a citation in 2005 for a nitrate violation. The areas available for water wells within the District are very limited due to proximity to septic systems and to the locations where producing water wells can be constructed.	400,000	485	1,000 15	Los Angeles	IV	2007
4217	1910244	1910244-005	GREEN VALLEY CWD	Additional water source – Drill alluvial well	The project involves the drilling of a test well and if successful the drilling and development of the production well. The installation of the pump, panel and pipeline to existing pipelines would follow the completion of the well. Location of the well would be on property already owned by the District. The well location would be in conformance with DHS standards, Los Angeles County standards and plumbing code requirements.	O	0	C	All the District's wells pump a total of approximately 200 gpm and deliver it into the lower zone tanks. Customer demand is furnished from the 800,000 gals of storage which are in three pressure zones. An additional well would increase the production capacity available and would allow the wells to be pumped at a lower rate to increase their life span. As well as provide backup supply in case of pump or motor failure or a problem with the temporary water quality in one or more of the wells.	110,000	485	1,000 15	Los Angeles	IV	2007
4218	4010028	4010028-001	SLO CSA NO. 16 - SHANDON	Distribution lines	Replace existing water distribution lines	O	0	C	existing distribution lines are inadequate for providing fire flows and pressures	700,000	344	1,030 06	San Luis Obispo	IV	2006
4219	4710010	4710010-002	City of Tulelake	Tulelake water system renovation	steel main line needs replacementin line valves need replacementground level tank needs renovationwater tower tank needs renovationcommunity needs emergency generator	O	0	C	The City of Tuelake is a low income farmworker community in the Klamath basin. The drinking water system in old with steel pipe in the distribution system and a tall water tower along with a ground level water tank requiring rehabilitation.Steel main distribution line needs to be replaced, in line main valves need replacement. Water tower and ground level water tank need renovation and the communities needs a 150KW emergency generator keep system in operation during an emergency.	305,000	484	1,058 01	Siskiyou	I	2011
4220	4510004	4510004-002	Shasta Co. Service Area #6	Plant Control Upgrade Jones Valley CSA 6	The proposed project will replace the obsolete electronic controls with a new PLC and updated software and parts to better automate plant operation. The controls upgrade will prevent excessive water waste by properly controling plant backwash cycles and correctly reading and responding to storage tank levels--tank overflows are not uncommon with the existing system.	O	0	C	The Jones Valley water treatment plant has had ongoing telemetry and control problems. Some of the electronic valves are now obsolete-parts are not available for repairs. The existing software will not interface properly with the plant resulting in tank overflows, excessive backwashing of the filters, and unnecessary service calls to operate the plant manually. These problems are wasting water and money on after hours service calls.	80,000	377	1,119 02	Shasta	I	2007

4221	4710006	4710006-011	McCloud C.S.D.	Lower Elk Springhouse Rehabilitation	Identified improvements from a 2006 engineering report include the need to: Construct missing sections of the interior concrete retaining wall to keep the spring area intact. Uncover the spring inside the building by removing dirt over the existing French drain area. Cap the spring area with support beams and concrete/steel deck. Install 3 screened air vent/overflow pipes above the concrete cap. Replace the existing 10" WS inlet pipe from the Upper Elk Spring with a new 16" WS fusion-bonded epoxy coated pipe and install rubber strips underneath the pipe to prevent damage on the pipe coating by pipe supports. Replace riveted steel surge tank with a new WS fusion-bonded epoxy coated tank approximately 3.5' in diameter and 8' tall. Provide a sealed cover and install a new baffle wall inside the tank. Replace the 12" WS pipe that discharges from surge tank to concrete distribution box with a new 16" WS fusion-bonded epoxy coated pipe. Replace 10" Lower Elk Spring outlet pipe from the spring with a new 10" WS fusion-bonded epoxy coated pipe. Install a new gate valve on the pipeline. Replace existing concrete distribution box with a new weir box and connect the new Lower Elk Spring outlet pipe and 16" pipe from the surge tank. Replace the existing 20-24" WS pipe from the distribution box to the Lower Elk Spring Pipeline with a new 24" WS fusion-bonded epoxy coated pipe. Install a new 16" WS fusion-bonded epoxy coated	O	0	C	The Lower Elk Springhouse, McCloud CSD's largest water supply source, has a number of deficiencies that need correction to address the potential for water contamination that can affect the Upper and Lower Elk Spring water supplies. Samples taken in 2011 by CDPH tested positive for total coliform, and a 11/10/11 CDPH letter recommended the lower Elk Springs be bypassed until a solution is in place. The emergency bypass was completed in October 2011.The appropriate long term to put this source back into service includes complete rehabilitation of the structure. A 2006 engineering study determined that the springhouse is beyond its remaining useful life, dilapidated, does not provide a secure water supply source and is accessible by rodents and other animals. The 2011 annual inspection by CDPH indicated that a significant amount of soil had eroded from the upslope side of the protective concrete dam such that the overflow pipe adjacent to the collection pipe was exposed. Pooled surface water was also partially submerging the concrete junction box. The proposed rehabilitation project will address these significant concerns and restore a safe and reliable drinking water supply for the residents of McCloud.	550,000	641	1,300 01	Siskiyou	I	2012
4222	4710006	4710006-012	McCloud C.S.D.	McCloud Water Distribution System Replacement	Installation of a new water delivery system in the northwestern corner of the District's service area which includes approximately 12,410 linear feet of 6"-12" PVC pipe, two connections into the existing Phase 2 Bypass Pipeline system, three railroad crossings and 123 public water service lines. This installation will be performed within Siskiyou County road right-of-ways with minimal easement acquisitions necessary. This installation constitutes a new infrastructure footprint since the existing, antiquated system runs helter-skelter through private properties and under residential structures. This installation will require open trench construction.	O	0	C	The project is located in the northwestern section of the boundaries of the McCloud Community Services District. McCloud's company-owned mill town legacy includes deeded inheritance of approximately 12,410 linear feet of piping in this area of the water distribution system predominantly installed in the 1940s without benefit of design planning or engineering. The existing helter-skelter pipelines include mains running through now private properties since the company divested itself of ownership. Homes sit atop infrastructure. Valves are located on private properties and frequently lie under residential structures. Infrastructure was deeded to McCloud with minimal documentation to facilitate accurate location of water mains, service lines and appurtenances. Although MCSD employees have developed a map book based on the minimal documentation provided and additional field observations, it is difficult and sometimes impossible to accurately establish the location of lines or appurtenances. An inordinate amount of staff time must be spent performing open trench investigations of infrastructure prior to performing what should be minor repairs or replacements since unknown factors often cause significant, negative consequences. A 2006 engineering report identified multiple causes of concern in the distribution system including an estimated 65% water loss attributed to age, deterioration and high	4,200,000	641	1,300 01	Siskiyou	I	2012

4225	4910021	4910021-002	Bodega Bay Public Utility District	Bodega Bay Public Utility District Bodega Harbour High Zone Intertie	The project involves construction within the Bodega Bay public water system of an interconnection between two independent water service pressure zones within the Bodega Bay community. The independent water pressure zones are identified as Bodega Harbour North and Bodega Harbour South. Each zone is now served by a booster pump station that pumps water from a lower pressure zone to the upper pressure zone. Each zone also is served by a water storage tank placed at approximately the same elevation. Project components would include construction of approximately 2,300 feet of 8-inch diameter water main, installation of valves and accomplishing two connections to existing water mains. A portion of the project would be constructed within existing streets and the balance would be through undeveloped land. Crossing of a seasonal creek would be required with that portion of the project potentially being constructed with directional drilling methods. The project also requires crossing California State Hwy. 1. The planned construction method for crossing Hwy. 1 would be directional drilling.Preparation of an initial study is underway for the Bodega Harbour High Zone Intertie Project and adoption of a Mitigated Negative Declaration by the Board of Directors of the Bodega Bay Utility District is anticipated in June of 2009. Proposition 218 has been satisfactorily addressed for the project by adoption in November of 2008 of new fee ordinances	O	0	C	The town of Bodega Bay is the largest unincorporated commercial and residential center in western Sonoma County located along Highway 1, on the County's southern coast. Historically, the town was primarily a fishing village with relatively few permanent residents. The surrounding hillsides consisted largely of rangeland for sheep and cattle grazing. In recent times, Bodega Bay has evolved into a popular tourist destination with associated commercial development. In the mid-1970s, Bodega Harbour Subdivision, a major housing and golf course project was developed. Today, due to the desire to live at the coast, the town includes a broader cross-section of full and part-time residents. The Bodega Bay water system is classified as a small water system and serves residential and commercial customers. The approximate number of existing residential equivalent units (RUE) is 1900.The District is a publicly-owned utility with the Board of Directors elected by registered voters living within the District boundary. The District operates the water and wastewater facilities within Bodega Bay. Development within the District is guided by the Sonoma County Local Coastal Plan/Sonoma County General Plan and the Sonoma County Zoning Ordinance. There are two water pressure zones within the District that enable provision of water within appropriate pressure ranges for use by customers. The high pressure zone is further divided geographically into	480,000	1,032	1,423	18	Sonoma	II	2009

4236	4710002	4710002-004	City of Dunsmuir	Dunsmuir Water System Improvement Project	Project components include design and construction. The 1994 Master Water Plan and 2010 draft Preliminary Engineering Report have identified the following problem areas:Dunsmuir Water Project Summary Estimated Cost _ Bush Street Water Main $165,000North Dunsmuir Water Main $360,000Willow Street Water Main $130,000Oak Street Water Main $64,000Blackberry Hill Water Mains $1,130,000Prospect/Scenic/Needham Water Mains $703,000Downtown Storage Tank & Water Main $1,754,000 _ Total $4,306,000Historically, the City's water supply from Mossbrae Springs has been able to supply the City's maximum hour demand (MHD), with some exceptions. On a few occasions, the Lookout Booster Pump Station lost suction pressure and the Upper Zone was out of water for 8- to 10-hour periods. The inadequate suction pressure condition at the Lookout Booster Pump Station occurred a number of times during summer 1992, which was at the end of a five-year drought. Therefore, if the spring supply was not meeting the estimated MHD of 1.55 MGD, it can be concluded that the effective supply capacity of the spring system was about 1.5 MGD during those drought conditions.According to California Department of Public Health (CDPH) Standards, the effective capacity of a spring shall be "…the lowest anticipated daily yield, based on adequately supported and documented data."	O	0	C	The City's 1994 Master Water Plan (MWP) investigated supply, storage, distribution, and internal pumping facilities, and recommended immediate, near-term, and long-term improvements. City completed all of the recommended immediate improvements, but none of the near-term improvements. These improvements are now ten years beyond the time in which implementation was originally recommended. As such, many deficiencies, including inadequate system pressures and fire flows, currently pose health and safety risks.Approximately 34,000 feet of 4-inch to 18-inch mains in the City are 60 to 70 years old. These include the North Dunsmuir Water Main Replacements and the Downtown Water Main Replacements. Due to the history of significant leaks in the last six months, both are now considered high priority replacement projects. The Bush Street water main is located in the same trench, and in some cases below the existing sewer main. When the water main is depressurized during leak repairs, significant public health risks exist. The Dunsmuir Avenue water main is primarily located on private property and traverses under existing large trees, landscaping, and structures rendering access for repairs difficult. The deteriorating pipeline and poor access increase the health and safety risks to the City. Currently, the Dunsmuir Elementary School is fed by the Downtown Pressure Zone, which obtains pressure	4,500,000	1,285	1,923	01	Siskiyou	I	2012
4237	1710010	1710010-007	Lower Lake County Water District	Groundwater Recharge	Cache Creek intake, microfiltration unit and recharge well.	O	0	C	Aquifer level decreasing. May soon be too low for existing Cache Creek wells to continue to be viable system sources.	2,000,000	886	2,025	03	Lake	II	2002

4240	3610048	3610048-002	TERRACE WATER CO	Terrace Water Company Emergency Interconnection Project	Terrace Water Company is seeking support from the CDPH, Division of Drinking Water, to replace the system's emergency interconnection. Our previous connection was abandoned as a result of line upgrades by our partnering system. Therefore, for reasons beyond our control, Terrace Water Company is currently without an interconnection to service customers in an emergency.We have partnered with Riverside Highland Water Company (RHWCo) to replace this interconnection and have a signed letter of agreement from their General Manager. RHWCo has higher water pressure than Terrace Water Company, so parties have agreed that the main beneficiary of this intertie would be Terrace Water Company. If in the future RHWCo has the need for water from Terrace, a booster will be installed to overcome the pressure differences. Terrace Water Company will pay for all materials and installation, including an RP backflow prevention device and a meter, while RHWCo will provide their as-built water plans. This connection will likely occur along Rancho Avenue in the City of Colton. Terrace Water Company would like to install a 10 inch intertie with RHWCo. This construction will include hot tapping both existing lines and installing a 10-inch C900 PVC lateral from RHWCo main to the Terrace Water Company meter. Materials will include the 10-inch lateral, a 10-inch saddle type meter, a 10-inch reduced	O	0	C	Terrace Water Company is currently without an emergency interconnection. For many years, the Company had an intertie with a neighboring system. When the system replaced lines in the area, the intertie was abandoned without notification. Without prior knowledge of the connection termination, Terrace Water Company was left without an emergency interconnection to service residents. Terrace Water Company has built a relationship with Riverside Highland Water Company, which operates within a close proximity. They have agreed to allow Terrace Water Company to establish a new interconnection with their system.	100,000	574	2,200	13	San Bernardino	V	2008

4241	5610015	5610015-009	VENTURA CWWD NO. 19 - SOMIS	County of Ventura Waterworks District No. 19 - Well #4 Facility Treatment	The Contractor shall furnish all materials, equipment, tools and labor for the construction of an operational facility to pump raw water at a rate of 1200 gpm from existing Well No. 4, (drilled and constructed in late 2007), and receive filtration to remove excess concentrations of Iron and Manganese, before supplying water to the 745 pressure zone and the existing 1 MG Balcom Canyon Reservoir. Work includes construction of the following: Well Pump, Booster Pump Station, Filtration System, Chemical Containment Area, Reclaimed Water Tank and Pumps, Electrical and Instrumentation, and Site Work. When completed this project will also reduce energy costs, conserve the water supply, and reduce dependence on imported State water.	O	0	C	Ventura County Waterworks District No. 19 (Distict) provides water service to the community of Somis. Well #4 was drilled in December 2007. When the well water was originally tested, it had excessive concentrations of Iron and Manganese secondary contaminants. To comply with California Department of Public Health standards, the water will require treatment prior to delivery to the system.The well is needed to provide additional local water supply for domestic needs and fire protection to the 745 pressure zone in the District. .	2,500,000	775	2,266 06	Ventura	IV	2009
4242	5610015	5610015-004	VENTURA CWWD NO. 19 - SOMIS		Construct a 4,500 LF of 10-inch water line to replace existing 8-inch CI water line.	O	0	C	Needs to replace the deteriorated distribution pipes.	297,000	775	2,266 06	Ventura	IV	1998
4243	5610015	5610015-008	VENTURA CWWD NO. 19 - SOMIS	Ventura County Waterworks District No. 19 Infrastructure Improvement	The project goal is to provide a reliable high quality water supply in compliance with Federal and State requirements and to provide fire flow. This infrastructure improvement project in District No. 19 would implement a replacement program based on an established priority for pipeline replacement, replacing old and deteriorating waterlines in the system that have exceeded their economic life.	O	0	C	Ventura Waterworks District No. 19 (District) provides water service to domestic and agricultural customers in the Somis community and the surrounding areas. The District was established in 1981 when it assumed the ownership of the Rancho Las Posas Mutual Water Company. Many of the waterlines in the system are over 75 years old and have exceeded their economic life. Mainline breaks are occurring frequently, which results in interruptions in service and unnecessary loss of water.	12,100,000	775	2,266 06	Ventura	IV	2007
4244	5610015	5610015-006	VENTURA CWWD NO. 19 - SOMIS		Construct 2,200 LF of 8-inch water lines to replace existing water lines.	O	0	C	Needs to replace inadequate size distribution pipes.	131,000	775	2,266 06	Ventura	IV	1998
4245	5610015	5610015-014	VENTURA CWWD NO. 19 - SOMIS	Ventura County Waterworks District No 19 - Reservoir Safety Upgrades	This project is to install Safe-T-Climb Devices, extend existing ladders, provide enclosures for security and safety, and install/repair liquid level indicators.SolarBee type circulation equipment will also be installed.Once completed, this project will comply with all OSHA requirements and provide for a safer environment for employees, and protect the health and safety of customers.	O	0	C	Ventura County Waterworks District No 19 (District) provides domestic water and fire Protection for the community of Somis.The District has various reservoirs that are inadequately equipped and not in compliance with OSHA regulations such as ladders with no fall arresting device, or lanyards to prevent injury from a slip or fall while climbing the reservoirs (many of them are over 30 feet tall).Stratificaiton and stagnant zones are causing loss of disinfectant residualsAlso, there are District reservoirs that do not have functioning liquid level indicators.	375,000	775	2,266 06	Ventura	IV	2009
4246	5610015	5610015-011	VENTURA CWWD NO. 19 - SOMIS	Ventura County Waterworks District No. 19 - SCADA Upgrades	The project will include the installation of SCADA hardware consisting of Remote Terminal Units, radios for data communication, antennas to transmit the data to the main SCADA control station, and pressure transmitters to read the water pressure at the station or the level of water in the reservoir. This data will be used by SCADA to control the wells, booster pump stations, and pressure reducing stations. Completion of this project will ensure a reliable source of water for District customers; this project will also reduce energy costs, help conserve water, and reduce dependence on imported State water.	O	0	C	Ventura County Waterworks District No. 19 (District), which provides water service to the community of Somis, has a Supervisory Control and Data Acquisiton (SCADA) system to monitor and control various facilites. The District's water supply comes from both imported and local sources. The District is striving to reduce its dependance on imported water, prices of which are escalating at alarming rates.In order to manage locally produced well water in a cost effective and efficient manner, it is imperative that the SCADA system be upgraded to connect facilities not currently on SCADA.	200,000	775	2,266 06	Ventura	IV	2009
4247	5610015	5610015-003	VENTURA CWWD NO. 19 - SOMIS		Construct 2,500 LF of 12-inch water line to replace existing 6 inch CML steel water line.	O	0	C	Replace deteriorated distribution pipeline.	182,000	775	2,266 06	Ventura	IV	1998

4252	4510002	4510002-008	Mountain Gate C.S.D.	South Reservoir Project	The Project would be to establish a South Pressure Zone by installing a separate 8-inch Main from the existing South Reservoir to a South Zone and installing a check valve between the Main Zone and the South Zone.The Project would also include adding a "new pressure reducing station" on an existing 6-inch Main Line in the same area.	O	0	C	The South Reservoir is not functioning to control the downstream pressure or to provide equalizing storage during MHDs. A new feeder line should be installed from the Main Line because of the the problem of over-pressure.The District has been informed by its engineering company that these pressure control issues can be resolved by creating a new Pressure Zone.	115,000	664	2,500	02	Shasta	I	2011
4253	4410018	4410018-003	Central Water District	Valencia Road Water Main Replacement Project	The project plan is to replace the 6600 lineal feet of 6 inch World War II era thin-wall steel pipe water main with 6600 lineal feet of 8 inch C900 Class 200 PVC water main pipe. This project will also include the replacement of all isolation valves as well as the upgrading of hydrants. The project planning of the new water main will incorporate the most current design and technologies in order to maintain structural integrity of the pipeline, in particular so that the pipeline will withstand natural disasters such as earthquakes.Additionally, replacing this water main will help facilitate the transfer of water to District interties with other local water agencies.	O	0	C	The existing six inch (6 ") water main was constructed in the 1950s and is constructed of World War II era thin-walled steel pipe. The water main has been compromised in several locations over the past decade. The pipe line has exceeded its service expectancy and is overdue to be replaced.	660,000	808	2,700	05	Santa Cruz	II	2011
4254	2110006	2110006-028	North Marin WD - Pt. Reyes	Coast Guard Well Salinity Monitors	The project proposes the installation of a salinity monitor at the Coast Guard Wells in Pt Reyes Station. This monitor would send feedback via SCADA to the central Operations center for identification and alert. This system would eliminate the need for staff to manually measure salinity levels entering the distribution system and would help prevent the exceedence of secondary Maximum Containment Levels in the distributed water.	O	0	C	North Marin Water District's (NMWD) West Marin Distribution System services Point Reyes Station, Olema, Bear Valley, Paradise Ranch Estates and Inverness Park. The Town of Inverness also benefits because it has an emergency water supply connection to the NMWD West Marin Distribution System. The existing primary supply source (Coast Guard Wells) for the sole treatment plant serving this distribution system is under the influence of flows in the tidal reach of Lagunitas Creek. The water supply is thereby subject to periodic salinity intrusion during high tides and low stream flows. This problem has worsened over the last year after the Giacomini Ranch was inundated with Tomales Bay water as part of Point Reyes National Seashore's Giacomini Ranch Wetland restoration project. NMWD has adopted a policy of avoidance pumping where no water is pumped from the wells 3 hours before or after a high tide. However, the frequency of the salinity intrusion has increased and now requires more staff monitoring to forecast avoidance pumping schedules. Chlorides will generally exceed 100 mg/l during these events and have also exceeded Secondary Maximum Containment Level (SMCL) of 250 mg/l. When elevated salinity is encountered in the Coast Guard Wells, the District has adopted a policy of customer notification.	12,000	762	3,000	18	Marin	II	2009

4255	3010068	3010068-002	East Orange County WD - RZ	EOCWD New Well Project	The 1926 Well is encountering bacteriological problems and during the last cleaning, the contractor advised that the casing is "fragile" and should not be brushed again. This has limited our ability to resolve the bacteriological issues and we have taken the well out of service. Because of reduced demand at this time of year, this loss of supply has not caused service reductions or interruptions at this time. However, we anticipate that the reduced availability of existing imported water supplies that we may experience this problem as early as July, due to imported water reductions that have been projected by the Metropolitan Water District of Southern California. Complicating this is the limited availability of nearby agencies to "lend" or otherwise assist us by supplying water as they have their own supply issues to deal with.The New Well Project is the most cost effective solution and will supply the District with a safe and reliable source of supply. It is being sized so that if the District's other well, the 1946 well, also experiences reliability problems, the District's entire demand can be produced from that well. The Project itself is comprised of drilling a new well and supplying the pumping equipment, variable speed motor, connection piping, valving, sampling station and instrumentation and controls. The well drilling itself cannot commence until the winter months because the actual drilling will impact the nearby 1946 well. We	O	0	C	The East Orange County Water District serves two functions: 1) it provides wholesale imported water to over 100,000 people directly served by three public and one private retail water agencies and, 2) it provides groundwater and a small amount of imported water to 1,200 retail customers located in an unincorporated area of Orange County, California. The retail customers are primarily single and multi-family residential developments; there are only two commercial establishments and and one elementary school in the District.The primary source of water for retail customers is provided by two wells: one drilled in 1926 and the other in 1948. Both were agricultural wells that were converted to municipal use as the area developed in the 50s and 60s. The useful life for a well is generally considered to be 50 years; these wells have exceeded their life by 33 and 11 years, respectively. While they both are still producing water, given the 1926 well's age, it could fail catastrophically at any time, permanently leaving the District without an important source of potable water.The 1926 well is encountering increasing bacteriological issues. We have experienced repeated positive coliform counts at the well, and did have one positive result in the distribution system, however resampling did not confirm this result. Based upon this, we have taken the well out of service and are trying to determine the source of contamination.The	1,800,000	1,198	3,000	08	Orange	V	2009
4256	5010039	5010039-006	WESTERN HILLS WATER DISTRICT/DIABLO GI	Western Hills Water District Water System Security Improvements	The Western Hills Water District (WHWD) owns and operates the water system that serves the community of Diablo Grande. The system is located in a rural area within western Stanislaus County. The original designers of the system did not take into account security and vulnerability issues. Studies conducted by the WHWD identified several key areas where the raw water supply and the treatment and distribution system were vulnerable to disruption or security breach. Critical to supplying water to the community of Diablo Grande are the raw water pump stations, which draw water out of the California Aqueduct, and pump it over a 1,000 feet vertical lift to the water treatment facility. These facilities are remote from the community. Additional physical improvements are needed to provide access control to the various pump station sites. None of the pump stations sites are remotely monitored. The water distribution system facilities such as the Zone 3 Tank and the Diablo Grande WTP have minimal security features to prevent unauthorized entry. Many of the facilities just have a chain link fence and gate to prevent casual entry. The chain link fencing to the raw water pump stations is routinely cut by intruders to gain access to the sites.	O	0	C	Security Project	200,000	1,000	3,000	10	Stanislaus	III	2007
4257	2110006	2110006-024	North Marin WD - Pt. Reyes		Alarms and redundancy could prevent future events. SCADA controls and additional backup pumps proposed.	O	0	C	Water supply outage due to lack of alarms on remote system and lack of redundancy in pumping resulted in coliform contamination.	200,000	762	3,000	18	Marin	II	2001

4258	3010068	3010068-001	East Orange County WD - RZ	EOCWD Barrett-Marcy-Newport Pipeline	The area served by this pipeline is characterized by steep changes in topography. The pipeline was originally installed in easements through residential property, not in a street easement. Through the years, access to the main and its associated valves and service connections has been restricted by land movement, fences and improvements constructed by residents. Several of the valves are now inoperable and fire flow to the area has been adversely affected.Replacement of the existing pipeline, service connections and valving will allow the District to improve service, particularly fire flow, to this area as well as the adjoining areas connected to the pipeline.	O	0	C	The Barrett-Marcy-Newport Transmission Main Project will replace approximately 2,200 lineal feet of aging 8-inch Asbestos Cement (AC) pipe, most of which is located in areas that are very difficult to access (sloped areas, under landscaped areas). This transmission main is further burdened by a number of inoperable valves, which preclude operation of the pipeline and affect fireflow in the area served by the pipeline.	650,000	1,198	3,000	08	Orange	V	2009
4259	2110006	2110006-027	North Marin WD - Pt. Reyes	Gallager Well & Pipeline	The North Marin Water District (NMWD) proposes construction of a new well and a pipeline to supplement a periodically unreliable water source. The new well will be constructed near an existing NMWD Gallagher Ranch standby well located approximately 1.3 miles east of Point Reyes-Petaluma Road at Gallagher Ranch, upstream of any flooding and tidal reaches of Lagunitas Creek. The existing standby well there has a limited flow capacity (170 gpm) and is not connected to the West Marin distribution system. The new 7,200 feet of 12" pipeline will convey water to the Point Reyes Treatment Plant. This project will increase the Gallagher Wells site's capacity and integrate it to the distribution system thereby insuring reliable, high quality water supplies during high tide and flood events on Lagunitas Creek. Coast Guard Wells will continue to be the primary supply source because it has good water quality, is reliable during most months, and has ample recharge.	O	0	C	North Marin Water District's (NMWD) West Marin Distribution System services Point Reyes Station, Olema, Bear Valley, Paradise Ranch Estates and Inverness Park. The Town of Inverness also benefits because it has an emergency water supply connection to the NMWD West Marin Distribution System. The existing primary supply source (Coast Guard Wells) for the sole treatment plant serving this distribution system is under the influence of flows in the tidal reach of Lagunitas Creek. The water supply is thereby subject to periodic salinity intrusion during high tides and low stream flows. This problem has worsened over the last year after the Giacomini Ranch was inundated with Tomales Bay water as part of Point Reyes National Seashore's Giacomini Ranch Wetland restoration project. NMWD has adopted a policy of avoidance pumping where no water is pumped from the wells 3 hours before or after a high tide. However, the frequency of the salinity intrusion has increased and now requires more staff monitoring to forecast avoidance pumping schedules. Chlorides will generally exceed 100 mg/l during these events and have also exceeded Secondary Maximum Containment Level (SMCL) of 250 mg/l. When elevated salinity is encountered in the Coast Guard Wells, the District has adopted a policy of customer notification.	1,676,272	762	3,000	18	Marin	II	2009

4260	0910015	0910015-002	Tahoe Keys Water Company	Water line replacement Beach Drive	The scope of the project will include 2,449 feet of 6" C-900 main waterline with approximately 23 polyethylene service lines that will be 1 1/4" in diameter. These will replace the existing 1" galvanized service lines plus additional service lines will be added to improve the ratio of service lines to homes from the current ratio of 1:4 to 1:2, meaning that no more than two homes will be tied to each new service line. Additionally, water meters will be added to 45 homes. Project costs are based on two similar projects completed in 2008 and 2010. Costs include engineering plans, permits and all construction costs including asphalt overlay as required by the City of South Lake Tahoe. The TKPOA has completed three similar projects during the past three years so should funding be available the TKPOA is prepared to start work on the Beach Drive project as soon as grading season starts on May 15, 2011.	O	0	C	The Tahoe Keys Property Owners' Association (TKPOA) has proactively begun to replace 45 year old galvanized service lines and AC concrete mains throughout the Tahoe Keys Water service area. Existing lines have degraded to the point where the repair costs are no longer economically feasible. The proposed project on Beach Drive will replace these failing lines as well as provide additional service lines with a larger capacity. This will result in increased water pressure to our fire hydrants. Water districts within in the Lake Tahoe Basin are required to have fire systems installed with a minimum flow of a 1000GPM. Currently, our hydrants do not meet this flow requirement but upon completion of this project the hydrants within the project area will be compliant. The current service lines in this project area are insufficient to supply the homes in this project area with adequate water pressure. Currently we have 4 homes connected to a 1" service line. This proposed project will decrease the number of homes per service line to two and the line will be increased to 1 1/4". Currently the TKPOA does not meter residential water usage. Upon completion of this project, the TKPOA will have installed 45 water meters which will help us move forward in our goal to have residential meters installed at all homes by 2025.	748,200	1,578	3,004	09	El Dorado	I	2011
4261	0910015	0910015-001	Tahoe Keys Water Company	Water line replacement Balboa Drive	The scope of the project will include 1,239 feet of 6" C-900 main waterline with approximately 17 polyethylene service lines that will be 1 1/4" in diameter. These will replace the existing 1" galvanized service lines plus additional service lines will be added to improve the ratio of service lines to homes from the current ratio of 1:4 to 1:2, meaning that no more than two homes will be tied to each new service line. Additionally, water meters will be added to 33 homes. Project costs are based on two similar projects completed in 2008 and 2010. Costs include engineering plans, permits and all construction costs including asphalt overlay as required by the City of South Lake Tahoe. The TKPOA has completed three similar projects during the past three years so should funding be available the TKPOA is prepared to start work on the Balboa Drive project as soon as grading season starts on May 15, 2011.	O	0	C	The Tahoe Keys Property Owners' Association (TKPOA) has proactivaly begun to replace 45 year old galvanized service lines and AC concrete mains throughout the Tahoe Keys Water service area. Existing lines have degraded to the point where the repair costs are no longer economically feasable. The proposed project on Balboa Drive will replace these failing lines as well as provide additional service lines with a larger capacity. This will result in increased water pressure to our fire hydrants. Currently the TKPOA does not meter residential water usage. Upon completion of this project, the TKPOA will have installed 33 water meters which will help us move forward in our goal to have residential meters installed at all homes by 2025.	381,600	1,578	3,004	09	El Dorado	I	2011
4262	1910006	1910006-001	SO. CAL. EDISON CO.-SANTA CATALINA	SCE "Island Wide" Water Conservation Program	The program has two "full service" elements that encompass a "City Wide Water" Conservation Program. Element A: A team of trained plumbers will retrofit 1,900 residential homes / 4,000 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 118 acre feet per year. Element B. A team of specialist will retrofit 200 residential yards with modern ET water controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 30 acre feet per year. .This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 – 24 months and employ 75 to 100 people.	O	0	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 150 acre feet per year or 50.0 / 75.0 gallons per day, per person.	3,000,000	1,972	3,127	16	Los Angeles	IV	2009

4263	3110150	3110150-001	CalAm - West Placer	Walerga Road Tank, Booster Pump Station, and Pipeline Project	The project installs approximately 2,900 LF of 16 inch DI Transmission Main, a 2.5 million gallion Storage Tank & a 3,500 gpm Pump Station. It is the only reservoir in the system of about 1,000 homes with the potential for about 3,500 more in the future.	O	0	C	The project provides emergency storage, enhances fire protection & meets peak hour demands. This project will address California Regulation Section 64554 (a). Due to the size of the system, approximately 1,000 connections, and single permanent source of supply, this system will greatly benefit from this project. In addition, the system suffers from low pressures during the peak use months and this tank will help boost the system pressure.	6,500,000	925	3,148	09	Placer	I	2009
4264	0910019	0910019-002	Lakeside Park Association	Main replacements	Replace old inadequately sized steel pipe with adequately size C 900 pipe and loop all sections to eliminate dead-end mains.	O	0	C	Large sections of the Water distribution system are too small (11/2" and 2") which can not supply demand capacity, old steel pipe which is failing due to corrosion and has many dead-end sections.	1,500,000	128	3,200	09	El Dorado	I	2004
4265	2810008	2810008-003	Veterans Home of California	Clearwell Piping Modifications	Project would consist of modifying the inlet piping to the existing clearwell by extending the piping approximately 40 feet to the head of the first chamber in the clearwell. Piping would be suspended from the roof of the clearwell. Project will require engineering, plant shutdown and purchase of water from an alternate supplier while the work is completed.	O	0	C	The Rector Water Treatment Plant has a sub-floor serpentine clearwell for chlorine contact prior to transfer to storage. The inlet piping currently enters the clearwell approximately mid-span of the first chamber. This leaves an area approximately 40 feet long, 8 feet wide and 9 feet deep that receives minimal circulation (stagnant zone). This stagnant zone has a detrimental effect on finished water quality and chlorine residual. Project proposes to eliminate this stagnant zone to provide additional contact time and eliminate the water quality issues associated with the current design.	125,000	10	3,290	03	Napa	II	2007
4266	2810008	2810008-005	Veterans Home of California	Rector WTP Backwash Recovery System	Engineering and construction of underdrain system, collection sump, pumps, controls, metering, monitoring instruments and piping to return backwash water from backwash ponds to the plant headworks.	O	0	C	Project is aimed at water conservation efforts by recovering water currently being wasted to percolation or evaporation from process operation.Will also improve operation through enabling improved maintenance of backwash storage ponds.	250,000	10	3,290	03	Napa	II	2008
4267	2810008	2810008-004	Veterans Home of California	Replacement Media for Roughing Filters	The project would consist of evaluation of media to determine the best material for the application followed by replacement of the existing media with the selected alternative media.	O	0	C	The water treatment plant for the Veterans Home of California, Yountville is equipped with five pressure vessel filters, intended as roughing filters, ahead of two upflow clarifier / mixed media package filter units to aid in handling high turbidity of the source water following storm events. The media which was installed in the roughing filters does not meet the sieve size requirements to retain solids effectively. As a result, solids become dislodged during pressure fluctuations associated with backwash events which detrimentally affect the water quality being applied to the package treatment units which then adversely affects finished water quality.	50,000	10	3,290	03	Napa	II	2007
4268	2810008	2810008-001	Veterans Home of California	Rector Reservoir Solar Circulators	Purchase and installation of solar powered circulation equipment in the source water reservoir to provide environmentally acceptable alternative to chemical treatment for algae, iron and manganese.	O	0	C	Algal blooms, iron, manganese, dissolved oxygen levels. This system is currently treating with copper sulfate for algae control. A neighboring system has recently been sued regarding use of copper sulfate under similar application. Iron and manganese problems arise when drafting from certain depths within the source water reservoir. Project proposes use of solar powered circulators in the source water impoundment to increase dissolved oxygen for prevention of algal blooms and natural precipitation of iron and manganese to eliminate or minimize use of chemical treatment for these constituents.	125,000	10	3,290	03	Napa	II	2008

4269	2810008	2810008-002	Veterans Home of California	Telemetry for Storage Tank	Purchase and installation of a tank level transducer, chlorine residual analyzer and telemetry equipment to transmit the data from the storage tank to the water treatment plant where the data will be monitored and trended with associated alarms.	O	0	C	A project has just gone out to bid for rehabilitation of an existing 1 million gallon storage tank at the Veterans Home of California. This application is for funding to provide tank level and chlorine residual monitoring equipment and telemetry from the rehabilitated tank to the water treatment plant for monitoring purposes.	25,000	10	3,290	03	Napa	II	2007
4270	0510003	0510003-004	Angels, City of	City of Angels Backup Well	Construction of one well and connection to City distribution system.	O	0	C	No backup emergency water supply for City	325,000	1,773	3,441	10	Calaveras	III	2003

4273	3110010	3110010-004	Tahoe City PUD - Main	TAHOE TAVERN HEIGHTS WATER DISTRIBUTION SYSTEM IMPROVEMENTS	The Tahoe City Public Utility District (District) plans to reconstruct and install new water mains and facilities for specific portions of the Tahoe Tavern Heights Water Distribution System. The existing infrastructure has been identified as containing undersized “bottle neck” water mains, non-looped systems, has presented pressure delivery deficiencies during certain conditions.The project will include:1. 2,000 linear feet (LF) of new 12-inch transmission line replacement for the Four Seasons Tank transmission line.2. 500 LF of new 6-inch water main connecting Woodhill Court and Woodview Court.3. 600 LF of 6-inch transmission line replacement along the Edelweiss transmission line extension.The reconstruction and addition of these new water mains and transmission lines effectively address the deficiencies identified within this water system. They will redistribute and deliver the necessary capacity required to maintain minimum system pressures per current California Waterworks Standards.	O	0	C	The Tahoe Tavern Heights Water Distribution System consists of the consolidation of two previously privately owned and operated water systems. The consolidation occured in the 1970's. Several improvements that were istalled to perform the consolidation appear to have been done in haste and were not thouroughly evaluated and engineered. The result is a distribution system that experiences significant pressure and delivery deficiencies during certain conditions. The distribution system in question provides backup source capacity to the lower pressure zone of the Tahoe City Main system in the southern portion of the system. During previous mechanical failures of the Tahoe Tavern Well source, the Tahoe Tavern Heights distibution system was used to provide backup source water during the repairs of the well source. The added hydraulic load to the distribution system reulted in delivery pressures less than the required 20 psi to areas of the system.In addition to this issue, during the recent Washoe Fire (August 2007) usage of the fire hydrants in the distribution system caused similar issues.The proposed improvements will be designed to maintain minimum pressure requirements in the distribution system and delivery points as per current California Waterworks Standards Section 64602.	716,580	2,663	3,997	02	Placer	I	2009
4274	5610005	5610005-003	MEINERS OAKS CWD	Storage Tank Replacement	Replacement of two of the 500,000 gallon storage tanks, and the 80,000 gallon tank. Build new concrete pads adjacent to the current tanks, replace the three tanks including interconnection valving, and demolish the three old tanks.	O	0	C	The system storage consists of 3-500,000, 1-250,000, and 1-80,000 gallon ground storage tanks. All are inter-connected with the distribution system. The tanks are located on gravel base. All are in dilapidated condition. Two of the 500,000 gallon tanks are next to each other. They are both dilapidated and leaking. Both have significant structural defects indicated by leaning, sides bowing, and leaking bolts. One of the 500,000 tanks is in critical condition exhibiting leaning of more than 3%. The 80,000 gallon tank is extremely dilapidated, constantly leaks, and has several large holes in it's sides. All five tanks are in use on a daily basis. Loss of service from any of the tanks will result in critical water outages to the community.	750,000	1,283	4,000	06	Ventura	IV	2007

4275	1310003	1310003-002	GSWC, Calipatria	Date Road from Sorenson Rd to Ironwood Rd 2010	Replace 6-inch Transite pipeline with 12-inch PVC between Church Street and Date Street from Ironwood Road to Lake Avenue, and install new 12-inch from Lake Avenue to Sorenson Road.	O	0	C	The existing 6-inch pipeline requires replacement for hydraulic and fireflow deficiencies. The installation of a 12-inch line will provide better fire flows to the west side of the Calipatria system and result in higher residual presure during a fire flow event.	292,249	873	4,040	14	Imperial	V	2008
4276	1310011	1310011-011	Coachella VWD: I.D. NO. 11	Highway 86 Transmission Main Ph III	The Highway 86 Transmission Main Ph III will provide safe, reliable drinking water and fire protection to areas along the west shores of the Salton Sea. This project involves the design and construction of approximately 10 miles of 24/30-inch ductile iron pipe, including environmental documentation and permitting and easement acquisition.	O	0	C	The Coachella VWD - I.D. No. 11 water system No. 1310011 provides drinking water and fire protection to the communities of Desert Shores, Salton Sea Beach, and Salton City along the west shores of the Salton Sea. The water system infrastructure consists of three groundwater wells, approximately 10 miles of 16/18-inch diameter transmission main, several miles of distribution piping, and one 1.0 million gallon storage reservoir.The aging 10-mile 16/18-inch diameter asbestos concrete transmission main was constructed in the early 1960s and has surpassed its useful life. Water demands for this service area have increased significantly over the past 50 years and the amount of water supplied through this transmission main exceeds the Coachella Valley Water District's design and operating criteria.The District completed a needs assessment and water supply feasibility study to identify a reliable, long-term solution for water service to the west shores communities. Replacing the aging transmission main with a 24/30-inch diameter ductile iron pipe is one element of the long-term water supply plan.	10,000,000	2,624	4,198	20	Imperial	V	2011

4280	3710004	3710004-003	Del Mar - City of	City of Del Mar - Zuni Reservoir Roof Replacement	The work includes the complete removal and disposal of the existing gravel covered bituminous roof and plywood deck, removal of the wood framed structural support members, repair or replacement of up to twenty (20) 6-inch square wood columns and one (1) 8-inch square center column. The contractor will be responsible for the design, fabrication, and erection of the new roof system which will include new 316 stainless steel columns, column supported aluminum alloy joist and purlin structural framing system, fiberglass roof deck, and cold-applied modified bituminous membrane roof system with gravel surface finish. The roof shall have one aluminum access hatch and 360 degree fascia ventilation screened to protect the potable water storage system. The Zuni Reservoir is a one million gallon concrete reservoir with an inside diameter of 100 feet and a height of 20 feet.	O	0	C	The Zuni Reservoir is an existing one million gallon, concrete reservoir built in the 1930s. The existing roof is composed of a bituminous mastic applied over roofing felt base sheets and covered with a gravel finish. The roof deck is plywood sheathing supported by a wooden joist and purlin framing system. The framing system is supported by the circular concrete reservoir and interior wooden columns. The reservoir was seismically retrofit in 1994 however, the project did not include replacement of the existing roof structure. The existing roof system is subjected to constant moisture from the underside of the roof (inside the reservoir) which contributes to premature failure and requires regular maintenance to protect the public water supply and the safety of the City's workers.	600,000	1,846	4,580	14	San Diego	V	2009
4281	1910185	1910185-006	LOS ANGELES CO WW DIST 36-VAL VERDE		INSTALLATION OF EMERGENCY GENERATORS AT TWO CRITICAL PUMP STATIONS.	O	0	C	VAL VERDE GENERATORS. THE DISTRICT'S TWO EXISTING PUMP STATIONS ARE ELECTRICALLY POWERED. ALSO, A DEAD END SYSTEM EXISTS THAT CREATES STAGNATION WHICH COULD RESULT IN WATER QUALITY PROBLEMS.	300,000	1,320	4,660	16	Los Angeles	IV	1998
4283	1310800	1310800-001	Calipatria State Prison	Calipatria State Prison VFD Booster Pump Retrofit	Currently the Institution uses five centrifugal Peerless pumps one 100 GPM, one 400 GPM and three to 500 GPM, one of the 500 GPM pumps is a standby pump for use if one of the other pumps fails. The pumps are power by constant speed non high efficiency electric motors of 15 hp, 40 hp and 75 hp respectively. The system is non-expandable and struggles to keep up with demand during peak summer flows. The proposed retrofit VFD system would eliminate both the high energy use and pressure/flow demand problems. By retrofitting a VFD drive system to the existing drive motors the 100 GPM 15 hp pump could be eliminated and the standby pump placed in the auto system to activate as demand required thereby increasing the system's total pumping capacity and operating at a lower cost to the taxpayers.	O	0	C	Calipatria State Prison is experiencing water delivery/pressure problems at peak summer flow and uses excessive energy to produce said flow/pressure both due to the design of the Institution's Booster Pumping equipment.	125,000	4,000	4,800	14	Imperial	V	2009
4284	1710006	1710006-003	Konocti County Water District		Replace with 12 inch PVC pipe.	O	0	C	Undersized and aged raw water pipeline to water treatment plant.	600,000	1,744	4,986	03	Lake	II	1998
4285	3110001	3110001-016	North Tahoe PUD - Main	Kingswood West Booster Station Relocation	This project will relocate the booster station adjacent to and at the same level as the paved arterial road. The structure will use fire resistive construction including walls, doors, and roof. The new structure will retain the duplex pump layout to provide a reliable source for the system. Standby power in the form of a self contained engine/generator set will be housed within the structure to provide continuous pumping capability in the event of commercial power loss due to fire or other natural or manmade conditions. Remote control valving operated over the District radio based Supervisory Control and Data Acquisition system will be provided in order to allow operator intervention during a disaster without placing operating personnel at risk.	O	0	C	The Kingswood West (KWW) booster and the storage tank serve 220 existing connections (320 at buildout). The KWW booster pump station is comprised of a 1970 wood framed building housing the pumps, automatic valves and SCADA hardware. The station is physically located 85 feet downhill from the nearest public access road. This booster station is the only supply source for water to the upper zone (3) of the NTPUD Main system. The station is in a location vulnerable to wildland fire. The Kingswood West storage tank provides back up water supply for domestic and fire suppression water to the lower pressure zones through automatic valves. The service area of this booster station has no backup water source in the event of loss of this booster station. The service area itself is forested and surrounded by general forest. Access to the subdivision is limited to one paved road which is the access to booster station. This access issue places additional reliance on the water system to not only provide fire protection but also to provide sufficient fire suppression water to allow for orderly evacuation in the event of a catastrophic wildfire.	733,500	3,294	5,000	02	Placer	I	2008

4286	3110001	3110001-017	North Tahoe PUD - Main	Kings Beach Water Storage Project	The water storage project will increase the gross storage volume to achieve continuous water treatment plant operation while maintaining recommended and regulated operational, emergency and fire suppression reserves. The project will accomplish these goals by constructing two storage tanks. The Zone 1 storage will be an estimated 1.3 million gallon tank located centrally within the Main System's piping network. The tank site will require extension of existing water transmission mains by about 2,600 lineal feet. The site is in close proximity to a zone 2 water transmission main and will allow the NTPUD to relocate the zone 2 booster pumping station to the new tank site. The siting of this tank will provide operational benefits in allowing the National Avenue Water Treatment Plant to be operated without process shut downs, provide more consistent pressure throughout the system, provide reservoir storage for upper zone supply while maintaining recommended reserves for operations, emergency and fire storage, provide storage during maintenance of the existing tanks, provide for process contact time in the event of contamination or additional disinfection treatment requirements. A zone 2 storage tank of 0.5 million gallon capacity is also a part of this project. The tank will be constructed adjacent to an existing 0.12 million gallon tank which will be removed upon completion of the new tank. The purpose of this tank is	O	0	C	The NTPUD Main System source of water consists of a municipal well and a water treatment plant using Lake Tahoe as the raw water source. The District operates the National Avenue Water Treatment Plant under Filtration Avoidance criteria using chlorination and ultraviolet disinfection. The plant is designed for continuous operation but insufficient treated water storage volume results in plant shut downs during low water demand periods. The insufficient storage combined with peak demands typical of a resort community require the water treatment plant to operate at full capacity together with the backup well source during peak daily demand periods. The plant shuts down during low demand periods when the zone 1 tanks are full. The peak demand periods are amplified by insufficient water storage in the system's next higher pressure zone, zone 2, which is sourced from the zone 1 source and storage components. The water storage tank in zone 2 does not meet current design standards and therefore the peak demand periods coincide exacerbating the zone 1 storage conditions and the plant shutdown and startup cycles. Treatment plant shutdown and startup cycles shorten UV lamp life expectancy, promote premature lamp failures, and may upset the chlorine dose and contact time disinfection process. Any plant operational upsets can threaten the finished raw water quality and may result in	2,685,000	3,294	5,000	02	Placer	I	2008
4287	3110001	3110001-019	North Tahoe PUD - Main	National Avenue Water Treatment Plant Redundancy and Standby Pumping	The project consists of the addition of a third (standby) pump at the National Avenue Water Treatment Plant to provide system redundancy and improved reliability. Title 22 Section 64554 and HSC Section 116555(c) require that all systems have the source capacity to assure that an adequate quantity of water under sufficient pressure is available to serve consumers at all times. The two existing pumps at the National Avenue Water Treatment Plant currently provide addequate pumping capacity to supply the community. The addition of a third (standby) pump at the National Avenue Water Treatment Plant will assure redundancy and improve system reliability should one of the existing pumps fail.	O	0	C	The project consists of the addition of a third (standby) pump at the National Avenue Water Treatment Plant to provide system redundancy and improved reliability. Title 22 Section 64554 and HSC Section 116555(c) require that all systems have the source capacity to assure that an adequate quantity of water under sufficient pressure is available to serve consumers at all times. The two existing pumps at the National Avenue Water Treatment Plant currently provide addequate pumping capacity to supply the community. 4291	3110001	3110001-018	North Tahoe PUD - Main	Main System Zone 2 Storage Tank Project	This pre-application is for a new zone 2 storage tank construction project. The new tank will have a capacity of 0.5 million gallons. (Note: Zone 1 storage will be addressed by the applicant in a future project.) The zone 2 tank will be constructed adjacent to an existing 0.12 million gallon tank which will be removed upon completion of the new tank. The new tank will be constructed at a higher base elevation to improve the system pressure at the highest service connections in this zone. The new tank will relieve the peak demand on zone 1 and to provide operational, emergency and fire suppression water to protect local, state and federal lands in and surrounding zone 2. The new tank will be constructed to current seismic codes to improve critical infrastructure reliability and provide vital health and safety services during and following earthquakes.	O	0	C	The water storage tank in NTPUD's Main System zone 2 does not meet current standards for volume or seismic design. The lack of storage in this zone causes supply problems with the systems sources, a water treatment plant and backup well source. The storage volume limitation exacerbates a storage deficiency in zone 1 . Zone 2 is surrounded on three sides by Federal lands. The fire flow in the urban/wildland interface, which constitues a large portion of zone 2, is limited. Any limitation to firefighting capability can have devasting effects. The present zone 2 tank elevation is not sufficient to meet waterworks pressure standards to the highest service connections. The NTPUD Main System's source of water consists of a municipal well and a water treatment plant using Lake Tahoe as the raw water source. The District operates the National Avenue Water Treatment Plant under Filtration Avoidance criteria using chlorination and ultraviolet disinfection. The plant is designed for continuous operation but insufficient treated water storage volume results in plant shut downs during low water demand periods.The insufficient storage combined with peak demands typical of a seasonal community require both the water treatment plant and the backup well source to operate at full capacity during peak daily demand periods. At low demand and because of inadequate zone 1 storage capacity the plant shuts down. The peak	1,293,500	3,294	5,000	02	Placer	I	2009

4293	1910108	1910108-007	BELL GARDENS-CITY, WATER DEPT.	Reequipping of Water Well No 3F Including Well Head Treatment	The installation of well head treatment at Well No. 3F with new pumping equipment to meet the State water quality MCL for manganese. Funding therefor is requested for the well head treatment and new pumping equipment for reactivation of Water Well No. 3F.Project :Reequipping of Water Well No 3F Including Well Head Treatment. The installation of well head treatment at Well No. 3F with new pumping equipment and to comply with the State water quality requirements. Benefits:The benefits to the City of Bell Gardens owned water system is by reactivating Well No. 3F with needed well head treatment and pumping equipement, so as to utilize more of its groundwater pumping rights in the Central Basin, be less dependent on the MWD state water supply, and to meet the State water quality MCL for manganese and to assure a continuous water supply to the customers of the City of Bell Gardens Water System. The estimated overall cost of this project is as follows:Provide water well head treatment at Well No. 3F with new pumping equipment $757,575 Subtotal = $757,575Construction Contingencies (10%) = $ 75,757Construction Total = $833,333Engineering & Construction Services (20%) = $166,667Project Total = $1,000,000Estimated Project Total = $1,000,000	O	0	C	Existing Condition:For a number of years before 1992, the water system that served the northeastern part of the City of Bell Gardens relied upon Water Well No. 3F, which is located at Gage Avenue and Chalet Street for one of its main source's of water supply. When the City purchased this water system in 1992, the well was out of service, because of water quality issues from manganese in excess of the State MCL. Since that time (1992) the City has relied considerably upon the imported water supply from the Central Basin Municipal Water District/Metropolitan Water District of Southern California (MWD) to meet the needs of this part of the community. The City of Bell Gardens has reviewed the possibility of reactivating Well No. 3F with needed well head treatment, so as to utilize more of its groundwater pumping rights in the Central Basin. The installation of well head treatment at Well No. 3F with new pumping equipment should allow the City to keep as low as possible the cost of water to be served to its residents and businesses and meet the State water quality MCL. This project replaces the previously submitted request of 003 of rehabilitation and new electric motor.	1,000,000	1,589	5,247	15	Los Angeles	IV	2011
4294	5510010	5510010-004	TUD - Crystal Falls Water System	Particle counters at WTP	INSTALL PARTICLE COUNTERS.	O	0	C	LACK OF PLANT MONITORING EQUIPMENT FOR CRYPTO OPTIMIZATION.	18,000	2,232	5,301	11	Tuolumne	III	1998

4295	2810002	2810002-007	Calistoga, City of		Drain and clean tank, recoat with epoxy, clean outside of tank and paint.	O	0	C	There are concerns about the seismic/structural integrity and condition of the welded steel, 1MG Feige Canyon Water Storage Tank. A 2013 evaluation by Kennedy/Jenks Consultants determined that the existing tank has significant structural/seismic deficiencies. In addition to the seismic concerns, the tank needs major maintenance including being taken off line, so that it can be cleaned and recoated inside and painted outside. The report suggests that replacement is the best long term solution.	100,000	1,491	5,302 03	Napa	II	1998
4296	5810006	5810006-002	North Yuba Water District	North Yuba Water District Pipeline Replacement and Hydro Project	The Project consists of the replacement of approximately 52,300 linear feet (9.91 miles) an existing unlined open ditch with approximately 51,600 linear feet (9.77 miles) of 36- and 42-inch diameter pipe. The pipe will convey water from the SFWPA penstock adjacent to the Woodleaf Surge Tank to the proposed hydroelectric generation plant and associated facilities at the existing District water treatment plant in Forbestown. Approximately 49,900 linear feet (9.45 miles) of the pipe will be constructed within existing roads, 1,065 feet (0.2 miles) within the existing Ditch, and 660 (0.13 miles) feet within the existing siphon.PROJECT EXECUTION & STAGINGFour Basic Elements1. Environmental and Preliminary Engineering - The District is currently in this stage, which includes environmental evaluation and otherstudies necessary to comply with state and federal environmental processes, i.e. California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA). A CEQA Environmental Impact Report (EIR) and, more than likely, a NEPA Environmental Assessment (EA) will be prepared. Preliminary engineering studies, design, and surveying are a component of this element.2. Engineering Design -This element includes additional surveying, final design and the preparation of construction improvement plans. Appraisals, easement acquisitions, and permitting are components of this	O	0	C	Presently, the District's 811 domestic customers (i.e., households) and 110 raw-water customers (irrigation) receive their water after it has been transported from the water source via the Forbestown Ditch. The Ditch is an open, unlined canal that loses an estimated 35% to 40% of its water to evaporation, percolation and leakage as it travels from the Woodleaf penstock to the Forbestown Water Treatment Plant. In addition to the loss of water, the Ditch presents health issues with evidence of septic tank and/or animal waste infiltration at several places along its length. Recent testing has revealed high levels of coliform bacteria that exceed state water quality standard thresholds.Accordingly, District management believes that continued use of the Ditch constitutes a latent security threat to the District's customers. It is the only supply of potable drinking and agricultural water for the communities of Brownsville, Challenge, Dobbins, Forbestown, Oregon House and Rackerby.	28,645,000	695	5,303 21	Yuba	I	2011

