TOXIC SUBSTANCES MONITORING PROGRAM
1991

Introduction

The Toxic Substances Monitoring Program (TSMP) was initiated in 1976 by the California State Water Resources Control Board (State Water Board). The TSMP was organized to provide a uniform statewide approach to the detection and evaluation of the occurrence of toxic substances in fresh, estuarine, and marine waters of the State through the analysis of fish and other aquatic life. The TSMP primarily targets water bodies with known or suspected impaired water quality and is not intended to give an overall water quality assessment. The California Department of Fish and Game (DFG) carries out the statewide TSMP for the State Water Board by collecting and analyzing samples. The State Water Board provides funding for the program under an ongoing interagency agreement with the DFG. Sampling stations are selected primarily by the nine Regional Water Quality Control Boards (Regional Water Boards) which are identified on the inside back cover.

The DFG reports annual sampling results to the State Water Board. The information is transmitted to the Regional Water Boards and to other federal, State, and local agencies in the form of an annual TSMP report. The report provides information on the statewide occurrence and levels of toxic substances and the data can be used by the Regional Water Boards and other agencies to identify waters impacted by toxic pollutants and to eventually abate such problems. This report presents the results of the 1991 sampling and analysis program. The raw data from the 1991 sampling program has already been released to the Regional Water Boards, other State agencies, and to the interested public. This report is the formal report on the 1991 program. The TSMP reports are routinely transmitted to the Office of Environmental Health Hazard Assessment of the California Environmental Protection Agency, which has responsibility for evaluating pollutant levels based on human health concerns and issuing fish consumption health advisories if indicated.

TSMP results are used by the State and Regional Water Boards in the statewide Water Quality Assessment/Clean Water Strategy. Water bodies are classified from good to impaired water quality relative to each other and ranked according to this classification and resource value. TSMP results are used to assist in the ranking process. For example, water bodies that exceed human health criteria are considered more impaired than water bodies that only exceed environmental protection criteria. TSMP results are also used in the regulatory activities of the Regional Water Boards and the Department of Pesticide Regulation.

Summary

Table 1 at the end of this section lists the 108 stations (94 water bodies) sampled in 1991 including 15 stations sampled as part of a special urban lake survey in Region 4. Fifty-six of the stations were sampled for the first time. A total of 159 samples were analyzed for trace elements (metals), pesticides, and PCBs (Appendix A). Fish were collected at all but five of the stations. Crayfish were collected at five stations in Regions 4, 5, and 8. A spiny soft shelled turtle was collected at the Westmorland station on the New River in Region 7. Along with aquatic organisms, sediment was analyzed from five stations in

Regions 1 and 3 (Appendices B and C). Arroyo chub, speckled dace, prickly sculpin, and Santa Ana sucker were collected and analyzed for the first time in the TSMP. Species collected in 1991 are listed in Table 2 (freshwater fish), Table 3 (marine fish), and Table 4 (non-fish species) at the end of this section.

Sampling results were compared to criteria such as Maximum Tissue Residue Levels (MTRLs), U.S. Food and Drug Administration (FDA) action levels, Median International Standards (MIS), and the National Academy of Sciences (NAS) recommended guidelines for predator protection (see Administrative and Comparative Criteria section). MTRLs are a new criterion developed from water quality objectives in the November 1992 *California Inland Surface Waters Plan* (SWRCB 1992). MTRLs were exceeded at 13 water bodies from Regions 3, 4, 6, 7, and 9 (Appendix D). The FDA action level for mercury was exceeded in white bass from two stations on Lake Nacimiento in Region 3 (Appendix E). The FDA action level for chlordane was exceeded in a carp sample from Harbor Park Lake in Region 4 (Appendix F). Mercury exceeded the MIS at seven water bodies in Regions 1, 4, and 5 (Appendix E). Selenium exceeded the MIS at 2 stations; Suisun Bay in Region 2 and Lindero Lake in Region 4 (Appendix E). The NAS guidelines for organic chemicals were exceeded at 17 stations (15 water bodies) in Regions 3, 4, 7, and 8 (Appendix F). In addition to the regular chemical scan, four samples from Region 1 were analyzed for PCP and TCP and one sample of arroyo chub from the Valencia station on the Santa Clara River (Region 4) were analyzed for polynuclear aromatic hydrocarbons (PAHs). PCP and TCP results can be found in Appendix G. PAHs were not detected at the Valencia station.

