Subject: Re:

Dr. Mayer,

Thank you for the response. It does not directly answer the question about dry and wet weights which we are hopeful you can answer. Specifically,

1. Are the reported weights of impinged organisms (Tables A and B of Attachment 8, and correspondingly in Tables 5-1, 5-2 and Attachment 3, all in the March 9, 2009 Minimization Plan) reported in dry weight or wet weight? and
2. Are the weights of bat ray pups reported in the Martina and Cailliet paper (i.e., 0.16 kg and 0.21 kg) you reference in dry weight or wet weight?

We appreciate your assistance in helping to clarify this information.

Thank you.

Catherin

Ms Catherine Hagan.

The bat ray data question that you reference in your email request to L&W as copied below is perfectly consistent with data we have collected in impingement studies at a number of California power plants over the years. I have no reason to doubt the accuracy of the data; in addition, I took the time to actually look at the readily available scientific literature pertinent to the question you seemed to be raising.

Here's a sentence quoted verbatim out of the Martina and Cailliet paper on bat rays...

"Disc width at birth in bat rays from this study ranged from 220 mm DW (0.16 kg), the size of the smallest free-living specimen collected, to 305 mm DW (0.21 kg), the largest full-term fetus collected."

4/1/2009

Our bat ray weights are reasonably consistent with Martina and Cailliet reported findings, and I again find no reason to question their accuracy. Please let me know if I am missing your question; I will be glad to look into your question from another point of view.

Best regards, David Mayer

David,
Do you think you can respond to Catherine Hagan on this point re the accuracy of the weights provided, per my earlier email?

Chris

Subject: RE: FW: Poseidon project - Raimondi Initial Review
I asked Dr. Mayer to get back to you on this issue as well.
I believe that he told me today that he had confirmed that the weights presented were correct.

Chris,

On a related matter, in the initial review, Dr. Raimondi asks for clarification about the reported weights in the data. He asks: "Are these dry or wet weights (this becomes very important later on). If they are wet they seem low - at least for some species. For example, it was reported that 50 *Myliobatis californica* were in the sample count with a total weight of 20000 grams (20 kg). This means that the average weight was 400 grams. This value is lower than the typical birth weight of a bat ray pup. Indeed the total weight of all the bat rays (20kg) is not much more than the average weight for adults. Obviously the accuracy of the weights is important - especially for the consideration of mitigation and the use of fish production in that assessment."

Has anyone from Poseidon or David Mayer gotten back to him to clarify?

4/1/2009

If not, when do you think they will be
able to provide the
clarification?

Thanks.

Catherine