4299	4110010	4110010-059	Montara Water and Sanitary District	Existing Alta Vista Water Storage Tank Improvements	This project will repaint the existing Alta Vista water storage steel tank with special coating encapsulating lead paint on the tank interior and exterior. In addition, the tank roof access hatch will be replaced as part of this project. To accomplish this temporary storage will be needed during the tank outage.	O	0	C	The existing 462,000-gallon Alta Vista treated water storage tank is a coated steel tank exhibiting interior and exterior corrosion and coating deterioration. Existing coating is known to contain lead paint in it. In addition, the access hatch has deteriorated and corroded and is in need of replacement. This project is necessary to maintain water quality, protect public health and safety and the environment. This project will also extend the remaining service life of the steel storage tank.	250,000	1,640	5,412 17	San Mateo	II	2009
4300	4110010	4110010-048	Montara Water and Sanitary District	Water Sampling Station Installation	This project will install up to twelve water quality sampling stations to throughout the system to enable the District's staff to take the samples directly out of the main instead of from a individual house bib as it is the current practice.	O	0	C	This project will install water quality sampling stations to throughout the system to enable the District's staff to take the samples directly out of the main instead of from a individual house bib as it is the current practice. The purpose of this project is to ensure accurate sampling and to protect water quality in the distribution system thus protecting health and safety of the public.	22,000	1,640	5,412 17	San Mateo	II	2009

4301	4110010	4110010-038	Montara Water and Sanitary District	Photovoltaic Cells Installation	This project will install solar panels on the the existing Alta Vista Tank roof and provide for a similar installation at the new Schoolhouse Tank. A new pG&E connection will also be established to ensure ability to provide power back into the grid during the hours of excess generation.	O	0	C	This project will install solar panels on the existing Alta Vista Tank and the new Schoolhouse Tank. Installation and operation of solar panels on the tank roofs will contribute to a significant reduction of the electric loads in the community and cost and energy savings for the District. This project is Phase II of the solar panel installation that started with the District installing solar panels on the roof of the existing raw water reservoir at the Alta Vista Water Treatment Plant in 2007. This project provides clean renewable power, reduces carbon foot print, and contributes to energy conservation goals.	220,000	1,640	5,412	17	San Mateo	II	2009
4302	4110010	4110010-042	Montara Water and Sanitary District	Park Well Rehabilitation	This project will re-drill an existing groundwater production well to a greater depth and construct a new well pad to protect water quality in the well.	O	0	C	The District owns a groundwater source, Park Well, that has been taken out of service due to severe water quality problems and flooding in its location. However, hydrogeologist's observations indicate that there is a high probability of reaching high quality and sufficient supply in another, deeper, aquifer in the same location. In addition, to protect water quality, the well pad will need to be raised to avoid flooding with nearby creek waters during rainy seasons.	150,000	1,640	5,412	17	San Mateo	II	2009
4303	4110010	4110010-029	Montara Water and Sanitary District		Construct additional storage tanks	O	0	C	Increase storage capacity	1,000,000	1,640	5,412	17	San Mateo	II	2004
4304	4110010	4110010-046	Montara Water and Sanitary District	Raw Water Turbidity Meter Installation	This project will purchase and install a turbidity monitoring device to be installed in an location already prepared for the installation.	O	0	C	Raw water line turbidity monitoring is needed to comply the Federal and State Drinking Water Regulations.	21,000	1,640	5,412	17	San Mateo	II	2009
4305	4110010	4110010-050	Montara Water and Sanitary District	Alta Vista Water Treatment Plant SCADA & Controls Improvements	This project will replace the Alta Vista Water Treatment Plant (AVWTP) antiquated control and instrumentation system with new equipment and establish a connection of the treatment plant with the District's SCADA system.	O	0	C	Montara Water and Sanitary District (MWSD) owns and operates Alta Vista Water Treatment Plant (AVWTP) providing surface water treatment for the Montara Creek source. The AVWTP instrumentation and controls are antiquated and no connection to the District' s Supervisory Control and Data Acquisition System (SCADA) currently exist. AVWTP has no remote control capabilities requiring frequent visits by the District's operators and increasing the number of trips made daily to the plant. This project will enable remote control of AVWTP thus improving operational efficiency and protecting water quality coming out of the treatment plant into the distribution system.	185,000	1,640	5,412	17	San Mateo	II	2009
4306	4110010	4110010-051	Montara Water and Sanitary District	SCADA System Upgrade	This project will include replacement of outdated and faulty SCADA communication brains at each of the nine sites and the Main Office and purchase up to four new computers and two printers for operations of the SCADA system.	O	0	C	The District's Supervisory Control and Data Acquisition System (SCADA) currently included nine sites, including the Main Office where the server and the control screens are located. The SCADA system is proprietary and antiquated and gives too many error messages and false alarms. This project is needed to ensure that all facilities are properly and timely controlled and operated and that the operators are alerted to problems in a timely manner. This upgrade will serve the District in ensuring public health and safety protection.	540,000	1,640	5,412	17	San Mateo	II	2009
4307	4110010	4110010-052	Montara Water and Sanitary District	Portola 4 Well Emergency Back-up Generator	This project will install an emergency backup generator for Portola No. 4 groundwater production well. The generator hookup and switch have already been installed.	O	0	C	This project includes an installation of an emergency backup generator for the existing Portola No. 4 groundwater supply well. This project is required to ensure supply during a power outage event in the District's system.	40,000	1,640	5,412	17	San Mateo	II	2009

4308	4110010	4110010-053	Montara Water and Sanitary District	Portola Tank Water Quality Improvement Project	This project will install a "Solar Bee" style mixer for the existing Portola Water Storage Tank to improve water quality in the tank and the distribution system. Temporary storage might be required during the installation to allow draining the tank for the project.	O	0	C	This project will install a "Solar Bee" style mixer for the existing Portola Water Storage Tank to improve water quality in the tank and the distribution system. The mixer will contribute to a reduction in disinfection byproducts formation in the water system and will assist in maintaining compliance with the Drinking Water Standards. In addition, this project will utilize solar power generation and will not increase energy consumption for the District.	115,000	1,640	5,412	17	San Mateo	II	2009
4309	4110010	4110010-030	Montara Water and Sanitary District		Construct new GW wells	O	0	C	Increase source capacity	1,500,000	1,640	5,412	17	San Mateo	II	2004
4310	4910027	4910027-003	Sonoma State University	Rehabilitation of Wells No. 3 and 4	The life cycle of Wells No. 3 and No. 4 are approaching the end of their useful life. These are the only two operating wells that the University has and due to the age and detioration of well casing, and they are approaching the end of their useful life. The casings in wells no. 3 and no. 4 is compromised due to sand encroachment and well casing dertioration. They are over 20 years old and the only reliable water source for the campus. If one of the wells should fail due to age, the campus would have only one well to supply all water for the campus. The wells intertie with the campus system, but not to any outside (external) system that could provide backup.Since the campus has requested funding for a UV System to treat water from well no. 2 which is currently not in use due to the need of a UV system, the campus is proposing that after that after the UV System is up and running, wells no. 3 and no. 4 be taken off line separately so that the casings could be replaced to extend the life cycle of each well. The monitoring systems that would be included in rehabilitation of wells no. 3 and no. 4 would include PLC communication and automated alarm to Police and Plant Operations to allow for fast response for repair or implimenting alternate measures.	O	0	C	The life cycle of Wells No. 3 and No. 4 are approaching the end of their useful life. These are the only two operating wells that the University has and due to the age and detioration of well casing, and they are approaching the end of their useful life. The casings in wells no. 3 and no. 4 is compromised due to sand encroachment and well casing dertioration. They are over 20 years old and the only reliable water source for the campus. If one of the wells should fail due to age, the campus would have only one well to supply all water for the campus. The wells intertie with the campus system, but not to any outside (external) system that could provide backup.	150,000	1,100	6,000	18	Sonoma	II	2008
4311	4910027	4910027-006	Sonoma State University	Drill New Well No. 1	The University is proposing to drill a well in close proximity to the proposed project of constructing a new 350,000 welded steel tank #3. This well would be the sole source for tank #3. The project would include using a water locating service to determine the location of water source which would ideally be located near Tank #3 to reduce the amount of additional infrastructure needed. The project would go out to bid with the following requirements for contractors to meet.Installation of electrical service for well system, pouring of concrete slab around well casing, install and connect water piping from the well location to the pump house on campus. The well specifications would be as follows: Drill and case an 8' x420' domestic water well, provide fluid tank for storage of drilling fluid and development water throughout drilling process and vacuum truck to remove fluids off site, install a 230S250-8B 25hp Grundfos submersible pump (or equivalent) set in 350' deep, install wellhead and plumbing items, install Siemens (or equivalent) pumping plant panel with motor protection, install check valve, chlorinate well and begin monitoring of water quality through lab testing.	O	0	C	As stated in the Water Systems Analysis and Report dated August 2007, prepared by Winzler and Kelly, Consulting Engineers, the entire potable water supply is provided by 3 existing campus wells (No's. 2,3 and 4) with two of the wells producing 200 gpm each and one well producing 220 gpm. The wells were originally installed in the mid-1960's. Since then, well No. 2 has recently been replaced with well No. 2A cannot be used at this time due to detection of coliforms which require a disinfection system project that the University is asking for funding for under a separate application for CDPH Drinking Water Funding Program grant. Due to the presence of coliforms, the University is unable use the water from Well No. 2A. This places the University as risk as student population is growing and the campus is bringing an additional 699 student resident beds online in Fall 2009. With the growth of the student population, the wells are not able to provide adequate water supply. Both Wells No. 3 and No. 4 are approaching the end of their life cycle due to sand encroachment and if one should fail, the University would be forced to close until such time a new well could be drilled, and tested as only one well would be operational but not able to provide sufficient water supply.Due to the lack of sufficient ground water, the University is in violation of CDPH Drinking Water Regulations §116555. Operational requirements.(a)Any	275,000	1,100	6,000	18	Sonoma	II	2009

4312	4910027	4910027-002	Sonoma State University	Domestic Water Tank #3	This project includes construction of a new 350,000 gallon welded steel tank for water storage, including tank foundation, subgrade preparation, anchorage, and tank accessories including internal and external pipe and pipe connections, inlet, outlet, overflow, drain, access manways, vents, ladders, guardrails, and miscellaneous equipment, together with associated site preparation, removal of trees, site grading, construction of new access roads to and around the tank, fencing, water systems piping, electrical work, instrumentation, protective coatings, disinfection, testing and demolition. Project earthwork is unbalanced and requires disposal of unsuitable material and importation of suitable material for engineered fill.The Univeristy is proposing to construct a new 350,000 gallon welded steel tank to facilitate the domolition and reconstruction of two new 300,000 gallon tanks. Since the University is operational 24/7, 365 days a year, the ideal solution is to bring Tank #3 online first to ensure that the campus would have ample water supply during the reconstruction of tanks #1&2 which would have to be done separately so that sufficient water storage remained.	O	0	C	The University intends to construct a new 350,000 gallon welded steel tank for potable water storage northeast of the existing two 200,000 gallon concrete tanks in the Facilities Services Area on the northeast side of the Sonoma State University Campus. The purpose of this project is to increase the reliability and the capacity of the University's potable water storage by constructing a new welded steel tank for water storage. The University has an existing potable water storage capacity of 400,000 gallons in two concrete tanks originally constructed in the mid 1960's. Both reservoirs have damage, which has led to continuous leakage of water from the reservoirs. In addition, the age of the reservoirs and their proximity to the active Rodgers Creek Fault, less than 3.5 km from the site, which is capable of producing strong ground shaking means that the reservoirs are susceptible to failure in an earthquake. Continued operation of the reservoirs places the University's water supply at an unacceptable risk. Recommendations for potable water storage for the University have been documented in the Water System Analysis and Report prepared for Sonoma State University by Winzler and Kelly, Engineers in October 2007. This project includes the construction of a new 350,000 gallon tank located northeast of the existing two 200,000 gallon tanks. This would provide the University with approximately 750,000 gallons in water	1,200,000	1,100	6,000	18	Sonoma	II	2008
4313	2810004	2810004-003	St. Helena, City of	Engineering to Research Replacement of Source Water Intake Structure	We would like to hire a civil engineering firm who has experience in replacing intake structures and to research who and how this could be accomplished.	O	0	C	Source Problem, Malfunctioning Intake Tower. The mid intake valve of our Bell Canyon Reservoir failed around Year 2008. 2 attempts were made to repair it. During the spring, summer, and fall it is necessary to be able to draw off the top and mid valve to obtain good water quality. Due to the failure of the midvalve we had taste and odor complaints for a month in July and August 2010. An inspection in 2003 recommended that all gates need to be replaced by 2006.The intake tower has been in service for over 50 years and it has gone beyond its useful life expectancy. It would not make sense to put new valves on a corroded intake tower. The City needs the source and doesn't have enough of other sources to meet the Cities demand. Bell Canyon Reservoir can't be taken out of service to replace the tower.	20,000	2,448	6,006	03	Napa	II	2011
4314	3410005	3410005-003	Rancho Murieta Community Servi	Lookout Hill Water Tank Rehabilitation	The 0.5 MG steel tank was constructed in the early 1970's and has been out of service since the late 1980's althouth it is still in good shape. The project entails painting the tank interior and exterior. The tank will be siesmic retrofitted to comply with current AWWA siesmic requirements. Miscellaneous valve and level equipment as well as alarm and telemetry controls will be replaced and or rehabilated.	O	0	C	In a 1976-77 year drought event, the District has a 1500 af water storage deficit. As part of the overall drought water supply project, conversoin of the commercial area to an alternative water supply requires rehabilitation of an exisitng out of service water storage tank. The tank will be necessary to provide operational storage for the commercial area.	600,000	2,525	6,060	09	Sacramento	I	2009
4315	3410005	3410005-002	Rancho Murieta Community Servi	Drought Water Augmentation Supply	The project entails on off site well(s), transmission mains, and rights-of way acquisition to convey water to the existing distribution system. In adition, the project includes conversion of the commercial area to alternative irrigation supplies, consisitng of pump stations and piping.	O	0	C	In a 1976-77 year drought event, the District's sole source of water, the Cosumnes River is essentially dry. With no other source available, the District is unable to refill raw water storage reservoirs until the following year, causing a 1500 af storage deficit.	11,700,000	2,525	6,060	09	Sacramento	I	2009

4320	3110026	3110026-011	Nevada ID - North Auburn	North Auburn Highway 49 Transmission Main	The "North Auburn Highway 49 Transmission Main Project" is to construct approximately 4100 feet of new 16" I.D. transmission main line. The intention of the project is to provide for a reliable system to both future and current water customers in the North Auburn Area for potable and fire protection demand. The project will connect service loops in the project area. Construction will be from Locksley Ln to Quartz Dr and Education St to Cottage Dr along the Highway 49 corridor. A combination of open cut construction and trenchless construction will be used.	O	0	C	The intention of the project is to provide for a reliable system to both future and current water customers in the North Auburn Area for potable and fire protection demand. The project will connect service loops in the project area. The CEQA work is complete on this project and this is a category O project.	2,200,000	2,724	6,320	21	Placer	I	2009
4321	2310001	2310001-005	Fort Bragg, City of	Newman Gulch Reservoir	Construct a 45 acre foot water storage reservoir and associated piping near Newman Gulch, on property at the end of Summers Lane that is owned by the City of Fort Bragg. The Summers Lane reservoir will be constructed of sandy dune deposits and, therefore, must be reinforced with geotextile fabric and lined with a synthetic liner to prevent leakage. Water is currently piped form Waterfall Creek via a 6" asbestos concrete pipe to the existing Newman Reservoir. The existing 6" pipe will be intercepted at Brush Creek Road. A new pipe will be installed and routed East on Brush Creek to Summers Lane and again intercepting the existing 6" pipe on City property. The order of work is as follows: Harvest trees and remove stumps, clear vegetative materials off work area, grade reservoir and install geosynthetic fabric, construct outlet structures and pipe boots, install synthetic (HDPE) liner in the reservoir, trench and install new water pipe, temporarily shut off water flowing in existing water pipe & connect new line at both ends, reestablish flow of water, disinfect new pipeline, seed and mulch disturbed areas, repair any damaged road sections, install permanent fencing and gate.	O	0	C	The City of Fort Bragg has expended water enterprise funds to complete the design of a 45 Acre Foot Reservoir that when constructed will help meet the water needs during drought conditions. The City is under a modified pumping program for the Noyo water source and during late summer and fall months cannot meet the necessary storage limits for domestic use and fire flows. Based upon work completed by the former Water Projects Manager, there is a several month window that water reserves are not available and fire flows may be limited.Construction of the newly proposed reservoir will go a long way to fill that gap and help meet the by-pass requirements associated with the Noyo Water Source.	1,735,042	2,791	6,963	03	Mendocino	II	2011

4322	2310001	2310001-003	Fort Bragg, City of	Waterfall Gulch Transmission Main	Final project design has identified replacement of the existing 8" raw water pipeline with 10" PVC C900 pipe from Hwy 20 north about 1850 feet utilizing the existing water line easement. From that point the water line would follow an alternate alignment along public right of way on Thomas Lane to Brush Creek Road and then east on Brush Creek Road for a total additional distance of 3500 feet, bringing the length of the pipeline project to just over 1 mile in length.This project is expected to tie into the pipeline replacement as part of the Newman 45 Acre Foot Reservoir project.	O	0	C	The City of Fort Bragg receives water from three sources, one of which is Waterfall Gulch, and the water gravity flows through a transmission system of PVC, old asbestos cement, ductile iron and steel pipe. Much of this raw water transmission line has been in place for decades and has reached a point that failures are becoming more and more common. During the past year Public Works personnel were called on to repair several leaks in the pipe running from Hwy 20 to Newman Reservoir, and based upon visual inspection of the pipe, additional leaks are expected.Since this source is one of the purest water sources owned by the City, it is essential that the transmission line remain operational.	800,000	2,791	6,963	03	Mendocino	II	2011
4323	1710015	1710015-004	Hidden Valley Lake CSD	HVLCSD Well #5	This project would construct an emergency well (Well #5), or redundant well to provide potable water for the District in the event that the existing main well is not usable. Currently the District serves approximately 2,433 customers requiring a flow rate of approximately 1,400 gpm. The District currently has three wells. The main well produces 1,400 gpm and the other two produce 300 gpm and 500 gpm, not enough to supply the District during peak usage periods. The proposed Well #5 will provide capacity to meet the needs of the District in the event of the main well failing.	O	0	C	Currently there is no redundancy with the District's main well.	1,200,000	2,433	6,971	03	Lake	II	2009
4324	2910023	2910023-005	Nevada ID - Lake Wildwood		Add a second pump. Involves design and construction.	O	0	C	Inadequate reliability of treated water supply due to lack of redundancy in mechanical and electrical equipment.	95,000	3,137	7,090	21	Nevada	I	1998
4325	2910023	2910023-002	Nevada ID - Lake Wildwood		Replace section of canal with pipeline. Involves design and construction.	O	0	C	Inadequate reliability of raw water supply due to dilapidated section of Newton Canal.	550,000	3,137	7,090	21	Nevada	I	1998
4326	2910023	2910023-001	Nevada ID - Lake Wildwood		Encase and armor canal headworks. Project involves design and construction.	O	0	C	Inadequate reliability of raw water supply due to vulnerability of canal headworks to periodic severe damage from high water.	280,000	3,137	7,090	21	Nevada	I	1998

4333	1010044	1010044-007	Huron, City of	Water Metering System	AB 514 (2003) requires all users of Federal Central Valley Project (CVP) water to install water meters and bill a metered rate by 2013. The City of Huron contacts for water annually from the Westlands Water District which represents 100% of Huron's water supply. Meters allow for a water system to account for water produced versus where it was used. With a water meter a customer may track their use and reduce their use which will reduce their bill. The City currently has an outdated and inaccurate meter system. This project will consist of replacing all old mechanical water meters in approximately 900 residential and commercial units with a grid network system. This will reduce and/or eliminate water loss due to the old meters. The new system will allow real-time monitoring of the water distribution system and improve water conservation efforts while helping to locate problems within the system if any exist.	O	0	C	The City of Huron has an average of 200,000 gallons per day of unaccounted for water – with the lowest being 158,000 and a high of 500,000 gallons per day! Unaccounted for water is the difference between the amount of water produced – or purchased – and the amount of water sold to customers. Unaccounted for water can include underground leakage, unauthorized use, unavoidable leakage, inaccurate meters and unusual causes. The unaccounted for water in Huron is extremely high which means the system is producing water which it does not know where it went or how it was used and there are those out there who are not paying their fair share for the water they are using. This costs the City and its rate-payers considerable monies annually in a city with one of the lowest median household incomes of $24,609, highest unemployment rates of 28.9% and highest percentage of persons living below poverty at 39.4%.	1,200,000	860	7,306	23	Fresno	III	2011
4334	4810004	4810004-003	City of Rio Vista	well 10 arsenic	need to meet reguirements for the state we have a well at 13 and wont meet 10mcl asking for treatment funds for well. 4335	4810004	4810004-005	City of Rio Vista	Rio Vista Well Water Arsenic Abatement	The City's domestic water supply is provided by 8 wells, 3 which are inoperative due either to low flow or arsenic levels above the EPA MCL of 10 ppb. Well 10, the best water producer has been tested and has arsenic concentrations at all depths above 10 ppb. Thus, water from a specific depth will not solve the problem. The water from wells 11, 13 and 14 is blended in a 2 million gallon tank to obtain an effluent below 10 ppb. The concern is that as the arsenic concentration in each of these three wells varies due to pumping rates and changes in the aquifer, it will not always be possible to obtain a blend of the effluent below 10 ppb.Tests to determine the most economical method for the arsenic abatement of these wells will be completed within two-three weeks. To guarantee an adequate quantity as well as a safe water supply for the City, it is essential that the concentration of arsenic not exceed the MCL of 10 ppb at all times, especially during the dry season. Arsenic abatement of the water from these wells is the only method to guarantee safe drinking water for the City.	O	0	C	The City's domestic water supply is provided by 8 wells, 3 which are inoperative due either to low flow or arsenic levels above the EPA MCL of 10ppb. 4336	3610015	3610015-003	CRESTLINE VILLAGE CWD - DIVISION 10	Additional Storage Tanks for Local Source Supply	The project will include the furnishing and erecting of two new 250,000 gallon welded steel tanks with reinforced concrete caissons, drainage facilities, and site piping. The tanks will be seismically anchored, and will include erosion control, paving, and fencing. A pump/control station will be constructed at the tank location. If funding is secured, this new distribution infrastructure will supply the community with 500,000 additional gallons of storage capacity to assist in the District's emergency preparedness plan, disaster response, and drought mitigation supply, as well as day-to-day residential water supply.	O	0	C	54% of our drinking water is supplied from local groundwater sources. The ability to provide local source water to our customers is restricted due to limited available storage capacity. Construction of additional storage tanks will allow us to maintain a higher percentage of local water to our customers and permanently decrease our dependency on State Water Project water. There is currently one tank in the proposed construction zone and it is the only distribution method available to customers in the area. The tank is very old and should the system malfunction, there will be no water supply available to those customers. We will add two new storage tanks to this site alongside the existing tank.Additionally, Crestline Village Water District is located in a high fire danger area of the San Bernardino mountains and it is essential that we are able to provide sufficient water pressure and quantities to help fight potential massive wildfires in the various elevation zones. Lastly, it is important that we increase our community's drought water supply as a buffer to the uncertain future of the State Water Project and Colorado River water supplies.	300,000	4,900	7,400	13	San Bernardino	V	2008
4337	0210002	0210002-005	Kirkwood Meadows Pubilc Utilit	Kirkwood Water Supply Feasibility Project	The proposed Kirkwood Water Supply Feasibility Project (Project) will address water supply piped from nearby Caples Lake through an existing pipeline used to convey water to snow-making facilities at Kirkwood Mountain Resort (KMR). Water would be diverted from the KMR line and treated at a new package plant treatment facility before release into the public water system. Additionally, Project studies will create a comprehensive water master plan, water supply assessment, and consistency with adopted land use plans, bringing the system into compliance with state water policy. The Project consists of the following components: 1. Information/Data Gathering and Review 2. Water Supply Assesment/Water Demand Projections 3. Water Quality Test Program 4. Identification of Alternative Treatment Plant Site Areas 5. Identification of Infrastructure Requirements and List of Alternatives 6. Development of Preliminary Conceptual Layouts1. Information/Data Gathering and ReviewReports, plans, and studies relative to the project will be gathered and reviewed. This will include information on the physical condition of the Caples Lake and Kirkwood areas, existing and projected populations, flow and tank level data, and historic water use records.2. Water Supply Assesment/Water Demand ProjectionsDevelopment of a 20-year and ultimate maximum day water demand projections for the	O	0	C	The Kirkwood Meadows Public Utility District (KMPUD) currently draws water from four of its five groundwater wells to satisfy the demand from the 633 equivalent dwelling units (EDUs) connected to the water system. Existing storage capacity for emergency, operational, and fire protection purposes totals 950,000 gallons. However, the KMPUD water system requires urgent attention to serve the needs of the community. Three key issues bar this public water system from fulfilling the demands of the Kirkwood community, of the hundreds of thousands of visitors annually, and of state code: 1. Capacity 2. Safety/Reliability 3. Regulatory Compliance1. Capacity The Kirkwood Specific Plan (Adopted jointly in 2003 by Alpine, Amador, and El Dorado counties) estimates the number of EDUs in KMPUD service area will increase to 1757 at build-out. This represents a 177% increase in the water demand on the KMPUD system. In order to accommodate the planned expansion it will be necessary to increase infrastructure proportionally with development to support planned capacity.The aquifer and groundwater recharge rates have not been proven through scientific studies to have the capacity required to service the Kirkwood population upon planned build-out. It is, therefore, necessary that alternative sources be explored/utilized to supply water to the KMPUD service area. 2. Safety/Reliability Historically, the lack of	250,000	848	7,500	09	Alpine	I	2011

4338	4910016	4910016-002	Cotati, City of	Meter Replacement and AMR Upgrade Project	The project consists of replacing meters, and in some cases, meter boxes to fully replace all manual read meters. Meters would then be AMR enabled in a pilot area followed by City-wide implementation.Work would require purchase and installation of new water meters and associated meter boxes, meter and meter reading equipment for AMR reading, and in-home meter reading devices.	O	0	C	The City of Cotati currently has a mix of manual read and touch pad meters for service connections. To increase the efficiency and accuracy of meter reading and billing, the City needs the resources to complete the retrofit of manual read meters. Due to resource constraints, the City reads meters every 2 months. This is insufficient in the face of on-going water shortages, as the customer does not have timely information to modify water usage patterns. With continued regional growth, water supply uncertainties due to global warming and competing natural resource needs, it is imperative that we use water more efficiently. Therefore, the City is looking to implement automatic meter reading (AMR) to provide real-time usage to customers through in-home devices. In conjunction with established water budgets for each customer, this is antcipated to greatly increase the effectiveness of water conservation efforts.	200,000	2,560	7,532	18	Sonoma	II	2009
4339	4910023	4910023-001	California-American Larkfield (PUC)		Improvements to existing water treatment plant.	O	0	C	Water exceeds odor standards.	210,000	2,367	7,775	18	Sonoma	II	1998
4340	4910023	4910023-004	California-American Larkfield (PUC)	Larkfield "District Wide" Water Conservation Program.	The program has two "full service" elements that encompass a "District Wide Water" Conservation Program. Element A. A team of trained plumbers will retrofit 1,800 residential homes / 3,600 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 110 acre feet per year. Element B. A team of specialist will retrofit 600 residential yards with modern ET water controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 36 acre feet per year. This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 – 24 months and employ 75 to 100 people.	O	0	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 146 acre feet per year or 50.0 / 75.0 gallons per day, per person.	1,756,000	2,367	7,775	18	Sonoma	II	2009
4341	5610014	5610014-005	Golden State Water Company - Ojai	Ojai - San Antonio Reservoir, piping, and booster upgrade	The existing 100,000 gallons of storage would be destroyed and a new 1.0 MG reservoir would be constructed, along with the required yard piping. Existing booster pumps would be upgraded to increase flows out of the plant.	O	0	C	This storage reservoir would be sited at the well field where the bulk of the water for the Ojai system is produced. The current 100,000 gallon forebay has reached the end of its useful life and is in a deteriorating condition; it's size is insufficient to allow for pumping in off-peak hours to take advantage of reduced energy rates. A larger reservoir, along with the associated yard piping and booster pump upgrades, would allow for increased fire flows for greater community protection, as well as allowing better use of groundwater to supply peak flows, potentially reducing dependence on purchased water.	3,200,000	2,870	8,200	06	Ventura	IV	2009
4342	5610014	5610014-006	Golden State Water Company - Ojai	Ojai - Mutual Well #6	A new well will be drilled and equipped in our Mutual Plant well field, and all necessary yard piping installed to connect it to our treatment and distribution system.	O	0	C	Aging wells and increased demand necessitate the drilling of a new well to reduce dependence on purchased water, thus ensuring our customers of a more stable supply at a lower cost.	2,500,000	2,870	8,200	06	Ventura	IV	2009
4343	5610014	5610014-004	Golden State Water Company - Ojai	Ojai - Country Club Road Main Replacement	2400 feet of 4 inch pipe will be replaced with 8 inch ductile iron pipe.	O	0	C	Because of aging infrastructure, deteriorating pipeline condition, and too high pressures necessary to provide adequate flow, water loss in this 2400 foot section of Country Club Drive has risen too high, and leaks and main breaks have become too frequent. To conserve water and reduce disruption of service to our customers, this 4 inch main line needs to be replaced with an 8 inch line.	1,100,000	2,870	8,200	06	Ventura	IV	2009

4344	4210020	4210020-001	Santa Ynez River Water Cons. Dist. ID#1		Replace liner and upgrade piping and inlet/outlet.	O	0	C	Needs to upgrade the 6.5 million gallon reservoir.	1,500,000	2,327	8,298	06	Santa Barbara	IV	1998

4346	4210020	4210020-004	Santa Ynez River Water Cons. Dist. ID#1		Implement slope stabilization measures necessary to control embankment creep below the reservoir and reservoir reconditioning.	O	0	C	Improve 6.5 MG reservoir's structural stability	2,500,000	2,327	8,298	06	Santa Barbara	IV	1998
4347	4210020	4210020-006	Santa Ynez River Water Cons. Dist. ID#1	Security Safeguards for Booster Pump Stations	Problem Description Currently, Santa Ynez Water Conservation District, Improvement District No. 1 (ID#1) has two booster pump stations that are remotely located, putting these pumping stations at risk of intentional destruction due to vandalism and/or terrorism. Both of these booster pump stations are in need of security fencing, as well as remote cameras for surveillance to ensure the reliability of the water system. One booster pump station, Meadowlark, is located on a 2 acre site. The other booster pump station, Mesa Verde is located on a ¼ acre site. Meadowlark Booster Pump Station has an approximate flow of 3850 gallons per minute and Mesa Verde Booster Pump Station has an approximate flow of 4713 gallons per minute. Additionally, Mesa Verde Booster Pump Station provides for the entry of Cachuma Project and State Water Project water into ID#1's system. Should these facilities be damaged or interrupted due to security breaches, there would be insufficient backup supply to meet demands or fire flows. This would amount to a critical failure of the system. This project is not only essential to the 8,298 residents that reside within ID#1's service area, but to the	O	0	C	Security Project	155,000	2,327	8,298	06	Santa Barbara	IV	2007

4351	1910250	1910250-005	NEWHALL CWD-PINETREE	RMS for Pinetree Reservoirs 1 & 1A	Newhall County Water District posesses enough land to install the RMS system and housing for the system at Pinetree Reservoirs 1 and 1A. The project would involve construction of a block building, installation of a onsite sodium hypochlorite generator, sodium hypochlorite day tank, and aqueous ammonia storage tank. Also installed would be Total Chlorine Analyzers and dosing equipment to deliver the chemicals. The RMS system will be maintained by NCWD staff and integrated into SCADA.	O	0	C	The Pinetree service area is located in the farthest easternmost section of the Santa Clarita Valley. Customers within the Pinetree Division receive approximately 40% alluvial groundwater and 60% purchased State Water Project (SWP) water. SWP water is treated at the Castaic Lake Water Agency treatment facilities that are 5 and 10 miles away from the Pinetree service area. The extended residence time of the water before NCWD receives it coupled with additional residence time in the Pinetree distribution system make maintaining water quality standards a constant struggle. To complicate matters further, chloramines are used in the disinfection process. Using chloramines as a disinfectant reduces TTHM formation but may cause nitrification within the distribution system. Most nitrification problems appear when detention time is increased after chloramination. What happens is the chlorine dissipates leaving ammonia. The uncombined ammonia is then reduced by bacteria into nitrites. NCWD operators are skilled at monitoring and dealing with nitrites before they become an issue. During the summer months increased temperatures in reservoirs complicate the process by dissipating chlorine at a higher rate. This translates into additional flushing activities to combat long detention times in the reservoirs. Reservoirs 1 and 1A are the “heart” of the Pinetree Distribution system. All waters are pumped to	150,000	2,648	8,689	15	Los Angeles	IV	2009
4352	2710007	2710007-003	Gonzales, City of	2010 Johnson Canyon Water Main Improvement	The general project description: This project includes furnishing all labor, materials, tools, and incidentals required for the construction and installation of approximately 6,600 lineal feet of 12'' PVC water main, valves, fittings, trenching backfill & restoration. The SCADA system will allow the City to remotely monitor the entire system, place any or all wells into hand and run them manually, or disable any well from running, or operate any well in automatic mode based on tank level (with individual on/off setpoints, with or without time-of-day override).The proposed system will easily allow future expansion for the City to include lift stations, future storage tanks, and/or the City's wastewater plant without the need to purchase additional software. The following scope of work shall include all labor and materials (installation of the panels, conduits, and antennas at each well site, tank site, and City Hall);Supply one(1) Master 1 watt ISM spread spectrum RTU unit, Omni directional antenna and cableSupply five (5) Slave 8ADI/9D0 1-watt ISM spread spectrum RTU units with battery back-up power supplies, 20' antenna cables, and Yagii antennasFRM to install necessary current switches/transformers and control wiring at each of 4 well sites to allow monitoring/control of well pumps and chlorine pumpsSupply one (1) level transducer for Tank #1 - (provisions for 2 additional tanks included)Supply one (1) Dell dual hard drive	O	0	C	Our City Goal for this project is that our water system continue to besafe, reliable, and energy efficient. Our operational challenges werestorage and deliver supply lines. Recently, we increased our storagefrom one million gallons to seven million gallons of storage capacity, effectively addressing that issue.Now, our immediate focus is on the main truck line to the new tanks.The existing supply line is not large enough, and limits our pumpingcapabilities. The other issue is water system control through automation. Our present telemetry system is aging, and only provides control 2 of the 4 city wells. In fact, we have been having problems with the system the last couple of months. The telemetry system is a low voltage contact system that runs via phone lines, and the phone company has given us notice that it no longer recognizes this system. The addition of additional water main capacity along with SCADA will permit the city to alter its pumping schedule, lowering operating costs while becoming more environmentally responsible and sustainable.	855,000	1,916	8,803	05	Monterey	II	2011

4353	3610044	3610044-002	DWP - BIG BEAR LAKE/MOONRIDGE	Wellhead Treatment - Nitrate Concentration in Lake William Service Area	Preliminary recommendations indicate the need to treat water prior to distribution to our customers. A nitrate treatment plant including monitoring equipment will be required. The results of an engineering study would provide further details on the facilities required.	O	0	C	The Lake William Service Area consists of 120 developed lots with buildout capacity of 234 lots. Since 1990, nitrate has been detected in increasing concentrations in ground water from all wells serving the area. Septic systems are the source of ground water nitrate.Evaluation of the available natural recharge, residential lot density, and aquifer storage capacity suggest that the area has a limited capacity to dilute existing and future septic effluent contributions to the ground water system. Without mitigation, future nitrate concentrations will continue to increase to levels that will exceed the MCL at some time in the future.The rate at which nitrate concentrations will increase is uncertain and appears to be correlated with infiltration and deep percolation of precipitation. Given the current nitrate concentration of 32 mg/L and the observed increases after an above-normal precipitation year, it is imperative that the Department of Water and Power begin planning to mitigate the nitrate as soon as possible.	100,000	10,366	8,839	13	San Bernardino	V	2008
4354	3610044	3610044-001	DWP - BIG BEAR LAKE/MOONRIDGE	Mainline Extension to Service Lake William	The purpose of the project is to provide supplemental water to the Lake William water supply system. Water would be delivered from the existing Erwin Lake water system to the Lake William water system through a new 6-inch pipeline. The engineering was completed in November 2004 and included the installaion of 8,000 LF of 6-inch Class 350 DIP pipe, 7,100 LF of 6-inch Class 200 DIP or PVC pipe and a new booster station.	O	0	C	The Lake William system is isolated geographically from the rest of the service area and relies on local ground water resources to meet domestic water demands. Hydrogeologic studies conducted in 2003 indicate that the average water demand of existing customers and the adjacent YMCA Camp exceed the perennial yield (safe yield) of the subarea. Only one-half of the legal lots in the system have been improved. After stringent summertime water budgets, temporary use of reclaimed water for landscape irrigation and restrictions on landscaping including no new grass, a building moratorium was put in place in 2006.	2,500,000	10,366	8,839	13	San Bernardino	V	2008
4355	0910013	0910013-007	Georgetown Divide PUD	GDPUD Meter Replacement	Purchase and install new water meters and install additional meters at unmetered locations. The new meters will promote water conservation, provide additional assistance with leak detection, and improve operating efficiencies.	O	0	C	Replace water meters throughout distribution system	1,600,000	3,587	9,021	09	El Dorado	I	2009

4356	0410008	0410008-004	Thermalito Water & Sewer District	Contact Time Enhancement	The District has switched the plant to a fixed speed operation and when the tank reaches its maximum level the plant is shut off and the tank is allowed to draw down as much as 20 to 25% once a day. This is not a good fix as when the tank draws down there are numerous customer complaints of low pressure and again taste and odor complaints do arise do to the fact the tank water is improperly mixed. The tank needs an independent inflow on the opposite side of the tank. This would give the tank a maximum mixing operation keeping the Chlorine levels up to treatment plant levels. The other benefit would be the treatment plant could be kept in the automatic mode and water would be moving through the tank 24 hrs a day. When demand reaches its maximum the tank fluctuation would not be in the 20 to 25% range, more like 10 to 15%. A positive benefit from this would be reduced pressure swings in the distribution system and the total water supply in the 2.5-MG tank would be cycled through the tank daily. Another positive gain is added Chlorine Contact Time gained by utilizing the 2.5MG tank, another 40 to 60 minutes of added contact time could be realized.Scope of Work1. CEQA - Complete and Approved2. Project Design - Complete3. Bid Documents - Complete4. Remove and replace existing system5. Flushing and Pressure Testing To replace the approximate 2,000′ of remaining dysfunctional pipe and make the 24″ inlet tie	O	0	C	In 2008 this 24″ distribution main was required to be utilized to meet state required Chlorine Contact time for disinfection purposes. The line was isolated in 2008 from the distribution system and the water is pumped directly from the treatment plant to the point where the new 30″ distribution line was connected. The approximate total length of pipe to be replaced or installed is 2,000′. The District gains approximately an additional 19 minutes of Contact time when the plant is operated at 3,200 gpm. The problem we have is the pipe is over 60 years old and has deteriorated to the point that its physical strength and integrity is gone. It is an old pipe that was built from sheets of steel rolled, tarred and riveted on site. The problem the District is having with this old pipe is unexpected major blow outs at times have nearly emptied our main storage tank. The major risk is the loss of the use of the 2.5 million gallon (MG) tank for a time in which the whole District is depressurized and becomes at risk for contamination. The other side effect, is this pipe has become a major component in developing the Districts Chlorine Contact Time requirements and if this pipe is removed from the contact time equation, the secondary plumbing that could be utilized in such an emergency would not allow the District to utilize its treatment plant at its fullest capacity or not at all depending on the finished water quality attributes (temperature, pH, and the free	325,000	2,779	9,513 21	Butte	I	2011

4359	1910020	1910020-003	EAST PASADENA WATER CO.	Nitrate Analyzer to Detect Harmful Nitrate Levels	As mentioned, the project is to install a Nitrate Analyzer with peripheral monitors. The analyzer will send a signal to on-call operators notifying them if the nitrate level should climb to a potentially harmful level. We currently have interconnections with the City of Pasadena and City of Arcadia. The Analyzer will also detect Nitrate in blend water. If needed, we could give data feedback to these cities if we detect that blend water nitrate levels are climbing.	O	0	C	As directed by the Department of Health, we must install a nitrate analyzer which will determine nitrate levels of well water, reservoir water and blend water. The analyzer will send an alarm to our SCADA system to let operators know if nitrate levels are exceeding 80% of the maximum contaminant level. The MCL is 45 parts per million. In the past, our well has exceeded 45 ppm and the Dept of Health ordered East Pasadena Water Company to shut the well off, leaving the company with only two wells to supply our over 9,000 consumers, 2,900 service connections. We have since lowered the nitrate level in that well by isolating its upper zones, but the nitrate may increase at any time. The Nitrate Analyzer will literally notify operators of potentially harmful water conditions, especially in homes which have new-born babies, and will allow our operators to react by shutting off a well or blending with water from our interconnection. This is a much-needed tool as it acts as an alarm to potentially harmful water conditions.	50,000	2,945	9,745 22	Los Angeles	IV	2009

4360	1910020	1910020-002	EAST PASADENA WATER CO.	Well #11	A new well called W 11 will serve to augment our source of supply by acting both as a back up well and a relief well which will extend the life of existing wells. This is the most cost-effective way to address our source of supply problem in lieu of relying on our interconnections with the cities of Arcadia and Pasadena. Interconnection water ranges in cost from $600-$900 per acre-foot. This is quite costly when compared to our pumping costs of about $100 per acre-foot. This high cost is ultimately passed on to the consumer. Well 11 would be cost-effective and augment our source water challenges. East Pasadena Water Company may have to install a treatment facility for the new well depending on nitrate and other constituent levels.	O	0	C	East Pasadena Water Company is a small water company (B) serving about 9,700 people. We have been serving portions of Pasadena, Temple City and Arcadia since 1913 via our parent company. We currently have three wells; w7 is 86 years old, w8 is 72 years old and w9 is 62 years old. W7 cannot run for an extended period due to nitrate contamination. W8 is lined with a device to isolate the top zones due to nitrate contamination. As you can see, we need at least one new well which will pump at least 1,000 gallons per minute to serve the public in the event one of our wells fails. It is imperative to place another well in service immediately. However, due to our size and our concern about burdening our customers further, we have not drilled the desperately needed well as of yet.	2,458,500	2,945	9,745	22	Los Angeles	IV	2009

4368	4010011	4010011-003	MORRO BAY WATER DEPARTMENT	Upper Kings Waterline Replacement	In 1997 the City of Morro Bay adopted an updated Water Master Plan. This plan included a hydraulic model designed to analyze flows through our system for both current and build out conditions. Based upon the findings of the model there are a number of lines that based upon anticipated future flows will have excessive line velocities. Excessive velocities can lead to water quality/turbidity problems with the removal of materials and films from the pipe walls, as well as reduce the life expectancy of the pipe. This pipeline will be upsized to decrease velocities and ensure adequate fire and service capacity for the build out conditions. The Upper Kings Tanks in Morro Bay is a blending tank for all of the water sources the City uses. The entire distribution network starts at the Upper Kings Tanks and flows to customers through the distribution piping. The existing 6-inch line that leaves the tanks feeds residential areas near the tank as well as provides water to the Elena tanks. Based upon our hydraulic modeling this line is undersized.The 6-inch line does not provide a sufficient flow to meet the expected fire flow demand in the areas local to the tank. Replacing this line with a 12" line will allow the water system to maintain residential pressures to high elevation areas under high demand conditions and will improve overall distribution efficiency. This upgrade will extend from the Upper Kings Tanks to King Avenue, north along Kings Avenue	O	0	C	The current flow rate from the Upper Kings tanks in Morro Bay is not sufficient to meet build out fire flow required to serve the residential area near the tank.	33,000	5,425	10,270	06	San Luis Obispo	IV	2008

4369	4010011	4010011-005	MORRO BAY WATER DEPARTMENT	Nutmeg Waterline Replacement	In 1997 the City of Morro Bay adopted an updated Water Master Plan. This plan included a hydraulic model designed to analyze flows through our system for both current and build out conditions. Based upon the findings of the model there are a number of dead end lines, which need to be converted into pressure loops. The addition of this line will serve the dual purposes of eliminating a dead end line where water age problems such as nitrification can occur, as well as providing an alternate flow path allowing for future system maintenance. To meet fire flow requirements in the northern portion of Nutmeg, an 8-inch pipeline is proposed in Elena Street extending from Hemlock Avenue to Juniper Avenue about 800 feet. Additionally 10-inch pipe is needed along Avalon Street from Laurel Avenue to Ironwood Avenue and continuing on Ironwood Avenue to the previous Hayward Lumber site, totally approximately 2375 feet.	O	0	C	Existing deficiencies within the Nutmeg Zone include supplying residential fire flow requirements to the southern portion of the zone, primarily along Bayview, Rockview, and Ponderosa. Residential fire flow requirements also cannot be met in the northern portion of the zone along Hemlock and Sequoia.	115,000	5,425	10,270 06	San Luis Obispo	IV	2008
4370	4010011	4010011-007	MORRO BAY WATER DEPARTMENT	Nutmeg Water Tank	The City of Morro Bay's Water Master Plan is being used to guide upgrades to the City's water system. The Nutmeg Tank is undersized for it's service area by 1.19 million gallons. In order to meet this demand a new system of tanks will need to be designed and installed in order to provide water to residences for use and for fire flow demands. The upgraded tank and associated pressure zone modifications will increase turnover and reduce delivered water age, which will improve water quality.The current tank site and proposed tank site are on private land outside of the City limits. The new tank installation will need remote Supervisory Control and Data Acquisition (SCADA) communications creating an opportunity to enhance emergency service communications capabilities.The project will entail, design of a tank system and construction of the project. This project will provide the required water supply the City needs to meet build out fire flow demands while reducing the number of pressure zones in the City.	O	0	C	In 1997 the City of Morro Bay adopted an update of the Water Master Plan. Based upon a hydraulic model created at that time it was recommended to install storage capacity for the Nutmeg pressure zone since the existing tank at the Nutmeg site is undersized to meet future fire flow demands. The tank addition will enable the optimization of the pumping station operations and will increase system storage and reliability.	750,000	5,425	10,270 06	San Luis Obispo	IV	2008

4371	4010011	4010011-004	MORRO BAY WATER DEPARTMENT	New 8 inch line Kern to Piney on Anchor	In 1997 the City of Morro Bay adopted an updated Water Master Plan. This plan included a hydraulic model designed to analyze flows through our system for both current and build out conditions. Based upon the findings of the model, there are a number of dead end lines, which need to be converted into pressure loops. The addition of this loop line will serve the dual purposes of eliminating a dead end line where water age problems and nitrification can occur as well as providing an alternate flow path allowing for future system maintenance.The Upper Kings Tanks in Morro Bay are blending tanks for all of the water sources the City uses. The entire distribution network starts at the Upper Kings Tanks and flows to customers through the distribution piping. The existing 6-inch line that leaves the tanks feeds residential areas near the tank as well as taking water to the Elena tanks. Based upon our hydraulic modeling this line is undersized for current and future fire flowsTo help move water more efficiently and to meet the fire flow requirement a new 8" water line is needed on Kern Street from Pecho to Olive and continuing down Olive Street to Bernardo.	O	0	C	The current flow rate from the Upper Kings Tanks in Morro Bay is not sufficient to meet build out fire flow required to serve the residential area near the tank.	60,000	5,425	10,270 06	San Luis Obispo	IV	2008
4372	4010011	4010011-006	MORRO BAY WATER DEPARTMENT	Upgrade Upper Kings Tank	The City of Morro Bay's Water Master Plan is being used to guide upgrades to the City's water system. The Upper Kings Tank is undersized for it's future service area by 0.78 million gallons. In order to meet this need a new tank will need to be designed and installed in order to provide water to residence for use and fire demands. The upgraded tank with network pipe changes and pressure zone modifications will increase turnover and reduce delivered water age, which will improve water quality.The project will include the design and construction of the new tank system. This project will provide the required water storage to meet the City's needs at build out in accordance with water supply regulations.	O	0	C	In 1997 the City adopted an update of the Water Master Plan. Based upon a hydraulic model created at that time it was recommended to install storage capacity for the Upper Kings pressure zone since the existing tanks at the Upper Kings site are undersized to meet future fire flow demands. The tank addition will enable the optimization of the pumping station operations and will increase system storage and reliability. The new tank installation will need remote Supervisory Control and Data Acquisition (SCADA) communications creating an opportunity to enhance emergency service communications capabilities.	355,000	5,425	10,270 06	San Luis Obispo	IV	2008
4373	4010011	4010011-002	MORRO BAY WATER DEPARTMENT	Upgrade Black Mountain Tank	The City of Morro Bay's Water Master Plan is being used to guide upgrades to the City's water system. The Black Mountain Tank is undersized for it's service area by 0.21 million gallons. In order to meet this need, a new system of tanks will need to be designed and installed in order to provide water to residence for use and fire demands. The project will include the design and construction of the new tank system. This project will provide the required water supply the City needs to meet water supply regulations.	O	0	C	In 1997 the City adopted an update of the Water Master Plan. Based upon a hydraulic model created at that time it was recommended to install storage capacity for the Ridgeway pressure zone since the existing tank at the Black Mountain site is undersized to meet future fire flow demands. The tank addition will enable the optimization of the pumping station operations and will increase system storage and reliability. The new tank installation will need remote Supervisory Control and Data Acquisition (SCADA) communications creating an opportunity to enhance emergency service communications capabilities.	100,000	5,425	10,270 06	San Luis Obispo	IV	2008

4374	4010011	4010011-001	MORRO BAY WATER DEPARTMENT	Lower Kings Waterline Replacement	In 1997 the City of Morro Bay adopted an updated Water Master Plan. This plan included a hydraulic model designed to analyze flows through our system for both current and build out conditions. Based upon the findings of the model there are a number of lines that based upon anticipated future flows will have excessive line velocities. Excessive velocities can lead to water quality/turbidity problems with the removal of materials and films from the pipe walls, as well as reduce the life expectancy of the pipe. This pipeline will be upsized to decrease velocities and ensure adequate fire and service capacity for the build out conditions.The Lower Kings Zone of the Morro Bay water system is currently served solely by the Upper Kings Zone through a single PRV located at Morro Bay Blvd. and Kern Avenue. The Lower Kings Zone includes most of Morro Bay's business districts and visitor serving facilities along the Embarcadero. This single PRV is the only source of water to the zone. The addition of a second PRV at Dunes Avenue and Napa Avenue will provide a second source of supply to the zone from the Upper Kings Zone.To meet the 3,750 gpm fire flow requirement at the El Morro Lodge, the 6-inch line on Dunes Street from Napa to Monterey Avenue will need to be upgraded to a 12-inch line. Additionally there are several other lines that require upsizing such as: the existing 6-inch line along Monterey Avenue from Dunes	O	0	C	The current flow rate from the Upper Kings tanks in Morro Bay is not sufficient to meet build out fire flow required to serve the residential area in the Lower Kings Pressure Zone.	100,000	5,425	10,270	06	San Luis Obispo	IV	2008
4375	5510001	5510001-005	TUD - Sonora/Jamestown Water System	Particle Counters for Crypto compliance	INSTALL PARTICLE COUNTERS.	O	0	C	LACK OF PLANT MONITORING EQUIPMENT FOR CRYPTO OPTIMIZATION.	18,000	4,342	10,294	11	Tuolumne	III	1998
4376	1910148	1910148-003	SIERRA MADRE-CITY, WATER DEPT.	High Capacity Well	The proposed project will provide for the replacement of an existing water supply well with a new high capacity well to provide for groundwater supply reliability. The City's existing production wells are nearing their useful life and a need exists to drill and equipment a new well to allow one of the old wells to be decommissioned. The city is highly dependent upon it local groundwater supplies for the East Raymond Basin. Recent drought years have lowered the pumping levels o of the existing wells and the new well would be drilled and set at an optimum level for groundwater exaction. This project would include well design, hydrogeological services, as well as drilling and equipping construction contracts. The water supply well project is planned to provide increased system reliability, assurance of water quality and fire protection in the residential and commercial areas adjacent to the San Gabriel Mountains.	O	0	C	The quality and reliability of drinking water supplies for the city of Sierra Madre are at risk due to the deterioration of their water infrastructure due to age and from the potential impact from a major seismic event in the region. The design and construction of the purposed projects is imperative in order to safeguard the quality and quantity of the drinking water supplies in their communities. Improvements to water storage reservoirs, pump stations, and well supply sources are needed to lower the risk of contaminating the drinking water supply and ensure sustainable water supplies due to the failure of water infrastructure systems.	2,000,000	3,867	10,800	07	Los Angeles	IV	2009

4377	4410013	4410013-003	Scotts Valley Water District	Water storage tank rehabilitation	The project consists of four components: 1) Repairs at Bethany storage tank. The 400,000 gallon tank would be stripped, repaired and recoated. The existing old sheet iron roof would be replaced with a new welded steel or aluminum roof. Tank vents would be modified to prevent contamination and unauthorized access. The tank staircase would be secured against unauthorized access.2) Repairs at MacDorsa storage tank. The 750,000 gallon tank would be stripped, repaired and recoated. The existing old sheet iron roof would be replaced with a new welded steel or aluminum roof. Tank vents would be modified to prevent contamination and unauthorized access. 3) Replacement of the existing 40,000 gallon Orchard Run Water Treatment Plant decant tank with a new steel bolt-up tank of the same capacity. 4) Replacement of the existing 20,000 gallon Orchard Run Water Treatment Plant sludge tank with a new steel bolt-up tank of the same capacity.	O	0	C	Several Scotts Valley Water District (SVWD) water storage tanks have deteriorated over time, creating potential exposure to drinking water contamination, loss of water delivery capability, and/or environmental releases. Specific problems include:1) Bethany and MacDorsa storage tanks require recoating, roof replacement, and modification of tank vents to eliminate the risk of contamination. In addition, the Bethany tank staircase, which provides access to the roof, needs security improvements. The roof, vent, and security deficiences were documented in a letter from CDPH to SVWD dated 8 September 2006. The CDPH letter followed an inspection of SVWD's system conducted in May 2006. The letter required SVWD to either make the required repairs or submit a corrective action plan for doing so. The corrective action plan was submitted; the repairs remain to be completed. There is no redundant water storage in the pressure zone served by Bethany tank. Therefore, tank contamination at this site would seriously impair SVWD's ability to meet customer demand until such time as the tank could be brought back into service. There is redundant storage for MacDorsa tank, though insufficient to fully meet customer demand during peak periods.2) Decant and sludge tanks at Orchard Run Water Treatment Plant have aged and need replacement. These tanks are vital to operation of the treatment plant, which processes	1,150,000	3,852	11,301	05	Santa Cruz	II	2009
4378	4110016	4110016-002	Hillsborough Water Dept.	AMI Installation Project	The Town requests funding to convert its current Sensus “touch-read” meters to an Advanced Metering Infrastructure system. The AMI system would use “smart meter technology” to remotely “read” all Town water meters up to twenty four times per day. These individual meter reads would be transmitted in “data packets” up to four (4) times per day via two Tower Gateway Base Stations (TGBs). The system would use a single, primary-use (unshared) licensed radio band, which is less vulnerable to interference during transmission (an important consideration in Hillsborough given its topography). The data packets transmitted via the TGB (and several strategically placed repeaters) would be sent to a metering database housed in a Regional Network Interface (RNI). The RNI consists of 2 servers. Once in the RNI, the data is available for viewing via the Meter Data Manager (MDM). The MDM is a browser-based application that shows meter reading data in a user friendly interface and allows the utility to view the information from any PC connected to the network. The MDM also acts as a middleware between the customer billing system and the RNI. The MDM has the ability to import data from the customer billing system and export meter reading data back to the customer billing system. It also provides reports for management of the meters within the AMI system as well as graphical and table views of	O	0	C	The Town of Hillsborough is a residential community located in San Mateo County, California. The Town has an area of 6.23 square miles of hilly canyon-lands with a current population of just over 11,000. The Town’s water system includes 8.2 million gallons of water storage facilities, 14 pump stations and 17 tanks and 100 miles of water piping to 4,233 service connections. The Town provides all water delivery, meter reading and water billing functions. The Town reads meters manually once every two months using a Sensus RFI “touch read/wand” technology. The current system is over fifteen years old. There are a number of disadvantages with the Town’s current meters and meter reading system: Meters must be physically read by a Public Works staff person using a “wand” placed next to the meter. Meters are spaced by considerable distances. Meter reading requires the use of a vehicle and the associated greenhouse gas emissions and environmental impacts associated with its use.Meters can currently only be reasonably read by the Town once every two months. More frequent meter reads is cost-prohibitive. Reading water meters once every other month is like opening your eyes once every thirty seconds while driving on the freeway: a lot can happen between looks. For example, the Town does not have the data necessary to help its customers identify line breaks, leaks and other associated over-use of water on	909,500	4,296	11,328	17	San Mateo	II	2009