The pesticide diazinon was found at the three highest concentrations found to date statewide. Diazinon was detected at 260 and 180 ppb in whole samples of red shiner from San Diego Creek near Michelson Drive in Region 8. Diazinon was also found at 180 ppb in another whole sample of red shiner from Peters Canyon Channel, a tributary to San Diego Creek. The previous high diazinon value was 140 ppb in a 1990 whole sample of red shiner from Peters Canyon Channel. The second highest levels of arsenic, lead, and dieldrin were also found in 1991. A liver sample of grey smoothhound shark from Mugu Lagoon (Region 4) contained 20.9 ppm arsenic. Grey smoothhound shark collected from this station in 1988 contained the highest level of arsenic at 29 ppm. Lead was found at 1.2 ppm in a whole sample of fathead minnow from Belvedere Park Lake, an urban lake in Region 4. This concentration is second only to a whole sample of California killifish collected in 1990 from Famosa Slough in Region 9. Dieldrin was found at the second and third highest levels (1,100 and 1,000 ppb) in whole samples of threespine stickleback from Blanco Drain near the Salinas River in Region 3. The highest concentration of dieldrin (1,700 ppb) occurred in a whole sample of threespine stickleback from Watsonville Slough (Region 3) in 1984. DDT continues to be found in high concentrations with the third and fourth highest concentrations yet detected in the TSMP. The two stickleback samples from Blanco Drain contained 13,019 and 12,299 ppb DDT. The highest DDT concentration found statewide is 19,270 ppb in a 1989 goldfish filet sample from Rio de Santa Clara in Region 4.

Additional tabular summaries of chemistry data are provided in Appendices H through N. Marine fish samples exceeding criteria are summarized in Appendix H (trace elements) and Appendix I (organic chemicals). Lipid weight data ascendances are summarized in Appendix J (freshwater) and Appendix K (marine). Summaries of all chemistry data are provided in Appendix L (trace elements), Appendix M (organic chemicals), and Appendix N (lipid weight data). A complete TSMP sampling history is provided in Appendix O. Station location descriptions and latitude and longitude information can be found in Appendices P and Q, respectively. Regional maps showing 1991 station locations are in Appendix R.

FIELD AND LABORATORY OPERATIONS

The presence of many toxic substances in fresh waters is determined by analyzing tissues from fish and other aquatic organisms. Concentrations of these substances in water are often too low or transitory to be reliably detected through the more traditional methods of analysis of water samples. Also, many toxic substances are not water soluble, but can be found associated with sediment or organic matter. Fish and other aquatic organisms are sampled because they bioaccumulate and bioconcentrate toxic substances to levels which may be many hundreds of times the levels actually in the water. This concentration factor facilitates detection of toxic pollutants. The following is a general overall discussion of field and laboratory procedures. A detailed discussion is provided in Appendix S.

Substances Measured

A total of 10 trace elements (metals) and 45 pesticides and PCBs (organic chemicals) are analyzed in the TSMP on a regular basis. Additional substances, such as polynuclear aromatic hydrocarbons (PAHs), pentachlorophenol (PCP), and tetrachlorophenol (TCP), are looked for on a request basis only. Not every sample is analyzed for all metals or organic chemicals. Each sample at each station is handled individually. The requesting agency, usually the Regional Water Boards, will specify the type of analysis for each sample. All metals, except mercury and selenium, are routinely analyzed in liver tissue. Mercury, selenium, and all organic chemicals are analyzed in muscle tissue (filet). When only very small fish are available, metal or organic chemical analysis is performed on a whole-body composite of larger than usual numbers of individual fish.

Sample Size

Composite samples, using six fish of each species, are collected whenever possible. The number and size uniformity of the fish in each composite depends upon their availability. Replicate composites are collected and analyzed to measure the variability of toxicant concentrations in single species composites collected at the same time and place. Collection of the same species from all stations is desirable to minimize possible variation in the data due to differences in pollutant uptake between species. However, this is not possible over the entire State due to the variety of habitat sampled and limited collection time available in the program. All reasonable efforts are made to maintain both station-to-station and year-to-year uniformity in collections. In general, predator fish are desired from all stations. Forage fish are desired as supplemental samples at stations where pollution problems are known to exist, or as substitute samples where predatory fish are not available.