4379	4110016	4110016-006	Hillsborough Water Dept.	Darrel Tank #1 and #2 Replacement Project	The Town is at 25% design of the 2 mil gallon pre-stressed concrete water tank and anticipates completing 100% design by June 2011. The tank will be built above ground using the pre-stressed concrete design method. The pre-stressed concrete tank will be secure and virtually maintenance free. The tank will be built on the foot prints of the existing tanks #1 & 2. The tank design provides a better inlet / outlet piping design along with a mixing system to improve water quality that requires no electricity to operate. It will be designed to meet all current American Water Works Association (AWWA) standards for seismic design and will include an earth quake shut off system. The new tank design will also save on exterior and interior coatings costs, as well as eliminate the need for cathodic protection which in turn will save on electricity and ongoing maintenance costs.The increased water storage capacity will give the Town more water reserve to service the residential and other areas during peak water demand in the event of an emergency water shortage, wildfire or earthquake.	O	0	C	The Town of Hillsborough is a residential community located in San Mateo County, California. It lies west of Highway 101 and east of Highway 280 and is very close to the San Andreas Fault line. Fully two thirds of the Town is in a CalFire State Fire Hazard Zone and nearly half is in a state designated Very High Fire Hazard Zone. The ABAG Mulit-Jurisdictional Local Hazard Mitigation Plan identifies 3,458 acres or 89% of the Town as being at risk from wild land-urban interface fires.The Town's water system includes 8.2 million gallons of water storage facilities, 14 pump statoins and 17 tanks and 106 miles of water piping to 4,200 service connections. Much of the system was originally installed in the early to mid 1900s. The Town would like to replace two of its existing older 500,000 gallon welded steel potable water tanks located at the Darrell Tank Site. These two tanks were constructed in 1952. We would like to replace them with a single larger 2 million gallon pre-stressed concrete tank with current seismic, structural and OSHA standards. The existing tanks are both in need of structural upgrades and repairs to the rafters, floor, the roof steel is deteriorated, and the interior and exterior coatings need to be replaced. Tank #2 has had water quality issues in the past due to the tank being the middle of three tanks and the way the inlet / outlet piping is configured. This tank has a tendency to stagnate due to low water turnover. This new tank will	3,500,000	4,296	11,328	17	San Mateo	II	2011

4384	1910096	1910096-011	Newhall CWD-Newhall	Newhall Avenue Pipeline Replacement Project	The replacement of the pipeline on Newhall Avenue will be completed by construction staff employed by Newhall County Water District. To complete the project new 12 inch ductile iron pipe will be installed and tied into an existing 12 inch transmission line. Approximately 3753 feet of 12 inch ductile iron pipe will be used for the new main line. Lateral mains branching off of the 12 in main will also be used and will consist of 166 feet of 8 inch pipe. Upgrading fire mains to 6 inch ductile iron will also be done at this time and 462 feet of pipe will be used for this. Traffic control and shoring during the installation of pipe will also be done in house with NCWD equipment.	O	0	C	Newhall is the oldest service area in all of Newhall County Water District's boundaries. Aging pipe in this area is beginning to effect reliability and water quality. Steel pipe installed 40, or more, years ago has reached the end of its usable life. Reliability is affected when pipeline failures lead to system shutdowns for repair. Shutdowns inconvenience customers and increase the risk of disaster if fire response is needed. Failures also hinder surrounding neighborhoods by putting increased demand on other pipelines. Replacing the steel pipe on Newhall Avenue also improves how NCWD can effectively convey water. When new ductile iron pipe is installed it gives NCWD an opportunity to properly align the mainline. Currently, the steel main has many crossings and bottlenecks that hinder the flow rate water being fed. Bottlenecks in pipelines can contribute to stagnant water in the distribution system. Presently, the water main consists of 12 inch steel pipe with various sized laterals branching off. Engineered reports suggest that 12 inch ductile iron pipe should be used to replace the current main. When replaced better flow and reliability will be reached. With better flow, water quality in the area will improve and will decrease the amount of water wasted through constant flushing procedures.	446,596	3,846	12,566	15	Los Angeles	IV	2009

4385	1910096	1910096-012	Newhall CWD-Newhall	RMS for Newhall Reservoirs 4 & 4A	Newhall County Water District posesses enough land to install the RMS system and housing for the system at Newhall Reservoirs 4 and 4A. The project would involve construction of a block building, installation of a onsite sodium hypochlorite generator, sodium hypochlorite day tank, and aqueous ammonia storage tank. Also installed would be Total Chlorine Analyzers and dosing equipment to deliver the chemicals. The RMS system will be maintained by NCWD staff and integrated into SCADA.	O	0	C	The Newhall service area is located in the Santa Clarita Valley. Customers within the Newhall Division receive approximately 70% groundwater and 30% purchased State Water Project (SWP) water. SWP water is treated at the Castaic Lake Water Agency treatment facilities that are 5 and 10 miles away from the Newhall service area. The extended residence time of the water before NCWD receives it coupled with additional residence time in the Pinetree distribution system make maintaining water quality standards a constant struggle. To complicate matters further, chloramines are used in the disinfection process. Using chloramines as a disinfectant reduces TTHM formation but may cause nitrification within the distribution system. Most nitrification problems appear when detention time is increased after chloramination. What happens is the chlorine dissipates leaving ammonia. The uncombined ammonia is then reduced by bacteria into nitrites. NCWD operators are skilled at monitoring and dealing with nitrites before they become an issue. During the summer months increased temperatures in reservoirs complicate the process by dissipating chlorine at a higher rate. This translates into additional flushing activities to combat long detention times in the reservoirs. Reservoirs 4 and 4A are centrally located within the Newhall Distribution system. Water is pumped to these reservoirs before being disbursed	150,000	3,846	12,566	15	Los Angeles	IV	2009
4386	1910096	1910096-008	Newhall CWD-Newhall	Newhall Well 14	Newhall County Water District plans to drill and outfit a deep well for potable water production. Currently the District has five wells in the Newhall Division, two of which are in production. A hydrogeologist hired by NCWD has already produced a report giving guidance to where the best production should occur for a new well. Based upon proposed locations, property shall be acquired that meets all of the parameters of functionality, ease of integration into current system, and best possible water production. The well (Newhall Well 14) will perforate the Saugus Aquifer, an underlying water bearing formation in the Santa Clarita Valley, to depths of 950 to 1000 feet below ground surface. NCWD will utilize the services of a hydrogeologist during drilling and will entertain drilling offers from several drilling outfits. Furthermore, the pump, motor, and appurtenances will all be designed by an engineering firm. All aspects of the well will abide to AWWA and Title 22 standards. Staff will also work closely with the engineers to assure NCWD's specifications are met.	O	0	C	With the uncertantity of State Water Project allocations, Newhall County Water District (NCWD) is planning to increase it's supply reliability by drilling a new potable water well. While a new well incereases reliability in daily operations, Newhall Well 14 will also increases the reliability of water distributed to customers in emergency situations. This is because NCWD will not have to depend on other entities avalability of water during a disaster (such as an earthquake). Another positive aspect of enhancing groundwater production is the water quality benefit. Groundwater is very low in TOC's which are precursers to disinfection byproducts. Having these low levels of precursors translates to decreased disinfection byproduct levels throughout the distribution system. In addition to lowering disinfection by products, the use of groundwater can also help prevent against nitrification in the distribution system. Most nitrification problems appear when detention time is increased after chloramination. What happens is the chlorine dissopates leaving ammonia. The uncombined ammonia is then reduced by bacteria into nitrites. Detention time would be decreased with groundwater because the transmission time from well to customer is shorter, ultimately resulting in better chlorine residuals and lower nitrites.	500,000	3,846	12,566	15	Los Angeles	IV	2008

4387	4010026	4010026-005	NIPOMO COMM SERVICES DIST	NCSD Supplemental Water Project	Nipomo Community Services District is leading a project focused on the construction of treatment facilities as well as a pipeline to import between 3,000 to 6,200 acre feet of supplemental water per year from the Santa Maria Basin to resolve overdraft of groundwater in the Nipomo Mesa Groundwater Management Area. Currently, all water supplies for the Nipomo area are groundwater derived. Rapid urban growth and increased agricultural production in the area over the past 20 years has resulted in pumping depressions and decreased water quality. The entire Santa Maria Groundwater Basin is currently being adjudicated as a result of these issues. The pipeline inter-tie project will connect the City of Santa Maria water distribution system to the Nipomo Community Services District water distribution system via an 8,000ft, 16-inch pipeline which must cross the Santa Maria River. A pump station, storage reservoirs and treatment facilities will also be included in the project to facilitate delivery into the District system. The project will provide increased supply reliability for all users in the Nipomo Mesa Groundwater Management Area, by decreasing the demand on the basin from urban users, and adding return flow from the imported water. Additionally the project will result in improved water quality for users as the Santa Maria water supply	O	0	C	The community of Nipomo is located on a coastal mesa averaging an elevation of 380 feet above sea level in the southern end of San Luis Obispo County. Approximately 12,000 customers within seven square miles receive water and wastewater services from the Nipomo Community Services District (NCSD) which has been in operation since 1965. Currently, all water supplies on the Nipomo Mesa are groundwater derived from the Nipomo Mesa Hydrologic Sub-Area of the Santa Maria Groundwater Basin. Over the past 20 years the groundwater basin has experienced pumping depressions and a decrease in groundwater quality in the form of increased salinity. On June 26, 2007 the San Luis Obispo County Board of Supervisors verified the severity of Nipomo's water supply issue by certifying a Level of Severity 3 designation. This designation indicates that water demand is exceeding available supply. In 1997, after years of increased urban and agricultural growth led to a depressed groundwater table underneath the Nipomo Mesa, a law suit to define the safe yield of the entire Santa Maria Groundwater Basin was initiated. Preliminary settlement agreements stipulate that water purveyors on the Nipomo Mesa must import supplemental water to the area. NCSD, as the purveyor of water to at least 12,000 Nipomo	26,000,000	3,879	12,626	06	San Luis Obispo	IV	2007
4388	5810001	5810001-002	Cal-Water Service Co.-Marysville	Marysville "City Wide" Water Conservation Project	The project has two elements.a. Indoor: CWSC intends to retrofit 5,700 bathrooms with water conservation products (toilets & showerheads) and the estimated water savings is 175 acre feet per year. b. Outdoor: CWSC intends to retrofit 945 ET controllers and the estimated water savings is 29 acre feet per year.	O	0	C	CWSC intends to reduce the districts total water consumption to match the long term water supply.	2,760,999	3,781	12,628	21	Yuba	I	2009

Currently the mainlines are inside the parkway, so those would be abandoned in place and the new pipeline would be placed in the street servicing both sides of Clara Street. This project would replace all the old pipeline on Clara Street.	O	0	C	Currently we have two steel pipelines running on each sides of Clara Street. The pipelines are frail and have very little density, there is no lining within the pipe and the coating on pipe seems to be ineffective against the soil in the area. Any veriation in pressure seem to always cause main line leaks which make it a problem every time we need to utilize a fire hydrants or isolate the mainline. The condition of the pipe result in numerous leaks per year.	2,000,000	1,093	14,000	07	Los Angeles	IV	2011
4398	3910007	3910007-002	RIPON, CITY OF	City of Ripon Aquifer Storage and Recovery Feasibility Study	This project is being submitted for Proposition 84 funding under Section 75025 (Groundwater Contamination Grants). The City is proposing a feasibility study to evaluate the viability of an Aquifer Storage and Recovery (ASR) facility to store SSJID surface water in the ground for subsequent extraction, blending with existing potable and non-potable groundwater wells, and potential direct delivery to the potable water system. The SSJID surface water provides an attractive alternative to the existing water quality-impaired groundwater wells used to supply the potable and non-potable water systems. SSJID, a 72,000-acre district that surrounds and includes the City, has historically provided water for agricultural irrigation in the Ripon area. In 1999, the City of Ripon entered into an agreement with the SSJID for surface water that can be used for groundwater recharge or municipal and industrial use. The City has intended to use this water for non-potables uses, such as irrigation or for industrial/commercial process or cooling water. The City's agreement with SSJID contains a clause that would allow the City to re-negotiate the terms of the agreement in order to use the SSJID water for municipal potable supply following appropriate treatment. The City contracted with SSJID for the delivery of 500 acre-feet per year starting in	O	0	C	Rising concentrations of nitrate in the City of Ripon's groundwater supply have forced the City to take critical wells out of its drinking water supply. Nitrate contamination is attributed to crop over-fertilization and industrial contamination. One of the City's potable wells, Well 12 with a design flow of 2,000 gpm, is currently offline due to nitrate concentrations exceeding the MCL, while two other wells (Wells 3 and 14) are closely monitored and controlled to maintain nitrate compliance. In addition, five of the City's seven drinking water wells contain arsenic concentrations above the new arsenic MCL of 10 µg/L or within 20% of the MCL. The City also operates two municipal wells (Well 5 and Well 11) as supply for the non-potable water system. These wells have been converted from drinking water wells to non-potable use because of high nitrate concentrations. Currently the total pumping capacity is 1,750 gpm from these non-potable wells. Nitrate, with an acute health risk-based MCL of 45 mg/L as nitrate, has been detected in the City's wells at concentrations as high as 67 mg/L. Arsenic, which poses a chronic health risk and has a new MCL of 10 µg/L, has also been detected in the City's wells at concentrations as high as 14 µg/L. All of the City wells with water quality monitoring data have at sometime contained nitrate and/or arsenic within 20% of the	125,000	4,524	14,915	10	San Joaquin	III	2007

4399	4010830	4010830-001	California Mens Colony	California Men's Colony Drinking Water Storage Facility Roof Replacement	This project involves the complete demolishion and removal of the existing roof support structure, griders, purlins, plywood sheathing and rolled composition roofing material with Asbestos containing materials.The project involves the development of construction plans and specifications per CDCR's Design Criteria Guidelines. The plans and specification will require California State Fire Marshall review.Once the construction documents are approved, the delivery of the physical construction would be performed by low bid private industry construction company or could possibly be perfromed by CDCR's in house construction operation know as the Inmate Ward Labor Program.Construction inspection services, project management and project closeout will be performed by CDCR Professional Architectural and Engineering Staff.	O	0	C	At California Men's Colony (CMC), a correctional institution within California Department of Corrections and Rehabilitation (CDCR) there is a 2 million gallon potable water storage reservoir. The existing reservoir wood roof support structure, sheathing, purlins and roofing material have deteriorated to the point where the institution can not perform effective repairs. The roofing system is approximately 37 years old and has Asbestos containing materials. The roof has been deemed unsafe to walk on by a private contractor roofing company.A imminent roof structure failure will allow bird fecal matter and airborne contaminants to contact the treated stored portable water resulting in potential health risks to all consumers. CMC / CDCR is the water purveyor for the Chorro Valley. Water from CMC's water plant is available for use by CMC, Cuesta Community College, National Guard Camp San Luis Obispo, the State Office of County Education, non-profit agencys, a Cal Fire Facility and the County's male, female and juvenile detention facilities. A water purveyor has the responsibility to provide safe drinking waterFire suppression capacity will be severly impacted if the reservoir is taken out of service. The State Fire Marshall could impose operational restrictions on water customer's facilities and programs.If the roof collapsed a Do Not Drink Order would need to be distributed throught the Chorro Valley to customers who use the	1,200,000	5,357	15,000	06	San Luis Obispo	IV	2012

4401	1510019	1510019-012	Shafter, City of	City of Shafter Water Meter Retrofit Program	The proposed work appears to be exempt from CEQA because the installation and updating of water meters is a permitted use of the City’s water enterprise. There would be no right-of-way or easements to acquire since all work would take place at existing service connections and within existing right-of-way. The City’s unmetered water connections have already been located and quantified with the City’s Geographical Information System. The City has already adopted a water meter assembly for its Itron automatic meter reading (AMR) system which allows for multiple meter suppliers to be considered and used. The only primary task left in order to proceed with project implementation would be for the City’s engineering staff to prepare documents as well as construction plans for bidding purposes which can be completed within two months of a grant award.	O	0	C	The passage of State of California Assembly Bill (AB) 2572 requires that the City of Shafter have all of its water services metered for billing purposes by 2025. In 2009, the City approved a multi-year water enterprise financial plan and service rate increase to fund a meter retrofit program. The recent focus of the program has been to update existing manual read meters to automatic meter reading assemblies to help the rate payers avoid the cost of funding more staff to manually read thousands of meters every month. Existing staff can now use a handheld device to read meters equipped with radio transmitters without having to lift service box lids or enter private property. Since the current rate plan was approved, the City has successfully retrofitted several hundred meters and converted affected customers to metered billing but will soon be facing a more costly retrofit phase that involves installing meters where no existing meter or service box exist. The current water enterprise financial plan does not include the next phase of the retrofits and is finding that its economically disadvantaged customer base will be facing extreme hardships with future rate increases to cover the next phase. With grant funding, the City can complete the balance of the meter retrofits in a quick and efficient manner to minimize the financial impact to the rate payers. These rate payers include the City residents, businesses as well as several	2,000,000	3,863	15,609	12	Kern	III	2012

4404	2310003	2310003-004	Ukiah, City of	Automated Leak Detection for the City of Ukiah's Distribution System	The project objective is to improve the City of Ukiah's existing water audit and leak detection program by consolidating our resources with the use of electronic leak detection devices.This project will be implemented by replacing survey teams that walk the distribution system using hand-held listening devices to discover and locate leaks with a much faster and more successful electronic remote leak detection system.By permanently installing an electronic leak detection system throughout the distribution system we anticipate pinpointing over sixty percent more leaks than using handheld devices in the first year alone. This will be accomplished by using an automated data collection system to locate leaks for repair. The line sensors will send data that staff can immediately use to locate and repair leaks. The project goal is to improve the 68 miles of water distribution system piping. The original system, dating back to the late 1800's, was gravity fed from a hillside spring. The initial pressurized system was operational by 1938. Due to the age of the system it is difficult to know how many leaks will be found and how long each repair will take. However the initial goal would be to locate and repair all major leaks within the first year of the new RLDS being fully operational. As the larger leaks are repaired, smaller and smaller leaks will be found. These small leaks will take longer for the sensors to locate them but will not	O	0	C	The City of Ukiah's water distribution system is an aged system that is susceptible to above average leaks and/or breakages. The proposed project will install acoustic leak detection sensors throughout the entire 68 miles of the water distribution system and effectively insure that all leaks and/or breakages are immediately detected and repaired. Therefore allowing us to conserve and potentially reduce the amount of water used in our distribution system. Once this project is implemented sensors will be fixed onto pipe fittings and placed approximately 1,000 feet apart throughout the entire distribution system. The sensors will localize the general area of a leak in a water main by detecting leak noise and then transmit the leak noise data by radio to a receiver (Patroller). The sensors send data continuously and demand no maintenance for many years. Along with the sensors we will purchase two digital correlators (a survey tool and ground microphone) that will confirm the leak and precisely locate it for repair. The life of the RLDS is expected to be 15 years; after that time sensors may need to be replaced.We strongly believe water audits and leak detection are important components to the efficient management of our water distribution system. There are several benefits to the RLDS over the existing system: •Foremost, leaks are recognized very early, saving water by reduction of run time of leakages.	273,050	5,486	15,955	03	Mendocino	II	2008
4405	1910223	1910223-002	GSWC-SOUTH SAN GABRIEL	GSWC - South San Gabriel System - Garvey Well (Prop.50 Project)	This proposed project is for the drilling, development, and equipping of a new well with a capacity of 1,000 gallons per minute (gpm); building a treatment facility to treat for VOC's and perchlorate, if needed, and all appurtenant equipment such as a disinfection facility, motor control center, and all necessary valves and piping. New chemical storage facilities are included as part of the treatment system due to the increased capacity of the production facility. Also included in the project are the proper abandonment of the three existing wells (Garvey Well No. 1, Garvey Well No. 2, the unnamed well), and the abandonment of existing facilities on site to make room for the new facilities.	O	0	C	This project has a received a commitment from the Proposition 50 Fund for full funding at $5.8M (P50-1910223-090).The GSWC - South San Gabriel system demand is supplied by groundwater and purchased water from the Upper San Gabriel Valley Municipal Water District (USGVMWD), which is supplied by the Metropolitan Water District of Southern California (MWD). There are eight groundwater wells within the system and one connection (USG1) for the purchased water. Of the eight wells, five are offline, primarily due to levels of VOC's and perchlorate which exceed the maximum contaminant level (MCL). A new well and accompanying treatment will significantly reduce GSWC – South San Gabriel's dependence on water supplied by MWD, in turn reducing the demand on the Colorado River water supply.	5,800,000	4,836	16,078	07	Los Angeles	IV	2009

4408	1610002	1610002-007	Avenal, City of	City of Avenal Application	A study completed by the City Engineer indicates that the installation of five pressure reducing stations would elimintate the need for a new tank. The cost of a new tank would be $3.9 million. Using the pressure reducing stations would decrease that cost to $1 million.The City's main three million gallon tank would be utilized and a new tank would not be constructed. The presure reducing stations would be needed since the three million gallon tank is located approximately 250 feet above the residential area of the City. The new pressure reducing valves would be located in various parts of the city.	O	0	C	The City of Avenal takes its water from the California Aqueduct, treats it and pumps it to the top of a hill five miles away. From there the water is distributed to the City by gravity from three tanks.The City is faced with the immenite failure of one of those tanks constructed in the 1950's. It supplies the entire residental area of the city with drinking water. A current study indicates that corrsion is has eaten away the entire roof structure of the tank and the tank walls and floor are severly carroded. The tank has been deemed to be beyond repair. It is beleived a moderate earthquake would cause the failure of the tank.This project would replace the need for a water tank with five pressure reduciing stations (PRS). The PRS would reduce the cost of the project by eliminating the need for a new large storage tank.	1,000,000	1,892	16,737	12	Kings	III	2008

The project improvements include: 1. Installation of pre-treatment process consisting of contact clarifiers in pressure vessels.2. Installation of two waste washwater clarifier-thickener units.3. Installation of new sludge drying beds.4. Installation of new on-site hypochlorite generation equipment and appurtenances.5. Removal of existing sodium hypochlorite system and installation of new hypochlorite metering pumps and associated controls.6. Removal of existing and installation of a new caustic soda storage tank, pumps, and piping.7. Removal of existing and installation of a new potassium permanganate storage tank, mixer, pumps, and piping.8. Removal of existing and installation of a new polymer metering pump and piping.9. Installation of a new polymer storage tank.10. Removal of existing and installation of a new in-line flash mixer.11. Removal of existing and installation of a new alum metering pumps and piping.12. Installation of a new ferric chloride storage tank, metering pump and piping.13. Construction of secondary containment for all new chemical storage tanks. 14. Installation of upgrades to the treatment plant control system15. Removal of one existing and installation of two new Denniston Creek	O	0	C	The District owns and operates the Denniston Creek Water Treatment Plant (DCWTP) which was constructed in 1972. The DCWTP was designed to treat up to 1,000 gpm and 250 MG per year of local surface water from the Denniston Creek watershed and local groundwater using a direct filtration treatment process. The District has had to limit the DCWTP treated water production to approximately 90.5 MG per year (based on a 5 year average between 2005 and 2009) due to a CDPH requirement that prohibits using the existing direct filtration treatment process to treat raw water when turbidity is greater than 20 NTU. Throughout the winter months, when the local surface water supply exceeds 20 NTU, the DCWTP is unable to produce treated water and the District must purchase water from the San Francisco Public Utilities Commission (SFPUC).This project is being implemented to increase year round treatment of the local surface water supply permitting the District to increase water system reliability and reduce long-term operating costs through the use of an existing water right. This project will add new pretreatment units that will reduce the raw water turbidity to meet the CDPH limitation as well as clarified water goals included in the California Cryptosporidium Action Plan (CAP) and CCR Section 64658 (b) (11). The added pre-treatment will also help reduce total organic carbon (TOC) precursors of regulated disinfected	5,650,000	6,893	16,900	17	San Mateo	II	2011
4411	3410016	3410016-001	Orange Vale Water Company		Build an above ground storage facility and install water meters.	O	0	C	Water demand problems. Also federally mandated to install water meters on all service connections.	1,000,000	5,327	17,500	09	Sacramento	I	1999

4412	1210009	1210009-004	Humboldt C.S.D.	Ridgewood Storage Tank Improvements	The Ridgewood Tank Improvement Project involves construction of an additional 1.0 MG tank adjacent to an existing 0.5 MG tank for a total storage capacity of 1.5 MG that would result in providing adequate fire protection capacity volume per State Drinking Water Act Standards Title 22. The District has already performed approximately $18,000 worth of preliminary engineering to confirm feasibility of a second tank at the same location. This work consists of:1. Hydraulic computer analysis confirming required tank size2. Topographic survey confirming new tank will fit within the existing tank site footprint (without having to obtain additional property).3. Prepared preliminary second tank design to confirm piping requirements, control panel and power requirements. The preliminary design also provided an assessment of the environmental needs determination and constraints.4. Preliminary biological and endangered species evaluation to further refine the environmental determination and permitting requirements.5. Environmental site evaluation resulted in no identifiable environmental constraints. It is anticipated that a Negative Declaration will be adequate with the District as lead agency. The only permit required is a Building Permit issued by the County of Humboldt.	O	0	C	Title 22 of the State Drinking Water Act Standards requires 1.5 MG storage for fire protection. The District's "Cutten Zone" currently provides only 0.5 MG of storage affecting approximately 2,000 customers and their property.	1,250,000	7,266	19,000	01	Humboldt	I	2011

4422	4110018	4110018-004	City of Millbrae		Design and construct 2 MG water storage reservoir for low elevation service area.	O	0	C	Approximately 40% of our customers do not have water storage reservoirs for emergency water supplies if SFPUC system fails.	2,500,000	6,397	21,500	17	San Mateo	II	2001
4423	1910186	1910186-001	CAL-AM WATER COMPANY - DUARTE	L.A. District "City Wide" Water Conservation Program.	The program has two "full service" elements that encompass a "District Wide Water" Conservation Program. Element A: A team of trained plumbers will retrofit 24,000 residential homes / 48,000 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 1,472 acre feet per year. Element B. A team of specialist will retrofit 8,000 residential yards with modern ET water controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 490 acre feet per year. .This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 months or less. The program will employ 75 to 100 people for 12 months.	O	0	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 1,962 acre feet per year or 50.0 / 75.0 gallons per day, per person.	16,712,000	7,396	23,461	07	Los Angeles	IV	2009

4424	3710018	3710018-001	Rincon Del Diablo MWD (ID-1)	Rincon del Diablo M.W.D. Remote Site Security Surveliance	Rincon del Diablo Municipal Water District, CA, solicits approval for the submission of a grant application under Proposition 50: Water Security, Clean Water, Coastal and Beach Protection Act of 2002 (Water Code Section 79500 et seq.), Chapter 3 – Water Security. Rincon del Diablo MWD services a population of 25,000 over 24 square miles. It has 10 reservoirs and 6 pump stations with 132 miles of water mains. A Vulnerability Assessment conducted in 2004 identified 11 sites as being water security liabilities for the District. Each is vital in the storage and delivery of potable water to the District's customers. The majority of these eleven sites are remote with no electrical feed, being powered by solar panels. The absence of surveillance equipment compromises the reliability of the District's water resources and infrastructure. Rincon del Diablo MWD's remote sites reported incidences of vandalism (e.g. graffiti) and trespassing. The 2004 Assessment recommended the installation of an integrated security system at the following 11 critical sites: 1) District Administrative Facility: operations yard and administrative, SCADA and Network functions; 2) Reservoir Site R1: R1A and R1B water storage tanks; 3) Reservoir Site R2: R2A, R2B, and R2C water storage tanks; 4) Reservoir Site R3: R3A and R3B water storage tanks; 5) Reservoir Site R4: (1) water storage tank; 6) Reservoir Site R5: (1) water storage tank; 7) Reservoir	O	0	C	Security Project	340,000	6,251	24,471	14	San Diego	V	2007

4426	3710026	3710026-008	Valley Center MWD	Cool Valley Reservoir Cover Replacement	This 55.6 MG storage basin, was constructed in 1975, provides the only storage for the Cool Valley Zone. The Cool Valley Zone, a 23,920 acre service area, is one of the District's largest zones. Replacing the existing cover includes removal and disposal of an existing 340,000 square foot cover and replacement with a new 45 mill thick floating cover including sand tubes, floats, hatches, vents, and rainwater removal pump system.	O	0	C	The hypolan cover is experiencing tears, rips, and holes due to its deteriorating condition. Left alone, these holes may allow rainwater and other debris to enter the potable water reservoir which may impact water quality. Due to the overall condition of the liner, individual repair of holes is not warranted but instead the existing cover must be replaced	4,500,000	9,726	25,572	14	San Diego	V	2011
4427	3710026	3710026-002	Valley Center MWD		Construct pressure filtration plant.	O	0	C	Surface water reservoir which is not in service at this time does not meet drinking water standards.	6,000,000	9,726	25,572	14	San Diego	V	1998
4428	3710026	3710026-010	Valley Center MWD	Cobb Reservoir Cover Replacement	This 8.8 MG storage basin, was constructed in 1963, provides the only storage for the Cool Valley Zone. The Cool Valley Zone, a 23,920 acre service area, is one of the District's largest zones. Replacing the existing cover includes removal and disposal of an existing 89,000 square foot cover and replacement with a new 45 mill thick floating cover including sand tubes, floats, hatches, vents, and rainwater removal pump system.	O	0	C	The hypolan cover is experiencing tears, rips, and holes due to its deteriorating condition. Left alone, these holes may allow rainwater and other debris to enter the potable water reservoir which may impact water quality. Due to the overall condition of the liner, individual repair of holes is not warranted but instead the existing cover must be replaced	1,000,000	9,726	25,572	14	San Diego	V	2011

4429	3710026	3710026-011	Valley Center MWD	Chlorination Facility Relocation	VC-1A/B Relocation is a cooperative project with the County Water Authority (CWA). The CWA desires to relocate their existing service connection, constructed in 1956 and was designed to deliver 20 cfs. Staff has located a site and is in the planning stages of project design. The VCMWD portion of the project consists of the planning, design, and construction of a chlorination facility, temporary and permanent transmission pipelines, and the removal of the existing chlorination facility. VCMWD staff will also provide project and construction management services for the removal and relocation of the CWA facilities including site acquisition, CEQA, metered connection, piping, site improvements including pavement, fencing, landscaping, buildings, and existing facility removal.	O	0	C	The District is planning to relocate the chlorine facilities out of the Keys Creek flood plain. It is our intent to relocate this facility due to flooding in the past. The project would coincide with the CWA to move the connection to the aqueduct to the same location to the North.	1,100,000	9,726	25,572	14	San Diego	V	2011
4430	3710026	3710026-003	Valley Center MWD	Water System Security	Valley Center Municipal Water District requests an invitation to apply under Proposition 50: Water Security, Clean Water, Coastal and Beach Protection Act of 2002 (Water Code Section 79500 et seq.), Chapter 3 – Water Security. Valley Center MWD provides water and sewer services to 24,800 domestic, agricultural, and commercial customers over a mostly rural 100 square miles. The District imports 100% of its water from San Diego County Water Authority. It has 42 enclosed reservoirs, 26 pump stations with 289 miles of water mains. In 2004, VCMWD performed a formal Vulnerabilty Assessment through a third party. Based on a matrix of economic loss, loss of fire flow, water quality, and health impacts, the Assessment deemed eleven sites critical to the operation of VCMWD. The primary issue VCMWD hopes to solve with Chapter 3 funding is to secure the following eleven sites (assets) from any terrorist organizations, vandals, disgruntled employees or contractors, and disgruntled customers: 1) Valley Center Pump Station, 2) Rainbow Pump Station, 3) Paradise Pump Station, 4) Paradise Reservoir, 5) Oar Hill Pump Station, 6) Meadows Reservoir, 7) Country Club Reservoir, 8) Cool Valley Reservoir, 9) Betsworth Pump Station, 10) Miller Pump Station, and 11) Oat Hill Reservoir. Valley Center MWD wishes to accomplish the requisite water infrastructure security through 24 hour video surveillance, monitoring,	O	0	C	Water system security	1,600,000	9,726	25,572	14	San Diego	V	2007
4431	3710026	3710026-009	Valley Center MWD	Lilac Reservoir Replacement Cover	The storage basin was constructed in 1966 and the cover was installed in 1989 with a life expectancy of 20 years. The new hypolan cover is expected to last 30 years. The project consists of the removal and replacement of an existing hypolan floating cover on a 4.7 million gallon potable water reservoir. This storage basin provides the only storage for the Lilac Zone , a 920 acre service area, and relies on surplus storage from hydraulically higher zones. Work includes removal and disposal of an existing 70,000 square foot cover and replacement with a new 45 mill thick floating cover including sand tubes, floats, hatches, vents, and rainwater removal pump system. The cover and appurtenant facilities will prevent rainwater, silt, and other foreign debris to enter into the potable water reservoir.	O	0	C	The Lilac Reservoir is a 4.7 million gallon covered reservoir designed to store potable water for domestic and agricultural use. The current hypalon floating cover is approximately 20 years old and has reached the end of its life expectancy. The cover is experiencing tears, rips, and holes due to its deteriorating condition. Left alone, these holes may allow rainwater and other debris to enter the potable water reservoir which may impact water quality. Due to the overall condition of the liner, individual repair of holes is not warranted but instead the existing cover must be replaced	500,000	9,726	25,572	14	San Diego	V	2011

4432	3710026	3710026-004	Valley Center MWD	Gordon Hill Pipeline Replacement	The Gordon Hill Road Pipeline project replaces approximately 5,000 linear feet of existing 10-inch buried cement mortar lined and tar wrapped steel transmission pipeline located within and adjacent to Gordon Hill Road. The existing 10-inch diameter pipeline will be replaced with a 12-inch diameter buried ductile iron pipeline and anciliary appurtenances. The new pipeline will be located within existing improved private roadways and all existing meters and other appurtenances will be relocated to the new line, thus providing improved access to the pipeline by Distict crews.The new pipeline, as designed, will provide improved flows and pressures within the general area as well as provide a more reliable transmission feed to a high water use area thus improving fire protection and service reliability to this area of the District.	O	0	C	Valley Center Municipal Water District owns and operates an existing 10-inch diameter buried concrete mortar lined and tar wrapped transmission pipeline within and adjacent to Gordon Hill Road, in Valley Center, California. Installed in the early 1960's, this pipeline is a vital transmission facility that provides water for domestic and fire use to a high density residential, retail, and commercial use area including senior mobile home development, golf course, hotel, retail, and commercial developments.Due to various factors including pipeline age, deteriorating exterior pipeline coating, high groundwater, and corrosive soil, the pipeline is showing evidence of severe deterioration. As a result, this portion of the pipeline has experienced numerous leaks resulting in water service and transmission outages to the general area, significant property loss, and water loss. Because a portion of the pipeline is located within private property, maintenance and repair acivity is hindered thus extending the time necessary to complete repairs.The current status of the pipeline has diminished the District's ability to meet current water demands of the area. During emergency outages, the remaining water distribution facilities in the general area are neither designed to, nor capable of, providing adequate domestic and fire flows to the area. Thus, the replacement of this portion of the transmission line is	2,300,000	9,726	25,572 14	San Diego	V	2009
4433	3710026	3710026-005	Valley Center MWD	Rodriguez Road Pipeline Replacement	The Rodriguez Road Pipeline Replacement project consists of the construction of approximately 5,000 linear feet of buried 18- and 20-inch diameter ductile iron transmission piping including ancillary appurtenances within Rodriguez Road. The proposed pipeline will be relocated from within existing agricultural developments to within existing District easements. Minor grading is included to widen an existing graded dirt access road to accommodate the pipeline.Additional valving will be installed providing District staff the ability to maintain fire protection in the area and minimize future service interruptions associated with performing scheduled or emergency repairs.	O	0	C	Valley Center Municipal Water District owns and operates 5,000 linear feet of 16- and 20-inch diameter buried cement mortar lined and tar wrapped steel water transmission piping located within Rodriguez Road in Valley Center, California. Installed in the 1950's, the transmission pipeline provides a vital link in the District's distribution system in that it transports water from a San Diego County Water Authority metered aqueduct connection to the northwestern portion of the District.Due to various factors inlcuding pipeline age and external pipeline coating deterioration, this section of pipeline has shown extensive evidence of deterioration resulting in several leaks along the pipeline and at several mainline connections. These leaks have resulted in extended water outages, terminated water transfers within the District's distribution zones, significant water loss as well as property damage to the surrounding agricultural developments.The current status of the pipeline has greatly diminished the District's ability to meet current water demands within the northwesterly portion of the District. During emergency outages, water must be forced around this area causing loss of pressure and flows. This loss of pressure and flow greatly impacts the District's ability to meet minimal fire flow and pressure requirements within this area. Thus, the replacement of this portion of the transmission line is necessary at	2,600,000	9,726	25,572 14	San Diego	V	2009

4434	1310001	1310001-005	Brawley, City of	Brawley Water Treatment Plant Raw Water Storage Reservoir	A new third reservoir 500 feet x 150 x 30 feet would alleviate the issues we face. The three reservoirs would be configured in series which would minimize turbidities and allow less chemical dosing. It would allow maintenance of each reservoir without impacting operations by allowing the isolation of each reservoir. It would have the storage capacity to operate at a less strained level when source water outages occur. The new reservoir will be constructed similarly to existing reservoirs. Concrete walls with asphalt floors and a protective liner to prevent leakage. A sloping floor with a partition wall along the center to allow sediment to settle in one half of the reservoir. Two 36 inch intake pipes with isolation gates connected to the existing source water manifold. Two 36 inch effluent pipes with isolation valves connected to existing effluent pipe manifold. A 40 in plant intake pipe with isolation gates for reservoir isolation connected to the existing plant intake. An access ramp for maintenance. An 440 volt electrical access point for a sludge pump.	O	0	C	Our water plant has only one raw water source feeding two raw water reservoirs. These reservoirs will supply three days of water should an extended outage of source water occur during peak usage particularly during summer months. In addition our current raw water impoundment configuration does not allow to properly drain and clean the reservoirs. This puts a strain on our system during high peak demands as turbidity levels increase causing elevated chemical dosing to keep turbidities at their required level.Source water system repairs lasting three or more days have initiated water conservation efforts from citizens, schools and industries. Water plant operators cannot isolate a reservoir for maintenance because the demand thru one reservoir is too high and it's difficult to maintain a safe raw water level. The raw water turbidity increases into the 100's during the summer due to us sharing the main canal source with farmers such when they have high water orders this causes scouring of the canal banks and end up in our ponds where we need to use more chemicals to treat it.	2,500,000	5,530	26,513	14	Imperial	V	2008
4435	2410005	2410005-006	LOS BANOS-CITY	Los Banos Well head treatment of Hex Chromium for twelve wells	Install filtration system to remove Hexavalent Chromium. Install piping, sediment tanks, filtration units, monitoring equipment, electrical services, (489 V 3 phase) pumps, concrete pads, media, disposal and engineering	O	0	C	Our Chromium levels range from 22 to 38 ppb. It is anticipated to exceed the Mcl for drinking water.	13,600,000	12,277	27,635	11	Merced	III	2012
4436	4810005	4810005-003	SUISUN-SOLANO WATER AUTHORITY	New Cement Hill Potable Water Storage Tank	The project is to build a 2 million gallon welded steel water storage tank adjacent to and at the same elevation as the existing tank of the same size. Internal baffling, NSF-compliant coatings and a THM reduction system will be included. Piping and telemetry to connect the new tank to the system will be included. Due to the tank's location in the hills above the Cement Hill Water Treatment Plant significant earthwork and retaining walls to create the tank pad and maintenance access will be included. The tank will be set on a concrete grade ring. Associated work for right-of-way acquisition, surveying, engineering, inspection and project administration is also included.	O	0	C	This project will address the following problems:Water Quality: the Suisun-Solano Water Authority (SSWA) system uses the Cement Hill Water Treatment Plant to treat its sole water supply from the Federal Solano Project's Putah South Canal. The Canal can be out of service for cleaning for a day, or the water can be highly turbid due to uncontrolled overland and bank runoff into the Canal during high-intensity storm events. These make it necessary to take the Water Treatment Plant off-line until the Canal water quality improves, thus forcing SSWA to rely on storage and/or purchase water from the City of Fairfield (which also has water treatment plants facing the same issue) whose system is intertied with that of SSWA.Maintenance: an existing tank adjacent to the proposed new tank cannot be taken out of service for maintenance, most urgently to recoat its interior surface, because the existing tank is needed for operation of the Cement Hill Water Treatment Plant. System capacity: the SSWA water system has limited storage to meet peak demand on successive hot days and provide one full day of storage as needed per SSWA policyThis project addresses problems that do not involve any violations of drinking water standards, regulations, or CDPH directives. SSWA has been directed by CDPH to recoat the interior of the existing tank.	2,000,000	8,100	27,748	04	Solano	II	2009

4437	4810005	4810005-002	SUISUN-SOLANO WATER AUTHORITY	System Metering nd Monitoring System Expansion	One new metering station will be added to monitor flows into Old Town Suisun City from the Gregory Hill Storage Tank.Five existing meter stations will be upgraded for more accurate measurements and SCADA compatibility.Five pressure reducing stations and the metering stations will be equipped with telemetry equipment capable of transmitting instantaneous flow information and system pressures to the system control center at the Cement Hill Water Treatment Plant. This will provide operations staff with an increased ability to efficiently monitor and maintain the SSWA water system.	O	0	C	The Suisun-Solano Water Authority (SSWA) monitors the flow from its treatment and transmissions system into the service area's distribution system. The existing equipment is aged and needs to be upgraded and augmented to more accurately measure flows into the system and efficiently provide this information to the SSWA SCADA system for monitoring by the system operators.	275,000	8,100	27,748	04	Solano	II	2009

4444	4810001	4810001-023	City of Benicia	Benicia MIEX Installation Project	Install a magnetic ion exchange process as part of a pretreatment solution for removing disinfection byproduct precursors. The trial-proven technology is the MIEX (trademarked) resin developed by Orica. Since the total organic carbon (TOC) levels increase during the winter, a 6 million gallon per day MIEX (trademarked) removal process would be installed upstream of the coagulation process. Designed as a by-pass configuration, the MIEX (trademarked) system can remove up to 70% of TOC in the raw water, reducing alum dosage, alum sludge, and chlorine demand.	O	0	C	The total organic carbon content (specifically the dissolved phase) in the North Bay Aqueduct (State Water Project) contributes to high disinfection byproducts during the winter months when winter rains wash natural organic matter into Barker Slough. Benicia's water treatment plant must treat total organic carbon (TOC) ranging up to 18 mg/L, with high levels of color. The current precursor removal can only remove up to 45% of the TOC in the raw water. The remaining TOC passing through the water plant can create trihalomethane (THM) levels that approach the current Stage 1 disinfection byproduct level, and will exceed certain locational running annual averages for THMs.	2,000,000	9,548	28,000	04	Solano	II	2009
4445	3310006	3310006-003	Banning, City of		Pipeline and storage tank replacement	O	0	C	Potential for water outages due to aged transmission line and storage tank.	10,000,000	10,381	28,500	20	Riverside	V	2001
4446	4110003	4110003-003	City of Burlingame	Water Storage Tank Lead Based Paint Removal and Re-coating	The tank recoating project involves the sand blasting of the tank's exterior to remove old, lead-based paint. Because of the likely presence of significant lead inhalation risks during sand blasting, significant health and safety precautions must be taken to avoid exposing workers and adjacent residents.	O	0	C	Current storage tanks have old, loose lead-based paint on the exterior of the tanks. The California Department of Public Health has required that Burlingame re-coat the tanks' exterior. In order to perform this re-coating, the lead-based paint must be removed prior to painting. Additionally, the City is concerned that the deteriorated condition of the tank exterior may contribute to local lead contamination and potential stormwater quality impacts.	500,000	8,966	29,867	17	San Mateo	II	2009
4447	0110011	0110011-001	City of Livermore		Add two elevated storage reservoirs, associated piping and pump station to system.	O	0	C	Unable to provide service to specific areas at acceptable pressures for both domestic and fire purposes.	10,000	9,364	29,995	04	Alameda	II	1998

4448	0110011	0110011-002	City of Livermore	Emergency Water Interconnections	This project invovles constructing two emergency water interconnections. On the west side of the City of Livermore a water interconnection will be constructed with Dublin San Ramon Service District. The interconnection will be constructed northeast of the El Charro/I-580 interchange. Approximately 100 feet of 12-inch pipe will be installed to connect the two water systems at this location. A vault will be constructed with a dual direction meter. Valving and fire hydrants will be constructed so that the ends of these pipelines can be flushed prior to flowing water from one system to another. There is currently an interconnection with Cal Water at the other end of this pressure zone, however, the existing interconnection is almost two miles from the proposed new interconnect and it is not able to supply required residual pressures and fire flows in an emergency if the pressure zone is isolated from the supply reservoir. This new interconnection together with the existing interconnection will be able to provide required residual pressures and fire flows in the event of an emergency.This project also involves the construction of a second water interconnection with Cal Water at the east side of the City of Livermore. The design of the second interconnect is identical to the design of interconnect described above. Currently there is no interconnect in this pressure zone so this interconnect will provide a critical alternative water	O	0	C	Water supply during an emergency is critical, however, water supply can be threatened during an emergency due to a pipeline or reservoir rupture. The City of Livermore's water system has three pressure zones with a reservoir in each zone. A tank or supply pipeline rupture in one of the City's pressure zones would leave the pressure zone without operational, emergency, or fire storage during the repair period. Interconnections, allow the City to temporarily use the storage in a neighboring water system to fulfill these needs during an emergency.Two of the City's pressure zones currently have water interconnections with Cal Water, which is a neighboring water company. One of the zones does not have a designated water interconnection. The maximum flows through the two existing interconnections are not adequate to sustain minimum residual pressures and fire flows during an emergency.	160,000	9,364	29,995	04	Alameda	II	2009
4449	3610005	3610005-002	LAKE ARROWHEAD CSD	Bernina Water Treatment Plant Improvements	The scope of work generally includes the replacement of the existing water treatment plant filter piping, valves, instrumentation and controls. The project will improve the reliability of the water treatment system and avoid any unplanned disruption to water service.	O	0	C	The District's five million gallons per day Bernina Water Treatment Plant Filter piping is more than 35 years old and in need of replacement. A recent pipe failure prompted investigation of the filter piping, valves, instrumentation and controls and many deficiencies were identified. A catastrophic failure of this piping would result in the plant being shut down and potential interruption of service.	1,200,000	8,269	30,000	13	San Bernardino	V	2009
4450	1510017	1510017-001	INDIAN WELLS VALLEY W.D.		SPREAD WELLFIELD OUT. OTHER - DESIGN AND CONSTRUCTION	O	0	C	DOCUMENTED THREAT OF HIGH TDS WATER (91,200 PPM) MAY CONTAMINATE THE GROUNDWATER	3,925,000	11,688	30,000	19	Kern	III	1998
4451	4310028	4310028-001	San Jose State University	Water Distribution System Improvements Phase 3	The project installs sampling points on the distribution system in accordance with municipal standards.	O	0	C	The San Jose State University (SJSU) Public Water System (PWS) serves a population of between 10,001 and 100,000 and is intertied to the San Jose Water Company’s PWS that serves more than 100,000. There are inadequate sampling facilities necessitating sampling within buildings resulting in unreliable sampling results.	200,000	1,000	30,000	17	Santa Clara	II	2009
4452	3610043	3610043-002	GOLDEN STATE WATER CO - BARSTOW	Buena Vista Street from Avenue A to West Street 2010	Replace 12-inch Steel pipeline with 12-inch PVC along Buena Vists Street from Avenue A to West Street, and replace 4-inch Cast Iron and 8-inch Steel pipelines with 8-inch PVC along west Street from Buena Vista to Fredericks	O	0	C	The 61-year old Cast Iron and Steel pipelines require replacement due to pipe material and age of infrastructure. Additionaly, the portion of 4-inch main on West Street needs to be replaced due to hydraulic deficiencies.	171,171	9,233	30,469	13	San Bernardino	V	2008
4453	3410010	3410010-003	CalAm - Suburban		Booster station, tank and connecting mains. Involves design and construction.	O	0	C	General system improvement. Inadequate source of supply due to ground water contamination from Mather.	2,500,000	9,874	33,314	09	Sacramento	I	1998
4454	3410010	3410010-002	CalAm - Suburban		US 50 overcrossing. Involves design and construction.	O	0	C	General system improvement. Lack of system pressure due to loss of source of supply.	250,000	9,874	33,314	09	Sacramento	I	1998
4455	3410010	3410010-004	CalAm - Suburban		Drill and equip well. Involves design and construction.	O	0	C	General system improvement. Loss of source production due to VOC ground water contamination.	530,000	9,874	33,314	09	Sacramento	I	1998
4456	3410021	3410021-005	San Juan Water District		Reconstruction to replace or renovate the pipeline.	O	0	C	General system improvement. The water main pipeline has failed many times and is vulnerable to collapse by being suspended over a canyon by dilapidated wooden trestle.	940,000	10,240	33,792	09	Sacramento	I	1998

4457	3410021	3410021-001	San Juan Water District		Improve suction sides and replace pumps.	O	0	C	General system improvement. Existing pumps will not provide the water needed by the six agencies in case of floods or drought. Possible water outage.	2,800,000	10,240	33,792	09	Sacramento	I	1998
4458	3410021	3410021-006	San Juan Water District		Determine improvements/replacements to existing SCADA system and implement.	O	0	C	General system improvement. Scada system has unacceptable transmission capacity, with up to 15 minute data update time intervals, which is well below the expected response.	900,000	10,240	33,792	09	Sacramento	I	1998
4459	1910062	1910062-002	LA VERNE, CITY WD	Plateau Forebay Discharge Line	This proposed project would replace the aging 16" pipeline from the City's Palteau Booster Station to Summit Avenue, which is near the top of this small canyon or drainage area. Approximately 2,500 feet of new ductile iron pipe would replace the existing pipe.	O	0	C	The City of La verne purchased the assets of the La Verne Plateaus Mutual Water Company circa 1970, including the Plateau Forebay, pump station, and transmission pipeline. This existing 16" pipeline was originally constructed by the Plateau Mutual Water Company. Although the actual age of the pipeline is unknown, is it beleived to be at least 50 plus years old. The pipe alignment is through a small canyon into the Live Oak Canyon area and provides the major source of supply to the city's upper reaches. The pipe is susceptiple to damage from exposure due to eroding soil conditions within the canyon. The pipe is also under high pressure tue the pumping operations it supports and the elevation of the terminal reservoir. Any significant rupture of this line also poses a threat to the Leroys Home for Boys, whic is located at the mouth of the small canyon.	1,000,000	8,516	34,046	15	Los Angeles	IV	2009
4460	1910062	1910062-014	LA VERNE, CITY WD	Air Stripper Replacement	The project will demolish the existing air stripper and replace it with a similar unit capable of treating 2,000 gpm. Since this will occur on existing City owned property the project will not require additional rights of way or land acquisition.	O	0	C	Two wells in the City's system (Lincoln and Mills Tract) have exceeded the maximum allowable limit for Trichloroethylene (TCE) since the late 1980's. To continue extracting the water the City needed to treat it; thus, an air stripping system was installed at the 5th and White plant. This system has been in operation since this time and is nearing the end of its useful life. Replacing the air stripper is necessary for the City to continue production of groundwater from these two wells.	500,000	8,516	34,046	15	Los Angeles	IV	2012
4461	1910062	1910062-015	LA VERNE, CITY WD	New Groundwater Well	The project includes drilling for a new well and testing to determine amount of water that is available. Also, water quality testing to determine concentrations of any contaminants.The project includes equipping the well with an appropriate sized pump and electrical equipment required to extract the water.The project includes development of treatment equipment for treating nitrate contamination and any additional contaminants found during the water quality analysis. Lastly, all piping required for treatment and transmission to the City's existing water system.	O	0	C	The City is seeking to improve the reliability of it's system through the development of a new groundwater extraction well in the Main San Gabriel Basin. Currently, the City relies on imported water to supplement high demand periods. The development of a new will will lower the need to import water and improve the redundancy of the overall system.Similar to other wells in the are the proposed will is likely to encounter water quality issues with Nitrates. Therefore, the water extracted from this well will require treatment prior to distribution.	3,000,000	8,516	34,046	15	Los Angeles	IV	2012
4462	1910062	1910062-004	LA VERNE, CITY WD	Critical Facility Intrusion Alarms	This proposed project would install various electronic equipment to provide 24 hour monitoring and surveilance of critical water facilities incldluing reservoirs, pumping stations, and treatment plants.	O	0	C	The ciyt of La Verne is located in the Foothills of eastern Los Angeles County. many of its water facilities are located within the foothills and other remote locations and subject to vandalism. This includes unauthorized entry into reservoir hatches, unauthorized entry into pumping facilities, and treatment plants. Potential damages might include water quality threats from body contact or intentional dumping of contaminants into reservoirs, theft of communications and other electronic equipment monitoring water operations.	300,000	8,516	34,046	15	Los Angeles	IV	2009

4463	1910062	1910062-001	LA VERNE, CITY WD	E Street 16" Water Main Replacement	This proposed project will replace approximately 3,600 feet of existing 14" riveted steel pipeline with roughly 2,500 feet of new 16" ductile iron pipe and 1,100 feet of 8" ductile iron pipe. The new 16" line will also be connected to a new transmission line from the city's main pumping facility. The new 8" line will function as distribution only, thus the reduced sized.	O	0	C	The existing 14" pipeline in E Street is a riveted steel pipe with thin wall. The pipe is at least 80 years old and experiencing numerous leaks and failures. The pipe is also vulnerable to damage as it crosses two sets of rail lines. This pipeline is the major source of supply (domestic and fire) to the city's southern section, which is primarily industrial land uses with some residential. Any long term failure of this pipe will inhibit supply to this region subjecting users to limited water suply and inadequate fire flows. Installation of a new 16" water line will improve system hydraulics and ensure continued delivery of high quality water supplies and fire protection flows.	1,000,000	8,516	34,046	15	Los Angeles	IV	2009
4464	1910062	1910062-016	LA VERNE, CITY WD	White Ave - Treatment Facility	The project will include the construction of treatment vessels for the removal of nitrate and perchlorate contamination, all necessary piping to convey the water from the wells to the treatment facility and through the respective processes, a booster pump station to provide for the additional head requirements and equipment for chloramination disinfection prior to distribution to the City's system.The proposed location of the treatment facility is at the City's White Avenue Forebay; the project will not require land acquisition.The required piping includes a 12" ductile iron pipeline in 5th and "B" streets from the Walnut Well to the White Avenue Forebay.	O	0	C	The City has exclusive rights to produce unlimited quantities of groundwater from the Ganesha Basin. It also has rights to extract 7.72% of the safe yield from the Pomona basin. Historically these basins have been contaminated with nitrate and perchlorate in excess of the MCL. The City has stopped using it's wells ithat contain perchlorate until a treatment facility is constructed. The wells with nitrate concentrations slightly above the MCL are blended with treated surface water to lower the concentrations below the MCL. This project will help to develop new groundwater sources and reduce the City's demand for imported surface water.The project will provide for the development of a new groundwater Treatment Plant. The treatment plant will treate for nitrate and perchlorate at a discharge preliminary design rate of 2,000 gpm. The project proposes to utilized the Ion Exchange treatment processes for contaminate removal; however, the City is interested in pilot or demonstration programs provided adequate funding is available.The project will allow the City to produce more groundwater and reduce it's dependance on imported surface water.	5,500,000	8,516	34,046	15	Los Angeles	IV	2012
4465	2710017	2710017-008	Marina Coast Water District	Marina Undersized Mains and Hydrant Repair and Replacement	The Marina Undersized Mains and Hydrant Repair and Replacement Project would include planning, design and construction for replacing 26 locations of undersized drinking water transmission mains and Warfhead Hydrants to improve pressure flow in those public drinking water transmission main locations.- pre-design/planning for the transmission pipelines- design(including environmental documentation) and bid document preparation- construction to remove and replace 26 transmission main sections and associated water hydrants- disinfection of new drinking water transmission lines- drinking water sample collection to ensure safe connection to existing drinking water system- pilot operation to monitor pressure effectiveness and line integrity to protect drinking water quality	O	0	C	There are 26 locations in the Marina Coast Water District's Marina drinking water delivery system where the water transmission mains feeding oul-de-sacs are undersized and require replacement. These undersized transmission main sections pose pressure issues with our customers and flow issues with hydrants. Additionally, 14 of the hydrants are Warfhead Hydrants which get very low flow results also being unsuitable for fighting fires. The integrity of the system in those 26 locations is of concern for long-term drinking water delivery reliability relative to consistent and controllable pressure head throughout the public water deliver system.	1,400,000	8,133	34,600	05	Monterey	II	2008