Wet and Lipid Weight Measurements

Tissue concentrations of metals and organic chemicals are measured on a wet weight basis. Metal data are presented in parts per million (ppm), while organic chemical data are presented in parts per billion (ppb). In addition to wet weight measures, organic chemicals are also expressed on a lipid weight basis. Lipid

weight measurements offer several advantages. Because chlorinated hydrocarbons are much more soluble in lipids (fat tissues) than in water, they partition into lipid-rich tissues of aquatic organisms (Stout and Beezhold 1981). Animals with higher proportions of lipid in their tissue usually have had higher concentrations of chlorinated hydrocarbon pollutants (Phillips 1980). Factors such as season, water temperature, health of the organism, stress on the organism, and type of species can affect the lipid levels of samples collected for analysis and can, therefore, cause variability in results. Use of lipid weight measurements may reduce this source of variability, although disadvantages have also been noted (Phillips 1980). As a result, lipid weight values may represent a more realistic measure of environmental availability of chlorinated hydrocarbons than wet weight values. Wet weight measures, however, remain the preferred measure for most readers because all standards for human health and for predator protection are based on wet weight measures. Also, wet weight measures better reflect the exposure of predators or humans to the actual concentration in freshly caught fish.

Station Numbers

Each TSMP station is identified by a unique seven digit number derived from the State Water Board's hydrologic basin planning maps. The first digit of a station number signifies one of the nine Regional Water Boards. The second and third digits represent a hydrologic area, while the fourth and fifth digits identify a hydrologic subarea. The sixth and seventh digits represent the distance in miles above the downstream hydrologic boundary. For example, station 519.21.01 is in Region 5, hydrologic area 19, subarea 21, and is one mile upstream from the hydrologic unit boundary. Not all mileage indicators are accurate, however. In certain instances, it was necessary to assign an arbitrary mileage indicator. For example, the arbitrary designation is used when two or more stations within the same hydrologic subarea are located within the same number of miles of the hydrologic boundary, resulting in the same station number. In this case, one or more of the stations is arbitrarily assigned a mileage designator from 90 to 99.

ADMINISTRATIVE AND COMPARATIVE CRITERIA

In this report, as in previous TSMP reports, the term "criteria" is used to refer to the criteria against which a particular metal or organic chemical is being compared. As more than one criterion may apply to any one metal or organic compound, a hierarchy was established. The intent of the hierarchy is to compare data against the more important criterion. In general, FDA action levels and the "Median International Standards" (MIS), human health-related criteria, are considered more important or critical. Following human health criteria are NAS guidelines, predator protection criteria. Last in the hierarchy are "elevated data levels" (EDL). New to this report are Maximum Tissue Residue Levels (MTRLs), also human health related criteria. All appropriate 1991 data will be compared separately to MTRLs in addition to following the usual hierarchy. The criteria mentioned above are discussed below.

In interpreting the TSMP data by any of the criteria provided, the reader is cautioned that there is no simple relationship between concentrations of toxic substances observed in tissue samples and actual concentrations in water. Different aquatic organisms tend to bioaccumulate a given toxic substance in water to different levels; however, the differences usually do not prevent a general interpretation of the data. The reader is cautioned that the limited number of samples obtained and analyzed at each station in a single year is generally too small to provide a statistically sound basis for making absolute statements on toxic substance concentrations. The values reported herein should be accepted as indicators of relative levels of toxic pollution in water, not as absolute values. In this sense, trends over time and ranking values of a toxic substance in a particular species provide only an indication of areas where fish are evidently accumulating concentrations which are above "normal".

Maximum Tissue Residue Levels (MTRLs)

MTRLs were developed from human health water quality objectives in Table 2 of the State Water Board's November 1992 *California Inland Surface Waters Plan* (SWRCB 1992). The objectives represent concentrations in water that protect against drinking water and consuming fish or shellfish that contain substances at levels which could result in significant human health problems. MTRLs are used as alert levels or guidelines indicating water bodies with potential human health concerns and are an assessment tool and not compliance or enforcement criteria. MTRLs are compared only to filet or edible tissue samples and should not be compared to whole body or liver samples. Table 5 at the end of this section lists MTRLs for those substances monitored in the TSMP. The MTRLs for 10 of the 15 carcinogens listed in Table 5 are below the current tissue detection limit for those substances. Only MTRLs for arsenic, DDT, HCB, gamma-HCH, and PCP are above the detection limits.

The MTRLs were calculated by multiplying the human health water quality objectives by the bioconcentration factor (BCF) for each substance as recommended in the USEPA *Draft Assessment and Control of Bioconcentratable Contaminants in Surface Waters* (USEPA 1991). BCFs were taken from the USEPA 1980 Ambient Water Quality Criteria Documents for each substance. MTRLs were not calculated for objectives that are based on maximum contaminant levels (MCLs) or taste and odor criteria.

FDA Action Levels and NAS Guidelines

The U.S. Food and Drug Administration (FDA) has established maximum concentration levels for some toxic substances in human foods (USFDA 1985). The levels are based on specific assumptions of the quantities of food consumed by humans and upon the frequency of their consumption. The FDA limits are intended to protect humans from the chronic effects of toxic substances consumed in foodstuffs. The National Academy of Sciences (NAS) has established recommended maximum concentrations of toxic substance concentrations in freshwater fish tissue (NAS 1973). They were established not only to protect the organisms containing the toxic compounds, but also to protect the species that consume these contaminated organisms. The specific action levels and guidelines used in this report are shown in Table 6 at the end of this section.

Median International Standards (MIS) for Trace Elements

The Food and Agriculture Organization of the United Nations has published a survey of health protection criteria used by member nations (Nauen 1983). These criteria vary somewhat in the tissues to be analyzed or the level of protection desired, but may be compared qualitatively. Table 7 at the end of this section summarizes these standards as an indication of what other countries have determined to be unsafe levels of trace elements. Though the standards do not apply within the United States, they provide an indication of what other nations consider to be an elevated concentration of trace elements in fish tissues. Even so, the reader is reminded that most TSMP metal analyses are done in liver, rather than in edible portions. To date, only mercury and selenium are routinely measured in edible portions in the TSMP. Measurements in liver should not be compared to Median International Standards. A description of how the Median International Standards were compiled is provided in Appendix T.

Elevated Data Levels

The "elevated data level" (EDL) was introduced in 1983 as an internal comparative measure which ranks a given concentration of a particular substance with previous data from the TSMP. The EDL is calculated by ranking all of the results for a given chemical from the highest concentration measured down to and including those records where the chemical was not detected. From this, a cumulative distribution is constructed and percentile rankings are calculated. For example, the 50^{th} percentile corresponds to the median or "middle" value rather than to the mean. With a large number of records, the median can be approximately compared to the mean.

Starting in 1990, EDL calculations were modified to reflect the growing number of marine species analyzed in the TSMP. In the past, EDL calculations for wet weight measures were grouped by similar tissue types, such as filet or whole-body samples. In 1990, the EDL calculations were further split into freshwater and marine fish types. Now when any sample is compared to an EDL, it is compared to the EDL calculated from the same fish and tissue types (i.e. freshwater fish filets are compared only to other freshwater fish filets, etc.). The substance most affected by the change in the EDL calculations was arsenic. The EDL criteria for arsenic in freshwater fish livers and whole samples were lowered by approximately half from 1978-1989 calculations. A separate copper EDL is calculated for salmonid liver tissue because trout are known to accumulate copper to higher levels than other species. White bass also seem to accumulate copper and other trace elements to higher levels. Starting in 1988, white bass are not included in the EDL

calculations. White bass are found only in a few locations in California and further sampling of this species will be avoided whenever possible. In calculating the EDLs for lipid weight measures of organic chemicals, all tissue types are combined because lipid weight measures in different tissue types tend to be far more similar than wet weight measures (Phillips 1980). However, like wet weight measures, EDL lipid weight calculations were also split into freshwater and marine fish types. The 1978-1991 EDLs and the number of data points used to calculate each EDL are provided in Tables 8 through 16 at the end of this section.

The 85th percentile (EDL 85) was chosen as an indication that a chemical is elevated from the median. The 85th percentile corresponds to measures used by the U.S. Fish and Wildlife Service in their National Contaminant Biomonitoring Program and would represent approximately one and one-half standard deviations from the mean, if the data were normally distributed. The 95th percentile (EDL 95) was chosen to indicate values that are highly elevated above the median. The 95th percentile would represent two standard deviations from the mean, if the data were normally distributed. When used along with other information, these measures provide a useful guideline to determine if a chemical has been found in unusually high concentrations. A more detailed description of EDL rankings is provided in Appendix U. The reader is again cautioned that EDLs are not directly related to potentially adverse human or animal health effects; they are only a way to compare findings in a particular area with the larger data base of findings from all over the state.