4466	2710017	2710017-009	Marina Coast Water District	Marina Blow Off Replacement	The project would include planning, design, and removal and replacement of 65 blow-offs on dead end drinking water pipelines to enable the annual flushing required by DPH and ensure drinking water quality standards are met throughout the Marina Coast Water District's Marina drinking water distribution system. The repair/replacement of the blowoffs will provide for a more secure drinking water delivery system given the condition of the blow off valves. The project would include:- Pre-design/planning- Design (including environmental documentation and permits)- Preparation of bid documents.- Construction to remove and replace the blow-offs- Preparing lines for re-connection to system.- Monitoring performance of initial blow-offs to ensure appropriate design construction is working or modify if needed.	O	0	C	The Marina distribution system has 65 locations where water flow is into a deadend main where a blow off is located for deadend main flushing. DHS requires we flush all of the dead end mains annually. We are not able to do so and effectively flush them due to the blowoffs are either not working or constructed so that we cannot use them. Thus, drinking water quality at these locations, if not more easily flushed, may become problematic and may possibly affect other portions of the system or affect water quality at the tap in the localized deadline area. Improving these deadends would provide a more secure system with transmission mains distributing drinking water that throughout the system consistently meets drinking water quality standards.	1,000,000	8,133	34,600	05	Monterey	II	2008
4467	2710017	2710017-010	Marina Coast Water District	Ord CSUMB Housing Small Mains Replacement	The Ord CSUMB Housing Small Mains Replacement Project would include:- pre-design/planning for removing transmisstion main sections - design(including environmental documentation) and bid document preparation- construction to remove and replace 28 transmission main sections at cul-de-sacs - disinfection of new drinking water transmission lines- drinking water sample collection to ensure safe connection to existing drinking water system- pilot operation to monitor pressure effectiveness and line integrity	O	0	C	The conversion of the Fort Ord from military use to domestic use included transferring ownership to the Marina Coast Water District for the existing Fort Ord public drinking water supply, treatment, storage and distribution system. The Marina Coast Water District is now responsible for public drinking water service to the public now using and residing on the former Fort Ord land. The California State University (CSUMB) housing now present on the former Fort Ord property is served by the former Army drinking water transmission mains. These water mains have flow and pressure issues due to 2" mains feeding several sections at 28 couldesacks. Additionally, the mains are glued schedule 40 PVC which is not suitable for a public drinking water delivery system.	4,000,000	8,133	34,600	05	Monterey	II	2008
4468	4210016	4210016-011	Golden State Water Company - Orcutt	Orcutt - Park Avenue Main Replacement	Replace 1200 feet of 4 inch steel main line with 8 inch ductile iron pipe in order to increase pressure and flow to better serve customers in low pressure areas, and to increase fire flow for public protection.	O	0	C	Mains that are now undersized because of growth that has taken place result in low pressure for our customers, as well as insufficient fire flows for public protection. By replacing 11200 feet of 4 inch steel main line with 8 inch ductile iron pipe, this problem will be rectified.	400,000	10,846	35,212	06	Santa Barbara	IV	2009
4469	4210016	4210016-007	Golden State Water Company - Orcutt		Install two industrial approved sample stations for TCR sampling.	O	0	C	Upgrade distribution system for bacteriological monitoring.	10,000	10,846	35,212	06	Santa Barbara	IV	1998

Drilling a new well on an existing site will provide ground water inlieu of using Colorado River Water.	750,000	11,061	36,435	07	Los Angeles	IV	2008
4478	1910024	1910024-005	GSWC - CLAREMONT	Montana Lane Well 2009	This project will involve the complete developement of a new well facility. The project is currentlyin design and will involve the drilling and equiping of the well and building as well as chlorination failities.	O	0	C	The Montana Lane area Wells have reached the end of their economic usefull life. This is a new site to provide ground water inlieu of using Colorado River Water.	850,000	11,061	36,435	07	Los Angeles	IV	2008
4479	5610018	5610018-005	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District No. 1 - Reservoir Safety Upgrades	This project is to install Safe-T-Climb Devices, extend existing ladders, provide enclosues for security and safety, and install/repair liquid level indicators.Once completed, this project will comply with all OSHA requirements and provide for a safer environment for employees,	O	0	C	Ventura County Waterworks District No. 1 (District) has various reservoirs that are inadequately equipped and not in compliance with OSHA regulations such as ladders with no fall arresting device, or lanyards to prevent injury from a slip or fall while climbing the reservoirs (many of them are over 30 feet tall).Also, there are District reservoirs that do not have functioning liquid level indicators.	101,750	10,180	36,786	06	Ventura	IV	2009
4480	5610018	5610018-002	VENTURA CWWD NO. 1 - MOORPARK	Ventura County Waterworks District No. 1 - Well Treatment/Conversion to Chloramines	The District's intention is to treat District Wells 55,95, 96, and 98 with chloramines to be compatible with imported water treatment. The conversion to chloramines would include chemical analyzers and chlorine and ammonia pumps and othe related appurtenances. Completion of this project will ensure proper disinfection within the District's water system, and protect the health and safety of the customers.	O	0	C	Ventura County Waterworks District No.1 (District) provides water service to over 35,000 people in the City of Moorpark and contiguous areas. The District's water supply comes from imported and local sources. The imported chloraminated water is combined with chlorinated well water resulting in no chlorine residual which violates State of California Health and Safety regulations.	300,000	10,180	36,786	06	Ventura	IV	2009
4481	1910028	1910028-006	CRESCENTA VALLEY CWD	Emergency Water Supply Interconnection Between LADWP, CVWD and FMWD	CVWD is proposing a three (3) phase project includingPhase A - Plan, design and construct a new 1000 gpm emergency water supply interconnection with Los Angeles Department of Water and Power that will be activated in the event of a MWD system shutdown. This include installation of a new 6-inch water main in Honolulu Avenue from the existing LADWP termination point, west of the intersection of Honolulu Avenue and Lowell Avenue, to CVWD's Ordunio Reservoir site, a new 4-inch metering station within the public right-of-way, on-site piping from the meter to CVWD's Ordunio Reservoir inlet/outlet line,a chlorine analyzer; onsite sodium hypochlorite generation equipment, a hypochlorination building and SCADA and electrical equipmentPhase B - Plan, design and construct an interconnection between CVWD and FMWD at CVWD's Williams Reservoir site which will include new piping, a valved by-pass system and a metering system to allow water flow from CVWD to FMWD , a chlorination station with onsite sodium hypochlorite generation and anhydrous ammonia for disinfection conversion from free chlorine to chloramines, and SCADA and electrical equipment. Phase C - Plan, design and construct the upgrade to the exsting flow control valve at FMWD's Berkshire Booster Station to allow water to flow from the CVWD water system to the FMWD system. The overall project,	O	0	C	The problem is that FMWD has one connection to the MWD system and is reliant upon this one connection for all import water delivered to its eight member agencies. When the MWD system is shutdown for repairs and maintenance. Most of these shutdowns are seasonally planned to occur in low demand times and the proposed project will go into service when the MWD system is planning a shutdown or without warning due to acts of terrorism or 'acts of god'.The regions 80,000 customers needed protection from disruption of import drinking water deliveries from MWD's Weymouth plant due to natural disasters, intentional contamination caused by terrorist attack or deliberate acts of destruction or degradation. Further investigation confirmed that the number of people facing these threats has been increased to approximately 102,000 customers.This project will provide an emergency water supply interconnection between LADWP, CVWD and FMWD, so CVWD will have the ability to transfer water to FMWD in an emergency situation. The existing CVWD connections to the FMWD system are presently designed to transfer water from FMWD to CVWD and do not have the ability to distribute the water supply between CVWD and the other member agencies that are supplied by FMWD. This project will provide a new water source from LADWP at CVWD's Ordunio Reservoir site, a new by-pass system from the CVWD's	1,133,250	8,133	38,000	15	Los Angeles	IV	2009
4482	1910028	1910028-003	CRESCENTA VALLEY CWD		Funding requested for a water distribution system pipeline replacement program that has been in place since 1994/95 for a portion from 1997/98 beyond. Project involves: Design, and Construction	O	0	C	Aging distribution system pipelines with significant leak/rupture history; resulting potential for contamination and pressure losses within distribution system and inability to meet required fire protection flows.	8,173,060	8,133	38,000	15	Los Angeles	IV	1998
4483	4110025	4110025-006	North Coast County Water Dist		Phase 1 system modifications will allow leaking main to be taken out of service	O	0	C	Corroding and leaking transmission mains.	75,000	11,743	38,390	17	San Mateo	II	1998
4484	4110025	4110025-007	North Coast County Water Dist		Phase 2 of project will place a liner inside main after phase 1 work is completed.	O	0	C	Corroding and leaking transmission mains.	350,000	11,743	38,390	17	San Mateo	II	1998

4487	3710021	3710021-005	San Dieguito WD	SDWD Motorized Actuators for Transmission Lines and Valve Replacement Project	Installation of 16 motorized actuators and replacement of existing 24" and 30" valves in the 520 zone transmission mains. Construction will involve traffic control in major arterials of the City of Encinitas, shut down of transmission mains, removal and installation of new valves, installation of new motorized actuators include extending power sources to each site. The existing valves are old and do not fully seat or shut off the flow; therefore the valves will be replaced at the same time. This project would allow operations personnel to control the on/off positions of the valves without entering the vaults. Supply of potable drinking water is a fundamental responsibility of the District, and is supported in the City's General Plan by RM-1 to, "conserve, protect, and enhance the water resources in the Planning Area," and PS-2 which states, "The City of Encinitas will make an effort to minimize potential hazards to public health safety, and welfare."A Programmed Environmental Impact Report was certified by the District Board as part of list of Water Master Plan projects on May 22, 2002. This project was determined to have no significant impact. NEPA will require a Categorical Exclusion.	O	0	C	SDWD Motorized Actuators for Transmission Lines and Valve ReplacementProject No. CWW01AInstallation of 16 motorized actuators and replacement of existing 24" and 30" valves in the 520 zone transmission mains.This project installs motorized actuators and valve replacements in the districts transmission main. The motorized actuators will be installed in existing vaults power will need to be extended to every site. The existing valves are old and do not fully seat or shut off the flow; therefore the valves will be replaced at the same time. This project would allow operations personnel to control the on/off positions of the valves without entering the vaults. It would also eliminate the need for complex traffic control and confined space requirements and allow quick control of the valves, which is critical during emergency situations.	400,000	11,135	38,500	14	San Diego	V	2009
4488	3710021	3710021-003	San Dieguito WD	SDWD Corrosion Protection for Underground Facilities and Vaults	This project will provide protective corrosion protection for 10 underground facilities. The project is to strip blast paint and other containments from piping, flex coupler, clay valves, gate valves and supporting legs. A thermal spray will be used to coat all piping, valve components and appurtenances to a thickness of 0.008 to 0.010 inches. Project requires OSHA confined space requirements, including pre-entry testing, monitoring air quality, and continuous forced air ventilation. 4489	1910090	1910090-006	MONROVIA-CITY, WATER DEPT.	Solar power installation at 600 S. Mountain Avenue	The City would have a contractor construct a 650 kW DC solar system at this site. The solar power generating panels would be installed on the roof area and parking facilities. The associated equipment would be installed in the mechanical area at the site. This project would be of the highest benefit due to the amout of power consumed here which would allow a larger supply of power generated to be returned to the Edison system and a larger cost savings to the City Water System. The purchase of the system would show that it is a positive investment for all parties involved.	O	0	C	This is an application for the green-environmental projects.The City of Monrovia is a leader in green-environmental projects in Los Angeles County.To continue with our progressive approach the City of Monrovia has a plan to install a 650 kW DC solar powered system at our City Water System headquarters at 600 South Mountain Avenue. The City would reduce the demand on the power supplied by Southern California Edison and at the same time provide additional power to Southern California Edison for their use.This site is the headquarters facility for the City Water System and houses its offices, warehouse, SCADA system, and fleet. Southern California has experienced power outages and "brown outs"in the past and this system would supply an additional source of reliable power. The power costs for the City Water System average about $80,000.00 per month. The City Water System currently qualifies for "time of use" electrical rates by pumping in "off peak hours" when ever possible.Even with all these positive factors it is not economically feasible to construct these facilities without a grant. The City is unable to receive tax incentives that are available to the private sector that offset the installation and operating costs. Long term projections show no cost savings to investor operated or systems installed by loan funding.	4,350,000	9,169	39,147 22	Los Angeles	IV	2009
4490	1910090	1910090-002	MONROVIA-CITY, WATER DEPT.	Rehabilitation of Monrovia Wells #5 and #6	The City of Monrovia will hire a contractor to remove and rebuild the well pump and motors. The wells themselves will be inspected and cleaned and items repaired if needed. The wells will then be sanitized and tested and put back into active service. This will help insure the water quality and increase the water produced.	O	0	C	The City of Monrovia has identified two of the City Water System wells as needing rehabilitation. The number of hours that the wells run and the volume of water they produce has caused "wear and tear" on the pumps and motors. The volume of water pumped has decreased and the well casing, perforations and gravel pack need inspection. these factors could lead to a degradation in water quality, and amount of water supplied.	125,000	9,169	39,147 22	Los Angeles	IV	2009
4491	1910090	1910090-009	MONROVIA-CITY, WATER DEPT.	Solar power installation 510 Mountain Reservoir	The City would have a contractor construct a 105.6 kW DC system at this site. The solar power generating panels would be installed on the roof area and the associated equipment installed in the existing pump area. The projected power output would supply power back to our power supplier, Southern California Edison, for use in the area power grid.The purchase of the system would show that it is a positive investment for all parties involved.	O	0	C	This is an application for the green-environmental projects.the City of Monrovia is a leader in green-Environmental projects in Los Angeles County.To continue with our progressive approach the City of Monrovia has a plan to install a 105.6kW DC solar powered system at our Mountain Avenue Reservoir. The City would reduce the demand on the power supplied by Southern California Edison and at the same time provide addition power to Southern California Edison for their use.This site has a storage capacity of five million gallons of potable water and pumps water to four pressure zones in the City of Monrovia. Southern California has experienced power outages and "brown outs" in the past and this system would supply an additional reliable source of power. The power costs for the City Water System average about $80,000.00 per month. The City Water System currently qualifies for "time of use" electrical rates by pumping in "off peak hours" when ever possible.Even with all these positive factors it is not economically feasible to construct these facilities without a grant. The City is unable to receive tax incentives that are available to the private sector that offset installation and operating costs. Long term projections show no cost savings to investor operated or systems installed by loan funding.	900,000	9,169	39,147 22	Los Angeles	IV	2009

4492	1910090	1910090-001	MONROVIA-CITY, WATER DEPT.	Solar Power installation at City Well Field 2655 Myrtle Avenue	The City would have a contractor construct a 334 kW DC solar system at this site. The solar power generating panels would be installed on the roof area and parking facilities. The associated equipment would be installed in the mechanical area of the site. This project would reduce the power supply required to provide the City with it's water supply.The purchase of the system would show that it is a positive investment for all parties involved.	O	0	C	This is an application for the green-environmental projects.The City of Monrovia is a leader in green-environmental projects in Los Angeles County.To continue with our progressive approach the City of Monrovia has a plan to install a 334 kW DC solar powered system at our City well field site at 2655 South Myrtle Avenue, Monrovia, California. The City would reduce the demand on the power supplied by Southern Cafifornia Edison and at the same time provide additional power to Southern california edison for their use.This site is the well field for the City Water Supply and provides the majority of the water consumed in the City of Monrovia. The site also contains our chlorination and VOC treatment systems. Southern California has experienced power outages and "brown outs" in the past and this system would supply an additional source of reliable power. The power costs for the City Water System currently average about $80,000.00 per month. The City Water System currently qualifies for the "time of use" electrical rates by pumping in "off peak hours" when ever possible.Even with all these positive factors it is not economically feasible to construct these facilities without a grant. The City is unable to receive tax incentives that are available to the private sector that offset the installation and operating costs. Long term projections show no cost savings to investor operated or systems	1,680,000	9,169	39,147	22	Los Angeles	IV	2009
4493	1910090	1910090-003	MONROVIA-CITY, WATER DEPT.	Install Security Cameras at City Reservoir Sites	The City will hire a contractor to install all materials and equipment to create a security system of motion sensors and cameras at 10 of the reservior locations. The system would be able to raise an alarm to get immediate response to prevent a water quality problem and vandalisum to the site.	O	0	C	Due to the remote locations or several of the City reservoir sites security on the roof structures of the facilities is an issue. The water quality of the system could be compromised and vandalisum could occur. Cameras and motion sensors would be installed on 10 reservoirs.	60,000	9,169	39,147	22	Los Angeles	IV	2009
4494	3710019	3710019-008	Ramona Municipal WD	San Vicente Water Pipeline	The tasks for which this application is made are pipeline construction, construction inspection, and other construction phase activities. The proposed pipeline will have a diameter of 16 inches. Connecting pipelines have diameters of 8 and 12 inches. The pipelines will be installed concurrent with road construction. The significant changes in the pipeline alignment require the new pipeline be installed as the proposed road surface and horizontal locations change. The County will not permit pipeline work within a newly paved road for a minimum of 3 years. Several planning phase project activities are complete. The preliminary engineering, environmental documentation (EIR), land surveying, right of way acquisition, and road design documents are complete. The design of the water pipeline will commence in fall 2011. The pipeline construction will be concurrent with road construction. The County of San Diego and Ramona MWD have developed a preliminarily cost estimate for the construction phase of the pipeline work to be $4.4M.Neither a consolidation nor an intertie will not address the road and pipeline realignment challenge.	O	0	C	The County of San Diego is improving an approximately three-mile segment of San Vicente Road. The road improvements will include horizontal and vertical alignment modifications. The Ramona Municipal Water District owns and operates a critical water distribution pipeline along the existing alignment of San Vicente Road. Due to the significant modifications proposed to the vertical and horizontal alignments of San Vicente Road, combined with the age of the existing water pipeline, a new pipeline should be installed along the entire realignment of San Vicente Road. Funds requested are not for road improvements; requested funds are related solely to water pipeline related activities. If a new pipeline is not installed, portions of the existing pipeline will be located approximately 18' below the road surface, pipeline segments will be located in new habitat areas, and the repair/replacement of the existing pipeline will be forbidden by the County for at least three years.	4,400,000	9,330	40,000	14	San Diego	V	2012

4495	3710019	3710019-002	Ramona Municipal WD	24 inch Pipeline to Olive St. PS	Construct 5,200 lf of 24-in pipeline between Olive St. Pump Station and Julian Tank. This pipeline will increase the reliability of the water supply provided to Downtown Ramona, Bargar Pressure Zone, and the San Diego County Estates which total approximately 9,000 meters. By directing flow through the Westend reservoir and through the Olive St Pump Station the District is able to reduce the total energy use to deliver water to Downtown Ramona and the San Diego Country Estates. Also creates a second supply to the majority of the District and increases the water system reliability.	O	0	C	This pipeline creates a second supply to the majority of the District increases the water system reliability, and reduces energy consumption. It will provide addtional fire fighting capabilites to avoid the evacuation and destruction of the town of Ramona caused by the 2003 and 2007 wildfires.Currrently the water supply to entire the Ramona Area is restricted because nearly all the imported water comes to Mt Woodson Reservoir. This also results in higher energy demands and larger carbon foot print than a system that split the flow between the 1700 elevation reservoir (Westend) and the 1800 elevation reservoir (Mt Woodson). This pipeline will allow more demand to be placed on the Westend Reservoir which will improve the flows to downtown Ramona, the San Diego Country Estates and the Bargar pressure zone, representing nearly 9,000 meters. The District has constructed a new pump station and pipelines to help unload the demand on the Mt Woodson system and improve the reliability of water to the Ramona Area but this pipleline is needed for the overall system to fuction effectively. This project also reduces the demand on the single 12-in water line serving the San Diego County Estates (4000 meters) that is over stressed and has failed on a number of occasions.	1,310,000	9,330	40,000	14	San Diego	V	2009
4496	3710019	3710019-007	Ramona Municipal WD	Highland Valley Rd. Joint Replacement	Contract of the replacement of approximately 100 joints on approximately 4000 lf of 12 and 16-in pipeline and associated road repair.	O	0	C	The potable untreated water line in highland valley has suffered deterioration of the pipe joints requiring replacemenf of all joints. This work has been scheduled over a period of 10 years and results in repeated outages and road detours. The joints frequently leak resulting in damage to the roadways and potential contamination of the water supply.	500,000	9,330	40,000	14	San Diego	V	2009
4497	3710019	3710019-005	Ramona Municipal WD	18 inch Downtown Pipeline	Design and construct 9,000 lf of 18-in pipeline between Olive St. Pump Station and Julian Tank and upgrade pump station. This pipeline will increase the reliability of the water supply provided to Downtown Ramona and the San Diego County estates which total approximately 8,000 meters. By directing flow through the Westend reservoir and through the Olive St Pump Station the District is able to reduce the total energy and the carbon footprint associated with usethe to delivery of water to Downtown Ramona and the San Diego Country Estates.	O	0	C	The District's objective is to provide a reliable water supply to the existing San Diego Country Estates, Downtown Ramona and the Bargar Pressure Zone. Ramona suffered significant damage and forced evacuations during the 2003 and 2007 wild fires. Currrently the water supply to the San Diego Country Estates (4000 meters) is dependent on a single 12-in water line that is overstressed and has failed on a number of occasions. It is also limited to delivering high TDS water from the San Diego County Water Authority (CWA) supply which results in increased degredation of the ground water in the San Diego County Estates and additional energy use and costs for the operation of the San Vicente Wastewater Treatment Plant to RO the effluent. The addition of the pipeline will allow delivery of more low TDS water from Bargar WTP which will lower the TDS and improve the groundwater in the San Diego Country Estates. Currently the water supply to the Downtown Ramona area (4000 meters) is dependent on a number of small distribution lines to serve the area which result in low pressure areas. This pipeline will improve the pressure and reliability in much of the Downtown Ramona area. It will also reduce the energy and carbon footprint associated with the delivery of water to the Downtown Ramona Area by lowering the lift by 100 feet.	2,673,000	9,330	40,000	14	San Diego	V	2009

4498	3710019	3710019-003	Ramona Municipal WD	Poway Pump Station Standby Generator	Purchase and installation of standby generators to sited at the Poway Pump Station. Project may use standard diesel standby generators or natural gas or solar as an alternative.	O	0	C	In the event of a power outage, the Ramona area of the County will be without a water supply and in the Witch Fire event the water system was nearly dry. This resulted in No Use of Water Order, a No Drinking Water Order, and a Boil Order. In addition the Cal Fire "Fire Attack Base" was nearly out of water. The water supply to Ramona is pumped up 1000 feet in elevation to the Ramona area by the Poway Pump Station and a 30-in and 18-in pipeline. The pump station has no standby electrical generation, so there is no water to the Ramona Area during an event that takes the pump station out of service, such as a fire or earthquake. In addition San Diego Gas and Electric is proposing a rolling black out whenever there are high winds and this would mean more frequent loss of power to the pumps. The site is only accessible through a sensitive habitat and the installation of the generators would reduce the need to haul in generators each time there is an incident of power loss.	2,191,000	9,330	40,000	14	San Diego	V	2009
4499	4110023	4110023-007	City of San Bruno		Purchase five trailer mounted portable diesel powered electrical generators that would be stationed at each well head.	O	0	C	Need emergency power supply at booster pump stations and wells.	300,000	11,502	40,165	17	San Mateo	II	1998
4500	4110023	4110023-008	City of San Bruno		Construct storage facilities to expand storage capacity.	O	0	C	Need to increase emergency water supply. (combined with another project)	10,200,000	11,502	40,165	17	San Mateo	II	1998
4501	4110023	4110023-015	City of San Bruno	Seismic Retrofit and Rehabilitation of Water Tanks 1 and 3	As these tanks are the most critical to the safe and efficient operation of the City's water distribution system, this project has been placed on the fast track for reconstruction. The City recently conducted a feasibility study and determined that a rehabilitation of Tank No. 3 would be more cost effective than replacement. In depth physical analysis of the tank's condition has occurred. Work will include enlargement and strengthening of the tank foundation, rewinding the tank with pre-stressed strands that effectively rewraps the exterior wall, and anchoring the tank walls to the foundation through additional diagonal strand seismic cables to comply with AWWA D110 standards. The City also plans to install flexible pipe connections at both Tank 1 and Tank 3 to further increase the ability of these tanks to withstand seismic ground movement.	O	0	C	Existing Tank No. 1 is a welded steel tank that is structurally sound to resist seismic forces, but has rigid pipe connections to the distribution system that are susceptible to damage as a result of seismic ground movement.Existing Tank No. 3 performs a critical function by providing storage capacity to meet peak flow and fire flow demands. It is the City's only spiral wound reinforced concrete tank. The tank capacity is 2,000,000 gallons, the second largest holding capacity tank in the City's water distribution system. As a result of its very poor structural condition the City is able to fill safely only to half of its 32 feet in height and therefore only store one half the water the tank is designed to hold. The City of San Bruno water system thus faces an above ground water storage deficit of approximately 1-million gallons. This shortfall threatens the ability of San Bruno to supply enough potable water should a significant event impair the use of our water wells, and our ability to deliver fire suppression flows to all existing and future developments.	1,250,000	11,502	40,165	17	San Mateo	II	2009

4502	4110023	4110023-012	City of San Bruno	Advanced Water Meter System	This project will allow for real-time meter reads from a central location. It includes the installation of a new transmitting register at each of the approximately 11,500 service connections, the installation of two antennas on top of two 100-foot poles and associated equipment placed in key locations to receive transmissions from the registers to the antennas to a fix base unit at City hall. The project also includes installation of repeating transmitters to relay data from the registers to the transmitter poles, and all associated hardware and software to allow City personnel to receive hourly, accurate information from all 11,500 accounts. Once complete unaccounted water will decline dramatically, the City will be able to determine from each service account how much water was consumed and, by looking at water consumption history, be able to determine if each account is likely experiencing a leak on their service.	O	0	C	Currently, with limited funding and outdated technology, the City of San Bruno is only able to read the meters of its ratepayers once every two months. This length of time between reads leads to three major problems:o Customers are unable to track their water consumption in a timely fashion;o Water leaks on the service line go undetected for long periods of time, leaving ratepayers on the hook for excessively high bills and a clear waste of water; ando Due to undetected leaks, the City of San Bruno is often faced with a large amount of unaccounted for water, thereby necessitating insufficient management of the City's water resources.	2,500,000	11,502	40,165	17	San Mateo	II	2009
4503	5610059	5610059-008	Golden State Water Company - Simi	Simi Valley - Niles Booster Upgrades and Piping	To maximize groundwater use, extra pumping and piping would need to be added to send blended water from this plant and spread it around the distribution system. This would involve replacing aging booster pumps with more efficient VFD's and adding considerable piping to distribute the blended water effectively and efficiently.	O	0	C	Groundwater from the two wells in this system is very high in TDS, necessitating blending with purchased water from Calleguas Mutual Water District. Only a small portion of the groundwater can be used because of limits to how much of the blended water can be sent into the distribution system due to piping and pumping constraints. It would be beneficial to our customers to be able to maximize groundwater use, thus providing a more stable and cost effective source of water.	3,000,000	13,385	42,717	06	Ventura	IV	2009
4504	5610059	5610059-003	Golden State Water Company - Simi		Acquisition of property for the drilling of a well near Fitsgerald interconnection with Callegaus MWD will provide for the additioon of future emergency and alternative water supply to the system. Overall water qualityimprovement by blending.	O	0	C	Needs to improve sources for reliability.	150,000	13,385	42,717	06	Ventura	IV	1998
4505	5610059	5610059-001	Golden State Water Company - Simi		Drill and equip a well at the Rebecca Plant to provide for future emergency and laternative water supply.	O	0	C	Needs to improve sources for reliability.	450,000	13,385	42,717	06	Ventura	IV	1998
4506	5610059	5610059-002	Golden State Water Company - Simi		Provide an additional 2 MG of storage steel tank for emergency and peak supply.	O	0	C	Needs to improve storage capacity for meeting peak water demand.	1,000,000	13,385	42,717	06	Ventura	IV	1998
4507	5610059	5610059-004	Golden State Water Company - Simi		Study groundwater quality and quantity available in the area of the highest elevation. Results will be used to select a well site to provide emergency and alternative water supply of good water quality to this area.	O	0	C	Needs to improve sources for reliability.	30,000	13,385	42,717	06	Ventura	IV	1998
4508	3010036	3010036-004	City of San Clemente	Reservoir No. 1 Expansion	The project was recommended in the City's 2006 Water Master Plan. Reservoir replacement from 0.5 MG to 1.0 MG. Proposed reservoir will provide a higher overflow elevation increasing hydraulic grade of service zone which will improve fire flows and low pressure problems in the southernmost part of the City.	O	0	C	Require additional operational and emergency storage for reservoir service zone.	3,000,000	17,350	43,900	08	Orange	V	2009
4509	3010036	3010036-001	City of San Clemente	Calle Real Pump Station Rehabilitation	Calle Real Pump Station will improve redundancy within the City's Reservoir 10 and 6 service zones. The existing pump station has reached the end of its useful life and will be refitted with larger pumps, motors and an electrical system to provide service directly to Reservoir 10 which only has one source of supply. Reservoir 6 zone will be served from Reservoir 10 through a new pressure reducing station included as part of this project.	O	0	C	Pump station installed in 1960's and has reached end of useful life. No redundancy for pump station service zones.	1,150,000	17,350	43,900	08	Orange	V	2009

4510	1910156	1910156-001	BEVERLY HILLS-CITY, WATER DEPT.	Shallow groundwater well development in Beverly Hills	This project would potentially allow the City of Beverly Hills to manage the Hollywood Basin as two separate aquifers a deep with the existing wells and a shallow aquifer with a minimum of two new wells. To investigate the groundwater within the aquifers of the Hollywood Basin for potential drilling of the shallow water wells near the treatment plant to supplement the City water supply. The project requires drilling two shallow wells 200 feet deep with a 50 foot seal at the surface so the water would not be under the influence of surface water. Upon testing of the water and getting approval from the Department of Public Health the water would be piped to the nearby treatment plant for treatment. This project is estimated to supplement the City's water supply by no more than 300 acre feet annually. The proposed land for this project is already owned by the City.	O	0	C	California is experiencing a natural and regulatory drought. These conditions are limiting the amount of water conveyed from the State Water Project and Colorado River to Southern California. As a result more water is needed through local ground water sources. The City of Beverly Hills developed four wells and built a reverse osmosis water treatment plant capable of treating 3 million gallons of water per day. However, the four wells can only provide 1.5 million gallons of water per day. Therefore to optimize the capacity of the water treatment plant and help alleviate the water shortages to Southern California new sources of water are necessary. There is currently shallow ground water being pumped to the storm drain from properties located near the City's water treatment plant. The City hired a consultant to evaluate the possibility of using this water. One possible means of capturing this water and putting it to beneficial use is by drilling shallow groundwater wells and piping the water to the existing water treatment. The proximity of where these shallow groundwater wells to the treatment plant make this option a promising alternative.	1,500,000	9,898	44,290	22	Los Angeles	IV	2009
4511	1910156	1910156-014	BEVERLY HILLS-CITY, WATER DEPT.	Water efficient equipment replacement	As a member agency of the Metropolitan Water District, an water audit was performed in the Fall of 2008 that identified water devices throughout city facilities that could be replaced and/or upgraded to conserve more water. With the current water supply concerns, by making upgrades and/or replacement to toilets, urinals and irrigation spray noozles, the city can expect to save over 9,000,000 gallons in water per year.	O	0	C	Replace and/upgrade water devices with more efficient models to conserve more water.	80,000	9,898	44,290	22	Los Angeles	IV	2011
4512	1910156	1910156-003	BEVERLY HILLS-CITY, WATER DEPT.	Deep well development at robertson yard	Developing a functional deep well on existing City property is the highest ranked projects in the City's Groundwater Management Plan Technical Committee requiring exploration of increase local water supply. Currently, the City has released a contract to do the borehole testing required to determine if building a permanent well at this City property in West Hollywood is viable. The results are expected this summer. Then the City would require the funding to build the well and conveyance back to the City's existing treatment plant, which is the project being submitted to the State for funding. The City has experienced in the past deep wells in the Hollywood Basin producing 350 acre feet annually.	O	0	C	California is experiencing natural and regulatory droughts. These conditions are limiting the amount of water conveyed from the State Water Project and Colorado River to Southern California. As a result more water is needed through local ground water sources. The City of Beverly Hills developed four wells and built a reverse osmosis water treatment plant capable of treating 3 million gallons of water per day. However, the four wells can only provide 1.5 million gallons of water per day. Therefore to optimize the capacity of the water treatment plant and help alleviate the water shortages to Southern California new sources of water are necessary. The City owns some land located in West Hollywood known as the Robertson Yard where this project will be located.	1,288,283	9,898	44,290	22	Los Angeles	IV	2009

4513	1910156	1910156-009	BEVERLY HILLS-CITY, WATER DEPT.	Replacement of half century old steel tank reservoirs	The City of Beverly Hills is planning to replace the existing five welded steel water storage tanks and on-site piping at sites 3A, 4B, 5, 6 & 7 with new water storage tanks and on-site piping. Also, a seismic retrofit for the associated pump stations to comply with AWWA standards and the DPH drinking water requirements. The project will include automatic analyzers and chemical feed system to help improve water quality. The water storage tanks are essential for potable water uses and fire suppression.	O	0	C	Within the City of Beverly Hills potable water distribution system inventory are five flat bottom, ground supported circular steel water reservoirs tanks, all located at five separate sites within the city. These tanks were constructed in the mid-fifties to the mid-sixties and do not meet the current American Water Works Association (AWWA) standards for "Welded Steel tanks for Water Storage."The existing tanks and their on-site piping, which are an integral part of the City's water distribution system, need to be replaced to meet current Department of Public Health Services (DPH) drinking water standards, seismic design standards, and Cal OSHA safety standards. In addition, the associated five pump stations have to be seismically retrofitted. Presently the City's Water Utilityexperiences water quality problems with these tanks, mainly involving nitrification due to the water age in the reservoirs. Other problems with the reservoir include rusting to side walls, piping, and structural roof rafters. The interior coating/paint surfaces have also been tested and shown to have varying levels of lead.	8,800,000	9,898	44,290	22	Los Angeles	IV	2009
4514	1910156	1910156-002	BEVERLY HILLS-CITY, WATER DEPT.	Old obsolete water meter replacement	To change out the 61 remaining old obsolete turbine water meters and replace them with state of the art compound water meters that use the smart e-coder technology, it is necessary to enlarge the vaults because of the length of the new meters. This involves removing the old vault, digging out a larger area, and make modifications to the existing piping. The contractor hired for this job does not have the ability to do the work so in order to complete this project, the City either has to use internal forces that take away from other important functions or seek out the funds to hire a contractor who can complete this work in a timely manner without compromising other necessary water utility tasks.	O	0	C	With the state of the economy and the shortage of water it is important that we as professionals and administrators look for new and inventive ways to both save money as well as find ways to help the public conserve water. With that in mind the staff at the City of Beverly Hills with the support of the City Council embarked on an aggressive water meter change-out project. Staff spent months researching the available technology existing in the market. Staff was looking for a proven product that would help the City re-direct its labor force, vehicle usage, and overall equipment costs to enable the City to concentrate these assets in a direction that could be better utilized. In addition to this the City wanted to obtain more accurate water measurements, reduce the amount of unaccounted water, and offer benefits to the City's customers. As staff progressed through their research a technology began to stand-out above all others to achieve all of the goals and objectives the City had set to accomplish. Upon further research staff determined that the City should pursue a fixed network AMR (Automatic Meter Read) with smart meter technology. This system would allow daily meter reading of all of the meters throughout the City transmitting to data collections units which in turn contacted the utilities Network Control Center. By using a smart meter in conjunction with the fixed network system the City and the City's	518,500	9,898	44,290	22	Los Angeles	IV	2009

4522	1910003	1910003-003	City of Arcadia	Sustainable Energy - Solar System Project	Arcadia Water Master Plan identified the need for installation of Sustainable Energy Projects and solar systems at water pumping facilities to offset high demand cost of power. The project will provide for installation of photovoltaic solar panel energy generating systems at various facilities, where the City has available space as well as high demand for electrical power. There are identified three facilities to be equipped with the solar panel energy generating systems: St. Joseph water facility, Orange Grove water facility and Santa Anita water facility. It is proposed to locate solar panels on the roofs of reservoirs and provide power to booster pumps located nearby within facilities. Project will be designed and constructed in phases by location and the City will work in cooperation with the Southern California Edison and providers of solar panel energy generating systems.	O	0	C	Growing electricity prices are most pronounced in the high energy demanding water pumping areas of Southern California. This high energy demand occurs during midday hot weather periods when utilities have the most difficult time to provide power and the power supply is most susceptible to blackouts.Green energy projects will decrease demand and the use of non-renewable or limited resources by implementing technologies that provide equivalent or superior output utilizing recycled, renewable, or unlimited resources. This process is referred to as “Sustainable Design” and is becoming more and more necessary as the demand for water and energy increases and the supply from initial sources becomes less certain. Sustainable projects include the implementation of photovoltaic power at reservoirs and pumping stations. The installation of photovoltaic power supply systems provides the highest power output during the highest demand periods to dramatically lower the utility power cost as well as decreased grid susceptibility to blackouts.	3,000,000	14,719	44,814	22	Los Angeles	IV	2009

4524	1910167	1910167-006	VERNON-CITY, WATER DEPT.	Vernon Production Well 21	K. Project DescriptionThe City will be drilling a production well (Well 21) at 3200 Fruitland Avenue. This Well will be drilled to a depth of approximately 1400 feet and capable of producing 1500 gal/min. The casing will be approxiamtely 18-inches in diameter and the pump boles will set at 450 feet. At the conclusion of the drilling process, the following tasks must be facilitated: Pump & motor installation, piping design and installation, flush basin construction, SCADA design, backup power installation and treatment design.	O	0	C	J. Problem DescriptionThe City of Vernon is in need of a new potable water production facility in order to meet existing water demand conditions and to reduce our reliance on MWD surface water supplies. In the past year alone, the City has been forced to have one of its production wells destroyed due to excessive VOC's and another is currently off-line due to sanding and related water quality problems and may also have to be destroyed. This has forced the City to purchase expensive surface water supplies. The City is in the process of having specifications developed in order to have a production well drilled (Well 21) to makeup, in part, for the loss of the above-mentioned wells. The location of the proposed well is Soto Street & 50th Street, in Vernon, CA.	2,500,000	1,217	45,000	15	Los Angeles	IV	2009
4525	1910144	1910144-001	SAN GABRIEL COUNTY WD	Well 3 Rehabilitation Project	The project would iinvolve our well 3 which has been inactive for approxamately 18 years. It is situated at our Van Nuys reservoir site. It is an ideal spot for a rehabilitation because of the location next to our reservoir which it would dump directly into. Recently we had General Pump Company come in and test pump and pull water samples out of the well. Test results have come back for water quality and are mostly non detect or below the mcl. We feel very confident about this water source. The construction of this site would include a new building, new pump, new 75 hp motor, new column and shaft, new motor control center, pipe from well to existing reservoir. pump to waste line, nitrate analyzer and sodium hypochlorite injection system.	O	0	C	Over the last four years San Gabriel County water District has lost 2500gpm of production due to heavy sand problems at three of our well sites, well 11, well 9 and well 7. We would like to rehabilitate our well 3 that has been out of service for approxamatley 18 years. This well will provide us with an extra 700 gpm which would greatly improve our pumping capacity. Our max day is currently 11.5 mg. If you were to take out our biggest producer we would only be able to pump 7.5 mg. The extra 1 mgd would help us achieve our max day demand. In this time of drought we are in need of another water source.	500,000	8,943	45,000	07	Los Angeles	IV	2008

4526	1910167	1910167-004	VERNON-CITY, WATER DEPT.	Vernon Production Wells 9 & 10	K. Project DescriptionThe Vernon Production Wells 9 & 10 are needed by the City to meet its daily water demands. The City recently destroyed its Well No. 18 due to groundwater contaminates and its advanced age. This had required the City to purchase MWD surface water to supplement its water supply. Well 18 produced approximately 1400 acre-feet-year. Wells 9 & 10 both have sabitary seals that meet potable water well construction standards and with treatment should provide the City with a safe and consistent supply that will reduce our reliance on MWD water. The cost of this project is estimated to be $2,500.000 to complete.	O	0	C	Problem DescriptionThe City of Vernon purchased propreryty from the Smurfit Stone Container Corporation, located at 2001 57th Street, in Vernon, CA. Smurfit left two of its industrial wells: herein know as Wells 9 & 10, that were constructed in 2001 and 2004 respectively. The City would like to use this wells for potable water use. The City used Richard Slade & Associates to perform extensive testing of the source water supply for the above-mentioned wells. Slade's reports indicated that the groundwater supply tested positive for 1,2 DCA, TCE, Perchlorate and Boron. In addition, video log results have concluded that these wells need rehabilitation. In conclusion, treatment, rehabilitation, and construction of distribution lines will have to be facilitated in order to use the wells as a potable drinking water source.	2,500,000	1,217	45,000	15	Los Angeles	IV	2009
4527	1910167	1910167-005	VERNON-CITY, WATER DEPT.	Vernon Closed Distribution System	The proposed closed water distribution system uses a multitude of Variable Frequency Drive motors placed a strategic locations along with a highly complex automated telemetry system to provide system pressure. The closed system could be run in concert with the existing open system or be operated independently should the Elevated Storage Reservoir be rendered inoperable. Moreover, if the Elevated Storage Reservoir was to be taken off-line for purposes mentioned above, the City would have to utilize large quantities of MWD water in order to provide sustainability until such time the Elevated Storage Reservoir is placed back into service.	O	0	C	(Vernon Closed System):The City of Vernon's (City) Water Distribution System operates on an open to atmosphere system with one pressure zone. The City uses and Elevated Storage Reservoir along with strategically placed pumps to provide sufficient pressure for firefighting and drinking water purposes. Although the existing hydraulic system is simplistic in nature and provides ample pressure to the water distribution system, it is the only means the City has to provide water pressure to the water distribution system. In the event that the City's Elevated Storage Reservoir was damaged due to a natural or manmade disaster, the City would have no means of regulating the system pressure and be hard-pressed to deliver uniform water supplies for drinking water and firefighting purposes.The City had Infrastructure Engineering Corporation, Inc. design a closed water distribution system to provide an additional degree of redundancy to the water system. The proposed closed water distribution system uses a multitude of Variable Frequency Drive motors placed a strategic locations along with a highly complex automated telemetry system to provide system pressure. The closed system could be run in concert with the existing open system or be operated independently should the Elevated Storage Reservoir be rendered inoperable. Moreover, if the Elevated Storage Reservoir was to be taken off-line for	4,000,000	1,217	45,000	15	Los Angeles	IV	2009

4537	5610020	5610020-007	THOUSAND OAKS WATER DEPT	Automated Chlorine Analyzer	The project entails installation of automated Chlorine Analyzer equipment at select reservoirs for monitoring and detection purposes through the City's SCADA (Supervisory Conrol and Data Acquisition) system.	O	0	C	Certainly, service areas within the City's drinking water system experience the effects of low turnover, nitrification and a subsequent diminished disinfection agent residual. This is primarily a winter phenomena when irrigation use is low. As the City does not have the ability or the trained/certified staff to re-chloraminate, the recourse has been to drain tanks to minimal elevations and refill with fresh water, seeking to raise the chlorine residual. This pattern of drain-down, refill, reanalyze may continue for several weeks as these cycles are matched against peak-pumping hours, energy costs, the ability for inspectors to return to a specific location in a timely manner (weekends, evenings) and convey analytical results to appropriate staff. Additionally, these subject reservoirs being equipped with a common inlet-outlet structure minimizes the in-reservoir mixing that would enhance staffs ability to address the phenomena more expeditiously. The addition of on-line chlorine analyzers at selected reservoirs with SCADA input would directly enhance both operations and water quality staff ability to identify potential issues more quickly, respond more effectively and more consistently.I am not famiar with the equipment necessary for such installations. However, I believe it is imperative that long-term reliability, constancy and calibration routine and procedures be evaluated extensively during the	300,000	16,436	50,000	06	Ventura	IV	2009
4538	4410017	4410017-006	Soquel Creek Water District		Install a multipe shallow well system to reduce localized groundwater demand and avoid using deeper waters.	O	0	C	Need shallow well system in La Selva Beach due to seawater intrusion.	3,000,000	15,115	50,000	05	Santa Cruz	II	1998

4540	5610020	5610020-003	THOUSAND OAKS WATER DEPT	Water Meter Replacement (Automated Meter Reading)	Citywide, there are more than 17,000 meters currently active. The material used in manufacturing the meters (brass) contains a certain level of lead. In the older meters the level of lead content is higher than the newer models (as of 2010 there will be even more strict regulations applied in that respect). The City's existing meters breaking down or registering incorrect water usage, require additional site trips by City staff, resulting an inefficient operation and loss of energy and manpower, and ultimately increasing the City's overall carbon foot print. The proposed project will replace City meters with a more environmental friendly metering system. The new metering system will use meters manufactured with very low lead content material and will also be equipped with remote and automated reading capabilities. This will enable the City staff to quickly, correctly, and efficiently complete the meter reading activities while driving by through the City streets without leaving their vehicle and without compromising their personal safety.	O	0	C	Within the City's water system, there have been long lasting problems with water meters with respect to incorrect metering, higher lead content in older meters, and excessive carbon foot print due to maintenance and meter reading activities.	900,000	16,436	50,000	06	Ventura	IV	2009
4541	4410017	4410017-002	Soquel Creek Water District		Install treatment and water softening equipment.	O	0	C	Purissima aquifer needs treatment for taste, odor, and hardness of water.	1,100,000	15,115	50,000	05	Santa Cruz	II	1998

4550	1510005	1510005-002	Delano, City of	Deteriorated Waterline Replacement Project	The City will replace 12,450 lineal feet of deteriorated outside diameter (OD) steel water distribution pipelines and leaking valves. The pipes were prevously installed between 1930 and 1940. The 4" OD pipes will be replace with 8" PVC pipe. The main line valves will be replace to allow isolation of areas effectively. The existing galvanized water services will be replaced with plastic tubing.By replacing the pipes and vavles, the city will be able to address the Disinfection Byproducts Rule (high levels of Trihalomethanes and Haloacetic Acids). It will also address the chance for bacterial increase. Chlorine is absorbed into the buildup of corrosion on the inside of the pipes. By fixing the pipes, the amount of chlorine that is used will be reduced. The city receives numerous customer complaints of their water quality. The water has a rust color with sand. At this time, the City of Delano is not able to meet fire flow requirements as set by Kern County. Through implementing this project, the city will be better equipped to meet the safety needs of the community. The project will reduce the amount of shut-downs to the system. The city will also be able to address the substantial water loss for the leaking pipes. During this time of drought, the city and the state need to work together to ensure that water loss is addressed and repaired immediately.	O	0	C	The City of Delano needs to immediately replace 12,450 lineal feet of old deteriorated OD steel water distribution pipelines and leaking valves. There are over 100 water breaks per year that require emergency excavation and repair in the proposed area. There is substantial water loss due to the leaks.The drinking water regulation that will be addressed through the replacement of the pipelines and valves is the Disinfection Byproducts Rule. Due to the leaks, there is a reaction causing Trihalomethanes and Haloacetic Acids. The leaking pipe are also causing an interruption of water service and impeding the City's ability through the system to meet fire protection capacity as determined by Kern County Fire Department to various locations within the City because of substandard water pressure. The City is bisected by State Highway 99. Higher ground within the city is the eastern portion of the community thereby creating a gravity flow from east to west. The central core of the community of Delano is serviced by OD Steel water distribution pipe. The downtown area of the city is situated in a location that affects the ability to move of water to the eastern portion of the community. It was discovered through flow tests that several highly populated east side areas of the city do not meet the fire flow requirements of 1000 gallons per minute. Turning off valves to push the water uphill to the eastern portion of the city requires	2,200,000	8,670	53,855	12	Kern	III	2008
4551	0110003	0110003-002	CALIFORNIA WATER SERVICE - LIVERMORE		Install facilities to enable Chloramine disinfection of all system reservoirs (24) and purchase portable Chloramination equipment.	O	0	C	Improve disinfection reliability, so that it is compatible with Chloramine.	980,000	17,801	54,496	04	Alameda	II	1998
4552	5710006	5710006-018	City of Woodland	Surface Water Project	The project involves the design of surface water intake structure at the sacramento river and pipelines and tanks to mix the water in order to obtain better water quality. The surface water would be mixed with well water from well 10,11 and 20.	O	0	C	This project involves the design of a surface water intake structure to dilute the City water from well 17 and 10 to bring down the nitrate concentration below the MCL of 45 ppm.	250,000	14,065	56,000	09	Yolo	I	2011
4553	5710006	5710006-020	City of Woodland	Rehabilitation of well 10,11,18 and 20	The project involves the installation of blockers in the wells to reduce nitrate water infiltration.	O	0	C	This project involves the modification of the existing wells 11,18 and 20 to prevent excessive nitrate infiltration. These wells currently have high nitrate concentration. They are sometimes shut down from operation when there is a spike in nitrate levels. These project would identify zones of high nitrate and modify these wells accordingly to minimize contribution from these zones with the aim of reducing the nitrate levels.	1,000,000	14,065	56,000	09	Yolo	I	2011

4554	5710006	5710006-022	City of Woodland	City of Woodland Treated Surface Distribution and Storage Facilities	This project constructs the infrastructure to deliver treated Sacramento River water from the Woodland Davis Clean Water Agency (WDCWA) facilities to City customers. The project allows the City to reduce reliance on deteriorating groundwater supplies and ensures a reliable and sustainable long-term water source for the future which meets regulatory requirements for safe drinking water and wastewater discharges.The project includes design and construction of transmission, storage and distribution facilities to deliver treated surface water from the Woodland Davis Clean Water Agency intake and treatment facilities. The distribution system improvements include approximately 50,000 lineal feet of water transmission and distribution mains varying in size from 12" to 36", three new water storage tanks providing 7.0 MG additional storage capacity and three booster pumps providing 15.8 mgd additional pumping capacity to the system. The transmission and distribution piping and storage tanks will be designed and located to ensure the most efficient mixing of surface water with existing groundwater supplies to achieve maximum distribution of surface water to all customers throughout the City. The additional storage and booster pumps will replace some of the pumping capacity lost due to aging and/or offline wells and further reduce the City's reliance on groundwater wells. These improvements will transition	O	0	C	The City of Woodland currently relies exclusively on an aging system of 19 groundwater wells to meet consumer water demands. Declining groundwater quality and more stringent regulatory standards combined with the difficulties of maintaining water pressure and flows with the aging system make it infeasible for the City to continue to rely solely on groundwater to meet future water demands. The salinity of the City's groundwater supply and elevated levels of nitrates, manganese, boron, and selenium make it increasingly difficult to meet drinking water and wastewater discharge requirements. Woodland has temporarily taken wells offline and/or abandoned wells in order to protect public health and comply with water quality regulations. Groundwater nitrate levels within the city's water supply system are trending higher over time. Groundwater quality currently fails regulatory environmental standards for wastewater discharge before it even enters the city system. In addition to water quality issues, the City struggles to maintain sufficient flow and pressure to meet industry standards for peak demands with the existing water supply system. An evaluation of the system indicates a pumping capacity deficit of over 6,000 gpm and storage capacity deficits of almost 3 MG. Multiple wells within the system have reduced pumping capacity or production due to age-related deterioration and water	32,000,000	14,065	56,000	09	Yolo	I	2011
4555	5710006	5710006-008	City of Woodland	Well Site Security - Video	This project involves instal;ling vedeo cameras at the existing wells to record and transmit unwanted activities. This is a requirement of the department of homeland security for public watert systems.	O	0	C	This project is aimed at improving the security at the wells to comply with the requirements of the department of homeland security.	300,000	14,065	56,000	09	Yolo	I	2009
4556	2110003	2110003-039	North Marin Water District	Flushing Taps at Zone Valves	This project proposes to install flushing taps at the dead end zone valves to enable flushing as part of the annual flushing program. There are 43 locations requiring flushing taps. Mains 10" in diameter and smaller would receive a 2" flushing tap. Main 12" and larger in diameter would receive a 6" flushing tap.	O	0	C	Zone Valves in the system separate two different pressure zones and are permanently closed, to be opened only as an emergency connection. Water in the dead end zone adjacent to the valve becomes stagnant and needs to be flushed periodically to maintain acceptable water quality.	200,000	20,639	56,000	18	Marin	II	2009
4557	5710006	5710006-025	City of Woodland	Woodland: Farmer Central Pipeline Project	This project involves a master plan that identified the need, it involves CEQA that identified the mitigation measures required for enviromental impact, it also involves design and construction management. The project will be done in conjuction with the City of Davis	O	0	C	This project involves the construction of approximately 10,000 feet of 36 inch pipeline .	30,000,000	14,065	56,000	09	Yolo	I	2012
4558	2110003	2110003-037	North Marin Water District	Water Quality Sample Stations	The project proposes to install Sample Stations throughout the water system to test for water quality. There are 17 locations that have been identified as needing a permanent station installed. The Sample Station consists of a ¾" copper pipe tapped into the existing main with a hose bid at the end. The hose bib is surrounded by a heavy-duty steel enclosure, which is lockable, to prevent contamination and vandalism.	O	0	C	Sample stations are needed to monitor chlorine decay dynamics throughout the distribution system in accordance with CDPH and EPA regulations. Permanent sample stations increase the integrity of the data collected and eliminate the need to utilize customer's private taps.	100,000	20,639	56,000	18	Marin	II	2009
4559	5710006	5710006-021	City of Woodland	EMERGENCY CONNECTION OF COUNTY WELL	The project involves the connection of the well to the City's distribution system. It involves reconfiguration of the pipe network and integration of the two system together,. It also involves the installation of a SCADA control system on the jail well to maximize its utilization.	O	0	C	This project is aimed at balancing the loss of supply from other well due to high nitrate concentrations. The Yolo County well has excess capacity that can be used in supplementing our water supply to meet maximum day and peak hour demand. This is urgently needed to have this capacity for fire flow in the region of the City.	500,000	14,065	56,000	09	Yolo	I	2011

IWA is 100% reliant on the Whitewater Aquifer for its supply, and at pumps approximately 23,000 acre-feet annually (AFY) from the basin. The Coachella Valley is served with inexpensive ag/irrigation water from the Coachella Canal ("Canal"), administered by the Coachella Valley Water District (CVWD), though this water is high in TDS and unfit for potable use. No facility suitable for treating Canal water currently exists.Building a surface water treatment plant (SWTP) will provide three major advantages over the long term: providing for growth without overdraft, maintaining safe and affordable water in the event of a low Cr (VI) MCL, and enhancing recycling capabilities to improve conservation and enable recharge.Growth Without Overdraft:In our 2010 Urban Water Management Plan Update (adopted Dec 2011) IWA anticipates delivering over 44,000 AFY by 2030, based on population growth projections. However, to responsibly manage the basin, IWA has set a goal to limit groundwater pumping to 20,000 AFY indefinitely. In order to provide for a growing population while maintaining sustainable conjunctive use of ground and surface water, IWA will need to import and treat Canal water for potable distribution to anticipated residential developments. A	42,800,000	19,453	58,823	20	Riverside	V	2012
4562	0910002	0910002-007	South Tahoe PUD - Main	Angora Tank Replacement	STPUD is planning to replace the existing Angora Tank and waterline in an effort to upgrade the District's water distribution system. The project in its entirety involves building an access road, tank replacement, waterline replacement, and associated staging. The District proposes to replace the existing 63,000 gallon Angora Tank with a new tank with an operating volume of 249,000 gallons to meet District standards for domestic supply. In conjunction with construction of the new tank, STPUD will replace the existing waterline. The existing tank will be demolished after the new tank is placed in service.To simplify construction and provide reliable access to the site into the future, STPUD proposes to install a permanent access road to the site. With reconstruction of the tank, site improvements and instruments will be installed that will require more frequent access for maintenance than was needed for the old tank. A permanent road is also necessary to meet requirements stated in CA Waterworks Standards (22 CCR S 64585).It is the District's goal to design and construct a permanent road to the tank site that is both structurally and environmentally stable. The proposed road is approximately 630 feet long, 10 feet wide, and will be secured at the bottom by a Forest Service gate. It will require some earthwork and tree removal. The road will be stabilized using permanent erosion control best management practices and will be paved with AC	O	0	C	The Angora Tank is a critical facility for the South Tahoe Public Utility District's water system. This tank and the associated waterline is the only source of water serving the Angora Highlands neighborhood; there are no wells in this zone and there is no other connection to the main water supply system. The Angora Tank is located atop a ridge, approximately 80ft above the nearest residences being served by the tank on the perimeter of the neighborhood. Water is provided to over 87 residences by gravity, so that at this elevation only about 35-40 psi pressure is available at the nearest homes. This pressure is on the low end of what is acceptable for domestic supply and insufficient to meet current demand in an emergency situation. The existing tank was constructed in the late 1960's and has an operating volume of approximately 63,000 gallons. This tank is aging and undersized to meet public health storage requirements for domestic demand capacity. Based on current water supply standards for domestic capacity, the tank should be approximately four times its current size. The replacement of this tank is the first step in a number of upgrades needed to provide adequate domestic supply capability to this area. The District-owned tank site is currently land-locked, as the District has no means of accessing the site other than by foot across property owned by the United States Forest Service (USFS). Being restricted to foot-only access year-	1,200,000	13,635	60,000	09	El Dorado	I	2009

4563	3010018	3010018-005	City of La Habra	Installation of Reservoir Mixers at The Puente, Byerrum and Westridge Reservoir Sites	The project consists of the installation of 4 SolarBee Reservoir Circulators, to provide complete mixing throughout the reservoirs to reduce stratification, reduce stagnant water conditions, and provide a complete circulation of a full reservoir in less than two days. Although there are only 3 reservoirs, there is a need for 4 reservoir circulators as the Byerrum Reservoir is actually two tanks with a common baffle wall and therefore is in need of 2 seperate circulators. In efforts of reducing installation costs and conserving energy at these remote reservoir sites, the Solarbee Reservoir Circulators identified are solar-powered in design.	O	0	C	In a study conducted in 2007, high nitrite concentrations and low disinfectant residuals were observed in the City's reservoirs and in areas of the distribution system served by the reservoirs. Nitrification and residual loss in the reservoirs may be caused by poor mixing and high water age. Based on the study's evaluation, Puente Hills Reservoir has poor mixing characteristics and high water ages, conditions leading to disinfectant loss and nitrification. Low water level fluctuation in the Byerrum Reservoir at certain times of the year may also result in low residual events in the reservoir and in areas of the distribution system served by the reservoir. The Westridge Reservoir is also directly affected by the water quality of the Byerrum Reservoir as pumped water from Byerrum Reservoir is the sole source of water to Westridge Reservoir.To improve water quality in the reservoirs and those portions of the distribution system served by the reservoirs, the installation of reservoir mixers have been recommended by the study and our local CDPH branch office.	300,000	12,548	61,454	08	Orange	V	2009
4564	3010018	3010018-004	City of La Habra	Water Main Replacement Project	The project will be in the south eastern section of the City of La Habra and will consist of the replacement of approximately 17,000 feet of 4 inch to 8 inch water mains, including the installation of new valves, fire hydrants, water services, improvements to pressure regulating stations, and other related appurtenances.	O	0	C	The City is currently experiencing a high frequency of water main breaks (81 breaks in 2008 alone). The breaks are attributed to corrosion and the age of water mains, most of which were built in the 1950s and 1960s. The water main breaks have caused numerous interruptions of water service, compromised the ability to provide adequate fire protection, and destruction of streets and adjacent properties. Replacing problematic water mains will help to prevent unscheduled water outages and improve fire flows to the immediate area, thereby improving system reliability for public health and safety concerns.	3,300,000	12,548	61,454	08	Orange	V	2009
4565	3010018	3010018-001	City of La Habra	La Habra Well #3 and Booster Station	Drill a 1400 feet deep 2500 GPM ground water well. Install sodium hexametaphoshate iron/manganese sequestering or a filter removal system. Install an air stripper for ammonia and hydrogen sulfide removal. Install 5000 feet of 24" diameter supply pipeline to a 4000 GPM groundwater supply line from California Domestic Water Company. Construct a 200,000 gallon blending forebay to reduce TDS. Construct a 6000 GPM booster station. Due to the age and size of the existing water system piping that is adjacent the proposed project, it will be necessary to install approximately 8000 feet of 16-24" diameter transmission pipeline in order to properly distribute the new supply. Other equipment shall include a chlorine injector, chlorine analyser, PH analyser, fluoride injection, and flouride analyser. For emergency reliability there would also need to be a 800 KW emergency standby generator in order to produce the proper quality of water from this project site.	O	0	C	La Habra produces 10 percent of its water from the local ground water basin. Currently there are three water quality issues associated with the local ground water basin which are all secondary standards. The first problem is Total Dissolved Solids that range from 1000 PPM to 1070 PPM. The other water quality issues are hydrogen sulfide, and iron/manganese.	4,500,000	12,548	61,454	08	Orange	V	2007

4566	3610012	3610012-006	CITY OF CHINO	Eastside Water Treatment Complex - Phase 1	The Eastside Complex would provide water supply needs to meet existing and future potable water demand in the southern portion of the City's service area. The Complex includes the construction of various facilities including wells, storage reservoirs, booster stations, pressure regulating stations, treatment facilities, and associated pipelines. The proposed initial phase of the Eastside Water Treatment Complex will remove nitrate from up to 3,250 gpm of groundwater produced by Wells 16, 17, and 18. The proposed treatment facility will use ion exchange equipment that will result in treated groundwater that meets all drinking water standards for nitrate. The project will include the installation of ion exchange equipment, associated piping, tanks, filters, electrical controls, connections to existing water mains, installation of booster pumps, and construction of a brine waste pipeline. The initial phase of the treatment facility would also include the construction of a storage reservoir and a booster pumping station. A draft initial environmental study for a phased groundwater treatment program in the City of Chino's service area has been prepared according to the California Environmental Quality Act (CEQA). The study indicates that the proposed project does not create a significant negative impact. The brine resulting from the regeneration of the ion exchange resin will be	O	0	C	Chino Basin groundwater is a critical resource to the City of Chino. In 2010, local groundwater represented 83% of the City's potable water supply. However, past agricultural activities in overlying areas of the Chino Basin have significantly contributed to high levels of nitrate in groundwater produced from various wells throughout the Chino Basin. The southern portion of the City of Chino known as "The Preserve" was incorporated into the City in 2003. The Preserve is located within the Chino Valley Dairy Preserve and consists of approximately 5,228 acres of land.The City of Chino was responsible for the preparation of an EIR for The Preserve, which included a Water Supply Assessment in accordance with SB 221 and SB 610. The WSA indicated that The Preserve would significantly increase the City's potable water demand over a 20-30 year development period. The City also updated its Water System Master Plan to include a detailed evaluation of the future infrastructure that would be necessary to provide potable and recycled water to The Preserve. The Master Plan identified a multi-phased groundwater treatment facility that would include the construction of various wells, treatment facilities, storage reservoirs, booster pumps, and associated water distribution pipelines. The facility, referred to by City staff as the Eastside Water Treatment Complex, would be generally located near the intersection of	18,000,000	16,677	62,000	13	San Bernardino	V	2012

4570	3610012	3610012-004	CITY OF CHINO	Phillips Boulevard Treatment Facility	The proposed Phillips Boulevard Treatment Plant will remove nitrate and perchlorate from up to 2,200 gpm of groundwater produced by Well No. 12. The proposed treatment plant will use ion exchange equipment that will result in treated groundwater that meets all drinking water standards for nitrate and perchlorate. The project will include the installation of ion exchange equipment, associated piping, tanks, filters, electrical controls, connections to existing water mains, installation of booster pumps, and construction of a brine waste pipeline. A draft initial environmental study for a phased groundwater treatment program in the City of Chino's service area has been prepared according to the California Environmental Quality Act (CEQA). The study indicates that the proposed project does not create a significant negative environmental impact. The brine resulting from the regeneration of the ion exchange resin will be discharged to the Inland Empire Utilities Agency's (IEUA) North System Center Trunk industrial sewer line for transport and disposal out of the region, helping to further preserve and protect local groundwater quality.	O	0	C	Chino Basin groundwater is a critical resource to the City of Chino. In 2010, local groundwater represented 83% of the City's potable water supply. However, past agricultural and industrial business operations in overlying areas of the Chino Basin have significantly impacted the quality of groundwater pumped from various City wells generally located in the northern portion of the service area. Well No. 12, located at intersection of Phillips Boulevard and Central Avenue in the City of Chino, was constructed in 1982. Groundwater produced at Well No. 12 has nitrate concentrations that exceed the Maximum Contaminant Level (MCL) of 45 mg/L (as Nitrate). The City previously operated Well No. 12 utilizing blending as a treatment technique in order to reduce nitrate concentrations to permitted levels. Well No. 12 groundwater was blended with treated surface water from the Water Facilities Authority located in Upland, CA. Monitoring performed in 2008 indicated that groundwater produced at Well No. 12 had a perchlorate concentration of 16 µg/L, which exceeded the perchlorate MCL of 6 µg/L. Subsequent to this monitoring event, the CDPH, in a letter dated April 18, 2008, directed the City to discontinue operation of this well until "approved treatment is provided to meet all California Drinking Water Standards".Well No. 12 has a design capacity of approximately 2,200 gpm	4,000,000	16,677	62,000	13	San Bernardino	V	2012
4571	4310009	4310009-003	City of Palo Alto		Construct a new well on Middlefield Rd. with treatment for iron and manganese.	O	0	C	Need new well with iron and manganese treatment.	460,000	19,344	62,000	17	Santa Clara	II	1998
4572	3610012	3610012-001	CITY OF CHINO	Euclid Well Facility (Well #18)	The City is proposing to proceed with this wellhead equipping project to mitigate the impacts to the City's water delivery capability due to the two high volume groundwater wells that have been put on standby. The proposed improvements would include construction and installation of a new vertical turbine pump with electric motor, construction of new mechanical, electrical, communications and chlorination equipment and over 1000 feet of transmission pipeline. The project would also include construction of an approximately 400 square foot pump house building to enclose the wellhead equipment.	O	0	C	The City is experiencing rapid growth and increasing drinking water demands such that additional groundwater supplies are needed in order to mitigate potential water supply shortages. The City has idled, and placed on standby status, two high volume groundwater wells affected by high nitrate and perchlorate contaminants. Well head treatment is unavailable to these two groundwater facilities, which would be capable of producing approximately 4,500 gpm (6.5 mgd). As such the City is moving forward with a project, and seeking grant funding, to develop a cleaner groundwater facility located adjacent to the new growth demand center. The groundwater facility is designed to produce approximately 1,200 gpm (1.7 mgd) and is located in an area of known water quality meeting CDPH standards for nitrate and perchlorate.	1,500,000	16,677	62,000	13	San Bernardino	V	2009
4573	4310009	4310009-009	City of Palo Alto	Reservoir Water Quality Enhancement	The scope of installation of SolarBee reservoir mixing systems (6 mixers in 6 reservoirs, including mixing unit, solar panel assembly, wiring and SCADA capability) to the following City reservoirs:1. Monte Bello (1.5 MG)2. Dahl (1.0 MG)3. Park (1.0 MG)4. Boronda (1.5 MG)5. Corte Madera (1.5 MG)6. Mayfield (4.0 MG)These units are needed to preserve and enhance water quality by preventing nitrification pursuant to the City's water-quality monitoring program which supports distribution system management efforts for regulatory compliance. This monitoring program works in concert with the City's nitrification action plan to prevent nitrification episodes in the chloraminated system.	O	0	C	This project consists of installing SolarBee(tm) reservoir mixing systems at Monte Bello, Dahl, Park, Boronda, Corte Madera, and Mayfield reservoirs to prevent nitrification pursuant to the City's water-quality monitoring program which supports distribution system management efforts for regulatory compliance. This monitoring program works in concert with the nitrification action plan to prevent nitrification episodes in the chloraminated system. Implementation benefits include: fewer turnover of stored water, reducing the pumping (saving energy consumption and costs) and downflow cycle and minimizes risk of nitrification during sustained warm to hot weather conditions for water quality enhancement and compliance.	310,000	19,344	62,000	17	Santa Clara	II	2009

4574	4310009	4310009-002	City of Palo Alto		Extend a SCVWD line from Mt. View to Palo Alto along the Foothill Expressway.	O	0	C	Alternate source of water needs to be constructed.	3,000,000	19,344	62,000	17	Santa Clara	II	1998
4575	3610012	3610012-005	CITY OF CHINO	State Street Treatment Facility	The proposed State Street Treatment Facility will remove nitrate and perchlorate from up to 2,297 gpm of groundwater produced by Well No. 14. The proposed treatment facility will use ion exchange equipment that will result in treated groundwater that meets all drinking water standards for nitrate and perchlorate. The project will include the installation of ion exchange equipment, associated piping, tanks, filters, electrical controls, connections to existing water mains, installation of booster pumps, and construction of a brine waste pipeline. A draft initial environmental study for a phased groundwater treatment program in the City of Chino's service area has been prepared according to the California Environmental Quality Act (CEQA). The study indicates that the proposed project does not create a significant negative impact. The brine resulting from the regeneration of the ion exchange resin will be discharged to the Inland Empire Utilities Agency's (IEUA) North System Center Trunk industrial sewer line for transport and disposal out of the region, helping to further preserve and protect local groundwater quality.	O	0	C	Chino Basin groundwater is a critical resource to the City of Chino. In 2010, local groundwater represented 83% of the City's potable water supply. However, past agricultural and industrial business operations in overlying areas of the Chino Basin have significantly impacted the quality of groundwater pumped from various City wells generally located in the northern portion of the service area. Well No. 14, located at intersection of State Street and Benson Avenue in the City of Montclair, was constructed in 1988. Groundwater produced at Well No. 14 has nitrate concentrations that exceed the Maximum Contaminant Level (MCL) of 45 mg/L (as Nitrate). The City previously operated Well No. 14 utilizing blending as a treatment technique in order to reduce nitrate concentrations to permitted levels. Well No. 14 groundwater was blended with treated surface water from the Water Facilities Authority located in Upland, CA. Monitoring performed in 2008 indicated that groundwater produced at Well No. 14 had a perchlorate concentration of 9.9µg/L, which exceeded the perchlorate MCL of 6 µg/L. Subsequent to this monitoring event, the CDPH, in a letter dated April 18, 2008, directed the City to discontinue operation of this well until "approved treatment is provided to meet all California Drinking Water Standards".Well No. 14 has a design capacity of approximately 2,297 gpm	4,000,000	16,677	62,000	13	San Bernardino	V	2012
4576	3010046	3010046-009	City of Tustin	TUSTIN AVENUE WELL REPLACEMENT PROJECT	The proposed Tustin Avenue Well Replacement Project will consist of two phases- drilling and constructing and equipping a new well and related appurtenances. The new well will allow the City to pump groundwater that will satisfy part of Tustin's domestic water demands. The new well is expected to produce 1,936 AF annually. This new water supply will help reduce the City's reliance on imported water by an estimated 50%. The project will include the procurement of design services, design and construction of the well head, building, associated facilities/equipment, emergency power source and abandonment of two existing wells. In the drilling phase, the new well would be drilled to a depth of 1,200 feet. The diameter of the bore hole would be 36 inches. The drilled hole will be stabilized with alternating sections of solid and perforated 20 inch diameter stainless steel casing. The perforations maintain the integrity of the hole while allowing water to flow through it. A gravel pack, sanitary seal, and accessory tubes will be installed around the steel casing to ensure well stability and protect the local groundwater from potential contamination. A temporary sound barrier will be erected around the well site to minimize the effects of noise to the neighboring community during the eighteen day, twenty-four hour drilling process. The well will be tested to determine its pumping capacity. The test data will be used to design	O	0	C	Tustin Avenue Well was constructed in 1952 and has been in service for 58 years. It's currently producing 580 AF a year. The production capacity has been dramatically decreased in recent years due to poor construction and inferior materials used.1. Sand: Some production from the Tustin Avenue Well has sand. This has potential to reach nearby customers, wear down equipment and decrease well reliability. 2. No sanitary seal: Tustin Avenue Well site lacks an adequate sanitary seal. The well has the potential to allow contaminants to enter groundwater aquifer. 3. Security concerns: Well has no back up power and improved security is needed to meet post 9/11 standard. The lighting, fencing, access, and monitoring of the facility need improvement. 4. No disinfection: Well facility doesn't have ability to adequately disinfect water produced. The rehabilitation of the facility has been ruled out due to poor construction and inferior materials used. The construction of the new well on the same site is proposed.	4,250,000	14,071	62,100	08	Orange	V	2011

4577	1910092	1910092-010	MONTEREY PARK-CITY, WATER DEPT.	Russel Reservoir Replacement	The project consists of designing and constructing one 3 MB steel reservoir to replace the outdated systems. The new reservoir will be modern and seismically approved.	O	0	C	Russell 1 is a concrete 1 MG reservoir constructed in 1922 and Russell 2 is a 2 MG concrete reservoir constructed in 1927. Both are currently out of service due to cracking/leaking. This project to construct a new reservoir will alow the City to meet the its water demand. More importantly, the new reservoirs will meet seismic standards.This project will be part of the City's Climate Action Plan to reduce its carbon footprint. The additional storage allows pumping wells at night, during off-peak hours. This practice will reduce the draw of electricity in the region and help to mitigate against rolling blackouts.	3,000,000	13,045	64,000	07	Los Angeles	IV	2012
4578	4310005	4310005-004	City of Milpitas	TASP Water Tank & Pump Station Installation, CIP 2002	The proposed project includes a study to identify feasible sites and purchase land for a new potable water system tank and pump station. Other water system components anticipated to be housed at the site are: turnout, emergency generator, portable generators, surge tank, pressure reducing valves, and storage for piping, valves, and flexible hose. A preliminary site layout has determined that a minimum of three acres is needed. A larger site may be needed if the shape does not meet certain minimum dimensions. The new pump station and water tank will serve the SCVWD service area and is likely to be constructed near the Great Mall in south-central Milpitas. This area is preferred due to its proximity to the SCVWD wholesaler supply pipeline.	O	0	C	The City of Milpitas needs additional funding to purchase land for a new 6.6 million gallon potable water system tank and pump station. The Milpitas 2009 Water Master Plan Update identified a shortfall of 6.6 million gallons of potable water system storage in the City, impacting operational equalization capacity to minimize peak demands, emergency reserve to mitigate short-term water supply interruptions, and fire suppression storage. The City of Milpitas is located between the Cities of San Jose and Fremont. The City is home to approximately 71,000 residents, large and medium commercial retail outlets, and various industries, including high-technical/electronic facilities. The City purchases an average of 10.5 million gallons per day of potable treated water supply that connects to 16,500 service connections. The City is divided into two distinct wholesaler service areas: San Francisco Public Utilities Commission and Santa Clara Valley Water District (SCVWD). The SCVWD service area is comprised of about 2,800 acres and is predominantly zoned as industrial. The recently adopted Transit Area Specific Plan (TASP) converts a 437 acre subarea consisting primarily of light industrial zoning into high density residential, commercial and mixed use zoning. This zoning density increase is a cornerstone of the transportation corridor where the planned Bay Area Rapid Transit system will interconnect with the existing	5,500,000	14,808	66,200	17	Santa Clara	II	2011

4579	4310005	4310005-005	City of Milpitas	Ayer Reservoir & Pump Station Improvements, CIP 7102	The project work consists of designing and constructing seismic improvements to the Ayer Pump Station, sealing the pump station concrete floors to prevent moisture intrusion, replacing the hoist (used for moving large pieces of equipment), plumbing the tank discharge line to the sanitary sewer, and implementing various mechanical and electrical equipment upgrades at the pump station. The total project cost is $1,350,000. The City is requesting $1,100,000 in grant funding.	O	0	C	The City of Milpitas needs additional funding to rehabilitate its Ayer Water Tank and Pump Station. This facility primarily provides drinking water and fire flows to residential areas, including schools. The Milpitas water distribution system relies on storage to provide operational equalization capacity to minimize peak demands, emergency reserve to mitigate short-term water supply interruptions, and fire suppression storage. Several needed facility improvements have been identified. The City has already repaired the overflow structure settlement and is in the process of repairing or replacing pumps, motors, variable frequency drives, and controls. Remaining improvements include: seismic upgrades to the pump station building, sealing the floors to prevent moisture intrusion, replacing the hoist (used for moving large pieces of equipment), plumbing the tank discharge line to the sanitary sewer, and implementing various mechanical and electrical equipment upgrades. These improvements are required in order to assure continued reliability and a safe, potable water supply in the event of a catastrophic emergency; however, they are currently on hold due to a lack of funding. The City is completing a $9 million rehabilitation project at the Gibraltar Water Tank and Pump Station and is unable to fund multiple large-scale projects.The City of Milpitas is located between the Cities of San Jose and Fremont.	1,100,000	14,808	66,200	17	Santa Clara	II	2011
4580	4110006	4110006-003	California Water Service - Bear Gulch	Bear Gulch "City Wide" Water Conservation Program	The program has two "full service" elements that encompass a "City Wide Water Conservation Program". Element A: A team of trained plumbers will retrofit 13,176 residential homes / 26,352 bathrooms with one 1.5 gpm shower head, one 1.0 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 808 acre feet per year. Element B. A team of specialist will retrofit 4,425 residential yards with modern ET controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 136 acre feet per year. .This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 months or less. The program will employ 75 to 100 people for 12 months.	O	0	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 944 acre feet per year or 50.0 / 75.0 gallons per day, per person. Increasing the system water supply is not an option and saving water is the only practical option.	12,085,470	17,568	66,470	17	San Mateo	II	2009
4581	4110006	4110006-001	California Water Service - Bear Gulch		treatment plant upgrades-Particle Counter SCADA system connection, and Precursor removal for Total Trihalomethane (THM) control. 4585	0110008	0110008-003	City of Pleasanton		Evaluate design and construct well head water softening facilities.	O	0	C	Groundwater during the summer; customer complaints increased regarding hardness as well as complaints during other times of the year from dissoultion of CaC03 and colored water from corrosion.	15,000,000	21,516	67,876	04	Alameda	II	1998

4586	5610040	5610040-001	CAL AMERICAN WATER CO	Santa Barbra "District Wide" Water Conservation Program	The program has two "full service" elements that encompass a "District Wide Water" Conservation Program. Element A: A team of trained plumbers will retrofit 23,250 residential homes / 46,500 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 1,426 acre feet per year. Element B. A team of specialist will retrofit 7,750 residential yards with modern ET water controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 475 acre feet per year. .This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 – 24 months and employ 75 to 100 people.	O	0	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 2,162 acre feet per year or 50.0 / 75.0 gallons per day, per person.	25,879,500	20,135	67,894	06	Ventura	IV	2009
4587	3310021	3310021-015	Jurupa Community SD	56th Street Booster Station Expansion and Master Plan 18-inch Waterline from 56th Street Booster Sta	The project consists of constructing approximately 2,000 feet of 18-inch pipe and installing an additional pumping unit in the empty pump can at the existing 56th Street Booster Station. The project will allow further pumping redundancy and in conjunction with the pipeline installation greater pumping capacity to the 1100-foot pressure zone. Completion of the pipeline will benefit the overall system hydraulics and lower pumping costs.	O	0	C	The current Jurupa Community Services District distribution system does not have adequate redundancy for the main feed to the drinking water distribution system in the 1100-foot pressure zone. An existing 18-inch diameter waterline has been partially installed along the northern side of Indian Hills on Whitney Drive, with a section of approximately 2,000 feet pipe needs to be installed. The completion of the pipeline will provide the appropriate redundancy to the water system in the Indian Hills service area.	1,000,000	24,684	68,297	20	Riverside	V	2011
4588	3310021	3310021-016	Jurupa Community SD	JCSD-Rubidoux Interconnection Booster Station and Pipeline	The project consists of installing an inline booster station to deliver an additional seasonal range of 1,000-4000 gpm from the Rubidoux distribution system to the JCSD system. The booster station would provide the capacity to pump the additional water to the JCSD system and also would decrease the amount of electrical energy used to move water froom the 870-foot pressure zone to the 1100-foot pressure zone.Interconnection with the Rubidoux system will provide a more reliable water supply for JCSD.	O	0	C	An interconnection is needed to improve water supply reliability. The current Jurupa Community Services District distribution system does not have sufficient capacity to pump an additional seasonal range of 1,000-4000 gpm of drinking water available from Rubidoux Community Services District. The Rubidoux water supply is at approximately 1060-foot pressure zone and the Jurupa system is at 1100-foot pressure zone, making pumping necessary to convey the water from the lower Rubidoux area to the JCSD service area. An efficient pumping system is needed to reduce the energy to move the water from one distribution system to the other.	1,250,000	24,684	68,297	20	Riverside	V	2011

4589	5710001	5710001-007	City of Davis	City of Davis Treated Surface Water Distribution Facilities	Design and construct local facilities to distribute treated surface water supplies delivered by the regional WDCWA to city customers. The distribution system improvements will include: 46,000 feet of transmission and distribution pipelines (varying in size from 12 to 42 inch diameter), one 4- million gallon terminal water storage tank to dampen regional surface water deliveries into the city water system, new booster pump facilities to pressurize surface water deliveries into the distribution system, SCADA system control improvements, and deployment of an advanced metering system (AMR/AMI) to better manage, monitor, and report system-wide water use and reduce peak demands. These improvements will transition the city from total reliance on local groundwater supplies to a conjunctive use operation with year-round treated surface water supplies augmented by groundwater during peak demand periods. The City of Davis was established in 1917, meaning some of the existing water distribution system infrastructure is aging and needs to be replaced. The required modifications to the distribution system will serve two purposes: (1) upgrade old infrastructure, and (2) facilitate efficient distribution of treated surface water deliveries to city customers.	O	0	C	Replace old well capacity (high in: total dissolved solids, nitrate, total and hexavalent chromium, selenium, manganese, boron, and other constituents) with a new treated surface water source to comply with water quality regulations, provide water that is more aesthetically acceptable to customers, and improve future water supply reliability.The city has identified that a conjunctive use water supply portfolio represents the least costly alternative to: (1) provide potable water supplies that meet all current and future water quality regulations; (2) meet all of the city's wastewater discharge requirements issued by the RWQCB (including elimination or reduction of salts and other constituent levels), (3) provide customers with water quality that does not require water softeners and/or home treatment devices, and (4) diversify water supplies so that the City does not rely 100% on local groundwater resources which have declining water quality, and are not able to meet current and future water quality regulations or demands, and will cause long term subsidence effects.	22,400,000	16,339	68,420 09	Yolo	I	2011
4590	5710001	5710001-009	City of Davis	Davis - Well 34 - Water Well Manganese System	Construct new deep aquifer Well 34 and well treatment system to help supply current demands, comply with manganese secondary MCL levels, and improve source water quality for the city's wastewater treatment plant. The overall purpose of the new deep aquifer Well 34 and well treatment system is to replace lost well capacity to the City of Davis by providing a reliable source of high quality potable water that meets all regulatory requirements and results in the lowest overall cost to the consumer. Specific project objectives are to:• Provide necessary groundwater supply lost from wells removed from service and compensate for historic increase in demand.• Construct the well treatment system to obtain better water quality.• Meet current and anticipated primary and secondary drinking water standards established by CDPH.• Improve aesthetic water quality and reduce consumer related costs. • Lower the level of constituents of concern in wastewater supplied to the City's wastewater treatment plant to minimize potential for violating current or anticipated NPDES permit requirements.The new deep Well 34 will be completed into the deep aquifer (to a depth between 700 and 2000 feet below ground surface) with a pumping capacity of 2,250 gpm. The new well will help supply current demands and replace 30 percent of the supply lost from the abandoned intermediate depth wells. The new well will	O	0	C	Significant water quantity problems caused by source water capacity are insufficient to supply current demand. The City of Davis relies solely on groundwater to meet 100 percent of its potable water demand. Since 1917, the City of Davis policy had been to utilize the intermediate depth aquifer. Therefore the current wells can range from 22 to over 50 years old. Since 1987, the City has had to remove seven intermediate depth wells from service due to age, poor water quality, production, and/or operations and maintenance problems. The total average well capacity removed from service is approximately 6,050 gpm, resulting in a significant water quantity problem and an inability to supply current demand. Since 1992, the city policy changed to require that all new wells be installed in the deep aquifer where the supply is better and of higher quality. A new deep aquifer Well 34 is required to replace lost well capacity to the City of Davis and meet current demands. The City strives to provide the best water quality possible to its customers. The intermediate depth aquifer has experienced water quality problems including elevated levels of calcium, manganese, TDS, nitrate, boron, hexavalent chromium, and selenium. Studies indicated that better water quality exists in the deep aquifer, with much lower levels of hardness, selenium, total salinity, nitrates and other contaminants. The new deep aquifer Well 34 will help	3,500,000	16,339	68,420 09	Yolo	I	2012

4591	5710001	5710001-010	City of Davis	City of Davis Automated Meter Reading	The City will replace meters when the warranty becomes expired. Current meters are nearing their end of life and may have to be replaced. If the City has to change meter chambers and registers out, then installing an updated meter reading system at the time is likely a logical collaborative step. The City will consider the lifetime of existing meters including registers and chambers when implementing AMR and installing Meter Interface Units (MIU). The City will pull some meters in different zones and test for accuracy, and checking for sand especially near wells known for grit. Unlike meter chambers that may decline in accuracy, registers either function or fail. Note that the majority of City registers were installed in 1998 and that new registers are required for real-time reads. Again, the longer the City waits the less efficiencies and cost savings gained by switching to AMR. (Currently, new meters are going on with old registers.)The advantages and disadvantages of an AMR system are as follows:Advantages:• Very low annual operating cost• Continuous meter data collection • Data available in near real-time• Timely identification of leaks• Accurate data collection• Improved meter data management• Increased water savings. The ability to catch leaks in an efficient manner is significantly improved on both the customer side and system side. With the ability to compare production and consumption values daily, it is	O	0	C	The City of Davis seeks to avoid the significant annual cost associated with manual meter readings. Currently, the City reads its 16,350 water meters every two months with a contract meter reading firm. Difficulties with manual meter reading include accessibility to hard-to-reach locations, hazardous situations, loose dogs, unfriendly homeowners, and water-filled meter pits. All of these difficulties contribute to the high labor cost of manual reading. Through the implementation of an Automated Meter Reading (AMR) system, the City would like to accomplish:1. Reduced meter reading costs, 2. Improved water demand information to support water conservation efforts,3. Improved customer service, 4. Improved business operations, and5. Reduced green-house gas emissions from manual meter reading vehicular traffic.An AMR system will allow the city to read its water meters on an hourly basis to: 1. Provide early leak detection notification to customers, 2. Read meters remotely for such purposes as escrow closings, 3. Develop a water balance between water supply and demand meters to identify true unaccounted for water losses, 4. Eliminate manual meter reading processes by both contractor and city staff to reduce city GHGe, and 5. Provide additional demand data to customers to improve water conservation decision-making.The City would like to upgrade their water meter reading system to operate	3,700,000	16,339	68,420	09	Yolo	I	2012
4592	1910026	1910026-010	COMPTON-CITY, WATER DEPT.	Well # 20 excess Manganese Removal System	Well # 20, at a cost of nearly $ 3'000'000, is a key componant of Compton's balabced water sistribution system. It suffers from high level of Manganese. A pumping flow rate of 1'500gpm to 2'000gpm must recieve treatment for the removal of excess Manganese, befor well # 20 could serve the city of Compton.	O	0	C	Well #20 in the Sibrie Park is located in the North West area of the City of Compton. The Well Site was selected, in compliance with the Water Department's Policy of relying on a network of 9 local wells, to meet most of the Compton's water needs from Central Ground Water Basin. This Policy is to reduce the need for the more expensive water, provided by the Metropolitan Water District of Southern California (MWD). The City of Compton is determined to climb out of the pit of being a highly dis- advantaged community in the State. A "New Compton is being born. The Water Department's mission in support of a "New Compton", is to comply with water Quality, pressure and flow rate standards, at min. water cost.Well # 20, at a cost of nearly $ 3'000'000, is a key componant of Compton's balabced water sistribution system. It suffers from high level of Manganese. A pumping flow rate of 1'500gpm to 2'000gpm must recieve treatment for the removal of excess Manganese, befor well # 20 could serve the city of Compton.	1,000,000	14,055	71,000	22	Los Angeles	IV	2011

4593	3110025	3110025-009	Placer CWA - Foothill	Foothill Raw Water Supply Pipeline	PCWA is proposing to construct a 14,700-foot-long 45, 39, and 33 inch raw water supply pipeline, 100,000 gallon hydraulic control standpipe and 500 foot-long, 36-inch overflow pipe, and a new outlet pipeline that could discharge up to 17 cfs of water from the raw water pipeline to the Dutch Ravine canal.The objective of the project is to have operational flexibility, a backup raw water supply for the Dutch Ravine canal, and a redundant crossing of I-80 between the water source at Ophir and the Foothill Water Treatment Plant (WTP). Currently, water supply to Dutch Ravine and Foothill WTP comes from PG&E's South Canal which is subject to an annual PG&E maintenance. The project corridor is generally located in the communities of Newcastle and Ophir, Placer County, California. The proposed pipeline would extend between PCWA's Ophir Road Pump Station, located on Ophir Road, to the Foothill WTP. The Foothill WTP is located in Newcastle on the south side of Powerhouse Road, east of Newcastle Road.The 14,700 foot long pipeline would begin at the Ophir Road Pump Station and would follow Ophir Road west toward the community of Newcastle to a point just east of Lozanos Road, where it would cross under I-80. After crossing I-80, the pipeline would be placed underground across Dutch Ravine and then bored under the Union Pacific Railroad (UPRR) line. On the south side of the UPRR line, the pipeline would follow an existing dirt	O	0	C	Foothill Raw Water Supply ProjectPCWA is proposing to construct a 14,700-foot-long 45, 39, and 33 inch raw water supply pipeline, 100,000 gallon hydraulic control standpipe and 500 foot-long, 36-inch overflow pipe, and a new outlet pipeline that could discharge up to 17 cfs of water from the raw water pipeline to the Dutch Ravine canal.The objective of the project is to have operational flexibility, a backup raw water supply for the Dutch Ravine canal, and a redundant crossing of I-80 between the water source at Ophir and the Foothill Water Treatment Plant (WTP). 4594	3110025	3110025-007	Placer CWA - Foothill	Placer County Water Agency 2009 Water System Security Improvements	This project includes fencing and security improvements at several key water system facility sites. These sites include the Foothill Water Treatment Plant, the Sunset Water Treatment Plant, the Whitney Raw Water Reservoir, the Rocklin Road 1.0 MG Water Storage Tank, and the Sunset 2.5 MG Water Storage Tank.The Foothill Water Treatment Plant is PCWA's largest water treatment facility. It has a capacity of 55 MGD and is the primary source of treated water for this water system. The plant's current fencing is inadequate in many areas and does not meet PCWA's current stardard for security fencing at a water treatment facility. The project will bolster security in numerous areas of the perimeter fencing, install barbed wired atop existing fencing, and re-install fencing in areas that cannot bolstered. The Sunset Water Treatment Plant is the secondary source of treated water for this system. The plant's current fencing in need of security improvements in numerous areas.The Whitney Raw Water Reservoir is approximately 0.5 miles north of the Sunset Water Treatment Plant. The reservoir provides raw water storage for the Sunset WTP. Water is pumped from the reservoir directly to the WTP. The 14.7 acre site is currently fenced with rural style barbed wire fencing typically used for livestock. Some portions of the site do not have fencing. The project will install new fencing around the raw water reservoir, thus	O	0	C	Water security improvements needed.	250,000	21,995	72,584 02	Placer	I	2008

4595	3110025	3110025-008	Placer CWA - Foothill	Ophir Water Treatment Plant	The Ophir Water Treatment Plant (WTP) facility would have a treatment capacity of 30 million gallons per day. The project site would be located on the northwest side of Ophir Road, southwest of the City of Auburn, in Placer County, California. The Ophir WTP facility would include the following facilities:Operations, Laboratory and Maintenance BuildingsThe maintenance building will be used for office and operational work for the WTP. The laboratory building will be used for lab work at the WTP. The maintenance building will be used for plant maintenance activities. Chemical Storage and Feed Building Chemicals delivered to and used at the WTP will be stored within this building. Pretreatment StructureThe pretreatment process (Actiflo® system or Plate Settler Pretreatment) is designed to reduce the turbidity and total organic carbon content of the water to achieve satisfactory filter performance and to meet finished water quality goals and will be in an enclosed structure.Solids Handling FacilitiesSolids or sludge from the pretreatment process and the backwash sedimentation basin will flow to the on-site sludge handling facilities. The drying beds will consist of in-ground reinforced concrete basins. Filter StructureThe filter structure (either dual media filters or membrane filters) consists of a concrete basin constructed below existing grade elevation. 4596	3610050	3610050-001	CITY OF UPLAND	9th Street IX Plant Booster Project	The subject location treats groundwater through a fixed bed anion exchange (IX) treatment system followed by passive air stripping system (PASS). Both the IX and PASS systems were constructed in 2008 with local grants. The primary pollutants to be removed are nitrate and VOC. The treated water from the PASS is discharged to a below grade concrete wet well. It is then adjusted for pH, chlorinated, and pumped to an onsite above grade 0.2 MG steel storage reservoir, using low head wet well vertical turbine transfer pumps. The potable water in the steel reservoir is then pumped to the City's distribution system by a pump system (PS) that is outdated, insufficient and not reliable.This PS comprises of 3 different centrifugal horizontal split case pumps installed at different time in early 1960's. None is the same as others. These pumps, when combined, do not provide sufficient capacity (GPM), matching up with the capacity of the IX process. In addition, during normal operation, the system efficiency is only 55% to 60%, causing the City to incur a very high pumping cost to supply the needed water. It also does not provide the required necessary head to boost water to other part of the City. Furthermore, its associated pumping components are limited and unreliable due to wear and age, for example, the feed line from the reservoir serving these pumps is limited to 12-inch and electrical gear box is outdated.The City wishes to replace the	O	0	C	The City of Upland has three contaminated wells that can feed into it's Ion Exchange treatment plant at a total of 2600 gallons per minute. Unfortunately the booster pumps can only pump 1600 gallons per minute out of the plant leaving 1.5 million gallons of water per day unusable. That unusable water must be supplemented with expensive imported water deliveries from Metropolitan Water District. This is a drought year and MWD has significantly reduced deliveries, time is of the essence to get these new boosters on-line so we can be more reliable and self sufficient without having to rely on imported water. The project is ready to go to bid if the funds are made availble to the City of Upland.The more efficiently we can operate our facilities, the better stewards we are of public funds and resources. Again, this improvement will greatly increase our reliability, protect the public water supply, and allow us to be less dependant on expensive imported water deliveries.	2,000,000	18,271	73,300	13	San Bernardino	V	2009

4597	4110022	4110022-005	City of Redwood City	Automatic Meter Reading Equipment Installation	The City has already installed the infrastructure needed for automatic meter reading. This includes three Tower Gateway Base Stations (TGBs), servers, and miscellaneous hardware. The project would therefore only include the installation of new water meters at 18,655 single family homes.	O	0	C	The City of Redwood City is 100% dependent on the San Francisco Public Utility Commission for all of its drinking water supply. The City receives a water supply assurance in the amount of 12,243 acre feet per year. For the last ten years, the City has used an average of 700 acre feet per year over its supply assurance. This leaves the City extremely vulnerable during drought or water shortage emergencies.The City participated in an Aquacraft study that showed its 18,655 single family residential (SFR) homes have water leaks that account for as much as 14% of total water use. The City has implemented a pilot program to test automatic meter reading equipment that allows for leak detection and reporting and it has proven to be an effective tool for water conservation purposes. In addition, the meters that are used for this customer class are old and ineffecient, and the City's unaccounted for water loss is approximately 10%. The installation of new meters will have the potential for saving as much as 24% of total water use for this customer class, or 2,900 acre feet per year. Reducing the water use for this customer class will help provide a safe and reliable water supply for the City's 83,000 water customers.The water savings that could be achieved through the installation of these water meters will protect the City during drought. Not only will they help to provide an adequate supply of water, they will also reduce the City's carbon footprint	6,510,000	22,992	75,402	17	San Mateo	II	2009
4598	4310007	4310007-005	City of Mountain View		Removal of Bryant tank with system modifications.	O	0	C	Demolition of Bryant Elevated water tank.	150,000	16,246	76,000	17	Santa Clara	II	1998
4599	4310007	4310007-016	City of Mountain View		Design and construct upgraded system controls at three turnouts.	O	0	C	The City's existing control systems at the SFWD turnouts need to be replaced.	130,000	16,246	76,000	17	Santa Clara	II	1998
4600	4310007	4310007-004	City of Mountain View		Demolition and removal of pump station and reservoir.	O	0	C	Demolition of storage reservoir.	60,000	16,246	76,000	17	Santa Clara	II	1998
4601	4310007	4310007-017	City of Mountain View	City of Mountain View - Water Meter Replacement	The City is requesting funding to replace its aging meter inventory. New meters will be installed with remote reading technology, providing the ability to quickly identify leaks and excessive water use, ultimately improving conservation and reducing the amount of unaccounted for water. Customers will also be able to monitor real-time consumption using remote reading devices. Additionally, vehicle use and fuel consumption will be reduced, decreasing production of greenhouse gases. Although the project will project will provide more accurate and timely water reporting, improve the effectiveness of conservation efforts and assist in greenhouse gas reduction, the City has not identified adequate funding for this capital replacement. Requested funding will be used to purchase approximately 17,000 meters and remote reading devices, providing economic stimulus for the manufacturing industry. The program will also necessitate the addition of six employees for approximately 4-5 years to complete installation work and the purchase of several vehicles and related installation equipment and tools.	O	0	C	The City of Mountain View has approximately 17,700 water meters. The City's existing meters were installed in the early 1990s, indicating that City metering of water consumption is likely understated. The optimal operating life of a water meter is 15 years, and while meters function beyond this time frame they begin under-recording water use, reducing water sales revenue and increasing the amount of unaccounted for water. Based on manufacturer testing and American Water Works Association research, water consumption is underreported by 1% to 2% in meters 16 to 20 years old and 2% to 5% in meters 20 to 30 years old.	5,421,000	16,246	76,000	17	Santa Clara	II	2009

4603	4310007	4310007-009	City of Mountain View		Design and construct a replacement telemetry system.	O	0	C	The City's telemetry system is obsolete and inaccurate.	1,200,000	16,246	76,000	17	Santa Clara	II	1998

4604	3010037	3010037-002	Yorba Linda Water District	YLWD Well No. 15 Removal of Arsenic and Manganese	The least expensive method of correction for these chemical contaminants is adsorption by Iron-based adsoption media contactors-granular Ferric Hydroxide (GFH). This project would require piping modification, building enclosure, monitoring equipment, electrial improvement and pumping systems modification to Well No. 15. Typical installation of this system is in pressure vessels to allow a single pumping stage for the treatment system. Water continuously passes through the media bed where arsenic, manganese, and other heavy metals are adsorbed from the water into the media. The vessels are arranged in parallel or series with an empty bed contact time of about five minutes. The pressure vessels are backwashed once every two to six weeks to prevent bed compaction and to remove trapped particulates. Once the GFH media is exhausted, it is removed from the vessels and new media is installed. Exhausted media that has passed toxic characteristics leaching procedures tests in most instances can be disposed of in a non-hazardous landfill.	O	0	C	Presently the Well No. 15 water source exceeds the 10 parts per billion (ppb) arsenic primary drinking water standards. Currently, the 2-year average arsenic level of Well No. 15 is at approximately 16.42 ppb and marginally exceeds the 50 ppb secondary (aesthetic) standard for manganese. Currently, the District has an approved blending plan from the State for Well No. 15. In order to correct this problem, the District blends the water from Well No. 15 with 2-3 other wells. Currently, our staff must sample, test, and analyze, then log and report findings on the Arsenic and Manganese levels as well as; report the chemical contaminant levels every month to the State. If the chemical contaminants could be treated in Well No. 15 as proposed in this application for funding, it would provide better flexibility of using the well on its own when demand decreases during the winter months and ultimately reduce the demand on Colorado River Water. In addition, it would decrease the need for additional energy resources that are currently being utilized in the blending process and decrease staff time spent on sampling and monitoring.	760,000	23,489	77,513 08	Orange	V	2007
4605	2810003	2810003-006	Napa, City of	Jamieson Canyon Water Treatment Plant Ozone Project	The Jamieson Canyon Water Treatment Plant (JCWTP) serves 6 water systems in Napa County including the City of Napa, American Canyon, Yountville, St Helena, Calistoga and the Congress Valley Water District. The JCWTP is a critical facility to supply water via normal/emergency interties with each of the aforementioned cities for a combined population of 114,000 Napa Valley residents. Ozone is among the strongest oxidants and when used as a pre-oxidant, can reduce the amount of coagulant required for carbon removal. The JCWTP uses high doses of Alum as a coagulant, especially during the episodes of high total organic carbon (TOC) and turbidity occurring in the source water. Addition of Ozone at the pre-treatment stage will reduce the presence of TOC prior to sedimentation and filtration, thereby reducing the occurrence of disinfection byproducts (DBPs) in the final treated water. The City has included pre-ozone and the potential for intermediate ozone in the plant improvement project scheduled for 2008. Construction of the Ozone system will include ozone generators, a liquid oxygen (LOX) storage and vaporization system, an ozone transfer system, an ozone contactor (with bypass piping) ozone residual monitoring, an ozone off-gas collection and	O	0	C	Background The Jamieson Canyon Water Treatment Plant (JCWTP) has been unable to meet the Stage 1 Disinfectants/Disinfection Byproduct Rule (D/DBPR.) The source water for the JCWTP is North Bay Aqueduct water that is subject to episodes of high concentrations of both dissolved organic carbon (DOC) and turbidity. Nearly all of the total organic carbon (TOC), the constituent identified in the D/DBPR, is in the source water as DOC. If TOC is present at the end of the treatment process, the addition of chlorine to the treated water results in the formation of disinfection byproducts (DPBs) including THMs and HAA5 that exceed the limits of Stage 1 D/DBPR. The City monitors TOC removal to verify compliance with the Stage 1 D/DBPR and during 2003 was unable to meet the efficiency removal goals based on raw water TOC and alkalinity concentrations. Future The City is highly concerned about the impending Stage 2 D/DBPR and must implement this project in order to come into compliance. In addition the upcoming regulation of endocrine disruptors and personal care and pharmaceutical products (PCPPs) will introduce greater challenges to maintaining a treatment system that meets regulatory compliance standards. It is important to note that the Easterly Wastewater	7,400,000	24,990	79,959 03	Napa	II	2007

4606	2810003	2810003-012	Napa, City of	Sludge handling equipment for Jamieson Canyon Water Treatment Plant	The project includes purchase and installation of filter belt presses for fast and efficient dewatering of sludge material from the sedimentation basins and filter backwash operations. Consolidation of the sludge material will reduce the water content of the material for off-haul and greatly reduce the total volume and weight of material that must be handled. Solids removal and reduction of the waste stream and will assist the City in meeting the Filter Backwash Recycle Rule (FBRR) such that the filter backwash makes up no more than 10% of the total plant flow. The improvements to the overall sludge handling process will also assist the City in ensuring compliance with the Cryptosporidium Action Plan (CAP) and meeting the 0.2 NTU compliance point for the supernatant Additional capacity for sludge handling on site will result due to the increased ability to reduce the volume of solids because the sludge will consist of 16-20% solids which is significantly higher than the current 6-8% solids.This project poses no significant environmental impacts. The site is currently under construction with a certified CEQA EIS. This project reduces maintenance procedures for ogoing water treatment operations.The design and procurement of the equipment can be completed within three months of notification of funding.	O	0	C	The City of Napa currently treats State Water Project water via the North Bay Aqueduct. The water frequently brings episodes of highly turbid water loaded with organic carbon. As a result, the Jamieson Canyon Water Tretment Plant is forced to increase chemical addition to facilitate coagulation and sedimentation of the organic matter. The result is a high volume of sludge production and difficulty in meeting the Cryptosporidium Action Plan (CAP) and the Filter Backwash Recycle Requirement (FBRR.) The limits of the site and the City's ability to decant the supernatant off of the earthen basins impedes the sludge handling process. The inefficient process requires intensive labor and energy to turn the sludge and allow drying such that it is able to be hauled off to a local landfill. The sludge drying process can be compressed from months to days or even hours with the use of a filter belt press to compress solids in preparation for for removal from the sludge ponds and off-haul and/or land application. The sludge handling equipment will reduce the carbon footprint of the operation by reducing the energy applied to the drying process by eliminating mechanical handling, turning over and drying of the material. The equipment will produce a dryer product thereby reducing the weight and volume of the material to be off-hauled, and the associated carbon footprint of the hauling operation.	1,500,000	24,990	79,959	03	Napa	II	2009
4607	2810003	2810003-001	Napa, City of		Rehabilitate or replace intake tower.	O	0	C	Lake Hennessey intake tower valves are old and in poor condition. One valve is broken open.	700,000	24,990	79,959	03	Napa	II	1998
4608	2810003	2810003-005	Napa, City of	Napa Water System Security Improvements	Since completing the Vulnerability Assessment in 2003, the City of Napa has implemented a number of security improvements within the water distribution system and at the treatment plants including security cameras, fencing, lighting improvements, and access control gates. In 2008, the City will begin construction on the Jamieson Canyon Water Treatment Plant Improvements which includes security cameras, access control gates, perimeter fencing, security lighting, card key access, and control room monitors. The Jamieson Canyon Water Treatment Plant (JCWTP) treats State Water Project water for Napa, Calistoga, and Yountville. It also supplies water to St. Helena, American Canyon, and the Congress Valley Water District under supply agreements. The JCWTP is a critical facility to supply water via normal/emergency interties with each of the aforementioned cities for a combined population of 114,000 Napa Valley residents. The existing security measures at JCWTP consist of a single access control gate, two cameras, and a sub-standard perimeter fence or lack of fencing in some areas. The planned security improvements included two additional cameras, screens in the operator control room to monitor all security cameras on the water	O	0	C	Security Project	900,000	24,990	79,959	03	Napa	II	2007

4610	1210013	1210013-010	Humboldt Bay MWD	Ranney Collector 1 Laterals Replacement and Pump Replacement	The District has concluded focused engineering studies from 2002 through 2006 emphasizing the need for replacement or refurbishment to maintain water distribution at optimum levels. In early 2009, the District suffered a revenue loss approximating 55% of all receipts with the loss of industrial pulp mill operations. This delayed needed upgrades to maintain the quality of the current laterals and the two pumps retreiving the water. Our estimated replacement time is extended from 12-15 years to 25 and 40 for the respective pumps. The project is broken down into the following:Design, $184,950Construction-$1,230,864Pump Replacement - $258,930Inspection-$98,640Legal/Administration-$151,257Total Project: $,1924,641This project is a priority 3 project requiring the need to be addressed in less than a five year time-frame.	O	0	C	The Humboldt Bay Municipal Water District is a regional water district serving seven outside districts including more than one disadvantaged community. The Ranney collectors consist of concrete caissons installed to a depth approximating 600 feet in the Mad River of Eureka, California. The laterals collect the water and direct it to the central caisson for distribution. Engineering reports indicate all laterals are either plugged, capped or have the valves closed or nearly closed. Installation of new laterals will add operational life to the system and allow for an increase in production. This is especially useful for the summer time water requirements provided the valves and laterals can be re-opened. New lateral installation has been found to be cost and production beneficial based on past history of Collector 2 refurbishment and Collector 3 replacement.Pumping equipment supporting the distribution are 40 and 25 years old respectively (the replacement and upgrade cycle is 12 to 15 years). The pumps are running between 63% to 71% of efficiency creating excessive power and production costs despite rebuild efforts. Focused engineering studies recommend replacement within a minimum five year timeline.	1,950,000	224	80,000	01	Humboldt	I	2012
4611	3710005	3710005-001	Carlsbad MWD	Maerkle Pump Station Upgrade	The upgrades/replacements that will be performed as part of this project will replace failing components of the pump station. These components include switchgear, VFDs, soft starters, controls, relay, and contactors. Replacement of these facilities will assure a safe drinking water supply to the customers from CMWD's 200 MG storage facility. In addition, this project will upgrade the access gates to the site to improve site security.	O	0	C	CMWD is experiencing failures of various equipment at this pump station. These failures have a potential for interruption of water supply to CMWD customers. During outages of the aqueducts supplying CMWD, this storage facility is the only water supply for CMWD. In addition, the current access gates to the site are not secure and allow for easy access to the site.	400,000	27,517	80,800	14	San Diego	V	2009
4612	3010003	3010003-003	City of Buena Park	Eighth Avenue Water Line Replacement of Aging Asbestos Cement Pipe	The City intends to abandon in place the existing ACP water line, replacing it with new ductile iron pipe, increasing the size to meet today's demand and pressure requirements, as required by code. This project includes the installation of 1500 LF of 12" ductile iron water line in Eighth Avenue west of Knott. This project would include all design, potholing, permits, construction and repavement, traffic control, water quality management, inspection and project management. Construction would include the installation of ductile iron pipe and wrap, valves, connections, water service connections, dewatering, abandonment of existing facilities, fire hydrant service connections and necessary utility coordination and surveying. The project would be designed to City standards and inspected by City forces.	O	0	C	The City of Buena Park has an aging water supply system. The City has a program aimed at the replacement of existing asbestos cement pipe (ACP) installed in the 1960's. Most of this pipe is over 45 years old and the City intends to eventually replace all of its ACP with ductile iron pipe, replacing the older sections first.The Eighth Avenue west of Knott portion is 46 years old and due for replacement.	830,000	20,422	82,450	08	Orange	V	2009

4614	4210004	4210004-017	GOLETA WATER DISRICT	CDMWTP Creek Crossing Project	Modify existing crossing using box culverts or constucting new bridge to raise access road above creek flooding levels.	O	0	C	The access road to Goleta Water Districts Corona del Mar Water Treatment Plant (CDMWTP) crosses McCoy Creek. This creek has flooded numerous times to levels where access to or from the treatment plant for several hours is not possible. Plant staff either cannot respond to plant alarm conditons or have to remain at the plant during these episodes. Modifying the creek crossing to an alow access to the plant at the higher creek flows will improve the staff's ability to address alarm conditions at the treatment plant.	170,000	16,088	84,000 06	Santa Barbara	IV	2011
4615	5610023	5610023-002	VENTURA WWD NO. 8 - SIMI VALLEY	Tapo Canyon Production Well	The project consists of installing a new, fully equipped groundwater production well in Tapo Canyon in an area that is not subject to surface influence or other potentially contaminating activities. Well collector pipeline will be installed to convey the untreated groundwater supply from the new well to the treatment plant.The new well will provide asurance that maximum potable water production and provide improved reliability of the water supply and its quality.	O	0	C	The City of Simi Valley, Ventura County Waterworks District No. 8 (District) operates two existing groundwater production wells to supply to its Tapo Canyon Water Treatment Plant to provide potable water for its customers in the City of Simi Valley. One of the existing production wells is located in close proximity to a natural drainage course, and the Water Supply Permit issued by the California Department of Public Health does not allow for the use of this well while the Plant is in operation when water is present in the drainage course due to concerns that the groundwater can be under surface influence.The potable local groundwater produced by the Plant is a blend of reverse osmosis-treated groundwater and untreated groundwater that receives chlorination and chloramination disinfection before entering the District's water distribution system. Loss of use of the well under surface influence limits the production and reliability of the Plant to produce potable local groundwater supply.	1,200,000	24,811	86,000 06	Ventura	IV	2009
4616	5610023	5610023-001	VENTURA WWD NO. 8 - SIMI VALLEY	Replacement of Alta Vista Tank No. 2	The project consists of the construction of a steel water storage tank, with a capacity of 126,000 gallons and a high-water elevation of 1404 feet, to be located adjacent to the existing Alta Vista Tank No. 1 that has the same capacity and high-water elevation.Construction of the tank will also include approximately 30 feet of 8-inch inlet-outlet pipeline to connect the tank to the existing water distribution system, approximately 100 feet of 8-inch drain line, appurtenances, and site improvements, and electrical monitoring equipment to connect the tank to the District's SCADA system that provides alarms to operators advising of facility malfunctions.The project will increase the water storage in the Knolls Pressure Zone to 252,000 gallons, from the current 126,000 gallons, to provide sufficient time for the District to respond to pump station failures or fire hydrant/water main breaks and avoid the loss of water pressure and supply. The project will also satisfy the minimum fire storage requirements by the Ventura County Fire Department for the Knolls Pressure Zone.	O	0	C	The City of Simi Valley, Ventura County Waterworks District No. 8 (District) operates the Knolls Pressure Zone (Zone) to supply water to the Santa Susana Knolls area.Water facilities for the Zone include the Alta Vista Tank No. 1, which is deficient in storage capacity with only 126,000 gallons that does not provide for adequate reliability and fire storage.Deficient water storage in the Zone has led to a loss of supply and water pressure due to pump station failures, power outages affecting pump stations, or broken fire hydrants or water mains. Boil water orders can result from such occurrences.The Zone requires a minimum of 130,000 gallons of operating storage to maintain proper pressure regulation plus a minimum of 60,000 gallons of additional storage in reserve to meet the minimum fire storage standard by the Ventura County Fire Department. Other facilities for the Zone include the Oak Knolls and Alta Vista Pump Stations that operate with the Alta Vista Tank No. 1. The original Alta Vista Tank No. 2 was removed due to its badly deteriorated condition.	300,000	24,811	86,000 06	Ventura	IV	2009
4617	3010064	3010064-012	City of Westminster		Purchase 730 fire hydrants over a five year period to replace inoperable fire hydrants in the water system.	O	0	C	Other system defects. Replace inoperable fire hydrants in the water system to aid in the water quality flushing program.	511,000	20,161	93,027 08	Orange	V	1998