TABLE 5

Toxic Substances Monitoring Program

Maximum Tissue Residue Levels (MTRLs) for Carcinogens in Inland Surface Waters

Substance	Water Quality Objective [a] (µg/l)	BCF [b] (l/kg)	MTRL [c] (µg/kg, ppb)
aldrin	0.00013	**d**	0.05
arsenic	5.0 [e]	44	200.0 (0.2 ppm)
chlordane (total)	0.00008	14100	1.1
DDT (total)	0.00059	53600	32.0
dieldrin	0.00014	4670	0.65
heptachlor	0.00016	11200	1.8
heptachlor epoxide	0.00007	11200	0.8
hexachlorobenzene (HCB)	0.00066	8690	6.0
hexachlorocyclohexane (HCH), alpha	0.0039	130	0.5
hexachlorocyclohexane (HCH), beta	0.014	130	1.8
hexachlorocyclohexane (HCH), gamma	0.019	130	2.5
PAHs (total)	0.0028	30	0.08
PCBs (total)	0.00007	31200	2.2
pentachlorophenol (PCP)	0.28	11	3.1
toxaphene	0.00067	13100	8.8

Maximum Tissue Residue Levels (MTRLs) for Non-carcinogens in Inland Surface Waters

Substance	Water Quality Objective [a] (µg/l)	BCF [b] (l/kg)	MTRL [c] (µg/kg, ppb)
cadmium	0.01	64	0.64
endosulfan (total)	0.0009	270	0.25 (250 ppb)
endrin	0.0008	3970	3.0 (3,000 ppb)
mercury	0.000012	**f**	1.0
nickel	0.6	47	28.0

a. From Table 2, Human Health Water Quality Objectives, "California Inland Surface Waters Plan" (SWRCB 1992). MTRLs were not developed for objectives based on maximum contaminant levels (MCLs) or taste and odor criteria.

b. Bioconcentration Factors taken from the USEPA 1980 Ambient Water Quality Criteria Documents for each substance.

c. MTRLs were calculated by multiplying the Water Quality Objective by the BCF, except for aldrin, arsenic, and mercury.

d. Aldrin MTRL is derived from a combination of aldrin and dieldrin risk factors and BCFs as recommended in the USEPA 1980 "Ambient Water Quality Criteria for Aldrin/Dieldrin" (USEPA 1980).

e. Arsenic MTRL was calculated from the formula NSRL ÷ (WI/BCF) + FC = MTRL. [NSRL (California's No Significant Risk Level for arsenic) = 10 µg/d, WI (Water Intake) = 2 l/d, FC (daily fish consumption) = 0.0065 kg/d].

f. The MTRL for mercury is the FDA action level. The water quality objective for mercury in the Inland Surface Waters Plan is based on the FDA action level as recommended in the USEPA 1985 "Ambient Water Quality Criteria for Mercury" (USEPA 1985).

(EDL) means that the results were compared to EDL 85 and EDL 95 values.

(EDL/F) means that whole body samples were compared to EDL 85 and EDL 95 values and filet samples were compared FDA criteria.

F = Filet. W = Whole Body. Species codes are listed in Table 3.

APPENDIX P

Toxic Substances Monitoring Program
1991 Station Descriptions

Station Number	Station Name	County	Description
105.36.10	Klamath R/d/s Iron Gate Res	Siskiyou	Station located at "R" Ranch campground about 3 miles down stream from Iron Gate Dam.
105.50.04	Shasta River	Siskiyou	Station located from Highway 263 upstream ¾ mile.
105.50.35	Beaughton Cr/d/s HWY 97 Brg	Siskiyou	Station located about 3/4 mile downstream from Highway 97 Bridge.
105.92.01		Lost R/Tule Lake	Modoc Station located from about 1/2 mile north of the East/West Road Bridge to the ridge.
106.12.03	Trinity R/Willow Creek	Humboldt	Station located about 1/4 mile north of the confluence of the Trinity River and Willow Creek, adjacent to State Highway 96 and the local airport.
106.13.06	Trinity R/d/s Burnt Ranch	Trinity	Station located in about 200 yards of riffle at Gray Ranch which is about 1/2 mile downstream from Gray Falls Campground.
106.40.12	Carrville Pond	Trinity	Station located about 1/10 mile west of intersection of Highway 3 and East Side Road.
106.40.16	Trinity R/East Fork	Trinity	Station located at Alpine Cellars Bridge at the end of the county road approximately 2 miles upstream of East Fork Road.
110.00.90	McDaniel Slough	Humboldt	Station located at the pool just above the tide gate at Arcata Bay.
111.63.14	Lake Pillsbury	Lake	Station located near Lake Pillsbury Resort.
114.11.05	Russian R/Duncans Mills	Sonoma	Station located at the Moscow Road bridge crossing of the Russian River at Duncans Mills.
114.24.12	Lake Sonoma	Sonoma	Station located from the Rockpile Road Bridge upstream 1/2 mile in the Warm Springs Creek arm.
114.32.00	Lake Mendocino	Mendocino	Station located in the Marina off Highway 20 on the north end of the lake.
115.30.02	Estero de San Antonio	Marin	Station located at Valley Ford - Franklin School Road crossing.
115.30.04	Estero Americano	Sonoma Marin	Station located at Valley Ford - Franklin School Road crossing.
201.12.01	Walker Creek	Marin	Station located between Highway 1 Bridge and Camp Tomales Bridge.

APPENDIX P (continued)
Toxic Substances Monitoring Program
1991 Station Descriptions

Station Number	Station Name	County	Description
204.30.11	Alameda Cr/Niles Canyon Rd	Alameda	Station located about 1/2 mile upstream of Highway 238.
205.50.94	Stevens Creek	Santa Clara	Station located adjacent to and upstream of the Santa Clara County Park below Stevens Creek Dam.
206.50.14	Napa R/Napa	Napa	Station located on Oak Knoll Avenue off Highway 29 north of the city of Napa.
207.10.90	Suisun Bay	Solano	Station located throughout Suisun Bay.
207.32.06	Walnut Creek	Contra Costa	Station located off North Main Street at the Lincoln Street Bridge crossing.
304.12.90	Schwann Lake	Santa Cruz	Station located at East Cliff Drive and 9th Street in Santa Cruz.
304.12.91	Neary's Lake	Santa Cruz	Station located at Bay Street and California Street in Santa Cruz.
304.13.90	Corcoran Lagoon	Santa Cruz	Station located north of East Cliff Drive between 22nd avenue and 24th Avenue in Santa Cruz.
304.13.91	Moran Lake	Santa Cruz	Station located north of East Cliff Drive between Baker Street and Lake Avenue.
304.13.92	Aptos Creek	Santa Cruz	Station located in the County Park at Soquel Drive and Aptos Creek Road in Aptos.
307.00.01	Carmel Lagoon	Monterey	Station located near the cliffs at the west end.
309.10.01	Roberts Lake	Monterey	Station located at Roberts Avenue and Del Monte Boulevard in Sand City.
309.10.09	Blanco Drain/Salinas R	Monterey	Station located in the 100-yard stretch immediately upstream of the drain's confluence with the Salinas River.
309.50.01	El Estero	Monterey	Station located at the bridge at 3rd Street and Camino Aquaito.
309.82.04	Lake Nacimiento/Dip Cr	San Luis Obispo	Station located on Dip Creek arm of Lake Nacimiento.
309.82.08	Lake Nacimiento/Las Tablas	San Luis Obispo	Station located on Las Tablas Creek arm of Lake Nacimiento.
312.10.00	Santa Maria R/Mouth	Santa Barbara	Station located just above the beach area at the mouth of the river.
402.10.02	Ventura River	Ventura	Station located about 1-1/2 miles upstream from the Main Street Bridge in San Buenaventura.

APPENDIX P (continued)
Toxic Substances Monitoring Program
1991 Station Descriptions

Station Number	Station Name	County	Description
403.11.02	Rio de Santa Clara/Oxnard Drain	Ventura	Station located upstream of the bridge at Arnold Road.
403.11.91	Mugu Lagoon	Ventura	Station located at the sewage pond bridge and the lagoon bridge.
403.12.06	Calleguas Creek	Ventura	Station located downstream of Lewis Road crossing.
403.12.07	Conejo Creek	Ventura	Station located at Rancho Road crossing southwest of Camarillo.
403.21.05	Santa Clara R/Santa Paula	Ventura	Station located at the road crossing at the Livingston Graham Santa Paula Plant.
403.51.05	Santa Clara R/Valencia	Los Angeles	Station located about 1/2 mile down stream of Castaic Junction.
403.64.02	Arroyo Conejo	Ventura	Station located upstream of second wet crossing of the creek. Access is through the Thousand Oaks Sewage Treatment Plant.
403.67.04	Arroyo Simi	Ventura	Station located upstream of railroad bridge at end of Nogales Avenue in Moorpark.
404.21.01	Malibu Creek	Los Angeles	Station located at Cross Creek Road crossing.
404.21.07	Malibou Lake	Los Angeles	Station located near Lake Vista Drive and Cornell Road.
404.23.04	Lindero Lake	Los Angeles	Station located at Mainsail Cul-de-Sac off Lake Lindero Drive.
404.25.01	Westlake Lake	Los Angeles/ Ventura	Station located at Triunfo Canyon Road and Lindero Canyon Road.
404.26.00	Eleanor Lake	Los Angeles	Station located beside Westlake Blvd. (Highway 23 So.) about 3/4 mile south of Petrero Road.
404.26.01	Sherwood Lake	Ventura	Station located off Petrero Road about 1 1/2 miles east of Westlake Blvd.
405.12.00	Alamitos Bay	Los Angeles	Station located along beach area on the bay side of Ocean Blvd.
405.12.90	Harbor Park Lake	Los Angeles	Station located in the Wilmington area of the City of Los Angeles.
405.15.02	El Dorado Park Lake	Los Angeles	Station located in northern most lake in El Dorado Park
405.15.04	San Gabriel River	Los Angeles/ Orange	Station located in the unlined portion of the riverbed in Long Beach downstream to College Park Drive along the Los Angeles/Orange County Line.