4618	3010064	3010064-015	City of Westminster	Upgrade Existing Deficient 4-inch Waterlines	Abandon existing 4 inches waterline in several areas and replace with new 6 to 8 inches waterline. The total length is approximately 2,800 linear feet. This project will also include replacing existing water valves and service laterals to residents and businesses. This will improve the water delivery capability to provide sufficient current water supply demand.	O	0	C	Existing water system is deficient to meet the current water demand in several areas. The existing insufficient 4-inch waterlines need to be upgraded to 6 or 8 inches to provide sufficient current water supply demand.	600,000	20,161	93,027 08	Orange	V	2009
4619	3710001	3710001-005	California-American Water Co	San Diego "District Wide" Water Conservation Program	The program has two "full service" elements that encompass a "City Wide Water" Conservation Program. Element A: A team of trained plumbers will retrofit 23,250 residential homes / 46,500 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 1,426 acre feet per year. Element B. A team of specialist will retrofit 6,500 residential yards with modern ET water controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 398 acre feet per year. This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 – 24 months and employ 75 to 100 people.	O	0	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 1,901 acre feet per year or 50.0 / 75.0 gallons per day, per person.	25,879,500	20,791	96,000 14	San Diego	V	2009
4620	4810008	4810008-001	City of Vacaville	Butcher Reservoir Control Valve Vault Improvements	The purpose of this project is to enhance water circulation in the reservoirs, and improve the water quality in the Butcher Reservoirs. This will ensure that all current and future water quality requirements are met.The project includes a new partially buried valve vault to house motor actuated valves for controlling the flow into and out of Butcher Reservoirs 1 and 2; and associated site improvements. Site improvements consist of pavement reconstruction, partial demo of existing valve vault no. 1, drainage improvements, security gate, fencing & lighting, and landscaping. The partially buried valve vault consists of reinforced concrete retaining walls, stairs, security doors, roof mounted maintenance hatches, 120/480 volt power supply, lighting & ventilation, two 18-inch diameter motor operated modulating valves, two 18-inch standard motor operated valves, other valves and appurtenances, and SCADA integration and radio communication. Approximately 1,300 linear feet of 18 inch and 24 inch diameter ductile iron pipe would be installed.	O	0	C	The City of Vacaville constructed the Butcher Reservoirs 1 & 2 in 1970 and 1979 respectively. The reservoirs are located between I-80 and Lagoon Valley Park and sited side by side. Reservoir 2 (4 MG capacity) is 11.5 ft deeper than Reservoir 1 (2 MG capacity) leading to water quality concerns because of the dead zone in the bottom of Reservoir 2. The water quality at these reservoirs is further impacted because they primarily receive treated surface water which contains more TOC than groundwater.The existing piping and valve arrangement allows the reservoirs to stay fuller than other system reservoirs for a longer period of time and minimizes the turnover of water further impacting water quality problems.	3,200,000	25,149	96,735 04	Solano	II	2009

4621	1910051	1910051-004	INGLEWOOD- CITY, WATER DEPT.	Water Transmission & Main Replacement	Water Transmission & Main Replacement Project is the ultimate goal of the City of Inglewood to provide the City with the long range planning tool of resolving the problem of water quality system, meet the established criteria, maintain the system assets and prevent major pipeline breaks by replacing old pipes beyond useful lives.The project consists of replacing the old transmiision main as well as replacing and upgrading the 6" CIP distribution pipes to 8" to 12" DIP including the installation of blowoff, Fire hydrants and sampling stations and provide some flexible couplings in earthquake fault line.	O	0	C	The City of Inglewood domestic water system consists of 802,000 ft. of pipes. Significant debris has been observed in the transmission main and loss of disinfectant residual occurs in the pump discharge pipe.Distribution Pipes are mostly consists of Asbestos Cement Pipes and Cast Iron Pipes in 6 inches diameter and installed between 1940's to 1990's. most of the pipes are old and beyond their useful life. Water breaks occur in different areas and warter quality impacts the continued use of the old pipes. Replacing the aging pipes is one of the key item in the water master plan to improve the water system.Because the City is continued growing and developing, large increase in population and water demands are also a great concerns for the water distribution system. The Citya use this factor in pipe-upsize proposal that was outline in the water master plan,This project is a very significant factor to increase the water system reliability, properly maintain the system assets, prevent major pipeline disaster and promote the well being of the community by providing a good water quality.	11,600,000	14,916	100,000	15	Los Angeles	IV	2011
4622	1910051	1910051-003	INGLEWOOD- CITY, WATER DEPT.	Water Treatment Facilities	The City is currently working with the Corps to complete the design of the rehabilitation of its Water treatment facilities. These improvements will provide for the treatment of groundwater; discharged from the new wells into the City's transmission and distribution system or reservoirs, for bacteriological, inorganic or organic contaminants as deemed appropriate through water quality testing procedures as designated by the State Department of Public Health (DPH).	O	0	C	Incorporated in 1908 the City of Inglewood serves a constituency of 112, 600 persons, located on the Coastal Plain adjacent to the Baldwin Hills in Los Angeles County. The City is responsible for domestic water supple to 14,000 customers. The City completed a water master plan update in 2005 which identified several major improvements to its water system. The programs and projects described herein will increase water system reliability for domestic and fire suppression supplies within the City's water service area. This effort will be completed in time to provide definitive input as to specific projects which will be initially addressed under the proposed "Water System Infrastructure Program" (WSIP). This program is considered to be a significant first step and of primary importance toward reaching the City's goal of a more effective and efficient water supply and storage system.	2,200,000	14,916	100,000	15	Los Angeles	IV	2009
4623	1910051	1910051-005	INGLEWOOD- CITY, WATER DEPT.	Replacement of Water Well No. 1 and 4	The project consists of replacing the old well with a new well to achieve the efficient performance rate of the pumps/motors, heads, casing, bowls and other well accessories and produce significant sand including the removal of the TOC and other contaminants determine in water well No. 1	O	0	C	Water Well No. 1 was tested in 1999 and indicate that the operates at 1500 gpm and 461 total dynamic head. its current production rate fluctuates from 700 gpm to 1100gpm. the existing static water level is approximately 188 feet below ground surface, representing a drop of 43 feet. the well pump ocassionaly loses suction, indicating continued drop in the pumping water level. Excessive air may also result from cascading water through exposed well screens and low suction levels. Water quality issues includes the presence of iron, manganese, high ammonia and TOC ocncentrations.Water Well No. 4 was last repaired in July 1998. The pump suction bell is approximately 360 ft. below ground surface. The static and pumping water levels were aprroximately 180 ft. and 360 ft. below ground surface, indicating that the pump needs to be lowered to be able to continue production. Continued operation observed that the well has developed a sanding problem.	4,300,000	14,916	100,000	15	Los Angeles	IV	2011

4624	4810003	4810003-002	City of Fairfield	East-West Water Transmission Pipeline, Easterly Segment 3	The ambitious East-West Water Transmission Pipeline (Project) was developed to address both of the previously described service and supply problems. The Project was originally planned in two large, distinct portions, including about 2.5 miles of 30-inch pipeline from Hale Ranch Road near the Fairfield Anheuser-Busch brewery to the intersection of Westamerica Drive and Echo Valley Drive (“Westerly Portion”) and 7.5 miles of 36-inch pipeline from the intersection of Clay Bank Road and Cement Hill Road to the intersection of Cordelia Road and Hale Ranch Road (“Easterly Portion”).For economic and technical reasons, the City has divided the Project into 15 segments that will be constructed as individual projects. Construction is complete or underway on 3 segments to date. Of the remaining 12 segments, several have been assigned to development projects that are now delayed, but two that are “shovel ready” are under City control and could go out to bid as soon as financing is available: Easterly Segment 3 and Easterly Segment 6B.Descriptions:East-West Water Transmission Pipeline, Easterly Segment 3 (this application)Approximately 3,900 feet; 36-inch diameterBroadway and Illinois Streets from Union Avenue to Pennsylvania AvenueEstimated cost $2,400,000East-West Water Transmission Pipeline, Easterly Segment 6B (separate application)Approximately 2,000 feet; 36-inch	O	0	C	As part of its water system planning in the 1980’s, the City of Fairfield, California, identified the existing single 36-inch pipeline crossing of Suisun Valley from the central city to its Cordelia area as a fundamental weakness of the water system. Failure of this single line, or interruption of the lone treatment plant (Waterman WTP; the City has two plants) feeding that line, could result in an inability to supply water to Cordelia from the City system. Another concern was the existing system’s inability to serve water to large parts of the City from the new North Bay Regional Water Treatment Plant (NBR Plant), which was the City’s only source of Sacramento River delta water.	2,400,000	27,235	100,147	04	Solano	II	2009
4625	3710037	3710037-001	Padre Dam MWD		Miscellaneous projects to remedy deficiencies as listed on the attached CIP plan.	O	0	C	System deficiencies and upgrades of water system including pump stations, reservoirs, distribution and transmission lines, future water sources.	7,896,800	22,768	100,509	14	San Diego	V	1998
4626	3710037	3710037-012	Padre Dam MWD	Automated Meter Replacement Program	The AMR technology can minimize recording errors, minimizing the need for the District to go on the private property of residents, reduce travel costs and liabilities, and provide opportunities for monthly billing.Other options that are available include remote shutoff valves that can be installed and activated from the office for chronic shutoff users; availability of customer display units for in home consumption monitoring; and acoustical leak detection devices that would allow the District to monitor the adjacent water distribution system and send back results remotely.Ongoing drought concerns in Southern California have prompted the District to promote water conservation as a best management practice. An integrated AMR system could post reads to the web, thereby allowing customers and the District to manage usage in real-time. Furthermore, the ability to obtain daily and even hourly meter information could allow more options to the District to give incentives or penalties regarding water usage.The scope of this project will replace all existing meters within the District's service area with automated meters that will provide remote reads on more more frequent basis.	O	0	C	The primary purpose of water meters is to ensure that water customers are charged for water service according to the amount of water actually consumed by them. Metering water use is a water conservation Best Management Practice, as defined by the California Urban Water Conservation Council.However, water meters and their remote registers lose accuracy as they age and must be replaced periodically to ensure accurate billing. Padre Dam's Automated Meter Replacement Project will replace existing customer meters with new meters that transmit hourly and daily water use data to the District. The meter sensors and system software will alert staff to customer leaks, allow staff to enforce irrigation restrictions during drought conditions and allow customers to access their water use data on the web and understand and control their own water use. These are critical water conservation strategies. Benefits of an AMR system include: Save on regular "on-cycle" meter reading Obtain more easily initial and final meter readings for opening and closing accounts Streamline high bill investigations Flag potential high consumption before customers get a high bill Data available to initiate and enforce conservation efforts Help pinpoint system losses Help detect theft of service Enable more frequent readings with little incremental cost Enable custom billing dates Support customized rates (e.g., for large customers)	7,000,000	22,768	100,509	14	San Diego	V	2009

4627	3710037	3710037-013	Padre Dam MWD	Customer Service Center - Emergency Generator	Following the devastating Cedar Fire in 2003, the District's CSC was used as an EOC. The scope of this project includes the installation of an emergency generator for the CSC and appropriate instrumentation and controls.	O	0	C	During the devastating Cedar Fire in 2003, the District's Customer Service Center (CSC) was used as the emergency operations center (EOC). Subsequent to large, local wildfires in 2007, it was determined that a more reliable power supply was needed for the EOC. Without proper power supply, the District's ability to mobilize and manage resources during an emergecy will be severely compromised.	250,000	22,768	100,509	14	San Diego	V	2009
4628	3710037	3710037-002	Padre Dam MWD		Miscellaneous projects to remedy deficiencies as listed on the attached CIP plan.	O	0	C	System deficiencies and upgrades of water system including pump stations, reservoirs, distribution and transmission lines, future water sources.	12,241,500	22,768	100,509	14	San Diego	V	1998
4629	3710037	3710037-008	Padre Dam MWD	Santee Turnouts Upgrade Project	The District's wholesale facilities receive water from SDCWA from two sources: SDCWA Connection No. 4 located at the west end of the WSA on Mission Gorge Road and Connection No. 6 located at the west of the ESA in the southeast corner of Lakeside Water District. The water is then distributed via 5-metered connections (turnouts) to the WSA (Santee Connection No.1 through No. 5), 2-metered connections to the Riverview Water District (Riverview No.1 and No.2), 3 metered connections to the Lakeside Water District (Lakeside No.1 through No.3), and a single connection to the ESA via the El Capitan Pump Station. This project is to upgrade and replace old and dilapidated turnout structures and facilities at Turnouts 3 and 4. In addition, the Meter (6-Inch) Retrofit project (Project No. 202007) will be constructed as part of this project.	O	0	C	The purpose of this project is to replace two of Padre Dam's 10 turnouts, meter/flow control connections within the District's service area. The two turnouts that will be replaced are old and dilapidated with outdated instrumentations and controls. This project also includes replacement of some of the larger meters and structures within the retail area (6-inch and larger). An efficient water system depends on accurate meters and flow control devices. Old meters tend to "under read" and indicate water loss within the system that does not exist. Together, old meters and outdated flow control devices make it difficult for system operators to determine when the right amount of water is supplied to the system. When too little water is supplied to the system, pressure problems throughout the service area can result. When too much water is supplied, water quality problems result in more system flushing.	1,100,000	22,768	100,509	14	San Diego	V	2009
4630	3710037	3710037-004	Padre Dam MWD		Miscellaneous projects to remedy deficiencies as listed on the attached CIP plan. 4633	3710037	3710037-007	Padre Dam MWD	Security for Water Storage and Pumping Facilities	Padre Dam Municipal Water District of Santee, CA requests consideration for funding under Proposition 50: Water Security, Clean Water, Coastal and Beach Protection Act of 2002 (Water Code Section 79500 et seq.), Chapter 3 – Water Security. Padre Dam MWD intends to address the hazard of water contamination to the District's potable water system through the installation of an IP based video surveillance system. The District comprises approximately 404 miles of water mains. It has 27 potable water reservoirs and 16 water pumping stations. The lack of system redundancy and the large geographical area served by Padre Dam engenders an apparatus where the long term loss of any facility would result in the loss of potable water to whole regions - in some cases to approximately 50% of the District's population. Padre Dam MWD proposes to utilize Chapter 3 funding for the following: a) to eliminate or reduce the risk of water contamination to Padre Dam's water storage facilities; b) to eliminate or reduce the risk of vandalism to Padre Dam's pump stations and reservoirs; and c) to reduce the above mentioned risks by identifying and prosecuting the perpetrators of vandalism at Padre Dam MWD's sites. Furthermore, the District seeks to strengthen its Emergency Response's ability to respond quickly to security breaches and minimize consequences. The District identified six sites as critical assets for security	O	0	C	Security Project	750,000	22,768	100,509	14	San Diego	V	2007

4646	5610017	5610017-006	VENTURA WATER DEPARTMENT		Design and build 1.0 MG reservoir	O	0	C	Needs to improve storage capacity to meet storage deficit.	2,000,000	31,312	107,490	06	Ventura	IV	1998
4647	1910179	1910179-001	BURBANK-CITY, WATER DEPT.	Replacement of resrvoir #1	Demolish existing structure and reconstruct reservoir with the same capacity, meeting current codes and standards.	O	0	C	Reservoir #1 is 6.9 MG concrete reservoir with wood roof, constructed in 1928. The reservoir does not meet current structural codes, and the single inlet/outlet does not allow for thorough mixing to prevent nitrification episodes.	9,000,000	26,301	108,029	07	Los Angeles	IV	2008
4648	3010004	3010004-037	Mesa Consolidated WD	Wellhead Color Treatment at Wells 7 and 8	The District is proposing to install wellhead treatment to reduce the level of color in the wells.	O	0	C	The District is unable to consistently meet the secondary MCL for color (15 CU) at Wells 7 and 8.	3,200,000	23,179	108,724	08	Orange	V	2002
4649	1910017	1910017-002	SANTA CLARITA WATER DIVISION	New Well Development to Improve Source Capacity	The proposed project will develop a new, municipal groundwater well in the City of Santa Clarita. The proposed project involves three phases: (1) well drilling and construction, (2) pump development and testing operations and (3) construction of the well housing. Well drilling and construction will be conducted over approximately 23 days. This phase would require minor grading to prepare the flat site for the construction of a foundation pad for the well equipment. Construction tasks would include the mobilization of the drill rig to and from the project site, drilling of the pilot hole, and installation of well casing. The drilling of the pilot hole would require approximately 3 days of 24-hour site activity, and the reaming of the borehole, installation of well casing, and development of the well would require approximately 10 days of 24-hour site activity.Pump development and testing operations will require approximately 22 days. The development of the well pumping equipment will require approximately 2 days of 24-hour site activity and the production testing will require approximately 2 days of 24-hour site activity. The well will be drilled to a total depth of 160 feet below the ground surface and will have a pumping rate of 750 to 1,000 gallons per minute (gpm).An approximately 50-foot by 50-foot structure would be built onsite to house the well pumping equipment. The well facility will be surrounded by a 10-foot high chain-	O	0	C	During periods of reduced rainfall, groundwater well levels within the eastern portion of our service area drop precipitously. This forces us to abandon well pumping in those wells until rain returns and the groundwater levels rise. The loss of this groundwater supply is compounded when simultaneous reductions in State Water Project allocations occur and especially now after the recent court ordered water transfer restrictions intended to protect endangered species. Increasing our source water capacity by drilling additional groundwater wells in the western portion of our basin where water levels remain relatively stable, will provide a more reliable source capacity for our system and help compensate for the deficiencies in our eastern wells and the reductions in the State Water Project deliveries.	400,000	27,911	111,000	22	Los Angeles	IV	2008
4650	2710010	2710010-004	CWSC Salinas	Salinas "City Wide" Water Conservation Program	The program has two elements. a. Indoor: CWSC will replace / retrofit 19,000 bathrooms (toilets & shower heads) and the estimated water savings is 1,171 acre feet per year. b. Outdoor: CWSC will replace 6,113 ET controllers and the estimated water savings is 188 acre feet per year.	O	0	C	CWSC intends to reduce the district total water consuption to match the long term water supply.	18,243,540	25,451	114,840	05	Monterey	II	2009

4651	3310012	3310012-011	Elsinore Valley MWD		The District has an arsenic groundwater treatment plant currently treating arensic contaminated groundwater from two other wells in the same area. The plant is located about 1.3 miles north of the two subject inactive wells with high arsenic. An engineering study is almost complete to investigate the viable alternatives to blend or treat these two arsenic laden wells so the treated groundwater can be used for domestic supply, thus reducing imported water demand. This project will involve approximately 10,000 LF of 20-inch pipeline to convey the arensic contaminated well water to the groundwater treatment plant. The existing plant must also be expanded in treatment capacity to accomodate this extra incoming source. The preliminary estimated cost for this project is about $2,500,000.	O	0	C	Two active groundwater production wells, originally used for domestic water supply, have been shut down because of elevated arsenic concentrations, i.e., above the 10.0 ug/L arsenic MCL. The combined production capacity of these two wells is about 3.0 mgd. Without these two wells offline, the District has to purchase additional imported water to meet the water demand of the system.	2,500,000	36,817	121,420 20	Riverside	V	2009
4652	2710004	2710004-001	Cal Am Water Company - Monterey	Monterey "District Wide" Water Conservation Progam.	The program has two "full service" elements that encompass a "District Wide Water" Conservation Program. Element A: A team of trained plumbers will retrofit 36,000 residential homes / 72,000 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 2,209 acre feet per year. Element B. A team of specialist will retrofit 12,000 residential yards with modern ET water controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 736 acre feet per year. .This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 – 24 months and employ 75 to 100 people.	O	0	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 2,945 acre feet per year or 50.0 / 75.0 gallons per day, per person.	35,136,000	38,236	122,492 05	Monterey	II	2009
4653	4810007	4810007-003	City of Vallejo	Vallejo - Watermains Capital Improvements	Replacement and upsizing of approximately 3800 feet of Tennessee Street Pump Station suction and discharge line from 12" to 18" addresses the suction headloss problems of Tennessee Street Pump Station;Replacement of 1500 feet of 20" transmission main along Couch Street permanently eliminates the property damages that consistent failures of this section of the transmission main causes in the area;Installation of 2500 feet of 12" transmission main at Nebraska and Tuolumne Street completes the link between the major transmission mains there by enhancing fire flows in affected areas;Construction of 2700 feet of new 20 transmission main along Nebraska Street that links the West Grid pressure zone with that of the 20" C&H transmission main thereby greatly reducing headloss in the Grid Zone transmission system and enhancing system pressure and service reliability;Construction of over 9000 feet of 8" water mains along Benson Avenue, 14th Street, Alabama, Denton Court, Grapewood Street, Cottonwood Drive, Grennan Court, Illinois Street, and Indiana Street eliminates the pressure, flow, leakage, and water quality issues brought about by the existing old corroded 2" and 4" water mains.	O	0	C	The project aims to improve water circulation (age) concerns, water quality, fire protection, and to replace severely corroded and leaking distribution water mains in the City of Vallejo. It intends to prevent possible contamination of potable water in the affected water mains.While that is not currently a problem, the potential is there for backsiphonage of dirty groundwater into the leaking water mains should a sudden loss of water pressure be experienced by the affected areas. In addition, the corroded pipes have severely restricted the flows that water age due to stagnation and poor circulation has become a problem.Also, the flow restrictions greatly reduced the fire flows available in the affected areas well below the Fire Code requirements.The project also addresses suction pipe severe headloss problemst at the Tennessee Street Pump Station by upsizing the old 12" suction line to an 18" pipe. It also intends to complete the link between transmission mains at Tuolumne and Nebraska Streets as well as replace a section of an old 20 transmission main that has caused extensive property damage during its failures in the last five years.	3,000,000	36,663	125,000 04	Solano	II	2009

4654	4310014	4310014-001	City of Sunnyvale	Refurbishment of Water Tanks at Wright Ave	This project will refurbish two water storage tanks. This work entails exterior and interior coating and a seismic retrofit.	O	0	C	This project will refurbish two Wright Avenue water storage tanks, inside and out, in accordance with a complete structural and coating evaluation done in 2004 that found the tanks to be in poor condition. The Wright Avenue tanks hold 10 million gallons of water. The City follows a routine tank maintenance schedule in order to assure water tanks are properly maintained. A maintenance review is done every 10 years to determine the condition of the tanks and to make recommendations on coating repair, recoating, cathodic protection and/or structural modifications. Structural repairs, seismic retro-fits and interior coating of Tank #2 was completed in FY 2006/07. Exterior coating of both tanks and interior coating of Tank #1, along with seismic retrofit of Tank #1 will be completed in this project.Refurbishing the tanks is more cost-efficient than replacing them, since the cost of replacing one tank exceeds $5 million. Proper coating and regiular maintenance should keep the tanks in useable condition for up to 40 years. The water tanks located at Wright Ave. hold 100% of the water provided by Santa Clara Valley Water District, and represent approximately 40% of current City water-storage capacity.This is a critical project to comply with California Department of Public Health scores for water tanks. Without the tanks, it is possible that the City may not have enough water in case of emergencies (fire, earthquake) and possibly	3,763,000	29,324	133,751	17	Santa Clara	II	2009
4655	3010027	3010027-010	City of Orange	Water Well No. 28	Currently, Well 28 is in the study and planning phase to determine the best suitable site. The well's capacity; however, has been decided to be of 3,000 gpm and is scheduled to begin construction in 2013. According to the City of Orange Water System Master Plan, with this well in service and the ability to drop water from upper pressure zones down, pressure zone 370 will meet the demand of the coming years.	O	0	C	Pressure zone 370 which comprised of all the west side of the City is the earliest developed area in the City and therefore, equipped with older water infrastructures, such as production wells, reservoirs, main lines, pump stations, etc. The City of Orange Water System Master Plan, which was completed in 02/2007, indicated the need for at least two new water wells in pressure zone 370 to mitigate the deficient supply and enhance the reliability of the City's water production in the near future. Besides, the addition of a new well will enable the Water Division to accomplish routine maintenance services on the existing wells without compromising any shortage of water supply within our system.	2,000,000	35,645	138,640	08	Orange	V	2008
4656	3010027	3010027-007	City of Orange	Watermain Installation Under Cannon Street Bridge	Hydraulic analysis of the water system recommend that a 16 in. watermain to be installed in parallel to the existing 12 in. and that both to remain in services after installation of the 16 in. watermain. In addition to eliminate the bottle neck effect in the system, this new 16 in. pipe will provide redundancy to the existing 12" main. Currently, design of plans and specifications for approximately 520 linear feet of 16 in. pipe had been completed and construction shall commence as soon as funding is available.	O	0	C	Currently, the water pumping into Reservoir 6 to serve the northeast area of the City is transported via a 16 in. watermain. This main, however, is reduced to 12 in. as it goes under the Cannon Street Bridge due to the limited space of the bridge deck. In order to eliminate this bottle-neck effect, the existing 12 in. watermain needs to be upsize to 16 in. or another watermain needs to be installed in parallel to the existing 12 in.	450,000	35,645	138,640	08	Orange	V	2008

4657	3010027	3010027-009	City of Orange	Annual Watermain Replacement	The City of Orange Water Division had identified watermains in five areas that need to be replaced to address the concerns listed above. The total length of watermain in the five indentified areas is approximately 23,000 linear feet. For the year of 2008-2009, approximately 6,000 – 8,000 linear feet will be replaced to minimize the number of water main breaks, the repaired costs at the same time to improve the fire flow and better serve the areas.	O	0	C	The City of Orange Water System Master Plan, which was completed in 02/2007, indicated the need to install approximately 1 – 2 mile of new watermain annually to replace existing watermain within the system. Additional analysis performed by the City's Water Division staff which incorporated factors such as age, pipe condition, leak/break history, fire flow deficiency, etc., help to identify and prioritize the areas. Completion of this project will help to ensure the reliability of the system, increase the fire flow capacity and reduce the cost to repair breaks.	1,100,000	35,645	138,640	08	Orange	V	2008
4658	3010027	3010027-003	City of Orange	Reservoir 3A	The new Res 3A is proposed to be constructed next to one of the City of Orange existing reservoir (Res 3) mainly because there is enough room at this particular site. Res 3A, upon completion will help to alleviate the demand shortage during emergency by providing additional storage and enabling the shifting of water between the pressure zones.	O	0	C	The City of Orange Water System Master Plan, which was completed in 02/2007, indicated the need for a minimum of two new reservoirs by the year of 2030 to meet the future demand and more importantly is to mitigate shortages during emergency. The first reservoir (Res. 3A) will have a capacity of 1.0 MG and will be in needed as early as 2009.	1,350,000	35,645	138,640	08	Orange	V	2007
4659	3010027	3010027-002	City of Orange	Water Well No. 27	Tentatively, the new well (Well 27) is proposed in the northwest quadrant of the City (within pressure zone 370. Well 27 will have a minimum capacity of 2,500 gpm and is scheduled to begin construction in spring 2008. According to the City of Orange Water System Master Plan, with this well in service and the ability to drop water from upper pressure zones down, pressure zone 370 will meet the demand of the coming years.	O	0	C	The City of Orange Water System Master Plan, which was completed in 02/2007, indicated the need for a new water well in pressure zone 370 to mitigate the deficient supply in the near future. Besides the addition of a new well will enable the Water Division to accomplish routine maintenance services on the existing wells without compromising any shortage of water supply within our system.	1,700,000	35,645	138,640	08	Orange	V	2007
4660	3010027	3010027-013	City of Orange	City of Orange Marywood Pump Station	The City of Orange Water Division has hired a consultant to conduct a feasibility study to determine the most cost efficient option of replacing the existing Marywood Pump Station. Construction of the MPS will begin as soon as funding is available. The MPS will include installation of all new piping, bigger pumps, other associated mechanical equipment and building and site work. Once completed, this new pump station will enhance the ability to transport water between the two pressure zones more effectively.	O	0	C	The existing Marywood Pump Station (MPS) was built in 1964 and is located on the south side of Villareal Drive East of Santiago Bl., within the City's northeast quadrant of service area. The MPS is currently in use to pump water from Pressure Zone 2 from Reservoir 2 to Pressure Zone 3 into Reservoir 3. This pump station is very old with aging piping and equipment. With only 2 submersible pumps, the capacity of this station is very limited. In addition, access into the station for maintenance is in an undesirable condition i.e., it is a confined space because it was constructed inside an underground vault pit. MPS is one of 18 vital pump stations within the City's water system which is critical to ensuring the adequate and timely distribution of water to meet customer demands.	1,500,000	35,645	138,640	08	Orange	V	2012

4661	3010027	3010027-015	City of Orange	City of Orange Watermain Replacement	The City of Orange Water Division has identified aging watermains in twelve different study areas (within the City's water service boundaries) that will need to be replaced to address the issues listed above. The total length of watermain to be replaced in the twelve areas is approximately 67,710 linear feet. The City is targeting five key areas in particular which continue to be subject to frequent mainline breaks. The total amount of pipeline to be replaced for the five study areas equals 22,975 linear feet. For FY 2009-2010, 7,760 linear feet of watermain was installed. For FY 2011-2012, approximately 10,000 linear feet of pipe is proposed for replacement.	O	0	C	The City of Orange has about 480 miles of water pipelines serving approximately 139,000 customers. Many of these waterlines were constructed in the 1960's, have reached the end of their useful life and need to be replaced. In accordance with the City's Water System Master Plan dated February 2007, about 2 miles of main is recommended to be replaced annually. Funding from CDPH will enable the City to continue to meet its annual target goals for replacing its aging pipelines and ensure a continued reliable water supply. Additional analyses performed by the City's Water Division staff incorporated such factors as age, pipe condition, leak/break history, fireflow deficiency, etc., to help identify and prioritize the key areas for replacement. Completion of this project will help to ensure the system reliability, enhance fire flow capacity, reduce the cost to repair breaks, minimize staff (labor) expenses to repair /maintain the distribution system, and eliminate service interruptions to City customers.	2,000,000	35,645	138,640	08	Orange	V	2012
4662	3010027	3010027-012	City of Orange	City of Orange Big Serrano Pump Station	The Big Serrano Pump Station will feature three (3) pumps, each with a minimum capacity of 1,000 gallons per minute. The scope of this project will include preparation of plans and specifications, construction of new piping, mechanical equipment, pump station, building, landscaping, and site work. The design and construction phases are expected to begin as soon as project funding is available. When completed, the Big Serrano Pump Station will provide redundancy to and enhance the City's water distribution system in the event of a power outage, routine maintenance activities, and/or during an emergency (e.g. fire, earthquake, etc.).	O	0	C	This temporary pump station is located in the northeast quadrant of the City of Orange's service area, and is used to pump water from Pressure Zone 3 to Pressure Zone 4 to serve a major residential development. This temporary station has three horizontal closed coupling pumps, each with a capacity of 700 gallons per minute. Currently, there is no building structure enclosing the pumps. All of the piping and pump equipment are completely exposed to the outdoor elements. In addition, the capacity of this facility needs to be upgraded to enhance water service to the area, and accomodate anticipated growth in the future.	1,500,000	35,645	138,640	08	Orange	V	2012
4663	3010027	3010027-014	City of Orange	City of Orange Reservoir Seismic Retrofitting	Until 2009, five (5) of the City's sixteen (16) existing reservoirs have been seismically retrofitted to enhance their ability to absorb seismic forces and groundshaking movements. The City of Orange Water Division's goal is to upgrade the remaining eleven (11) reservoirs in the next 2-3 years. By completely retrofitting the inlet/outlet pipes, this program will: enhance the ability of the inlet/outlet piping to sustain seismic forces and movements; minimize labor, material and equipment costs to repair such damage; and avoid taking these eleven City reservoirs out of service for extended periods of time.	O	0	C	The City of Orange water distribution system currently includes 16 reservoirs ranging in capacity from 0.5 MG to 5.0MG (million gallons). Total system storage is approximately 43.0 MG. Collectively, the City's reservoirs provide storage that is critical in meeting a broad range of functions including emergency and fire protection requirements, equalizing daily supply and demand needs, increased operating convenience, balancing pumping requirements (i.e. minimizing cycling of pumps), decreasing power costs, surge relief, increasing chlorine detention time, and blending water from different sources. Most of the City's reservoirs were constructed in the 1970's. As a result, the Water Division has been working to improve these reservoirs by replacing the rigid connection in the inlet and outlet pipes with flex-coupling joints. Flex coupling joints have been proven to withstand seismic forces and groundshaking movements more effectively than their rigid counterparts.	1,000,000	35,645	138,640	08	Orange	V	2012

4664	3710006	3710006-011	Escondido, City of	Water Treatment Plant Sodium Hypochlorite Onsite Generation	To eliminate the continued use of chlorine gas and the numerous hazards it presents alternative disinfection methods were evaluated. The evaluations included elements for ease of operation and maintenance, risk reduction and life cycle cost. The alternatives included continued use of chlorine gas, bulk delivery of 12.5% sodium hypochlorite, onsite generation of high concentration sodium hypochlorite, and onsite generation of low concentration sodium hypochlorite.The onsite generation of low concentration sodium hypochlorite was the selected option and is currently under design. There are several manufacturers of the onsite generation equipment and depending on the manufacturer generally come as 3,500 or 4,500 pound units. Preliminarily depending on the supplier the plant will require 2 or 3 duty units and 1 standby unit. It is generally planned to provide storage of the generated 0.8% sodium hypochlorite for a minimum of 3 average days. This will likely be 2 to 3 tanks depending on size. Two brine tanks will be required for the salt itself. Metering pumps will be located at the tank farm while the sodium hypochlorite generators will be located in the existing chlorine building. The chlorine dioxide generators will be replaced with a proprietary Purate system which will require a Purate tank and acid tank. Supplemental equipment required for the process conversion includes	O	0	C	The City of Escondido operates the Escondido-VID Water Treatment Plant currently rated at 75 MGD and in the process to re-rate the plant to its design capacity of 90 MGD. Currently disinfection is achieved through the use of chlorine gas. The Escondido-VID Water Treatment Plant is the largest treatment plant in San Diego County still using chlorine gas for disinfection. The plant also has chlorine dioxide generators which are used when treating local water due to its high organic levels, the chlorine dioxide is introduced at the head of the treatment process. The treatment plant uses 17 ton cylinders of gas which are delivered by truck from Los Angeles, more than 2.5 hours on the road and the last 20 minutes are through the streets of Escondido. Escondido is a community of more than 140,000 residents with the nearest residences being less than a half mile and down gradient from the chlorine gas facility. For these reasons the Department of Homeland Security has a special interest in the security of the plant. Additionally the last time the gas supplier contract was out to bid only one supplier submitted a bid.	8,500,000	25,828	140,000	14	San Diego	V	2012
4665	3710006	3710006-009	Escondido, City of	Vista Verde Reservoir Replacement	A contract for a pre-design report is currently under way and upon completion the City will proceed directly to final design and contract documents. Construction is projected to begin in 2012. Part of the pre-design report will address a new tank site that will provide additional area to accommodate additional storage capacity at a higher elevation to increase the hydraulic grade line.The design will be for 2 million gallons of storage in two circular prestressed concrete tanks each holding 1.0 million gallons. The use of two tanks will provide the flexibility to take a single tank off line for maintenance if required while the other continues to supply customers. Interior piping elements and fixtures shall be stainless steel or non-metallic to eliminate future corrosion concerns. Piping shall be improved to provide separate fill and discharge pipes as well as seismically flexible joints outside the tanks. All overflow, drain pipe and fixtures will be built concurrent with the tanks including state of the art valves and control systems. The booster pump station which fills the existing tank will be upgraded to reach the new tanks at their higher elevation. This upgrade will include emergency generator capability. As the tanks will be at a new site, the project will include all necessary piping from the booster pump station to the tanks and re-connection of the distribution system. The project will also include the required road construction	O	0	C	The Vista Verde Reservoir is a 63-foot diameter welded steel tank. The tank was constructed in 1979 with a nominal storage capacity of 0.75 million gallons. The welded steel tank sits on a concrete ring foundation with no anchor bolts, making it susceptible to excessive movement during a seismic event. The tank is located on a leased lot and is very limited in size being approximately 10 feet from the tank to the existing fence or slope on all sides.Inspections and cleaning are done periodically, the most recent was completed in 2010. Inspections are done by a diver with the tank full. The latest inspection showed extensive progression of ongoing corrosion within the tank. The heaviest corrosion being above the normal operational water surface on both the walls and the inside of the roof. The beams spanning from the walls to the center column are heavily corroded along with the roof plates. Some steel purlins are missing from the roof and were found on the floor of the tank. One beam is so corroded that the bottom flange has separated from the web. Knee braces at beam seats on the wall are also heavily corroded. Significant corrosion also exists below the water surface on the walls and floor as well as on the fill/discharge pipe. The overflow pipe is also heavily corroded. Some areas of the wall are visibly deformed when viewed from the outside. The roof is a safety concern and staff have been directed to keep off unless	6,900,000	25,828	140,000	14	San Diego	V	2012

4666	3710006	3710006-008	Escondido, City of	Lindley Reservoir Replacement	A contract for a pre-design report is currently being executed and upon completion the City will proceed directly to final design and contract documents. The design will be for a minimum of 3 million gallons of storage in two circular prestressed concrete tanks 1.5 million gallons each. The use of two tanks will provide the flexibility to take a single tank off line for maintenance if required while the other continues to supply the customers. Interior piping elements and fixtures shall be stainless steel or non-metallic to eliminate future corrosion concerns. Piping shall be improved to provide separate fill and discharge pipes as well as seismically flexible joints outside the tanks. The new tanks will be located on or adjacent to the existing tank site and the old steel tank will be removed. The valves and controls for the new tanks will all be new and state of the art. All overflow, drain pipe and fixtures will be replaced concurrent with the tank. The supply piping down the drive that the tank site shares with several residences will be replaced. The supply piping which continues down the street will be evaluated during the pre-design report phase and replaced or prioritized for a future project as required.	O	0	C	The Lindley Reservoir is a 120-foot diameter steel tank. The tank was constructed in 1950 with a nominal storage capacity of 2.0 million gallons. The welded steel tank sits on a concrete ring foundation with no anchor bolts, making it susceptible to excessive movement during a seismic event.Inspections and cleaning are done periodically, the most recent was completed in 2010. Inspections are done by a diver with the tank full. The latest inspection showed extensive progression of ongoing corrosion within the tank. The heaviest corrosion being above the normal operational water surface on both the walls and the inside of the roof. The beams spanning from the walls to the center column are heavily corroded along with the roof plates to the extent that flakes would fall when someone walked on the roof. Significant corrosion also exists below the water surface on the walls and floor as well as on the fill/discharge pipe. The overflow pipe is also heavily corroded.The tank has performed well for over 60 years and has reached the end of its useful life as maintenance costs are increasing. The fill/discharge pipe outside the tank is also steel of the same age and is approaching the end of its useful life as well.The Water Master Plan is currently being upgraded and the preliminary analysis indicates that the zone in which Lindley operates requires additional storage capacity due to the development over the past 60 years.	5,200,000	25,828	140,000	14	San Diego	V	2012
4667	3710006	3710006-010	Escondido, City of	Lake Wohlford Dam Replacement Project	Final design has not yet begun for this project. Therefore, at this time specific construction specifications are not known. The following paragraphs generally describe construction efforts that will be necessary to complete the Lake Wohlford Dam Replacement Project. These subtasks are based on information within the alternatives analysis, which contained a conceptual design of the dam. Final construction specifications are anticipated to be determined in 2012, and construction is anticipated to begin following Construction Contracting in 2014.The upstream dam shell, a portion of the dam embankment upstream of the core, will primarily consist of earthfill. The makeup of the earthfill will consist of 3-inch minus materials placed against the downstream face of the existing dam with appropriate filter material placed between the two. Much of this earthfill may be available onsite from excavations for the foundation and abutments. Additional material may result from the spillway excavation near the northerly abutment. The southerly abutment may generate additional material from a borrow area and realignment of Oakvale Road. The desirable material for the earthfill would be decomposed or highly weathered granite having roughly 20% fines and classified as silty sand according to the Unified Soil Classification System. The upstream face would have a slope of 3:1 (horizontal:vertical).The	O	0	C	Lake Wohlford, located northeast of the City of Escondido, is a man-made reservoir that was formed by Lake Wohlford Dam. Current uses of Lake Wohlford include water supply, flood control, power generation, and recreation. Lake Wohlford supplies 30% of the City of Escondido's water, as well as water to another 120,000 customers in the Vista Irrigation District who live nearby in parts of northern San Diego County.Lake Wohlford Dam was constructed in 1895 to store water from the San Luis Rey River via the fourteen-mile Escondido Canal. In 1924 the seventy-six foot dam height was raised an additional twenty-four feet to increase the overall height and storage capacity to its current value of 6,500 acre-feet (AF). The expansion used hydraulic fill material. In 2004 FERC directed the City of Escondido to complete an evaluation of the potential for liquefaction-induced failure. The geotechnical study conducted found that a liquefaction-induced mudflow slide of the upstream slope of the dam would likely occur in a maximum credible earthquake. As a result, in 2007 FERC began requiring the City of Escondido to maintain Lake Wohlford at least 20 feet below the spillway crest level from dam safety purposes. This resulted in the water level being lowered to 43% of storage capacity, or 2,800 AF.Following FERC's determination, the City of Escondido began pursuing alternatives to retrofit Lake	15,798,100	25,828	140,000	14	San Diego	V	2012

4668	1910033	1910033-003	CALIFORNIA WATER SERVICE CO. - DOMINGI	Rancho Dominguez "City Wide" Water Conservation Program	The program has two "full service" elements that encompass a "City Wide Water" Conservation Program. Element A: A team of trained plumbers will retrofit 66,750 residential homes / 133,500 bathrooms with one 1.5 gpm shower head, one .90 gpf dual flush toilet and one sink aerator per bathroom to save 50.0 gallons per day per person or 20,000 gallons per home, per year (Estimated at 20 % indoor water reduction). The estimated water savings is 4,095 acre feet per year. Element B. A team of specialist will retrofit 22,000 residential yards with modern ET water controllers and save 50.0 gallons per day, per yard (Estimated at 30% water reduction). The estimated water savings is 683 acre feet per year. This program will save millions of tons of Co2, save electricity, save natural gas, save water and can be completed in 12 months or less. The program will employ 75 to 100 people for 12 months.	O	0	C	Basic issue / problem: The district needs to reduce their customer's water consumption to match the local water supply. Solution: Create water via system wide water conservation programs. The programs (indoor & outdoor) reduce the total water use by 4,778 acre feet per year or 50.0 / 75.0 gallons per day, per person.	64,687,500	33,637	143,664	22	Los Angeles	IV	2009
4669	1910070	1910070-025	LOS ANGELES CO WW DIST 4 & 34-LANCAST	Arsenic Treatment in Well 4-44	This project is for the removal of arsenic from the groundwater pumped from Well No. 4-44 to ensure compliance with the new arsenic standard. To accomplish this goal, the District proposes using one of the commercially available ion exchange systems for arsenic treatment. Ion exchange is designated as Best Available Technology by the US EPA for the removal of arsenic from drinking water sources and some ion exchange treatment systems have already been permitted by the California Department of Public Health and are in operation in the State. Also, a typical ion exchange treatment process is simple, robust, compact, easy to automate, and can be operated on demand. The treatment goal is to remove the arsenic in the effluent (treated) water to less than 4 ppb, meeting the arsenic standard of 10 ppb. The proposed packaged wellhead arsenic removal system includes a treatment module, pre-filter assembly, salt/saturator tank, brine processing unit, and brine wastewater storage tank(s). Details of each component that is sized to treat the flow rate from Well No. 4-44 at 1200 GPM are as follows. The treatment module (i.e., ion exchange system) uses multiple columns of ion exchange resin operating in parallel to remove the arsenic from the well water. The columns	O	0	C	Arsenic is the primary contaminant to be addressed by the project. Arsenic in drinking water has been shown to impact human health and is considered one of the prominent environmental causes of cancer in the world. The Safe Drinking Water Act Amendment of 1996 required the United States Environmental Protection Agency (USEPA) to finalize a new drinking water standard for arsenic. In January 2001, the USEPA adopted a new arsenic standard of 10 parts per billion (ppb). The new standard became effective in January 2006. The Los Angeles County Waterworks District No. 40, Antelope Valley, Regions 4 & 34, Lancaster (Regions), serves approximately 145,000 people through over 47,000 service connections in the Lancaster and Palmdale areas of the Antelope Valley. During 2006, approximately 20 percent of the water supply in the Regions was groundwater. The groundwater is extracted from 33 wells drilled into the aquifers in the Lancaster Subunit of the Antelope Valley Groundwater Basin impacted by arsenic, which is naturally present in rocks and minerals. The District collected sixteen arsenic samples between	1,000,000	46,878	144,215	16	Los Angeles	IV	2007

4683	3310037	3310037-005	Corona, City of	Groundwater Desalting Feasibility Study	The City of Corona is proposing to evaluate the feasibility of constructing an additional reverse osmosis facility. In order to reduce the TDS / TIN in the City's wastewater discharge, a reverse osmosis treatment facility will be evaluated as a means of reducing these contaminants. The City has identified several site locations and this study will help evaluate all locations and provide the most feasible option. The City has currently identified the options of: expanding the existing desalter or the construction of a new desalter on the west side of town (Mangular well system), at Water Reclamation Facility No. 1 (wastewater effluent), or on the east side of town (El Sobrante Groundwater Treatment Project). The desalter to be constructed on the east side of town will also improve known groundwater contaminants as identified in the City's approved AB3030 Groundwater Management Plan. The proposed feasibility study will include a preliminary analysis and an Engineering Design Report. The preliminary analysis will evaluate site location, groundwater capacity, and infrastructure improvements. Upon completion of the preliminary analysis and site identification, an Engineering Design Report will be prepared to help facilitate the necessary CEQA compliance and funding opportunities.	O	0	C	The City of Corona, as part of its Wastewater Discharge Permit, has to meet certain discharge levels for TDS and TIN. Currently, the City operates at or near the upper limits of these levels. The City currently operates the Temescal Desalter which desalts a portion of its groundwater supply in order to improve the quality of the wastewater discharge. An additional desalter can be used to further reduce the TDS / TIN levels within the City's groundwater thereby improving the City's wastewater discharge levels.	240,000	41,861	150,253	20	Riverside	V	2009
4684	3610041	3610041-026	SAN GABRIEL VALLEY WC - FONTANA	Plant F17 Nitrate Treatment Facility	The proposed project will augment the existing 10-vessel perchlorate removal ion exchange system with an additional ten vessels dedicated to nitrate removal. Site grading will include mobilization and demobilization and cleanup. Portions of the site will be regraded to provide a well-draining site with appropriate Storemwater treatment facilities and new Ion Exchange System facilities. The Ion Exchange system consists of eight 1,500 GPM ion exchange reactor vessels for nitrate and perchlorate removal on a reinforced PCC foundation pad and related piping.	O	0	C	Fontana Water Company's Plant F17 occcupies an approximately 4.15-acre lot just east of the southeast corner of the intersection of San Bernardino and Cherry Avenues about two blocks north of the I-10 Freeeway in the City of Fontana. The plant is a primary production and delivery point to south west portion of th service area producing approximately 5,000 gpm. Currently the plant is equipped with an ion exchange system to remove perchlorate. The site wells F17B and F17C have high levels of Nitrate which also must be removed. The same ion exchange system cannot be used for both pollutants due to differential removal rates for the same pollutant with a given media resin. A different resin must be used for each pollutant, therefore, a new ion exchange system must be used to remove nitrates. Well F17B has an historic high nitrate level of 70.0 ppm and well F17C has an historic high nitrate level of 50.0 ppm.	2,000,000	42,871	153,647	13	San Bernardino	V	2008
4685	3610041	3610041-017	SAN GABRIEL VALLEY WC - FONTANA	Install ion exchange treatment Well F35A	Install treatment using ion exchange technology to remove perchlorate	O	0	C	Well F35A is contaminated with perchlorate above the AL	1,750,000	42,871	153,647	13	San Bernardino	V	2002
4686	3610041	3610041-015	SAN GABRIEL VALLEY WC - FONTANA	Install ion exchange treatment Well F18A	Install treatment using ion exchange technology to remove perchlorate	O	0	C	Well F18A is contaminated with perchlorate above the AL	1,750,000	42,871	153,647	13	San Bernardino	V	2002
4687	3610041	3610041-011	SAN GABRIEL VALLEY WC - FONTANA	Install Ion Exchange Treatment Well F3A	Install treatment using ion exchange technology to remove nitrate and perchlorate	O	0	C	Well F3A is contaminated with nitrate above the MCL and perchlorate above the AL. (Well is inactive)	1,750,000	42,871	153,647	13	San Bernardino	V	2002

4688	3610041	3610041-023	SAN GABRIEL VALLEY WC - FONTANA	Plant F25 Perchlorate and Nitrate Treatment Facility	The proposed project will construct twelve (12) ion exchange vessels for nitrate and perchlorate treatment. The project includes grading, site work, and twelve ion exchange vessels on reinforced PCC foundation pads together with related piping and electrical facilities..	O	0	C	This project is intended to address treatment of groundwater sources with maximum contaminant level exceedances of nitrate and perchlorate. This treatment facility will treat groundwater from three sources, F25A, F35A, and F18A. The combined capacity from these three wells is approximately 7,000 gpm. All three sources are currently out of service. Perchlorate levels in these sources range from 6.0 ppb to 16.0 ppb and nitrate levels range at or above 45.0 ppm.	5,000,000	42,871	153,647	13	San Bernardino	V	2008
4689	1910039	1910039-015	SAN GABRIEL VALLEY WATER CO.-EL MONTE	Plant No. 8 Perchlorate & 1,4-Dioxane Treatment Facility	Construct and operate a 5,000 gpm ion-exchange and advanced oxidaiton with ultra-violet light treatment facility to remove perchlorate and 1,4-Dioxane from Wells 8B,8C, 8D, and 8E at Plant No. 8. The funds requested would cover engineering, equipment, and construction of the treatment facilities.	O	0	C	San Gabriel Valley Water Company's (San Gabriel) Plant No. 8 lies within the South El Monte Operable Unit of the USEPA San Gabriel Valley Superfund. Perchlorate at half the DPH established MCL of 6 ppb and 1,4-Dioxane at 0.57 ppb. San Gabriel currently operates a 5,000 gpm VOC treatment facility at Palnt No.8. Should perchlorate or 1,4-dioxane go above the MCL or NL respectively, San Gabriel will have to take Plant No. 8 off line due to the inablity of the existing VOC treatment technology to remove perchlorate and 1,4-Dioxane. Plant No. 8 is a vital water supply facility for San Gabriel. San Gabriel proposes to design and construct a 5,000 gpm ion-exchange treatment facility to remove perchlorate and an advanced oxidation with ultra-violet treatment system to remove 1,4-Dioxane from Wells 8B, 8C, 8D, and 8E and Plant No.8.San Gabriel currently also supplies emerency water supply for a municipal water agency, City of Monterey Park, from its Plant No. 8. The City of Monterey Park is currently affected by VOCs, and percholorate and are operating DPH approved treatment facilities to remove VOCs and perchlorate. Should Plant NO. 8 have to go off line due to perchlorate and 1,4-Dioxane, not only would San Gabriel not have this water supply available but, also the City of Monterey Park would not have this emergency supply available to augment their water supply needs.	5,534,700	46,304	161,945	22	Los Angeles	IV	2008
4690	1910126	1910126-011	POMONA - CITY, WATER DEPT.	Well 38 Drill & Equipment	The project will have the following components: 1. Engineering and Design 2. Land Aquisition (Possible) 3. Well Drilling 4. Equipping of Electrical, Mechanical, Piping, Etc., 5. Well Head Treatment 6. Construction of Housing for Well Head Treatment and/or equipment 7. Monitoring & SCADA Installation 8. Brine Disposal Pipeline.	O	0	C	With the increasing water demand generated by changes in population, Pomona has had to secure additional water supply sources. To meet this need, the City has determined that additional pumping in Six Basins is feasible. It is expected that this project will help Pomona meet its growing needs by adding an additional water source and providing flexibility in it water operations. The Six Basins, as in the neighboring groundwater basins, has been subject to high levels of nitrates. To that end, any new facilities brought on line will require a well head treatment in the form of an Ion Exchange Facility.	6,700,000	30,281	162,140	15	Los Angeles	IV	2007