APPENDIX P (continued)
Toxic Substances Monitoring Program
1991 Station Descriptions

Station Number	Station Name	County	Description
405.15.24	Echo Park Lake	Los Angles	Station located in the north end of this urban lake.
405.15.97	Belvedere Park Lake	Los Angeles	Station located between Pomona Blvd. And Highway 60, access behind court House.
405.15.98	Hollenbeck Park Lake	Los Angeles	Station located at 4th Street and St. Louis street adjacent to the Interstate 5.
405.15.99	Lincoln Park Lake	Los Angeles	Station located in the City of Los Angeles approximately two miles northeast of Union Station.
405.21.03	Calabasas Lake	Los Angeles	Station located at Park Serranto off Park Grenada in Calabasas.
405.21.16	Los Angeles R/Sepulveda Basin	Los Angeles	Station located east of Highway 405 at Burbank Blvd.
405.41.01	Legg Lake	Los Angeles	Station located in the western quarter of the northern end of Legg Lake in the Whittier Narrows Recreational Area.
405.41.08	Peck Road Lake	Los Angeles	Station located in the western end of the lake.
405.52.01	Puddingstone Res	Los Angeles	Station located from the middle cove on the west shore and from the inlet cove on the northeast shore.
510.00.30	Sacramento R/Hood	Sacramento/Yolo	Station located in the river stretch from Clarksburg to Courtland along the Sacramento/Yolo County line.
515.40.31	Feather R/d/s Oroville Res	Butte	Station located between Thermalito Afterbay discharge and Highway 70.
517.51.02	Yuba R/N.F./d/s Bullards Bar Res	Yuba	Station located adjacent to Colgate Power House.
519.21.09	American R/d/s Watt Ave Brg	Sacramento	Station located between the Howe Avenue and Watt Avenue Bridges in Sacramento.
519.21.19	American R/d/s Folsom Res	Sacramento	Station located about 1 mile downstream of Rainbow Bridge in Lake Natoma.
519.22.04	Sacramento R/u/s I-5 Overcross	Yolo	Station located about 1/2 mile upstream of the I-5 overcrossing.
519.22.90	Feather R/d/s HWY 99 Brg	Sutter/Yuba	Station located from 1/2 mile below the Highway 99 Bridge and upstream to the confluence with the Bear River.
541.10.90	San Joaquin R/Vernalis	San Joaquin	Station located about 4 miles upstream from South County Park near San Joaquin City.

APPENDIX P (continued)
Toxic Substances Monitoring Program
1991 Station Descriptions

Station Number	Station Name	County	Description
544.00.11	Franks Tract	Contra Costa	Station located along Old River channel about 1/2 mile north of Holland Cut.
601.00.02	Gull Lake	Mono	Station located along the north shore around the tules.
603.20.24	Bishop Creek Canal/d/s Bishop	Inyo	Station located at Warm Springs Road crossing.
603.20.41	Sabrina Lake	Inyo	Station located in southwest end of the lake.
603.30.05	Haiwee Reservoir	Inyo	Station located at the north end of the reservoir along North Haiwee Dam.
626.80.03	Little Rock Creek Res	Los Angeles	Station located along west shore between the campground and the dam.
628.20.02	Silverwood Lake	San Bernardino	Station located in the West Fork Mohave River arm.
632.10.15	Silver Creek	Alpine	Station located about 1 mile above confluence with East Carson River.
633.10.03	Carson R/W.F./d/s Paynesville	Alpine	Station located at the Diamond Valley Road crossing near Paynesville.
635.20.04	Donner Lake	Nevada	Station located about 1 mile west of the dam.
635.20.28	Squaw Creek	Placer	Station located downstream from first bridge above Highway 89 on Squaw Valley Road.
713.30.90	Colorado R/Needles	San Bernardino	Station located 5 miles south of Needles in Beal Slough.
715.40.08	Palo Verde Outfall Drain	Imperial	Station located from Highway 78 to 1/4 mile downstream from C-28 spill. Station moved in 1987 to six miles upstream just above Palo Verde.
715.50.90	Colorado R/u/s Imperial Dam	Imperial	Station located from Squaw Lake boat launch ramp to 1/4 mile north of Senator Lake.
723.10.02	New R/Westmorland	Imperial	Station located at the gauging station about one mile downstream of the Lack Road Bridge near Westmorland.
723.10.15	Mayflower Drain	Imperial	Station located at Highway 115 crossing by Weist Store.
723.10.20	Rose Drain	Imperial	Station located at McConnell Road.
723.10.22	Orange Drain	Imperial	Station located at Highway 115 crossing.
723.10.28	Peach Drain	Imperial	Station located at highway 115 crossing.