4691	1910126	1910126-012	POMONA - CITY, WATER DEPT.	Treatment - Ion Exchange (Pomona Basin Wells)	This project will have the following components: 1. Engineering and Design 2. Equipping of Electrical, Mechanical, Piping, Etc., 3. Well Head Treatment 4. Construction of housing for well head treatment and/or equipment 5. Monitoring & SCADA Installation 6. Brine Disposal	O	0	C	Because of the high nitrate and perchlorate levels from Well 3, Well 7, Well 8 and Well 32, it is necessary to blend MWD water for nitrate and perchlorate treatment. As we move forward with the statewide drought it is expected that MWD supplies will be cut back in response to the drought. This action, from MWD, is expected to render these water sources in-active. By establishing a regional ion exchange treatment facility, the well sources are not as vunerable to the actions of MWD. In addition, the treatment will lend flexibility to the water system operations by reducing the dependency on the City's 15 MGD Anion Exchange Plant located in the central part of Pomona.	4,531,375	30,281	162,140	15	Los Angeles	IV	2007
4692	1910126	1910126-013	POMONA - CITY, WATER DEPT.	Spadra Basin Well & Treatment	The project will have the following components: 1. Engineering and Design 2. Land Aquisition (Possible) 3. Well Drilling 4. Equipping of Electrical, Mechanical, Piping, Etc., 5. Well Head Treatment 6. Construction of Housing for Well Head Treatment and/or equipment 7. Monitoring & SCADA Installation 8. Brine Disposal.	O	0	C	With the increasing water demand generated by changes in population, Pomona has had to secure additional water supply sources. To meet this need, the City has determined that additional pumping in the Spadra Basin is feasible. It is expected that this project will help Pomona meet its growing needs by adding an additional water source and providing flexibility in its water operations. The Spadra Basin, as in the neighboring groundwater basins, has been subject to high levels of nitrates and perchlorate. To that end any new facilities brought on line will require a well head treatment in the form of an Ion Exchange Facilities.	6,700,000	30,281	162,140	15	Los Angeles	IV	2007
4693	1910124	1910124-002	PASADENA-CITY, WATER DEPT.	Sunset Well Perchlorate Treatment Facility	The proposed project includes installation of an ion exchange perchlorate treatment system (Ion Exchange System), a booster pump station, a chloramination system, and piping at PWP's Sunset Reservoir. The proposed Ion Exchange System will be designed to remove perchlorate contamination from groundwater produced from either the Copelin and Sunset wells or the Bangham well by iself. Ion Exchange treatment technology is a proven and accepted method of removing perchlorate. Currently, average perchlorate concentrations at the Copelin and Sunset wells are approximately 18.5 micrograms per liter (ug/L) and 16.4 ug/L respectively. These perchlorate concentrations exceed the California Department of Public Health (DPH) Notification Level for perchlorate of 6 ug/L.The proposed Ion Exchange System will be designed for an initial capacity of 2,300 gallons per minute (gpm) with the potential to upgrade to an ultimate capacity of 4,200 gpm. The Ion Exchange System includes the following process- groundwater is introduced to the ion exchange vessels using a piping manifold equipped with piping flow control valves to evenly distribute water into each of the lead ion exchange vessels. Depending on the system chosen, either two or three pairs of ion exchange vessels may be installed. Each steel vessel may be up to 12 feet in diameter and 15 feet 4 inches tall. Each pair of vessels will operate in lead-lag mode,	O	0	C	Several Pasadena Water and Power (PWP) groundwater wells are contaminated with perchlorate, a component of solid-rocket fuel. Weekly water samples were taken from January 1998 to Ocotber 2001, while monthly samples have been taken from October 2001 to present. During that time, perchlorate levels have ranged from "Not Detected" (ND) to 33 parts per billion (ppb). The California Office of Environmental Hazard Assessment (OEHHA) has set the perchlorate public health goal (PHG) at 6 ppb, which is also the perchlorate Notification Level (NL) set by the California Department of Health Services (DHS).Currently, eight groundwater wells have been shut down due to perchlorate contamination exceeding the NL. Specifically in the Sunset Reservoir, three wells have been shut down. The loss of these three wells represents a loss of 17,000 acre-feet (AF) of groundwater pumping capacity.As a result of the shut downs, PWP has increased its purchase and reliance on imported water from the Metroplitan Water District (MWD) and is forced to increase its draw from the remaining active wells, increasing power consumption and "wear and tear" of the wells. If the perchlorate plume continues to spread through the groundwater aquifer, PWP could be forced to shutdown additional wells and increase reliance on imported water. In addition to perchlorate contamination, PWP faces a challenge with the method	1,149,633	36,830	168,700	15	Los Angeles	IV	2009

4694	3610034	3610034-001	ONTARIO, CITY OF	Water Facilities Security Improvements	The current City of Ontario Water System Security Vulnerability Assessment (WSSVA) outlines renovations and upgrades that need to be made to all the City's water facilities to ensure the security of the City's water system. All well sites, reservoirs, pressure regulating stations, and booster pump stations were evaluated. The major recommendations include replacing or upgrading facility fencing and access gates, installing facility intrusion alarms and connecting the alarms to the City's SCADA system, and installing motion sensing lighting. Phase 1 of the project is currently under way. Several reservoir sites are getting fencing and access gate upgrades and intrusion alarms are being installed on eleven reservoir hatches which currently do not have any alarms. The alarms are also being connected to the City's SCADA system. Several of the reservoirs are located in the City of Upland and in City parks, so not only will this portion of the project benefit the City of Ontario's water security, but also help ensure the safety of the City of Upland's residents and people who visit the parks. A second portion of the project is to replace the access gates at the City's Public Works Agency. All new gates will be motorized and have a keypad entry system.	O	0	C	Security Project	1,200,000	34,006	172,701	13	San Bernardino	V	2007
4695	3010062	3010062-005	City of Garden Grove	Getaway Transmission Line	The City of Garden Grove (City) is seeking grant funds in the amount of $4,940,000, to fund the City's Getaway Pipeline Project. This project is located across the length of Garden Grove, beginning at Lampson Avenue east of Ninth Street, going westerly in Lampson Avenue to Euclid Street, going northerly in Euclid Street to Chapman Avenue, and going westerly in Chapman Avenue past Western Avenue where it empties into West Garden Grove Reservoir (a 10 million gallon storage facility). The Getaway Pipeline will interconnect with an existing transmission main located in Lampson Avenue at Beach Avenue and Santa Rosalia Street. These interconnects provide for better hydraulic distribution and will also allow Garden Grove to supply its own water to a City area presently served by a private water company. This project is scheduled to begin in September 2012 and will be completed in February 2013. This project will be publicly bid and awarded to the lowest responsive bidder, a properly licensed contractor with necessary experience, bonds, and insurance. The selected contractor shall be required to comply with all facets of the contract documents that include labor compliance practices in accordance with the Davis Bacon Act.The grant monies will fully fund project costs for equipment, installation, construction, legal, administrative and permits. The design and implementation of this project (funded by	O	0	C	The City of Garden Grove (City) currently has two major booster pump / reservoir sites within a half mile from each other on the east end of the town. The two sites, Westhaven and Lampson Pump Stations, have 20 million gallons and 8 million gallons of storage capacity respectively. The proximity of these two sites has lead to underutilization of their storage capacity due to water aging concerns and resulting in nitrification during certain times of the year. Concurrently, the west end of town was master planned to replace its Well 16 due to its age, concentrations of iron and manganese, and lack of waste discharge storm drain facilities.The Lampson site currently has two filling wells that can supply the 8 million gallons of storage at this site. However, one of the wells with a capacity of 4,000 gpm, Well 28, has been turned off due to recent high nitrate concentrations. Well 28 had traditionally blended its flow with that of Well 23, but Well 23 conveys only half the flow of Well 28 and Well 28 became too costly to run with pinching the flow down to reach acceptable blended nitrate concentrations with Well 23. It is also noted that Well 23 is a 33-year-old cable tool well that needs to be replaced with a larger and higher water quality well. The new well, Well 31, is currently being drilled. Well 31 is being constructed to ensure reliability of flow into the Lampson site storage. It is anticipated that Well 31 will be fully utilized with Well 28, upon its	4,940,000	34,077	172,781	08	Orange	V	2011

4696	3610039	3610039-018	SAN BERNARDINO CITY	Waterman Pump Station Upgrade	Existing pump station has a total capacity of 8,800 gpm pumping from a reservoir to a higher pressure zone with a static head differential of 167 ft. The project consists of removal of an existing vault roof slab and replacing it with a new slab designed to support the weight of the new pumps resting on the slab. The new pumps will be can-type submersibles with the motor above the slab and the pump below the slab. Suction and discharge piping from existing pumps will be re-routed to the new pumps in accordance with a schedule aimed at minimizing disruption of service. Work also includes new valves, fittings, pipe supports, control transmitters and other instrumentation, and necessary electrical equipment to complete the installation of the pumps. Disinfection, testing, and start-up is also part of the work. The old vault will be abandoned in place after the new pumps and controls are in in satisfactory operation.	O	0	C	The existing pumps in this project are located in a buried vault deep in the ground. The facility is about 60 years old based on the needs of the time. Maintenance is costly and difficult. Current confined space regulations make it even more difficult to maintain this facility. Pump controls are obsolete and require frequent physical monitoring. New pumps are desired to be can-type submersibles with above-ground motor. This will allow for better system operation, less costly maintenance, and better capability to respond to emergencies.	1,500,000	42,301	173,359	13	San Bernardino	V	2007
4697	3610039	3610039-040	SAN BERNARDINO CITY	Replacement of a 12" Pipe with a 16" Pipe on Meridian Avenue	This project is located in the Upper Pressure Zone (also known as 1416 Zone) of the City of San Bernardino. The project is located in Meridian Avenue between Baseline Street and Etiwanda Avenue for a distance of 2,900 LF. This pipe provides the link between a 20" diameter pipeline in Baseline Street and the distribution network. As such, it is an important part of the distribution system and needs to meet industrial fire flow demands. The Master Plan network analysis recommends the additional 16" pipeline to meet the increasing demands.	O	0	C	The San Bernardino Municipal Water Department's 2007 Water Master Plan identified certain pipe segments in the water distribution network that are undersized to meet the increasing current and future water demands. The Master Plan recommends that these undersized pipes be improved in accordance with a priority schedule. Priority 1 projects are those that need to be implemented within 5 years from the date of the Master Plan (2007). The replacement of a 12" pipe with a 16" pipe in Meridian Avenue is a Priority 1 project that needs to be implemented by 2012.	696,000	42,301	173,359	13	San Bernardino	V	2011
4698	3610039	3610039-019	SAN BERNARDINO CITY	Additional Capacity for Pump Station pumping from Upper to Mountain Zones	The Upper to Mountain Pumping Plant is also referred to as Mountain Pump Station and is located on Electric Drive north of Northpark. The combined capacity of this pump station is 1,500 gpm. The Master Plan recommends additional pumping capacity of 2,000 gpm as Priority 1 and 900 gpm as Priority 2, for a total of 2,900 gpm additional capacity. This additional pump capacity at the required hydraulic head requires 300 horsepower of additional pumps. The existing pump stations will need to be modified to accommodate the additional pump, motor, electrical equipment and wiring, as well as control instrumentation.	O	0	C	The San Bernardino Municipal Water Department has sixty six (66) water pumping facilities in its service area. These pumping stations pump water from lower pressure zones to higher pressure zones, when water demand in the higher zones is more than the source and storage capacity available within that zone. The Water Master Plan of 2007 for the City of San Bernardino has identified thirteen (13) water pump stations which are deficient in capacity and need capacity improvement. The Master Plan recommends additional capacity for the 13 facilities. The capacity increase has been given priority rates on the scale of 1 through 3, with 1 being the highest priority. Priority 1 and 2 projects are recommended for early implementation. The Upper to Mountain Zone Pump Station is one of the 13 deficient pumping facilities that needs to be improved.	1,000,000	42,301	173,359	13	San Bernardino	V	2007
4699	3610039	3610039-047	SAN BERNARDINO CITY	Enhancement of San Bernardino Basin Area Groundwater Flow Model	Provide update to the groundwater flow model.	O	0	C	An updated model will verify that existing contamination treatment is effective and identify new contamination if present. This effort is to ensure proactive surveillance and protection of the groundwater basin.	1,422,758	42,301	173,359	13	San Bernardino	V	2012

4700	3610039	3610039-021	SAN BERNARDINO CITY	3 MG Reservoir in Terrace Zone	The Terrace Pressure Zone, also known as 1312 Zone, is located at the south west area of the City of San Bernardino. Construction of a 3 MG reservoir requires finding an appropriate site to accommodate a reservoir of this size. Once an appropriate site is found and acquired, the project needs to be designed and constructed. The dimensions for the reservoir will be approximately 130 feet in diamter and 32 feet high.	O	0	C	The existing reservoir capacity in the Terrace Pressure Zone of the City of San Bernardino is 2.4 MG (million gallons). The Water Master Plan of 2007 identifies the need for an additional 3 MG capacity in this pressure zone as Priority 1. Priority 1 is the highest priority for a project and it means that the project needs to be constructed in the near future in order to sustain an adequate water service with due regard to public health and safety. The Water Master Plan also identifies another 3 MG of capacity as priority 3, which is in addition to the 3 MG under Priority 1. The Priority 3 work allows a lapse of time before that project is constructed.	3,250,000	42,301	173,359	13	San Bernardino	V	2007
4701	3610039	3610039-020	SAN BERNARDINO CITY	Additional Capacity for Pump Station pumping from Upper to Sycamore Zones	The Upper to Sycamore Zone Pumping Plant is located on 48th Street in the City of San Bernardino. The combined capacity of this pump station is 6533 gpm. The Master Plan recommends an additional pumping capacity of 1,606 gpm of additional capacity as Priority 2. This additional pump capacity at the required hydraulic head requires 150 horseper of additional pumps. The existing pump station will need to be modified to accommodate additional pump, motor, electrical equipment and wiring, as well as control instrumentation.	O	0	C	The San Bernardino Municipal Water Department has sixty six (66) water pumping facilities in its service area. These pumping stations pump water from lower pressure zones to higher pressure zones, when water demand in higher zones is more than the source and storage capacity available within that zone. The Water Master Plan of 2007 for the City of San Bernardino has identified thirteen (13) water pump stations which are deficient in capacity and need capacity improvement. The Master Plan recommends additional capacity for the 13 facilities. The capacity increase has been given priority rates on the scale of 1 through 3, with 1 being the highest priority. Priority 1 and 2 projects are recommended for early implementation. The Upper to Sycamore Zone Pump Station is one of the 13 deficient pumping facilities that need to be improved.	500,000	42,301	173,359	13	San Bernardino	V	2007
4702	3410001	3410001-013	Sacramento Suburban Water District	SSWD - Second Groundwater Well at North Antelope Site	The District proposes to construct a second ground water well on the Antelope North Road well site. Based on the test hole data and analysis, the ground water aquifer characteristics under the existing Antelope Well site show the potential for a second well to be drilled on this same site. The District proposes to construct a second ground water well on the existing Antelope North Road well site. In 2000, during the design of the Antelope North Road Well, the siting of the well and layout of the site was set up for two wells. The layout of the pump house, disinfection system, discharge piping and underground piping was set up to handle two groundwater wells. Within the pump house additional space exists for a second motor control center to operate a second well and pump. The proposed additional well and pump has the potential of another 2,000 gallons per minute thus increasing the potential production capabilities of this site to over 4,000 gallons per minute.The proposed project would call for drilling a new second well adjacent to the first well. The depth of the well would be approximately 500 feet. The screen intervals would be set to match the previous well at the 330 – 450 foot levels. The proposed new well would constructed similar to the first well connecting into the same underground line into the distribution system and utilizing the same pump house building. A new motor control center	O	0	C	In 2001, the Sacramento Suburban Water District (District) constructed the Antelope North Road Production Well and Pump Station (Antelope). The location of the well is near the Sacramento/Placer County Line west of Antelope North Road. The well is 18-inches in diameter and completed to a depth of 500 feet. The sanitary seal reaches a depth of 50-feet. The well is constructed with potential recharge capabilities; however recharging to not currently being practiced. The well is equipped with a 250 HP pump capable of producing approximately 2,200 gallons per minute. A concrete block building houses the motor control center and disinfection equipment. After drilling the test hole, the data was analyzed. The data showed similar aquifer characteristics as in a previous production well located south of this site, which currently supports three deep ground water wells. The test pump data also showed the specific capacity of the existing Antelope well to be 110 gpm/ft at a rate of 2,450 gpm. The geophysical characteristics of the Antelope Well demonstrates a possibility that this site can support two deep ground water wells.The general land use in the area is single-family residential housing. With future growth in the area consisting of more single-family housing, the District sees a need for additional potable source water for domestic and fire protection. The District's policy is to have sufficient ground water supplies at 15% over	1,500,000	44,744	177,000	09	Sacramento	I	2008

4703	3610018	3610018-002	Cucamonga Valley Water District	Zone 1 to 3 Pump Facilities	The project is made up of two parts a 6,000 to 10,000-gpm pump station and 20,000 liner feet of 18" -24" pipeline.The pump station would be located at the District's existing Reservoir 1 site.Estimated cost for the projects is $8,750,000.	O	0	C	The District has numerous producing wells in Zone 1. These wells produce water in excess of the Zone 1 needs. These projects would allow the District to better utilize its existing groundwater supplies by improving the ability to move the water from Zone 1 to Zone 3. This is critical to support the Lloyd W. Michael Water Treatment Plant during times of shutdown or reduced flow because of State water reduction due to environmental and drought conditions.	8,750,000	46,667	185,534	13	San Bernardino	V	2009
4704	3610018	3610018-001	Cucamonga Valley Water District	30" 1B-1C Transmission Line	This Project is to design and construct 8500 lineal feet of 30" Transmission Main from the 1B Pump Station header in Cleveland Ave to the 1C pipeline at 6th St to Charles Smith Road . The scope of work will include the construction of 2 PRV stations; one at 6th Street and Rochester Avenue and the other at the 1B Pump Station header. The complexity of the project includes extra depth requirements, traffic control, bore and jacking, and extensive paving and median island replacement.Estimated cost for the project $4,015,000.	O	0	C	The pressure and water system in Zone I is currently maintained through 1B Pump Station. The purpose of this Project is to construct a dedicated transmission main which will allow the District to operate the 1B pump station more efficiently. This pipeline would direct water into Zone 1 and the 1B Pump Station from the Zone 2 and would also efficiently use three new wells (Wells 39, 40, and 43) north of Foothill Boulevard recently brought in service.	4,015,000	46,667	185,534	13	San Bernardino	V	2009
4705	2110002	2110002-006	Marin Municipal Water District	Desalination Plant	Build desalination plant to treat water from San Francisco Bay	O	0	C	Insufficient potable water supply. Russian River supply is uncertain.	20,000,000	60,599	190,800	18	Marin	II	2002

4707	3710034	3710034-005	Otay Water District	Middle Sweetwater River Basin Groundwater Well Pilot Project	The purpose of the Middle Sweetwater River Basin Groundwater Well Pilot project is to identify the feasibility of developing a groundwater resource production system and to determine and assess any limitations or constraints that may arise.The Middle Sweetwater River Basin Groundwater Well Pilot Project scope of work will accomplish six primary goals as follows:• Update project setting • Update applicable project alternatives analysis• Prepare groundwater well pilot project implementation plan• Construct and test pilot monitoring and extraction wells• Provide recommendations regarding if treatment facilities are required, projected costs, and feasibility to develop a groundwater well production system within the Middle Sweetwater River Basin capable of producing a sustainable yield of potable water• Prepare groundwater well production project implementation plan and scope of workThe groundwater conjunctive use concept planned to be developed is described as the extraction of the quantity of water from the groundwater basin that was placed there by customers of the Otay WD by means of their use of imported treated water that contributed to the overall volume of groundwater within the basin. This quantity has been estimated to be on the order of 12.5% of the total consumption of the Otay WD customers within that basin as measured by their water meters. In the	O	0	C	The development and/or acquisition of potential groundwater supply projects by the Otay Water District (WD) has been resurrected in response to the regional water supply issues related to climatological, environmental, legal, and other challenges that have impacted regional water source supply conditions, such as the court rulings regarding the Sacramento-San Joaquin Delta, the current ongoing western states drought, and the spiraling water pricing pressures. Local ground water supply projects will allow for less reliance upon imported water, achieve a level of independence of the regional wholesale water agencies, and diversify the Otay WD water supply portfolio consistent the March 2007 Integrated Water Resources Plan.As a result and in recognition of the need to develop sufficient alternative water supplies, the Otay WD has moved to the next step for development of a production groundwater well within the Middle Sweetwater River Basin, which is the implementation of a pilot well project. The Middle Sweetwater River Basin is located within the Sweetwater River watershed and is that reach of the river from Sweetwater Reservoir to the upstream Loveland Reservoir.The ultimate objective of the Otay WD is to develop a groundwater well production system within the Middle Sweetwater River Basin capable of producing a sustainable yield of potable water as a local supply. The primary desired	2,000,000	45,446	191,500	14	San Diego	V	2009

4708	3710034	3710034-001	Otay Water District	IP Surveillance for Water Security	Otay Water District, CA, requests consideration for funding under Proposition 50: Water Security, Clean Water, Coastal and Beach Protection Act of 2002 (Water Code Section 79500 et seq.), Chapter 3 – Water Security. The District serves 190,000 residents over 125 square miles of southeastern San Diego County, California. Otay facilities serve the water and/or sewer service needs of the people living in the communities of southern El Cajon, La Mesa, Rancho San Diego, Jamul, Spring Valley, Bonita, eastern Chula Vista, East Lake and Otay Mesa along the international border with Mexico. The District has 37 operational reservoirs and 27 pump stations with 666 miles of potable water mains and 86 miles of sewer mains. The Metropolitan Water District of Southern California imports the Otay Water District's water, which it acquires through five connections to San Diego County Water Authority aqueducts. The District's 2004 Vulnerability Assessment found eight sites at high risk for terrorist threats, vandalism, and theft. The Assessment recommended increased perimeter security. Currently, Otay Water District finds it crucial to address the increasing incidences of vandalism and theft at their water facility sites. The 5% validity of perimeter alarms further supports the District's decision to overhaul perimeter security with requisite video surveillance. Otay Water District proposes to use Proposition 50, Chapter 3, funds to secure and police	O	0	C	Security Project	2,500,000	45,446	191,500	14	San Diego	V	2007
4709	3710034	3710034-002	Otay Water District	San Diego County Water Authority Regional Inter-Agency Security Cooperative	The San Diego County Water Authority (SDCWA) Regional Interagency Security Cooperative requests an invitation to apply for funding under Proposition 50: Water Security, Clean Water, Coastal and Beach Protection Act of 2002 (Water Code Section 79500 et. seq.), Chapter 3 – Water Security. SDCWA's Regional Interagency Security Cooperative comprises six water districts in District #14, San Diego County, CA, seeking regionalized, comprehensive communications interoperability in a collaborative effort to address the unreliability of their water safety security systems. The six water districts initiating this solution are as follows: 1) Otay Water District, serving population of 190,000 with 37 reservoirs, 27 pump stations; 2) Padre Dam Municipal Water District, serving population of 96,784; 3) Rainbow Municipal Water District, serving population of 18,000; 4) Rincon del Diablo Municipal Water District, serving population of 28,200; 5) Santa Fe Irrigation District, serving population of 20,900; and 6) Valley Center Municipal Water District, serving population of 24,800. The total population served by these six collaborating districts is approximately 378,684. Geographically, these districts span the length of San Diego County. As San Diego County Water Authority (SDCWA) member agencies, the districts receive an estimated 90% of their imported water from SDCWA, the sole source of which is the Metropolitan Water	O	0	C	Security Project	20,000,000	45,446	191,500	14	San Diego	V	2007

4710	3710034	3710034-006	Otay Water District	Otay Water 1296-3 Reservoir	This project consists of constructing a new 2.0 million gallon reservoir adjacent to the two existing reservoirs. The scope of work for the project includes a new access road providing easier access for large vehicles, a new 20-inch inlet pipeline and 16-inch outlet pipeline, extensive grading, relocation of a homeowner's water service, acquisition of access easements and temporary construction easements, reservoir appurtenances, and replacement of pavement on Bear Mountain Way. In order to create a self-sustaining and more environmentally friendly project, a solar power generating system was added to this project. The solar system includes a 75 square-foot photovoltaic panel for generating power, which is tied to the SDG&E power grid. When the demand for power at the site is low, the site has the capability of being self-sufficient.	O	0	C	This project addresses the issues of expansion and reliability, increased capacity, emergency storage, and reliability. According to the Otay Water Districts 2002 Water Resources Master Plan the 1296 pressure zone will require 3.03 MG of additional storage to meet the ultimate demand of 6.06 MG. Based on the existing demands, the existing storage of 3.03 MG is deficient by 1.00 MG. The 1296-3 Reservoir will add 2.0 MG of storage to the 1296 service area, resulting in a total storage of 5.03 MG.	3,640,000	45,446	191,500	14	San Diego	V	2009
4711	0110010	0110010-001	Zone 7 Water Agency	DVWTP Electrical Power System Upgrade	This project involves replacement of the main plant switchboard as well as the motor control center and switchgear for the backwash pumps and service water pumps, which were originally installed in 1975. The new equipment will have better electrical fault protection and the capability to communicate with our SCADA system, and will be designed with expansion capacity to support the plant for the next 35 years.	O	0	C	The Del Valle Water Treatment Plant's (DVWTP) main switchboard and motor control center is in extreme need of replacement. This equipment is well past its useful life, is in imminent danger of failure and is a potential safety hazard. This project will ensure that DVWTP has the ability to provide power to maintain continual operation and meet our water supply permit and safety requirements. Also, per Zone 7's 2006 Asset Management Plan (AMP) Condition Assessment, these assets are currently in poor condition, and have already outlived their expected useful lives. There are no available spare parts if any components were to fail. Failure of this system will take this 40MGD plant out of service for up to 9-12 months. Furthermore, the existing main switchboard has several code violations that pose a potential safety hazard to staff. It was recommended in the AMP that these assets be replaced immediately to minimize the chances of asset failure and the associated impacts on levels of service.	1,300,000	39	195,230	04	Alameda	II	2009
4712	0710003	0710003-013	Contra Costa Water District		two pipelines will be retrofitted with new encased at the crossing locations.	O	0	C	Encase two oil pipelines crossing the Canal to minimize potential contamination.	3,200,000	60,476	200,000	04	Contra Costa	II	1998

4716	0710003	0710003-010	Contra Costa Water District		Construct an in-line sedimentation basin near intake.	O	0	C	Construct in-line sedimentation basin to improve raw water quality in Canal.	1,000,000	60,476	200,000	04	Contra Costa	II	1998

4717	0710003	0710003-024	Contra Costa Water District	Contra Costa Canal Water Quality Protection	The project would replace the unlined portion of the federally-owned Contra Costa Canal (Canal) with a 10-foot diameter buried pipeline. The project will increase flood protection of a federal facility in an area that is experiencing rapid residential growth, increase public safety and security, improve drinking water quality, and improve reliability of CCWD's transmission system. The unlined Canal and associated levees are very similar to the USBR Truckee Irrigation Canal which failed in northern Nevada in January 2008. Both canals serve as flood protection for encroaching communities that are being built close to the canal and rely on the earthen levees to prevent flooding. This project is included as a high priority in the 2008 Federal Legislative Platform adopted by Contra Costa County and received support from the City of Oakley and the City of Brentwood, the local jurisdictions where the facility is located and areas that would be directly affected by flooding. The water quality improvements associated with this project will enhance the ability of the Central Valley Project to meet State water quality standards in the Canal thus reducing upstream reservoir releases. Environmental documentation is complete, $2,800,000 of environmental mitigation implemented and all regulatory permits are in place. Design work is complete, construction has commenced on the initial phase (Phase 1) to encase 1,900 lineal feet of the canal.	O	0	C	The federally-owned Contra Costa Canal (Canal) was completed in 1940 to convey agricultural water to rural Contra Costa County. The area surrounding the Canal has urbanized and the Canal is now the backbone of the CCWD's water conveyance system, which provides water to over 550,000 people. The levees associated with the 21,000-foot unlined portion of the Canal have experienced damage in past storms and are susceptible to failure in a seismic event.Approximately 21,000 feet of the Canal, a water supply aqueduct, is unlined between the intake at Rock Slough and Pumping Plant No. 1. Consequently, improvements to this unlined portion of the Canal are needed to eliminate the susceptibility to water quality degradation and to ensure long-term compatibility with planned land uses in the project vicinity. Hydraulically isolating drinking water supplies in a pipeline instead of conveying supplies through an unlined, porous, open canal will ensure water quality improvement to CCWD's 550,000 customers. Without remedy, CCWD's water supplies in the unlined portion of the Contra Costa Canal will be vulnerable to continuous degradation and additional safety, security, and liability risks as development in this area increases. CCWD has developed the Contra Costa Canal Water Quality Protection Project to protect and improve drinking water quality, protect public safety, increase system security, reduce seepage into and out	10,000,000	60,476	200,000	04	Contra Costa	II	2009
4718	0710003	0710003-023	Contra Costa Water District	Sherman Acres II Main Replacements and Strategic Valves Rehabilitation	A single bid package containing the main replacements and valve rehabilitations is currently under design.The main replacement portion of the project consists of the replacing seven (7) cast iron water mains totaling approximately 6,000 feet in length in Dawn Drive, E. Vivian Drive, Celia Drive, Phylis Drive, Anelda Drive, Peggy Drive and Marta Drive in Pleasant Hill, California. The existing 6-inch and 8-inch cast iron pipelines will be replaced with new 6-inch and 8-inch PVC pipelines. In addition, all 4-inch wharf head fire hydrants within the project area will be replaced with new 6-inch fire hydrants. This aspect of the project will not only increase the reliability of the distribution system in the project area, but will also improve system hydraulics through lower friction losses as well as improve fire flows from modern fire hydrants.The transmission main valve rehabilitation portion of the project consists of replacing three critical valves at key locations in the treated water service area.The Notice of Exemption for the main replacements has been prepared and will be filed with Contra Costa County in early March 2009.	O	0	C	The purpose of the Sherman Acres II Main Replacement portion of the project is to ensure reliable, cost efficient delivery of treated water through replacement of existing pipelines that have experienced significant leak repair history and undersized fire hydrants. The cast iron water mains in the Sherman Acres area are located in an older residential neighborhood in the City of Pleasant Hill, California and are over 50 years old. The pipes are problematic and have required numerous repairs over the years due to water main leaks or breaks. Deteriorating cast iron pipe is subject to internal leakage and can eventually experience sudden burst failures. Excessive leakage can lead to washout of bedding and subsequent structural failure. Leakage and structural failures can have direct consequences such as high maintenance costs, water quality problems, service interruptions, and loss of valuable treated water. Also, replacement of undersized fire hydrants performed as part of main replacement will ensure proper fire flow capacity in the area.Each time a water main leaks or breaks, it must be taken out of service until repairs can be made, and can impact numerous customers. After pipeline repairs are completed and prior to returning the water main to service, CCWD must follow applicable regulations and standards to ensure that water quality has not been compromised. These regulations/standards include 1) CCR: Title 22, Sections	500,000	60,476	200,000	04	Contra Costa	II	2009

4723	0710003	0710003-025	Contra Costa Water District	Treated Water Reservoir Water Quality Improvement	The District is in the process of procuring and installing new reservoir mixing systems and additional monitoring at fifteen remaining high priority reservoirs to address the water quality problems previously described: Kirker Pass, East, Oakhurst, Keller Ranch, Powerline, Clayton Valley, Murchio, Nob Hill, Irish Canyon, Divide, Shell Ridge, Newhall, Castle Rock, Northgate and Rancho Paraiso. The mixing system designs for each reservoir are unique since they vary in size, materials of construction (i.e. concrete or steel), and configuration (i.e. rectangular or cylindrical) with some located above ground and others below ground. Mechanical and/or hydraulic mixing systems can be cost effectively retrofitted without draining or entering the reservoirs. In addition, the work will include new monitoring capabilities with connection to radio telemetry to allow District staff to respond quickly if a water quality problem occurs.At reservoirs where mixing systems and updated monitoring have been installed (e.g. Midhill 2) it was found that consistent chlorine residual and water temperature is distributed through the entire depth of the reservoir and helps minimize long water age, loss of chlorine residual, and nitrification. No reportable coliform incidents have occurred in the retrofitted reservoir or adjacent water distribution systems. The District is confident that similar results can be achieved at the reservoirs listed above.	O	0	C	Contra Costa Water District (District) is experiencing chloramine decay and nitrification in the water distribution system that causes significant water quality problems that impact regulatory compliance (Total Coliform Rule); taste and odor complaints from customers; and system operations. The District operates 40 treated water storage reservoirs at 32 sites and over 780 miles of pipelines that are affected by chloramine decay and nitrification, especially in remote areas of the distribution system. The District has had several reportable coliform violations to CDPH over the past few years related to loss of chlorine residual and nitrification, however, the violations were addressed quickly and fortunately did not affect public safety or require public notifications.The District conducted a study in 2006 to quantify the level of chloramine decay and nitrification in its storage reservoirs and prioritize remedial action. The District's goal is to maintain a chloramine residual in the distribution system between 0.2 mg/l and 3.0 mg/l and the target total chlorine residual is 0.5 mg/l. These goals are consistent with American Water Works Standards. The 2006 study found that only seven of the 40 reservoirs meet the target levels more than 90 percent of the time. Measures have been taken to address the problems by installing mixers, new inlet/outlet piping, booster chlorination systems, flushing programs, and additional	500,000	60,476	200,000	04	Contra Costa	II	2009

4725	1910048	1910048-007	CASTAIC LAKE WATER AGENCY	Rio Vista Water Treatment Plant Expansion	Construction of new facilities to provide for additional treatment capacity (increasing from 30 to 60 million gallons per day) at the Rio Vista Water Treatment Plant will include additional intake pumps, clarifiers, filters, chlorine storage and injection facilities, ozone improvements, washwater return treatment improvements, a new raw water connection to MWD's Foothill Feeder, and improved maintenance facilities.	O	0	C	The population is growing rapidly in the Agency's service area. Additional treatment capacity is needed to accomodate future users and to ensure that high quality water consistently meeting health requirements is reliably delivered to the customers.	36,000,000	25	230,000	22	Los Angeles	IV	2009
4726	1910048	1910048-009	CASTAIC LAKE WATER AGENCY	Saugus Early Warning Monitoring Wells	The project will consist of the construction of two monitoring well clusters upgradient of the Saugus 1 and Saugus 2 Wells. The well locations will be selected based on travel time to the wells, position of the plume, and facility of installation. For each location a cluster of three wells will be drilled into different hydrostratigraphic units so that all likely pathways of contamination can be monitored. Work will include mobilization, drilling, installation, well development, proper disposal of drilling wastes, and preparation of location maps, boring logs, and documentation. All work will be performed in accordance with industry standards and in compliance with DPH standards.	O	0	C	Several drinking water wells perforated in the Saugus Formation of the Santa Clarita Valley were contaminated with perchlorate in excess of the current maximum contaminant level of 6 ug/L. The likely source is a former munitions manufactuing site in Saugus. These wells have been out of service since 1997. Some have since been abandoned. Some have been replaced with wells far removed from the contamination area. Two of the wells have been rehabilitated and will be connected to a treatment plant to remove the perchlorate. This treatment plant is undergoing construction. A number of monitoring wells have or will be installed by various parties (Whittaker Bermite, the U.S. Army Corps of Engineers, Castaic Lake Water Agency) to characterize the groundwater in the region and to provide an early warning should the perchlorate concentration increase or should other contaminants from the site (e.g. volatile organic compounds) also threaten the wells. DPH staff has stated that adequate protection is an important feature needed before start-up will be permitted and compliance will be achieved.	750,000	25	230,000	22	Los Angeles	IV	2009

4727	1910048	1910048-006	CASTAIC LAKE WATER AGENCY	Groundwater Transmission Mains--Phase 2	The project will consist of construction/installation of new distribution infrastructure including 1,650 linear feet of pipeline and related valves and appurtenances; saw-cutting and excavation; and restoration and repaving of sidewalks, curbs, gutters, and streets.	O	0	C	Several drinking water wells perforated in the Saugus Formation of the Santa Clarita Valley were contaminated with perchlorate in excess of the current maximum contaminant level of 6 ug/L. These wells have been out of service since 1997. Some have since been abandoned. Some have been replaced with wells far removed from the contamination area. Two of the wells have been rehabilitated and will be connected to a treatment plant to remove the perchlorate. This treatment plant is undergoing construction. A portion of the the pipelines that will convey contaminated water to the plant is also under construction as are a portion of the pipelines that will deliver treated water to the Agency's customers. A second phase has been designed and will be ready soon for construction. It is the second phase of the pipelines for which we seek funding.	1,300,000	25	230,000	22	Los Angeles	IV	2009
4728	3010092	3010092-007	Irvine Ranch Water District	IRWD Emergency Interconnection – Phase B	The Southern Orange County water agencies, Irvine Ranch Water District, MWDOC, and the Orange County Water District (agency responsible for groundwater basin management) have entered into agreements to deliver water via the Irvine Ranch Water District system infrastructure to the Southern Orange County water agencies in the event of a planned or emergency disruption to the regional imported water system, thus providing a more reliable, cost effective alternate water supply. The only other options available would be much more costly and energy intensive.The proposed project constructs a permanent pumping station facility at the Irvine Ranch Water District Zone 1 Reservoir. The proposed pumping station will allow excess available capacity to be delivered from the Orange County Groundwater Basin to the existing interties with the regional pipeline facilities that deliver water to the Southern Orange County water agencies. The project will also construct a pumping station upgrade to facilitate delivery of excess water to Southern Orange County.	O	0	C	Southern Orange County retail water agencies receive almost all drinking water from a single source, the Metropolitan Water District of Southern California (MWD) via the Municipal Water District of Orange County (MWDOC). This supply is comprised of imported water from the Colorado River and the State Water Project and is subject to quantity restrictions whether by regulatory/judicial controls, planned system outages, long-term drought, and/or natural disasters. Without a reliable alternate supply source, these water agencies have only a few days' potable water storage capacity. A water supply interruption of longer duration, a protracted drought, or large-scale wildfires, could require severe water rationing for hundreds of thousands of residents and adversely impact a multi-billion dollar per year economy. The Irvine Ranch Water District has the ability to supplement their imported water deliveries from MWD with local water supplies from the Orange County Groundwater Basin that the Southern Orange County water agencies do not have access due to the physical location of the groundwater basin.	15,269,000	88,423	316,000	08	Orange	V	2009

4729	3010092	3010092-004	Irvine Ranch Water District	Well 106	Well 106 is an existing well located in Irvine that currently produces 1000 gallons per minute of good quality water except for color units of an average of 30. Since this well is not of potable quality, it is currently supplementing IRWD's non-potable water system. IRWD proposes to add treatment so that Well 106 can be utilized in the potable water system. Well 106 will be pumped to the existing Irvine Desalter Project Potable Treatment Plant which desalts brackish groundwater using low pressure reverse osmosis (RO) membranes. Connecting Well 106 water to this treatment plant will require some additional piping, RO membranes, and pumping equipment. There will also be operational and maintenance (O & M) costs associated with the production and treatment of the water from Well 106.The increased flow of water to the IRWD potable water system will be approximately 1100 acre-feet per year which is enough for 2200 homes. This is a very cost-effective project when compared against the cost of imported water which is currently over $600 per acre-foot. The cost of Well 106 water after treatment will be approximately $700 per acre-foot comprised of $150 per acre-foot for amortized capital and $550 per acre-foot for O & M costs. If IRWD receives a loan - with principal relief - in the amount requested of $1,000,000, then the capital portion will be reduced and the total capital and O & M cost to	O	0	C	The State of California is in a statewide drought situation because of two consecutive years of below-average rainfall. Significant restrictions on diversions from the Delta due to various environmental factors have severely limited the State Water Project water supply deliveries to Southern California. Irvine Ranch Water District (IRWD) receives 35% of its drinking water supplies imported from Metropolitan Water District of Southern California (MWD). MWD gets its supplies from the Colorado River and the State Water Project and is faced with water shortages in these supplies. IRWD receives 65% of its drinking water supplies from the local groundwater basin and desires to further enhance potable supply reliability by constructing treatment for an existing non-potable well. Increasing local supply sources will reduce demands on imported state supplies.	1,000,000	88,423	316,000	08	Orange	V	2009
4730	3010092	3010092-008	Irvine Ranch Water District	Baker Regional Water Treatment Plant	The proposed Baker Regional Water Treatment Plant (WTP) is a new microfiltration (MF) plant. The selected site is the former Los Alisos Water District Baker Filter Plant site in Lake Forest, which is located near the terminus of the Baker Pipeline. Project partners include Irvine Ranch Water District (IRWD), Moulton Niguel Water District (MNWD), Trabuco Canyon Water District (TCWD), El Toro Water District (ETWD), Santa Margarita Water District (SMWD) and the Municipal Water District of Orange County (MWDOC). The main objective of the Baker WTP project is to improve the water system reliability in south Orange County. One of the project's key reliability features is supply of untreated water to the Baker WTP from Irvine Lake in case of Santiago Lateral or MWD Lower Feeder outage. The Baker WTP capacity will be 22 mgd, operating on a continuous basis. Treated water from the Baker WTP will be delivered to south Orange County water agencies through an existing connection between the Baker Pipeline and the Allen McColloch Pipeline at the facility site or by constructing a new product water pipeline to South County Pump Station.The Baker WTP will treat raw water from Santiago Lateral or Irvine Lake via the Baker Pipeline. The Santiago Lateral is an MWD pipeline that delivers raw imported water to Irvine Lake or the Baker Pipeline from Lake Mathews via the MWD Lower Feeder. The raw water quality in Irvine Lake is	O	0	C	The State of California is in a statewide drought situation because of two straight years of below-average rainfall. Significant restrictions on diversions from the Delta due to various environmental factors have severely limited the State Water Project water supply deliveries to Southern California. Recent petitions filed by the State Water Resources Control Board state that Metropolitan Water District (MWD) is in urgent need of additional imported water to meet its municipal needs during this statewide drought. Irvine Ranch Water District (IRWD) and neighboring agencies, as part of Municipal Water District of Orange County (MWDOC), which is a member agency of MWD, are faced with local shortages and need new sources of water supply.Besides water supply shortages, water system reliability in south Orange County is a significant problem for IRWD, Moulton Niguel Water District (MNWD), Trabuco Canyon Water District (TCWD), El Toro Water District (ETWD), and Santa Margarita Water District (SMWD). The majority of the treated water supply for these agencies comes from the MWD Diemer Filtration Plant, which is located in north Orange County. The Allen McColloch Pipeline (AMP) is the primary connection for treated water deliveries to south Orange County. Outages for maintenance, earthquakes or other natural disasters would leave south Orange County without a treated water supply.	5,000,000	88,423	316,000	08	Orange	V	2009

4732	0110001	0110001-009	Alameda County Water District	Physical Security Improvements at Critical Facilities	The project involves the installation of upgrades to perimeter site security, video surveillance for rapid alarm assessment, and other key asset protection enhancements at critical drinking water production, treatment, and distribution system storage facilities.	O	0	C	The Alameda County Water District (ACWD) provides potable water to over 330,000 people in the cities of Fremont, Newark, and Union City, California. Improvements to physical site security are needed to increase ACWD's ability to deliver safe and secure supplies of high quality drinking water by reducing the risk of water contamination or other malicious activities at critically important water infrastructure sites.Regional water supply benefits will result from the protection of stored drinking water which could be shared with other agencies through existing pipeline inter-connections. Local economic benefits include the creation of electrical, communication, and integration specialist jobs, as well as underground construction labor for the initial installation Long term security monitoring jobs will also be created.This project is consistent with the objectives outlined within the US EPA Water Security Initiative which was developed as a national effort in response to Homeland Security Presidential Directive 9. The project also complies with the national aggregate measures of water security as outlined by the National Drinking Water Advisory Council (NDWAC) in June 2005.	2,345,000	79,088	324,796	04	Alameda	II	2009
4733	0110001	0110001-011	Alameda County Water District	ACWD HQ Building, ADA, Structrual and EOC Improvements	This project will: 1) upgrade ACWD's emergency operations center; 2) add an area that will be used to stage field crews in the event of an emergency; 3) seismically strengthen vulnerable portions of the Headquarters building and radio communication antenna tower to meet current seismic building code standards; and 4) implement interior and exterior accessibility upgrades to comply with current Americans with Disabilities Act (ADA) standards.	O	0	C	The Alameda County Water District (ACWD) provides potable water to over 330,000 people in the cities of Fremont, Newark, and Union City, California. ACWD's headquarters building is located near the Hayward Fault, which is seismically active. Retrofitting the building for a seismic event and increased emergency operations and communications capability are needed to more effectively assist with water service restoration in the event of a large earthquake or other emergency conditions in the ACWD service area. Retrofit includes replacing the older existing lighting system with new, energy efficient fixtures, to reduce energy consumption. Improved access for physically challenged employees and customers is also required. The project will also stimulate the economy through the creation of jobs required for the construction work.	5,294,000	79,088	324,796	04	Alameda	II	2009

4734	0110001	0110001-007	Alameda County Water District	Niles-Newark Intertie Pipeline	This project consists of the installation of approximately 15,000 linear feet of 24-inch diameter high density polyethylene (HDPE) pipe and associated valves and appurtenances. Special construction details have been incorporated into the design for the pipe to withstand a maximum credible earthquake event.	O	0	C	The Alameda County Water District (ACWD) serves over 330,000 people with potable water in the cities of Fremont, Newark, and Union City. Local groundwater from the Niles Cone Groundwater Basin constitutes 40% of ACWD's overall water supply on average. Other supply sources consist of imported water from the California State Water Project and the San Francisco Public Utilities Commission Hetch-Hetchy system. The Hayward Fault bisects ACWD's distribution system into eastern and western areas.A pipeline is needed to transmit high mineral content ground water, produced at the Peralta-Tyson Wellfield (east of the Hayward Fault), to the Desalination Facility (west of the Hayward Fault) which produces low mineral content reverse-osmosis water, in order to produce blended water that more reliably meets water quality hardness criteria.Although the primary benefit of the pipeline will be to improve water quality, the project will also result in other significant benefits.Because most of ACWD's water production capacity is located east of the Hayward Fault, construction of the pipeline will enhance the distribution system reliability on the west side of the fault in the event of a seismic event.Pumping restrictions in the Sacramento-San Joaquin Delta, caused by degrading environmental conditions, result in a reduced, less reliable, water supply for ACWD. This project will allow ACWD to further leverage its local	13,469,000	79,088	324,796	04	Alameda	II	2009
4735	0110001	0110001-003	Alameda County Water District	Upgrade PT Blending Facility chemical feed system to Neal Feed	Upgrade PT Blending Facility	O	0	C	The PT Blending Facility experiences deficiencies in water quality & system reliability	1,000,000	79,088	324,796	04	Alameda	II	2003
4736	0110001	0110001-010	Alameda County Water District	Water Treatment Plant No. 2 Process Improvements	Convert the existing ozone air preparation equipment to a liquid oxygen feed system, add a second membrane filter press, and upgrade major equipment components, including chemical feed and storage, solids handling.Implementation of this project provides benefits in several areas:•Because of recent federal court-mandated pumping restrictions at the Sacramento-San Joaquin Delta pumps, the ability to treat water when it is available has become increasingly more important. The provision of a second membrane filter press and improvements to several major equipment components will better ensure that residuals management or other various subsystems of the plant do not become a constraint on water plant production.•Conversion of the existing ozone air preparation equipment to a liquid oxygen feed system will be more energy efficient and reduce ACWD's consumption of electricity. •Execution of the project will result in significant job creation in the depressed manufacturing sector for the fabrication and assembly of the press itself, as well as provide local skilled jobs to perform the mechanical, electrical, and control systems work needed for installation.	O	0	C	The Alameda County Water District (ACWD) provides potable water to over 330,000 people in the cities of Fremont, Newark, and Union City, California. Water Treatment Plant No. 2 treats water delivered via the South Bay Aqueduct of the State Water Project. Reliable water production at the plant is critical for ACWD to meet its customers' water demands. Improvements are needed to address several operational issues with this facility:•The existing ozone disinfection system is maintenance and energy-intensive. •The existing single membrane filter press used for solids dewatering constrains water production and reduces plant reliability •Wear on several major equipment components associated with chemical feed and storage, solids handling, and other systems is reducing plant reliability	10,804,000	79,088	324,796	04	Alameda	II	2009
4737	0110001	0110001-008	Alameda County Water District	Polybutylene Service Line Replacement	This project involves the replacement of polybutylene service laterals (approximately 1,000 laterals each year over the next five years) with copper laterals, proactively before they fail.	O	0	C	Replacement of polybutylene service laterals is needed to reduce the loss of unaccounted for water in the ACWD distribution system. The polybutylene lines continue to fail prematurely causing loss of water and property damage.	10,500,000	79,088	324,796	04	Alameda	II	2009

4738	3010001	3010001-007	City of Anaheim	Water Main Corrosion Control	Feasibility studies indicate that several ductile iron water mains in the Anaheim Hills area should be replaced with polyvinyl chloride (PVC) mains. Currently, five sections have been identified as a high priority at an estimated project cost of $2.0 million. Several PVC mains have been installed in the Anaheim Hills area and have been found to function well. They are corrosion resistant and require low maintenance. These projects will utilize Categorical Exemptions for CEQA compliance and since the design phase is relatively short, Anaheim can easily begin construction by early 2010.	O	0	C	The City of Anaheim's water system contains ductile iron water mains which have experienced high rates of corrosion in the Anaheim Hills section of the City. Corrosive soils in these areas have oxidized the iron in these pipes and caused many main breaks. Main breaks may cause numerous negative impacts, including: potential for water quality impacts via intrusion of dirty water during the repair; intrusions of water from cross connections during low pressure event; loss of water, both prior to the shut down of the line and for flushing following the repair; hamper fire fighting capabilities; water outages for customers; prevent the flow of water into or out of reservoirs or closed zones in the water system; property damage (especially streets and other underground utilities); street closures; and of course, financial costs. Preventing main breaks would help protect water quality, improve reliability, and reduce costs.	2,000,000	62,445	346,823	08	Orange	V	2009
4739	3010001	3010001-005	City of Anaheim	La Palma Blending Plant Rehabilitation	Per the results of an economic feasibility study, this project would replace the two asphalt-lined, subterranean reservoirs with two 2MG fully enclosed, partially buried, prestressed concrete reservoirs. The new reservoirs would meet all current seismic standards and would allow continued operation of the La Palma Blending Plant. This plant allows Anaheim to reduce the levels of TCE and PCE in its drinking water and to meet all regulatory requirements. The use of the contaminated aquifer has multiple benefits for regional water management: a) it makes use of a resource that would otherwise not be utilized, b) using this resource helps to relieve the burden on other wells or imported water (Well #14 has historically produced about 600 acre-feet per year, but it's possible that following this rehabilitation project, it could produce a higher volume), c) it helps to contain the contaminant plume and protect other downgradient production wells, d) it removes some of the contamination from the aquifer, and e) since the final blend of the water at the plant contains no detectable contamination, it meets all drinking water standards and public health goals.	O	0	C	Portions of the Orange County Groundwater Basin are contaminated with volatile organic compounds. One of Anaheim's production wells, Well #14, contains low levels of trichloroethylene (TCE), tetrachloroethylene (PCE), and other chlorinated hydrocarbons that have State and federal MCLs. The water from this well is blended at Anaheim's La Palma Blending Plant with water from another well that does not contain chlorinated hydrocarbons. This process ensures that plant effluent water contains no detectable lelvels of TCE, PCE or other regulated compounds. The plant, which is permitted as a blending plant by the DHS, utilizes two reservoirs for blending. The two dugout, asphalt-lined reservoirs were constructed in the 1950s and are need of significant repairs and seismic upgrades. An economic analysis determined it was more economically feasible to replace the reservoirs rather than make repairs.	5,000,000	62,445	346,823	08	Orange	V	2007

4740	3010001	3010001-006	City of Anaheim	Emergency Interties Between Anaheim and Neighboring Cities	Intertie with the City of Buena Park: The City of Buena Park has no emergency interties and their 2005 Water Master Plan Study recommended several be installed. The proposed intertie between Anaheim and Buena Park water systems would be a two-way emergency only intertconnection. Buena Park would connect an existing 12 inch water main to an underground interconnection facility in a secured vault at one of several possible locations. The interconnection facility will include components such as control valve, check valve, isolation valve, blow off valve and flow metering. The control valve would automatically activate in case of pressure drop to either water system. Once constructed, the intertie will provide both cities with access to supplemental water during an emergency that interrupts flow from their own sources. The proposed intertie will be able to deliver up to 4.5 MGD during emergencies. Intertie with City of Orange: The proposed intertie between the water distribution systems of the cities of Anaheim and Orange is a two-way emergency interconnection. The intertie would connect two existing 12 inch water mains with an intertie facility to be located in a secured underground	O	0	C	Security Project	600,000	62,445	346,823	08	Orange	V	2007

4742	3310009	3310009-065	Eastern Municipal WD	Eastern MWD - Perris II Desalter Project	Project DescriptionThe Perris II Desalter will provide up to 5.4 million gallons per day (MGD) of potable water from brackish wells feeding into a reverse osmosis (RO) desalination plant. The plant will be constructed to an initial capacity of 3.6 MGD with the ability to upgrade to an ultimate capacity of 5.4 MGD. This new water source will supply up to 11,000 families in the disadvantaged community of Perris, California. The proposed Perris II Desalter project consists of pre-treatment facilities (iron and manganese removal), RO treatment facilities, chemical storage/feed facilities and pumping facilities to dispose of brine concentrate and deliver finished potable water to the distribution system. Iron and manganese facilities will pre-treat the entire raw well water feed to remove potential foulants to the RO membranes. RO treatment facilities will include cartridge filters, RO feed pumps, RO membranes, and chemical storage and feed (for addition of disinfectant, control of PH, threshold inhibitor, and RO membrane cleaning agents). The project includes pumping facilities to dispose of brine concentrate and to deliver finished water to the distribution system. The project includes other required supporting facilities including instrumentation and control, laboratory facilities, maintenance facilities, HVAC, and electrical.The project will also include: up to seven new wells and associated equipment; approximately 60,000 feet of pipeline	O	0	C	Problem DescriptionThe goals of this project are to:• Mitigate exceedances of the primary MCLs for Nitrate and Perchlorate;• Mitigate exceedances of the secondary MCL for Total Dissolved Solids (TDS);• Reduce demand on imported water;• Protect drinking water sources; and• Supplement water supplies for disadvantaged communities using:o Desalination which provides an efficient use of local water resources and is more energy efficient than imported water supplies thereby reducing our Greenhouse Gas footprint; and o Water that would not otherwise be usable thereby conserving water resources for use in other areas. Eastern Municipal Water District (EMWD) provides water to a 555 – square mile area in western Riverside County, serving approximately 660,000 people. EMWD's total potable water demand of 134,000 acre feet per year (AFY) includes 82% of imported water from the state water Project and Colorado River Aqueduct and the remainder is provided by local groundwater.EMWD has successfully constructed two groundwater desalination plants and implemented a desalination program in the Perris Valley. Currently, up to 8 million gallons per day (MGD) of locally derived potable water can be generated by the desalters. These efforts were implemented in order to:• Increase reliance on local groundwater, decreasing dependence on imported water;• Increase reliance on local water resources in	91,200,000	141,243	414,710	20	Riverside	V	2012
4743	3310009	3310009-058	Eastern Municipal WD	Eastern Municipal Water District - Remote Site Security Improvements	Installation of remote event action video monitoring equipment and perimeter security systems are remote water distribution sites including treatment plants, pump stations, and reservoirs. 4745	3810011	3810011-001	SFPUC City Distribution Division	SFPUC Headquarters Building	The San Francisco Public Utilities Commission (SFPUC) is a department of the City and County of San Francisco that provides regional and local Water for 2.4 million customers.This project, a portion of the SFPUC's new administration building, is a Supervisory Control and Data Acquisition (SCADA) system that will monitor and control the SFPUC's regional and local water transmission and distribution system and supplement the SFPUC's emergency response capacity. This system will centralize the SFPUC's monitoring of its water system during emergencies. The agency will have a centralized rapid response system to immediately identify breaks, isolate areas of contamination and address other emergencies in the water system. The SCADA system will allow for rerouting of water distribution during emergencies to prevent contamination and manage safety of the entire system. The project has secured all entitlements such as Final Environmental Impact Report certification, SFPUC Commission and San Francisco Board of Supervisors approvals, Civic Design review approval and secured a general contractor for construction. Federal infrastructure stimulus investment for this project would provide in excess of 500 construction jobs.	O	0	C	The project will be built in a "disadvantaged" community neighborhood, the Tenderloin District, of the City of San Francisco.The SFPUC needs a new headquarater facility that allows operational and emergency response from a centralized location.	10,000,000	175,154	802,650	04	San Francisco	II	2009
4746	4310011	4310011-053	San Jose Water Company	Steel Tank Lining and OSHA compliance issues at Perie Ln Station	These improvements will increase the level of safety for personnel working in the area as well as the level of service following seismic events. This alternative ensures that consumers benefit from many decades of a high quality and reliable water supply. The estimated cost for making the improvements at Perie Lane Reservoir is $622,500. These costs include all labor, materials and permits needed to install the new coatings, perform a seismic retrofit and replace the ladder with a safety cage and hand railing for safe roof access. Major components of this cost estimate are:PERIE LANE STATION RESERVOIR IMPROVEMENTSCOST ESTIMATE AmountMaterial 4,600Company Labor 25,000Contract 482,000Permit 13,000Contingencies (5%) 26,230Subtotal 550,830Overhead (13%) 71,670Total 622,500	O	0	C	The steel tank and its appurtenances at Perie Lane Reservoir are over 40 years of age and approaching a point in their asset lives when major improvements are needed to maintain function and to allow SJWC to provide to our consumers a high quality and reliable water system. There are a number of improvements proposed for this facility that will accomplish these goals and include:• New Interior Coating• Seismic Retrofit• New Tank Ladder With Safety Cage and Hand RailsTank coatings are applied to provide corrosion protection from natural elements as well as the stored water. It is the experience of SJWC that steel tanks' interior lining have useful lives of approximately 20 years. Given a tank's useful life of 35 to 50 years, new coatings are often applied at some point during its life. The Perie Lane tank coatings are over 40 years old and new coatings are required in order to provide the desired level of corrosion protection. The majority of tanks within SJWC's distribution system were constructed with bottom penetration inlets/outlets and overflows. Data from the 1989 Loma Prieta Earthquake revealed that tanks with bottom penetrations have a high probability of failure due to their rigidity and response to seismic events. SJWC has developed an ongoing seismic retrofit program that includes replacing bottom tank shell penetrations with side penetrations and adding flexible couplings. Perie Lane tank was one	622,500	219,571	998,000	17	Santa Clara	II	2009

4752	4310011	4310011-048	San Jose Water Company	Water Main Replacement, Canyon Vista Dr, Santa Clara County	Category O Project – Replace 4,000-ft of 12" water main on Canyon Vista Dr, County of Santa Clara, CA, from Yona Vista Dr to Chula Vista Dr.Water Main Replacement: A critical need for replacement of potable water transmission and distribution system infrastructure has been identified by SJWC due to the changes in demography in the 1950's and 60's. Based on past San Jose Water Company developed infrastructure studies, as well as publications and reports from American Society of Civil Engineers (ASCE) and federal agencies such as EPA and GAO, SJWC's water main replacement performance over the last decade has averaged approximately 9 miles per year. The latest revised program to normalize replacement of pipeline infrastructure describes an annual length of pipeline replacement increase to about 17 miles in 2009, about 21 miles in 2010 and leveling off at about 25 miles in 2011 and beyond. SJWC total length of pipeline infrastructure is approximately 2,400 miles. Thus a rate of about 25 miles per year is in line to achieve a 1% per year recommended replacement rate.	O	0	C	Water Main Replacement: A critical need for replacement of potable water transmission and distribution system infrastructure has been identified by SJWC due to the changes in demography in the 1950's and 60's. 4760	4310011	4310011-057	San Jose Water Company	Montevina Treatment Plant Improvements	San Jose Water CompanyPre-Application for FundingProject Description – Montevina Water Treatment PlantKennedy/Jenks Consultants (KJC), was engaged by San Jose Water Company to assess the water quality data, regulatory drivers, infrastructure condition, develop detailed project objectives, evaluate technologies, and recommend a microfiltration membrane alternative with powdered activation carbon (PAC), improve washwater and solids handling, and provide structural and seismic improvements.The analysis confirmed the need for a water treatment process that can robustly handle “flashy” water quality and reliably meet the IESWTR turbidity parameters. The overall project objectives for the Montevina WTP Improvements Project include: Modification, replacement or addition of treatment processes with 30 MGD capacity to reliably produce treated water meeting State and Federal requirements from source water with turbidity levels of 100 NTU and short-lived turbidity spikes over 300 NTU. Operation of the facility up to 30 MGD and as low as approximately 3 MGD to take full advantage of the source water available to the Montevina WTP. Reduction of TOC and DBP precursors to reduce DBPs in the distribution system to meet the DPB2 requirements. Improvements to the washwater, solids handling systems and filtration processes as needed to comply with various regulations, design and	O	0	C	Montevina Water Treatment Plant (WTP) is the primary source of supply for the Town of Los Gatos and surrounding communities. Without Montevina WTP, water service to these elevated portions of San Jose Water Company's service area would rely on a limited source of supply and booster pumping capacity, which cannot meet peak summer demands. The current Montevina WTP was commissioned in 1970. Although several upgrades have been made to the WTP since that time, the treatment process – direct filtration and chlorination – remains unchanged. The existing Greenleaf filters lack modern features such as individual filter effluent control valves and filter-to-waste piping. The State and Federal regulatory requirements for turbidity removal, disinfection, and disinfection byproducts have become more significantly stringent.In addition to new regulations, the WTP is challenged by aging infrastructure. Many of its key components are at or beyond their useful lives, and the concrete structures do not meet current structural or seismic standards.In January and early February 2008, Montevina WTP exceeded the California Code of Regulations (CCR) Title 22 Operating Criteria for Interim Enhanced Surface Water Treatment Rule (IESWTR) individual filter effluent turbidity limits. The Corrective action required that Montevina WTP is limited to treating raw water of 15 NTU or less because of the limitations of the direct	73,700,000	219,571	998,000	17	Santa Clara	II	2011
4761	4310011	4310011-043	San Jose Water Company	Saratoga WTP Backwash Treatment Upgrades	This project will rebuild the backwash pond treatment system to allow additional detention and settling time for backwash water, and to prevent intrusion of creek water into the pond.	O	0	C	Existing backwash treatment facilities are failing and improvements are necessary to meet regulatory requirements. Problems with existing facilities include a failing retaining wall and intrusion of water from the adjacent creek.	262,500	219,571	998,000	17	Santa Clara	II	2009
4762	3710020	3710020-056	San Diego - City of	Serra Mesa pump station	Construct a new water pump station with five 5-mgd pumps. Total pump station capacity will be 20-mgd. The pump plant will pump water from the Alvarado Zone to the Northwest Mesa Zone.	O	0	C	Convey water from the Alvardo WTP system to a portion of the Miramar WTP system, this pump station will allow the Alvarado WTP to support the Miramar WTP service area and free up capacity within the overall Miramar WTP system.	5,426,000	273,015	1,266,731	14	San Diego	V	2002

4763	3710020	3710020-070	San Diego - City of	Miramar Clearwells	Construction of two new rectangular (vertical wall) clearwells with a combined capacity of 58.3 MG, bottom elevation of 686'and overflow level at 712'; Construction of a new chlorine contact chamber for 1.0 log giardia inactivation with an ammonia diffusion system and an effluent weir that will split the flow equally between both clearwells; Two clearwell inlets from the chlorine contact chamber (84" CMLC Steel PL); Clearwell effluent PL on the north side of the clearwell connected to the Miramar 2A PL (60" CMLC Steel PL); Two clearwell outlets on the south side of the clearwells connected to the Miramar PL (54" CMLC Steel PL); Replacement of the Miramar PL from Clearwells No. 1 outlet to approximately 50' west of Clearwell No. 2 outlet (54" & 66" CMLC Steel PL); Construction of a new 60' by 100' maintenance facility; Landscaping and paving that will not be covered under Miramar WTP Upgrades, Contract D, including entrance modifications, security guard shack, and entrance security surveillance; The above scope will allow the Miramar Water Treatment Plant to convert its current disinfection strategy of running free chlorine through the filters to biologically active filters. This option provides the largest amount of storage of all the alternatives studied which should help during high summer demand periods and with the amount of required flow changes for the treatment plant.	O	0	C	This project is driven by the need to replace aging infrastructure that has deteriorated and now has the potential to fail and compromise the water distribution system. Additionally, identify the remaining upgrades needed in the Miramar Water Treatment Plant (MWTP) site so that no additional large CIP projects would be needed in the near future; In 1959, the original MWTP and Clearwell No. 1 were built to supply newly developed regions of the City of San Diego. In 1974, due to increased demand in the Miramar Service Area, the plant was expanded to 100 MGD and Clearwell No. 2 was built. The plant expanded to 140 MGD in the 1980's. During the current MWTP Upgrades project that increased plant capacity to 215 MGD, several clearwell shutdowns were required in order to install new influent and effluent pipelines. It is during these clearwell shutdowns that gave City staff and consultants a chance to inspect the clearwells and determine that replacement of the clearwells was imminent. In July 2000, Bayez & Patel, Inc. performed a seismic evaluation and structural condition assessment of Clearwell No. 2, which stated that Clearwell No. 2 no longer met current seismic codes and needed a major seismic rehabilitation. No such report was done for Clearwell No. 1, but one can assume that conditions for this clearwell are similar or worse since this clearwell is 15 years older. During the MWTP Early Start	79,015,000	273,015	1,266,731	14	San Diego	V	2012
4764	3710020	3710020-067	San Diego - City of	Barrett Flume Cover	Covering the open flume sections or replacing with a pipeline to preempt fines and sanctions from resource agencies; benefits include maintaining water quality as well as reducing maintenance and down time.	O	0	C	This is a 12-mile open channel section of the Barrett Flume which is an excessive maintenance burden due to the need to remove soil, sediment, and sunlight-caused algae build-up; Precious golden eagles, deer, and other nearby wildlife drown in this section of the open channel.	66,000,000	273,015	1,266,731	14	San Diego	V	2012
4765	3710020	3710020-054	San Diego - City of	new flow control facility Miramar	Design and construct a new flow control facility to continue to meet the needs of the raw water supply to the Miramar WTP.	O	0	C	Miramar WTP flow control facility requires upgrades to the facility and the treatment process to comply with regs. Continued increase in water demand due to pop. growth has required additional rehab.	8,000,000	273,015	1,266,731	14	San Diego	V	2002
4766	3710020	3710020-069	San Diego - City of	Otay 1st/2nd Pipeline Consolidation - West of Highland	1. Otay 1st Pipeline – Replace the existing 30" and 36" main with a 16" pipeline. Consolidate all existing parallel pipeline. Replace Interstate 805 crossing with 30" pipeline. The pipeline limits are from the interconnection of Wightman Street and Highland Avenue to the intersection of Oregon Street and Polk Avenue. The length of Otay 1st Pipeline is 11,480' (2.17 miles).2. Otay 2nd Pipeline – Eastern Segment - Replace the existing 30" and 36" main with a 42" pipeline. Replace existing parallel pipelines to Otay 2nd PL with a 12" pipeline. The pipeline limits are from the interconnection of Wightman Street and Highland Avenue to the intersection of Wightman Street and Swift Avenue. The length of Otay 2nd Pipeline is 8,340' (1.00 miles).Western Segment – Install a 42" pipeline and replace existing parallel pipelines to the proposed Otay 2nd PL with a 12"and 16" pipeline. The pipeline limits are from the intersection of Wightman Street and Swift Avenue to the intersections of Upas Street and 30th Street. The length of the propose Otay 2nd Pipeline is 5,560' (1.58 miles).3. Otay 2nd PL 16" Extension – Replaced Otay 2nd PL with a 16" PVC from the intersection of Wightman Street and Swift Avenue to University Heights Reservoirs. Replace Interstate 805 crossing with a 36" pipeline. The length of Otay 2nd Pipeline is 5,420' (1.03 miles).4. Minor Pipeline Upgrades - Replace existing 16" Cast Iron pipeline in	O	0	C	The City's continuing effort to replace all the cast iron (CI) pipelines within the City is in accordance with CDPH's compliance order 04-14-96CO-022. This project was driven by the need to replace a facility reaching the end of its life cycle & has become a liability. The condition of the Otay 1st Pipeline & Otay 2nd Pipeline are known to be deteriorated. A failure could cause damage to private property and closer of streets. This project is comprised of the Otay 1st Pipeline (Otay 1st PL) & Otay 2nd Pipeline (Otay 2nd PL). Both the Otay 1st/2nd PL were originally used to supply raw water from the Lower Otay Reservoir to the old University Heights Water Treatment Plant (WTP). The University Heights WTP was decommissioned in 1950 & both pipelines were converted from raw water to potable water. The conversion increased the pressure in the pipelines roughly 20 psi. The entire Otay 1st PL runs from the 54th Street Pipeline (PL) connection in Easy Street to University PL in Oregon Street. It was built around 1915 using CI & Reinforced Concrete Steel Cylinder PL (RCSC). In 1969, the CI segments were lined with cement. In 1996, the segment crossing Interstate 15 was replaced with a 30" concrete encased Welded Steel Pipeline (WSP) & in 1970, the segment crossing Interstate 805 was replaced with a 30" Steel Cylinder Rod Wrapped Pipeline (SCRW). The pipeline sizes vary from 24" to 36" and the pipeline material includes are	30,700,000	273,015	1,266,731	14	San Diego	V	2012

4767	0110005	0110005-038	East Bay MUD	Large Diameter Pipeline Replacement	High-priority backbone pipes to be replaced to ensure reliable water service include:• Keith Avenue and Euclid Avenue (100 feet of 16-inch diameter pipe; Berkeley, CA): The existing pipe was installed in 1983 and has been susceptible to earth movement. The project would install flexible couplings and replace a 100-foot segment of this pipe.• Webster Street Pipeline Replacement (5,800 feet of 24-inch pipe; Webster Street, Alameda, to 9th Street, Oakland, CA): The existing pipe, installed in 1946, is at the end of its useful life.• Sequoia, Wildcat, 59th Street Aqueduct Pipeline Replacements (2,400 feet of 54-inch pipe; Claremont Center, Oakland CA): These pipes, which were installed in 1927, are critical in providing water to the majority of customers in the west-of-hills area and are near the end of their useful life.• Lincoln Avenue Pipeline Replacement (11,000 feet of 20-inch pip; between Webster Street and Park Street, Alameda, CA): The existing pipe, which was installed in 1924, is reaching the end of its useful life.• MacArthur/Davenport Pipeline Replacement (11,200 of 20-inch pipe; Alameda, CA): This existing pipeline, which was originally installed in 1927, is also reaching the end of its useful life and needs to be replaced.• Dingee Inlet/Outlet Pipeline (10,000 feet of 24-inch pipe; Oakland, CA): This existing pipeline, which was originally installed in 1931, is reaching the end of its useful life and needs to be to	O	0	C	EBMUD's distribution system includes over 4,100 miles of pipelines. Many of these pipelines are critical and form the "backbone" of the system that conveys water to over 1.3 million customers. Some of these pipelines have reached the end of their useful life and in need of replacement to ensure reliable water service.The replacement of these critical backbone facilities are needed to maintain infrastructure reliability. These large pipelines, by necessity, convey large volumes of water and many distribution pipelines branch off from them. These pipelines are difficult to remove from service and when they fail, there is a potential for collateral damage.	20,000,000	386,065	1,300,000	04	Alameda	II	2009
4768	0110005	0110005-037	East Bay MUD	Danville Pumping Plant No.1 Rehabilitation	This project includes replacement of electrical systems, including switchgear and motor control center.	O	0	C	Danville Pumping Plant No. 1 is a 60 MGD pumping plant located in Alamo, California. This pumping plant is critical to the water supply to the San Ramon Valley area. Danville Pumping Plant No. 1 has aging electrical switchgear and motor control center. This project would replace these and other components of the electrical system in order to provide more reliable operations.Electrical equipment inside the plant is approximately 47 years old. Repair parts are increasingly difficult to acquire for these facilities.	6,000,000	386,065	1,300,000	04	Alameda	II	2009
4769	0110005	0110005-016	East Bay MUD		Replace Redwood tanks which have historically been sources of high bacterial concentrations with steel tanks. Install reservoir sampling and on-site treatment/disinfection facilities. Install chlorine residual and conductivity monitoring system.	O	0	C	Distribution system has sources of bacterial concentrations - jeopardize compliance to the TCR.	8,800,000	386,065	1,300,000	04	Alameda	II	1998
4770	0110005	0110005-039	East Bay MUD	Walnut Creek Water Treatment Plant - Photovoltaic	The project consists of a renewable energy project to install a photovoltaic (PV) energy generation system on the roofs of the chlorine contact chamber and clearwell at Walnut Creek WTP. The project includes a 75,000 square foot PV system. The PV system will be capable of generating nearly 1 MWh annually, or about one-third of the total annual electric use at the WTP.	O	0	C	A goal of EBMUD and the State of California is to reduce greenhouse gas emissions and to promote sustainability. Power costs can be mitigated by reducing demand on the power grid during peak times and increasing on-site power production. This project is needed to reduce EBMUD's reliance on outside energy purchases and reduce the emissions of green-house gases.The project will offset roughly one-third of the treatment plant's annual electrical use.	5,000,000	386,065	1,300,000	04	Alameda	II	2009
4771	0110005	0110005-003	East Bay MUD		Replace deteriorating distribution pipelines.	O	0	C	Distribution system pipeline network is deteriorating. System has a history of leaks which needs to be evaluated and repaired.	31,600,000	386,065	1,300,000	04	Alameda	II	1998

4772	3710042	3710042-006	San Diego County Water Authority	SDCWA - Security Project Video Surveillance	Install video surveillance equipment at critical locations within the aqueduct system and install upgraded alarm response monitoring system at the Escondido Operations Center. Surveillance equipment will be installed at five key delivery system locations, two office facilities, two water control facilities, and four pump stations. This project is rated in 4th position in Prop 50, Chapter 3 and is ready to go.	O	0	C	The need for improved surveillance security at San Diego County Water Authority critical infrastructure facilities was identified in the required Vulnerability Assessment submitted to USEPA. Significant progress has been made; however surveillance technology continues to change and new facilities were added to the aqueduct system.	430,000	102	3,140,000	14	San Diego	V	2009
4773	1910067	1910067-028	LOS ANGELES-CITY, DEPT. OF WATER & POW	Water System Security Upgrades Project: Fire Hydrants	LADWP is seeking funding support for planned security upgrades to its fire hydrant network. LADWP operates approximately 58,000 fire hydrants throughout the City. Planned security upgrades include the purchase and installation of fire hydrant security devices for 300 critical locations throughout the City. Critical locations will be determined based on the level of risks, system requirements, and proximity to critical infrastructure or sites. Several alternative devices are available commercially on the market. The security devices that will be employed will be hydrant check valves and/or security caps. Hydrant check valves provide backflow prevention and are installed inside of the fire hydrant. Hydrant security caps cover the outlet coupling; they are forged from high-strength alloy steel, are virtually impossible to penetrate; and require a security cap wrench for removal. The LADWP, with the assistance of district crews and the Los Angeles Fire Department (LAFD), is evaluating the effectiveness, operational ease, and installation and maintenance costs of each of the aforementioned technologies. LADWP expects to select 300 check valves and 160 pairs of hydrant caps; certain high risk fire hydrants will be outfitted with both technologies. This combination will effectively prevent individuals from accessing the hydrants, but will allow ready access to firefighters who will have the equipment and keys to unlock the devices as needed	O	0	C	As the financial center of the Western United States, the worldwide hub of the entertainment industry, a center of national and international tourism, and home to one of the world's largest airport and port complexes, the City of Los Angeles (City) and its water infrastructure are high visibility targets for potential acts of terrorism. The Los Angeles Department of Water and Power (LADWP) provides essential water services to thousands of business, residential, governmental, and cultural locations with an infrastructure system spread throughout Los Angeles, Inyo, and Mono Counties. The LADWP water distribution system, which serves roughly 4 million people, encompasses a service area of 464 square miles; over 250 pumping plants, wells, tanks, reservoirs, and treatment facilities; 300 pressure-regulating stations; a 400-mile-long Aqueduct system with associated watershed; over 7,100 miles of distribution piping; and over 58,000 fire hydrants. Following the terrorist attacks of September 11, 2001, the LADWP retained a private consultant to prepare an in-depth security vulnerability analysis on all aspects of its facilities and operations. The LADWP Report on Security & Terrorism Threat Assessment (S&TTA) identified security strengths and weaknesses, deficiencies, and possible security imporvements that could be made to better secure the City's water system.	440,000	686,422	4,071,873	15	Los Angeles	IV	2009
4774	1910067	1910067-041	LOS ANGELES-CITY, DEPT. OF WATER & POW	CITY TRUNK LINE SOUTH UNIT 3	City Trunk Line South Unit 3 (CTLS 3) is a segment of the pipeline that will provide inflow to the existing Franklin Reservoir. CTLS 3 consists of approximately 10,400 feet of 60-inch diameter welded steel pipeline and appurtenances. The project route is along Whitsett Avenue from approximately 135' South of Vanowen St. to Magnolia Avenue. It will connect to City Trunk Line South Unit 2 and City Trunk Line South Unit 4.	O	0	C	The City Trunk Line South-Unit 3 project is part of the LADWP's aggressive Capital Improvement Program to replace the City's aging water infrastructure system. The existing City Trunk Line is 96 years old and is past its life expectancy. It has a history of leaks and breaks. The new trunk line will provide a more reliable supply of water to the area and will allow greater operational flexibility of the water distribution system in the City of Los Angeles.	68,749,785	686,422	4,071,873	15	Los Angeles	IV	2011

4785	2100545	2100545-006	WALKER CREEK RANCH EDUCATIONAL CENT	Walker Creek Ranch Primary Water Storage Tank Replacement	This project is to replace the primary water storage tank for the potable water system at Walker Creek Ranch, which serves over 5,500 elementary school students and about 6,000 guests per year.This will include the tear down of the current 100,000 gallon redwood tank which is over 50 years old and failed and dewatered in February of 2010. This tank has been lined since its failure, and operators are hopeful that the lining will extend the life of the tank until its replacement can be funded and implemented. It is anticipated that the pad for the new tank will need to be engineered and prepared according to the size and type of tank(s) identified as most cost effective to meet the needs of the system. It is anticipated that several of the water main valves and sections of the distribution system will also need to be replaced as a component of this project.	O	0	P	The primary water storage tank for the potable water system at Walker Creek Ranch, which serves over 5,500 elementary school students plus over 6,000 guests per year is a 100,000 gallon redwood tank that is now over 50 years old.In February of 2010, this primary storage tank failed when one of the planks at the base of the tank snapped and released all of the stored water.We were very fortuate that students and guests were not on site during this failure, as school programs would have had to be cancelled. The tank has been lined as a temporary measure to ensure that the system can continue to deliver water in the short term. It is uncertain how long the liner will extend the useful life of the tank.	595,000	21	100	18	Marin	II	2011

4800	4400751	4400751-001	BONNY DOON SCHOOL	Bonny Doon Union Elementary School Water System Upgrade	The Project is to upgrade the Bonny Doon Union Elementary School water system by replacing leaking underground supply and distribution piping and installing dedicated sample taps at each connection (building) for routine bacteriological monitoring.The scope of work for this project includes re-piping the connections between well W-2 and the storage tank to eliminate any leaking pipes and illogical plumbing cobbled together over the past 50 years, locating and replacing any leaky underground distribution piping, valves, or fittings, installing dedicated down-turned sample taps at each building/service connection, and preparing accurate as-built drawings of the upgraded water system for future operations, monitoring and repairs.	O	0	P	The Bonny Doon Elementary School is located in the town of Bonny Doon, at 1492 Pine Flat Road, in the Santa Cruz Mountains, in the unicorporated area of Santa Cruz County, approximately eight miles northwest of the City of Santa Cruz. Bonny Doon Elementary School has operated at this site since approximately 1947. Water for potable supply for students and staff at the School has been sourced from two on-site wells, W-1 and W-2. These well are NOT under the direct influence of surface water. Currently, water is supplied by well W-2 only. Well W-1 was disconnected from the water system in 2008 due to reported taste and odor problems. Well W-1 is now designated as a back-up well. Potable water for the School is currently supplied by well W-2. Water from well W-2 is stored in a 10,000-gallon concrete tank and a 5,000-gallon plastic tank. These two tanks are connected so that they act as a single tank. Underground piping distributes water from the storage tanks to the various buildings throughout the school grounds.Methyl-tert Butyl Ether (MTBE) has been detected in the water from well W-2. The MTBE appears to be from an underground storage tank (UST) that was removed from the site in 1998. The release of MTBE from the UST is being investigated and cleaned up with funds from the State Water Resources Control Board, and is NOT the subject of this Pre-Application. Piping between the wells and the storage tanks, and	25,000	1	300	05	Santa Cruz	II	2012
4801	2900563	2900563-001	BITNEY SPRINGS LLC WATER SYSTEM		Replace two 10,000 gallon poly tanks, or construct new steel tank on site	O	0	P	Failing water storage tanks, poly tanks are cracking and may fail at any time	50,000	14	400	21	Nevada	I	2001

4802	3400104	3400104-002	CAVANAUGH GOLF COURSE	Cavanaugh Water Supply Well	Install new well with increased holding tank capacity (10,000 gal) and associated reconnection infrastructure (including backflow device). The new well would be located approximately 1,000 feet away from the existing well. Other wells within the area have significantly lower level of contaminants and the proposed location has a high probability of success. Increasing the storage capacity has two benefits: (1) less risk exposure should the system fail and repairs take longer than a few days, and, (2) existing tank is aging and the potential for a catastrophic failure increases each day.	O	0	P	Existing single source water supply has contaminants exceeding MCL secondary drinking water standards for color, manganese and odor as per the 2009 Consumer Confidence Report. Current yearly costs for filters to remove contaminants average between $10,000 - $12,000 p/year. Water quality is still subprime even with these efforts. Additional storage capacity is needed to reduce probable adverse impacts should system suffer a failure requiring more than two days for repairs. Current well output has been averaging 1500 – 1700 gal/day.	159,000	3	500 09	Sacramento	I	2011
4803	1502074	1502074-001	EL TEJON ELEMENTARY SCHOOL	El Tejon Elementary School- New Well/Intertie with Lebec CWD	As part of this project, El Tejon School will either drill a second well or develop intertie with Lebec County Water District	O	0	P	El-Tejon Elementary School has only well. So, the water system is unreliable.	500,000	1	550 19	Kern	III	2008
4804	2300584	2300584-001	Mendocino School District- Mendocino	Mendocino Unified School District Universal Pre-App	Proposed new System The current water system must be abandoned and replaced with a new system. The new system provides over a mile of new piping including new 12 inch, and then reduced to 10 inch, piping from the well site to the schools. The new line will be placed in new trenches along the public streets - mostly Little Lake Road. Additionally the new line will use a boar jack to cross under State Highway One. The existing four inch line will be abandoned in place. The civil engineer has coordinated the deisgn with CalTrans and the County of Mendocino Public Works. Schematic Design and Design Development is complete and Construction Documents is under way. It is hoped that constructon can commence in October or November 2007.	O	0	P	Project Description Replace an aging and inadequately sized domestic water system for the Mendocino Unified School District. The current system is not reliable and does not meet requirements for water pressure. Existing Water System Many of the schools for the Mendocino Unified School District are located in the coastal community of Mendocino, California on the Mendocino County coast. Installed in the early 1970's, the four inch diameter water line serving the schools originates just over a mile to the east from District owned tanks and well on District owned property. The water line runs from this tank/ well site under public streets (mostly Little Lake Road) to serve the District's schools. This system is also a water souce used by members of the community of Mendocino. This remote location is the only viable source of water to serve the schools & community - there are no other municipal or public water systems in town. This four inch diameter line is over a mile in length, is in poor condition and is woefully inadequate to provide required flows. For example for public schools, code	1,889,750	15	750 03	Mendocino	II	2007
4805	1502229	1502229-001	RIO BRAVO GREELY SCHOOL WATER SYSTEM	Rio Bravo Greely School- New Well/Intertie with Vaughn Water Company	As part of this project, Rio bravo Greely School will drill a second well or devlop an intertie with vaughn Water Company.	O	0	P	Rio Bravo Greely School has only one well. Therefore, the water system is unreliable.	500,000	7	887 19	Kern	III	2008

4806	2910300	2910300-002	Malakoff Diggins SHP	Malakoff Main Water Line Replacement	We would like to replace the waterline running through Malakoff Diggins State Historic Park to stop water loss from the pipe. We propose to run the pipe in the same location as it is right now from the upper park water storage tank to the lower town tanks. The total distance of the waterline is approxinatly 2 miles. We would like to increase the size of the waterline to 4" from the 2". We would also install new pressure reducers in the system to compensate for the elevation drop in the system. Also we would like to install new isolation valves and blowoffs so we may maintain the line and also chlorinate it as needed. As it stands right now, when we have a break and we need to disinfect the section, we have to disinfect the entire 2 mile section. When we install the new line, we would bed the line in the correct material and then sift all dirt placed on the top of the line.	O	0	N	Currently the Malakoff State Historic Park main water line runs from the Derbec Well storage tank to the town of North Bloomfield. The line has numerious leaks and cracks in it. We are repairing it on a weekly basis and it will soon have more patches on it than immaginable. We would be replacing the pipe as we get these problems but when the pipe was installed, their were never any isolation valves installed in the ssytem. The pipe is currently only a 2" pipe serving the town. The reason we have high flow is because of the elevation drop between the storage tanks and the town it serves. The pipe varies in depth from several inches below the surface to 5 feet below the surface. When it was installed, it was not bedded correctly and now with the settling of the ground, rocks that were dropped onto the line are forcing down on the line and breaking it. Also the correct pipe and joint material was not used. The current pipe is schedule 40 PVC and alot of the joints are failing. The pressure reducers that are on the system do not keep the pressure at a constant also creating surges on the system. Even when we replace them, their is not enough of them in the system so when we get a surge, it blows them out. When leaks do occur, it takes a while to find them because the ground is so absorbant, the water just soaks into the ground and disapears. To find them, we spend days exposing the pipe and then listening to the pipe fittings for flow.	350,000	1	25 21	Nevada	I	2007
4807	4200626	4200626-001	FREMONT/SY IMPROVEMENT ASSN.	Fremont-Santa Ynez Improvement Association Account #4200626	1. In order to replace the 50 year old tank, it must be first disconnected and removed with a helicopter, the tank-bed must be leveled and a new water-tank flown in. After new tank is leveled, all fittings, hoses and connectors must be replaced &/or reconnected.2. Many of the water lines on the system are over 80 years old and extremely corroded and rusty. To replace the old water-lines they must be found, dug up and replaced with new connectors and valves.3. Permits from the US Forest Service and the Santa Barbara County, must be recieved before any of these projects can started.Also, an archeologist's survey is required by the Forest Service before they will issue permits	O	0	N	replace existing 50 year old water tank (approximately $12,000) and 60 year old water lines (approx $20,000)	20,000	46	25 06	Santa Barbara	IV	2009
4808	4300612	4300612-001	Mt. Madonna County Park		Install two water meters at wells.	O	0	N	Unable to monitor water usage, implement water conservation, manage watershed, etc.	10,000	12	25 17	Santa Clara	II	1998
4809	3104457	3104457-001	SKY MOUNTAIN CHRISTIAN CAMP	Sky Mtn. Well Construction	To furnish the labor, equipment , and material necessary for the construction of a 6" steel cased commercial water well to the estimated depth of 850'. Step #1: Bore hole drilled to 50'Step #2: Bore hole drilled to 850'Step #3: Submit 6" stell casing to a depth of 850'Step #4: Sanitary Well seal will be pumped between the 10" bore hole and the 6" casing from a depth oof 50' up to ground level.5hp, 3ph pump and all wiring associated with project.Constuction of pumphouse and all electrical connections required.	O	0	N	Current water treatment plant is nearly 15 years old. Treatment plant is producing less than 50% of total production that plant was designed for. Due to new regulations (LT2ESWTR) current plant may not be able to meet new regulation requirments for risk of disease caused by Cryprosporidium and other microorganisms. Instead of spending funds to update current treatment plant which treats surface water, we feel that a well will improve the water quailty at a lower cost as well as meeting all new regulations (LT2ESWTR). Placer County Health Department agrees that a well will be a better solution to meet current and future heatlh and saftey standards required by law.	85,000	14	25 02	Placer	I	2009

4811	3200139	3200139-002	Almanor Heights MWC	Water line replacement on upper Scott and lower Terrace	Installation of 1347' of 8" PVC pipe, retirement of 1347' of 4" steel pipe plus installation of one 6" dry barrel fire hydrant. This project will also include six 8" gate values and three 6" hydrant controls plus pavement cutting and replacement. This project will be from the tank down Scott Drive to the second fire hydrant with additional 160 feet being replaced on Terrace Drive. This is approximately 45% of existing water supply lines in the Almanor Heights Mutual Water Company. Please contact us with questions or comments.	O	0	N	Fifty year old 4" steel pipe watermain and one-4" fire hydrant are aged and need to be updated for improved domestic water supply and provide required fire protection.	162,751	37	25 02	Plumas	I	2007
4812	2700558	2700558-001	PENTECOSTAL CHURCH WS	Pentecostal Water System Consolidation	The properties on this system are located on U.S. Highway 101. Salinas city water is located on neighboring property to the south. Completion of this project will move city water hookups north along Highway 101, allowing further hookups in the future. The owners on this system have been researching easements, and options on this system for years. Numerous violations with the Health Department have happened during that time. This section of U.S. Hwy. 101 is slated to begin construction in July, 2010. The plan is to move the highway a short distance to the east. During that construction, there is an option for us to get a hookup from California Water Service. The large cost requested is due to the necessity of going under both the existing highway and the new highway to be built to the hookup. We were advised yesterday by Cal Water that they may have found a way to hookup on the same side of the existing highway as the water system, significantly reducing the cost of the project. They will be notifying us in the next few days of their findings on that option. The owners on this system would not be able to afford low-cost loans for this project. It will only be a feasible project if a significant grant could be applied toward it.	O	0	N	This is a small water system that has had numerous violations over the years due to high nitrates and coliform issues. There are businesses as well as residential hookups on the system. Even with Nitrate and Chlorination treatment systems we continue to get occasional test failures. The last coliform failure was on January 30, 2009. In 2008 there were failures in May and June.	955,000	1	25 05	Monterey	II	2009
4813	4901077	4901077-001	Sonoma Mountain Zen Center	Distribution upgrade and chlorination treatment addition	The project that we are planning to undertake is: Replacing the existing concrete storage tank with a new 10,000 gallon poly tank (or possibly two 5,000 gallon tanks)Replacing the existing lines, valves junctions etc. Installing an in-line chlorination system for disinfection.	O	0	N	We have had repeated violations of total coliform exceeding the MCL during the past 24 months/ 4 citations from the CDPH--Also in October of 2009 we had a positive test fore-coli. We have been on boil water notice twice in the last year--November 2009-January 2010 and alsoApril 2010- May 2010.These violations have been traced to our storage tank (very old cement tank) and to our distribution system which currently has no treatment. Our well has been thoroughly tested (microscopic particulate analysis and a full battery of wet season samples) and proves to be quite pure/not the issue. Being a small non-profit organization, we simply have not been able to financially support the needed upgrades to our system--especially due to the amount of fines, extra samples, and specialized tests that we have been subjected to because of these violations.	10,000	4	25 18	Sonoma	II	2011

4816	0202517	0202517-001	LAKE ALPINE REC. AREA	Lake Alpine Distribution System Replacement	We seek funds to hire a contractor/s to complete the following:Replace the existing water distribution system that is prone to leaks and breaks. This will require removal and replacement of the water line/s that circle the lake and service several campgrounds. Replace fixtures, faucets and connections with newer, low-flow types. This will greatly reduce water volume demands aiding us in decommissioning the spring and treatment plant. Most of the toilets in the area are flush toilets. They are badly outdated and parts are not even available for repairs. They break and leak regularly. Replacement with Low-Flow types would solve both volume and aging issues. Reduced volume demands are critical in allowing conversion to the new well to be successful and prompt. Decommission and cap the present surface water intake and treatment plant--once given the go-ahead by County Health Department. (It was noted by Alpine County that while inspecting our facilities the inspector witnessed a dog swimming next to the lake intake pipe). The treatment plant alone is a major cost to the agency and it's decommissioning would save electric costs, chemical costs and the need for a Water Treatment II Operator. Ceasing to rely on the surface water of Lake Alpine was strongly recommended by the Health Department officials. Decommission the east-end spring/horizontal well. This is a supplemental supply source and has been noted to	O	0	N	The Lake Alpine water system is presently a surface water fed system. Both Alpine C.D.H. (Dennis Lampson) and California State D.H.S. (Richard Blood) have advised me that our surface water intake is subject to contamination. The Stanislaus N.F. has received advisory letters notifying us of numerous compliance issues. We have sought to address them, however problems remain. The water is treated in a treatment plant and contact tank and sent to a 30,000 gallon storage tank, then on to the distribution system. Because of a lack of water volume during peak days, the system is also fed by a horizontal well/spring on the other side of the lake. This has also been pointed out by the above officials as being prone to contaminants. In response to these issues the U.S.F.S. initiated an assessment of the system to find viable solutions. This resulted in our drilling a deep-water well and we are currently planning on tieing this well into the existing distribution system by the end of the season. Alpine C.D.H. has notified us that we must remain on (or have it remain active) the surface water system until they are satisfied that the new well can meet needs. Other findings mentioned in the assessment were recommendations to address the volume issue by changing the aging flush toilets to low flow fixtures. We thus far lack the funds to accomplish this portion of the recommendation. We are also dealing with an aging	500,000	45	50 09	Alpine	I	2011
4817	3301097	3301097-001	CAMP JOE SCHERMAN	Camp Scherman Water System Upgrade	The water provides drinking, living, and irrigation water for Girl Scouts who reside on the property throughout the year and the maintenance staff (two live on site) who work there. Approximately 4500 Girl Scouts and others stay on the property over the year and up to 550 at one time.The system resides in a half square mile of the 700 acres of property and is a positive feed type water system with 4” to 6” piping and Mueller valves at strategic points in a looping system. Tank one and tank two would need to be retrofitted with 6” electric butterfly valves, electronic depth measuring, flow meters along with the necessary wireless sending units to the maintenance center for information gathering, control, and alarms. The maintenance center would need a control center system with auto and manual capabilities.Wells, one, two, and three would be retrofitted with electronic depth measuring capabilities, and auto-run/manual switching, wireless communication with tanks and maintenance center for filling and monitoring. Tank two needs fencing and a ladder cage to complete it’s security, wells one through three need more secure accessible well houses.All areas need further fire abatement to insure protection in the event of forest fire.	O	0	N	The water system is in need of proper level monitoring equipment for two tanks and three wells that feed the system. A monitoring would greatly assist in water conservation through observing aquifer levels and usage. The system would greatly benefit from auto warning systems in place for monitoring breaks in the system via flow rate as we have had water loss due to breakage without warning of loss until tanks may empty. The system would be wireless with computer and manual alarm capabilities in case of water and/or power loss. The system also in need of better security/source protection in regards to vegetation clearance and perimeter fencing plus structures as there are issues with possible un-authorized entry safety and lockout capabilities.	85,000	50	100 20	Riverside	V	2008

4820	5601701	5601701-001	DENNISON PARK	Dennison Park Water Main Replacement	This project consists of replacing the original water well distribution system, approximately 2,300 l.f. of existing galvanized water distribution main line and fittings with the same amount of PVC Class 150 water distribution lines and fittings with a hydraulic safety factor of 4:1. All PVC pipes, valves and fittings shall be new and unused. Expenses would include the pre-construction costs environmental screening, permits, and design costs. The construction contract costs would include mobilization, clearing and grubbing, construction surveying, excavation, compaction and grading, and the installation of a new 2" PVC water main, misc. valves and fittings, hosebibs, and quick couplers. Project management fees and contract tech fees are included. A water montoring system was installed with the new water tanks and is currently in use.	O	0	N	Dennison Park's water distribution system has been inplace since the early 1920's. In those days a natural spring provided the water. Later on a water well located on a property adjacent to the park's southwest corner became the source for the park. In the early 1950's the County installed a galvanized water distribution system from the well on the adjacent property that pumped water into a 1,500 gallon water storage tank and then distributed the water to the various facilities in the park. In 1971 at the request of the property owners the County entered into a year to year lease agreement for the use of the well. The lease was renewed for a 10 year term in 1983. At the end of the 10 year lease term the County decided not to renew the lease. The well was no longer producing the quantity or quality of water the County needed to support the park facility.The Ventura County Parks Department is an Enterpise system that operates by collecting revenue from the public use of the facilities within it's system. No tax dollars from the General Fund contribute to the operation and maintenance of Ventura County Parks. Fortunately the 2000 Park Bond was approved and the County appropriated $190,000 to upgrade the old water system. The County used the funds to install a well on the park property. In addition to the well, three new 3,000 gallon galvanized steel water storage tanks were constructed. A final	118,900	42	100 06	Ventura	IV	2008

4822	0910305	0910305-001	CA State Parks - Emerald Bay, Boat Campg	Replace/Repair 2 25,000 Gallon Water Storage Tank at Eagle Point Campground	We plan on taking tank #1 a 25,000 gallon water tank and having it bead blasted and then re epoxy coated. The epoxy coating we will use will be NSF and AWWA certified.the entire inside of the tank including all support beams, roof and roof beams will be re-epoxied. The exterior of the tank will also be re-coated to protect the exterior of the tank. Tank #2, is a 20,000 gallon hypolon lined redwood tank. we would have the hypolon liner replaced or repaired and the bands on the outside of the tank re adjusted. The exterior of the tank will also be re-treated with a boiled linseed oil finish to protect it. The existing roof of the tank will be removed and a new roof with vents will be installed. The entry hatch will also be rebuilt and reinforced to provide a more secure access to the tank. The new roof will have a steeper pitch on it to allow better shedding and runoff of rain and snow and the vent at the top of the tank will be replaced. The ladder on the outside of the tank will also be replaced with a ladder which is OSHA approved. Both tanks will have new tank fill valves and discharge valves will also be replaced with AWWA approved valves and the tank drainage valves will be re-designed to California Department of Public Health regulations.	O	0	N	The Eagle Point Campground Water System is located within Emerald Bay State Park on the shores of Lake Tahoe's Emerald Bay. The campground is open only during the summer months and is a popular camping location for thousands of campers from around the world. The park is currently supplied by water pumped out of Lake Tahoe and treated at the park treatment facility before being stored in 2 25,000 gallon water tanks. Storage tank #1 is a 25,000 gallon steel water tank located next to the treatment facility. The tank was installed back in 1980 and the epoxy sealer on the inside of the tank has failed and the tank is now rusting. If the tank is repaired now then it will place the tank back to another 25+ years of service. If the tank is not repaired, deterioration of the tank will continue and could result in the complete failure of the tank which would need to be replaced. The condition of the tank has been noted and written up by the California Department of Public Health and they are advising us to repair the tank before the tank begins to fail and they will have to issue us a notice of citation. Storage tank #2 is showing signs of failure. This tank is a redwood tank and was installed back in the mid 80s. The tank was lined with a hypolon liner and it appears to be leaking in several locations. The roof on the tank is also showing signs of fatigue and needs to be replaced prior to collapsing. The exterior ladder on the tank is also	125,000	5	125 09	El Dorado	I	2009

4823	0910024	0910024-001	Glenridge Water Company	Glenridge Water Storage Facility	Install a new 120,000 gallon bolted steel water tank with a state on the art radio telemetry system. There is no power or telephone lines at the tank site, solar is the best available green technolgy to power the radio transmitter. The telemetry will monitor tank level continuosly sending a signal to the well site.There will be site preparation with underground pipe, valves and fittings. A new foundation will be needed to support the 120,000 gallon large tank. The budget for a new tank is $1.00/gallon. The new pump controller telemetry unit and solar powered tank level monitor telemetry unit with remote access to pump control system today will cost $32,505There are about 10 privately owned parcels within 1000 feet of the service area, that will eventually need to have fire protection. This proposed new tank would be an asset to enhance the entire region.	O	0	N	The existing water system has an aged, installed a used tank in the 1960's, 100,000 gallon bolted steel water tank. In 1994, I invested $18,000 to have the tank rehabilitated; sand blasted,welded and interior epoxy coated. The tank is starting to fail. Just this summer a leak occurred on one section of the second tier of the tank wall. A redwood plug was used to stop water from leaking. A new radio telemetry system is also needed to start and stop the pump. A solar powered radio unit was installed in the late 1990's for $8,000. That technology is old and has been problamatic. The source water well only produces 50 GPM. In April of 2009 we installed a new pump and more efficient motor. The water main sizes are six inch and fire hydrants are adequate. There is a need to have a reliable water tank in order to insure public health and safety which includes fire protection.There are only 45 customer connections in this small water system.	237,000	43	130 02	El Dorado	I	2011

4833	3200019	3200019-001	Oakland Feather River Camp	Oakland Camp/Camps in Common Water System	The project is only in the conception stages at this point since money is not currently available to do any of the work. If funded, the project requires study of all aspects of the system to install an adquate system to meet needs of the camp. Through study, a well sight must be located, treatement and storage systems designed and a distributuion system must meet needs.	O	0	N	Oakland Camp faces numerous problems in delivering quality drinking water due to a low-performing well, a poorly retrofitted treatment plant and a deficient, decrepit distribution system which have foregone even routine maintenance for over a decade. When the Camp switched from surface to underground water few changes in the overall system were made. The well produces 12 gallons per minute. The system is severely overtaxed impacting revenues and limiting the ability to serve low-and moderate-income families. The Camp has capacity for over 350 campers but cannot exceed approximately 60% without depleting the water system or imposing strict water-use limits. Food service alone can drastically diminish the capacity of the system. The inadequate 15,000 gallon tank can store only enough water to last little more than one day of normal usage at 60% capacity. Downtime at production or treatment leaves the system depleted within hours. Surface treatment devices were not removed when the source switched. These devices interfere with the	1,000,000	1	300 02	Plumas	I	2007
4834	3000940	3000940-001	Caspers Regional Wilderness Park	Storage tank replacement	This project will replace the current 25k gallon reservoir with a new 50k gallon reservoir. Plans are to remove the current reservoir and replace with new piping, new controls a welded steel reservoir.	O	0	N	The current water storage tank for Caspers Park is a 25,000 gallon reservoir. The demand in the park during the summer months has approached 75,000 to 80,000 gallons a week. The current yield from the well is much lower and cannot keep up with this demand. Plans are to replace the current 25k gallon tank with a 50k gallon tank to address water quantity problems. The additional storage allows more water to be available for a longer period to the visitors of the park and will also provide additional water if a fire was to develop in the park.	150,000	1	500 08	Orange	V	2009
4835	5601706	5601706-001	LAKE PIRU PARK - UWCD	Lake Piru Recreation Area Water Distribution System Improvements	The distribution system improvement project will replace approximately 5100 linear feet of undersized pipelines, isolation valves, fire hydrants, blow-offs and appurtenances. In addition, the District will also remove approximately 1500 feet of asbestos cement pipe from service. The project also includes separating the existing irrigation system from the domestic distribution system with the objective of supplying landscaped areas with a non-potable water source and installing low output irrigation heads for water conservation and efficiencies. Separating the irrigation system ensures the water quality of the domestic system and eliminates the potential for cross connections.The District has initiated an improvement program to upgrade the recreation area's water system. The ongoing water system construction program includes a new 140,000 gallon storage tank, new pumping barge, new water treatment plant and various pipeline improvements. The District has invested approximately $1.7 million in the water system since 2007. The proposed improvement project to the recreation area's distribution system is the final component of the larger domistic water improvment program. Its completion will greatly enchance the potable water system, ensure the health and safety of up to 100,000 visitors annually and ensure adequate water supply and pressure for fire suppression needs.	O	0	N	United Water Conservation District (District) owns and operates Santa Felicia Dam, Lake Piru Reservoir and the Lake Piru Recreation Area under a license from the Federal Energy Regulatory commission (FERC). The district is required under the license to provide public access and certain recreation facilities. The Lake Piru Recreation Area has been in continuous use since 1956. The recreation facilities have been regulated by a Conditional Use Permit (CUP) from the County of Ventura since 1979. The recreation area includes over 400 campsites, several day use areas, boat launching facilities, marina, snack bar, dry storage yard and offices. The District also provides potable water service to campsites, restrooms, day-use areas, 8 on-site employee residences, administrative offices and facilities and a USFS Ranger Station (LPF #53), as well as to a landscaped irrigation system and fire suppression hydrants. Visitations to the Lake Piru Recreation Area average over 100,000 vistors annually.The Lake Piru Recreation Area infrastructure is more than 50 years old and is in need of major upgrades. The water distribution system within the recreation area was constructed in a piecemeal manner. The water system is undersized, requires constant repairs and, on occassion, is temporarily out of service. The system lacks isolation valves to isolate the line breaks, air valves and blow-offs to flush extended dead end pipes. The leaks and repairs	375,000	2	960 06	Ventura	IV	2011

4836	4800651	4800651-001	Lake Solano Park	Lake Solano well replacement and upgrade	The proposed project would fund the upgrading of current facilities that are in place.Youth Center consists of one well, a chlorinator and a 300 gallon pressure tank and a 500 gallon holding tank. The system services approximately 1500 visitors a year. Well sits approximately 50 feet from Lake Solano shoreline. There is a concern of cross contamination from the Lake's surface water affecting the Well itself. The monies would be used to relocate the Well approximately 200 feet south of the exitisting Well while updating to current codes. Recently, another abandoned Wellhead was discovered. Both Wells would be capped and the existing piping would be utilized. The 500 gallon galvanized holding tank would be replaced by a new 200 gallon tank. A cinderblock structure would replace the current chain link fence enclosure. Day Use Park consists of a 1200 gallon hydro pneumatic tank. The facilities are enclosed by a chain-linked fence. The water System serves approximately 200,000 visitors a year. The monies would be used to upgrade existing facilities, by replacing the fenced area with a cinderblock structure. Backflow devices would be placed on each hose bib in the Campground and Day Use Park. This would prevent contamination by RVs hooking up to the existing facilities. In the event of low pressure from the system, the tanks on the RV can backflow into the System causing contamination the	O	0	N	In October of 2008 Well number 1 in the Day Use Park test positive for both E coli and Coliform bacteria. Posting were placed throughout the Campground and Day Use Park. The problem was corrected with in a 20 day period. Youth Center consists of one well, a chlorinator and a 300 gallon pressure tank and a 500 gallon holding tank. The system services approximately 1500 visitors a year. Well sits approximately 50 feet from Lake Solano shoreline. There is a concern of cross contamination from the Lake's surface water affecting the Well itself.	200,000	105	1,000	04	Solano	II	2009
4837	2610300	2610300-002	CSP - BODIE SHP	Repair/Replace Water Distribution System and Storage Facility within Historic Park	With this project, we would like to install new pipe or re-line the existing pipes within the park to get them back to fully operational status. If we re-line all of the distribution lines, we would only have to pothole certain areas where the main line valves or fire hydrants are to be installed. Bodie is an area where Cultural resource's are throughout the soil so trenching could create problems. The new line would then be pulled through and the new isolation valves or hydrants with isolation valves installed where the pits were dug. All pipe, valves and hydrants would be approved by the American Waterworks Association, State and local codes. All valves and hydrants would be GPS ed and located on maps of the area so they would be easily identified at any time of the year and easily found if needed during snow and digitally filed for future use. We would also like to line the underground water storage tank. The reason we want to line the tank is because of the location that it is in. Bodie State Historic Park is a Historic Landmark and addition of an above ground tank or the digging of a hole for the removal and installation of a new one could not be done due to Cultural Artifacts within the area. The old tank would be sealed and made water tight from infiltration and then a hypolon liner installed. While doing this, we would also install a new valve assembly making all inflow, outflow and drain valves accessible from ground	O	0	N	The current water distribution system at Bodie State Historic Park was installed in the early 70's. The system has numerous leaks and we are continually repairing them as found. Most of the leaks go undetected due to the fact that the soil is so porous and the lines are buried 4 to 8 feet deep to prevent from freezing. During the winter months, when leaks do occur, we are unable to detect them until spring time due to snow on the ground. The system also does not have an adequate amount of isolation valves installed within the system and ones that are installed either leak through or do not operate. Fortunately, the leaks that we have had in the past have been minor so we have been able to install band-aid clamps to fix the problems. Also, the fire hydrants that are on the system do not operate properly and do not have isolation valves on them. All of the hydrants are "dry barrel" and most of them do not drain when shut off. The Town of Bodie has been recorded to be one of the coldest locations in the country experiencing temperature extremes year round so self draining fire hydrants are essential. It is not uncommon during the winter months for temperatures to drop to 45 below zero without a wind chill factor. This freezes pipes instantly and renders hydrants inoperable and has the potential to burst lines draining the entire water system and storage tank. The water system is kept charged during the winter months to	350,000	8	2,500	13	Mono	V	2009

4838	2610300	2610300-001	CSP - BODIE SHP	Bodie State Historic Park Repair and Security Fencing for Springs	We plan on repairing the existing concrete structure at Rough Creek to prevent it from further failure. The structure is currently in good condition and just needs minor repairs. The top and roof section of the box is in major need or repair and would be completely removed and an new one built. The pitch of the existing roof would be increased to increase snow and water shedding from it. The entry hatch would then be re-designed to prevent small rodents, birds and other unauthorized access to the box. The catch basin structure just outside of the Spring Box would be totally re-designed. The existing box would be removed and a new permanent one built and installed. This box would also be secured to prevent unauthorized access. We would then install an new fence completely around the area of the spring. The existing fence line is 3 strand barbed wire and approximately 300' X 300' with several access gates. We would install new fence poles and either a more secure barb wire fence or a cyclone fence to prohibit animal and human entry into the spring area. We would also do the same down at Spring 6. This fenced area is approximately 100' X 100' and would be the same design. We would then install monitoring equipment at each location and have it transmit the data collected back to the water plant located at Bodie.	O	0	N	Bodie State Historic Park is a ghost town located in the High Desert of the Eastern Sierras. The park is a Registered Historic Landmark in California and has a yearly park visitation of 250,000 people. The park receives its water supply from 2 locations within the area. The first is known as Rough Creek. It is a spring located approximately 7 miles from the park and was the original water supply to the park initially built in the late 1870s. The spring box improved to what it is today back in the 70s and has fallen apart and is in the need of repair. The enclosure that is their now is a concrete structure approximately 10 X 8 feet with a shingle roof on top. The concrete structure is in decent shape and needs only a few repairs but the roof is in a state of failure and if not repaired it may collapse resulting in spring box failure. The box also has many openings in it and small rodents and birds have been gaining access to the spring box posing a potential health hazard. The discharge pipe from the spring box runs down to the main line catch basin which is a wooden box lined with a stainless steel liner. We have not had problems with rodents entering into this box since we keep repairing the lid on the box so it is a tight fit and they are unable to enter. The entire area is surrounded by a 3 strand barb wire fence to keep the animals out. This fence is repaired on a yearly basis due to the fact that the winters are heavy and the wild animals of the area keep	35,000	8	2,500	13	Mono	V	2009
4839	0910301	0910301-001	CA State Parks - D.L. Bliss	D. L. Bliss State Park Main Waterline Rehabilitation Project	Due to the length of the water system, (approximately 20,000 feet) at D. L. Bliss State Park, we would like to line the existing waterline within the park instead of installing new. By doing this, we would be able to pothole down to the line where we would be installing isolation valves, fire hydrants or the pressure relief stations and then pulling/bursting the new line through the old line. This would reduce the amount of ground disturbance within the park. The new isolation valves, fire hydrants, pressure reducing valves and new line would be AWWA and NFPA approved and all installed to current code. Spacing of the fire hydrants and isolation valves would be to State and Local code. Depth of the line would be determined during project. Installation of the pressure reducing valves would be in the existing locations except for 1 new one which would be installed just above the Park Visitor Center. The new chlorine injection station would be located just below residence #3. This location has been sought because the water system in the winter is shut down from here to the lake. When we re-start the system, this would be the location to inject chlorine into the system for disinfection. This location is also good because we would need electricity to operate the station and their is a main power line which runs just behind the residence that we would be able to tap into. The proposed building would need to be approximately 5' X 8' and have a heater inside and	O	0	N	The main water distribution system at D. L. Bliss State Park leaks almost as much water as we produce. During the winter months when the park is closed and we have only 2 employees living their, we have a water usage of over 10,000 gallons per day. This is because the pipes within the park are buried too shallow within the park and they will freeze if we do not allow water to continuously flow through then and also to keep the chlorine residuals in the pipe at required levels for disinfection. The existing pipe being so old has many holes and repairs in it and leaks dramatically. One can follow the path of the pipe by surface vegetation growing well. Also if we ever had a major line break within the park, their are insufficient valves within the park to isolate where the leak is and when the main lines drain, we are highly susceptible to contamination of the remainder of the system. We would like to install new isolation valves throughout the system to alleviate this problem. The park also has limited amount of fire hydrants. The hydrants that are their are either non-operable or have limited access by the fire department due to incorrect thread style. We would like to install new ones approved by the AWWA and NFPA. The third problem we would like to repair is in the pressure reducing stations. The current stations are failing and have been repaired so many times that they are ready to be replaced. We currently have water pressures in	750,000	13	2,800	09	El Dorado	I	2009

4840	0105010	0105010-001	EBRPD - Del Valle Regional Park	Del Valle Water Treatment Plant	The Del Valle Water Treatment Plant currently utilizes conventional filtration to render potable water supply for a very popular park in Livermore. This project will install appropriate equipment utilizing membrane filtration technologies (either ultra or micro filtration) into existing treatment plant infrastructure to either replace or supplement existing treatment processes. This project will eliminate current concerns regarding turbidity and DBP production associated with the current water treatment system.	O	0	N	The Del Valle Water Treatment Plant is very old, fragile and requires renovation. Recent and periodic turbidity spikes of the finished water have exceeded state water standards of 0.3 NTU's. The elevated turbidity levels result in concern over adequate disinfection performance of the water system. In addition, excessive algae growth within the system clarifier has required pre-treatment chlorination resulting in concern over disinfection by-products (DBP's). The last DBP results (THM's and HAA's) from the water system exceeded state water standards. This project involves the installation of equipment utilizing membrane filtration technology into this system's water treatment process that will address the aforementioned concerns associated with current treatment processes.	1,500,000	101	10,000	04	Alameda	II	2007