APPENDIX P (continued)
Toxic Substances Monitoring Program
1991 Station Descriptions

Station Number	Station Name	County	Description
723.10.58	New R/Inter Boundary	Imperial	Station located up to two miles downstream of the international boundary.
723.10.91	Fig Drain	Imperial	Station located about 1/2 mile downstream of Diehl Road.
727.00.03	Reservation Main Drain	Imperial	Station located at Indian Rock and Fisher Roads.
728.00.90	Salton Sea/South	Imperial	Station located near the mouth of the Alamo River.
728.00.92	Salton Sea/North	Imperial/	Station located offshore at Salton Sea Riverside State Recreation Area near the Imperial/Riverside County line.
801.11.00	Huntington Harbour/Anaheim Bay	Orange	Station located in Anaheim Bay.
801.11.07	San Diego Cr/Michelson Dr	Orange	Station located between MacArthur Boulevard and Michelson Drive Station formerly located at MacArthur Blvd., but moved upstream out of tidewater.
801.11.09	San Diego Cr/Barranca Pkwy	Orange	Station located in the riffle 150 yards upstream from the confluence of San Diego Creek and Peters Canyon Creek.
801.11.16	El Modena Ch/u/s Walnut Ave Brg	Orange	Station located upstream of Walnut Avenue Bridge near confluence with Peters Canyon Channel.
801.11.96	Peters Canyon Channel	Orange	Station located upstream of Moulton Parkway Bridge.
801.11.97	Newport Bay	Orange	Station located in Newport Bay.
801.21.09	Santa Ana R/USGS Gage	Riverside	Station located from the Metropolitan Water District Aqueduct crossing upstream 1/4 mile.
801.25.00	Santa Ana R/Prado Dam	Riverside	Station located immediately below Prado Dam.
902.22.03	Rainbow Creek	San Diego	Station located at Water District road crossing about 1/2 mile upstream of the Santa Margarita River.
902.22.04	Santa Margarita R/Willow Glen Rd	San Diego	Station located about 3/4 mile upstream of Rainbow Creek.
903.11.05	San Luis Rey R/Foussat Rd	San Diego	Station located at Foussat Road crossing.
903.11.11	San Luis Rey R/HWY 76	San Diego	Station located at Highway 76 crossing.
903.12.06	Keys Creek	San Diego	Station located at Highway 15 overcrossing.
903.12.07	San Luis Rey R/HWY 15	San Diego	Station located about 1/2 mile upstream of Highway 15.
908.22.01	Chollas Creek/Main Street	San Diego	Station located at Main Street crossing.

List of Figures

*** The Tulare Lake Basin was not sampled in 1991. Figure 5c is not included in this report.

APPENDIX S

Field and Laboratory Operations

FIELD AND LABORATORY OPERATIONS

Sample Collection

Sample collections were obtained using a Smith-Root Model VII and Model XIA Portable Electrofishers; a Smith-Root SR-16E electrofishing boat; variable mesh, woven, and monofilament gill nets; baited hoop nets measuring three feet in diameter with one inch square mesh; or beach seines of varying lengths, widths, and material. Collected fish were kept in clean stainless steel buckets until they could be double-wrapped in extra-heavy duty aluminum foil (dull side inward), labeled, and packed in dry ice where they were frozen.

Laboratory Analysis

A detailed description of procedures and techniques discussed below can be found in the Department of Fish and Game's (DFG) Laboratory Quality Assurance Program Plan (DFG 1990). The following is a summary of the 1991 Quality Assurance/Quality Control (QA\QC) results provided by the DFG's Water Pollution Control Laboratory. Copies of the Laboratory Quality Assurance Program Plan and QA\QC results are available upon request.

Trace Elements Analytical Techniques in Tissues

A Varian Model Spectra 30 atomic absorption spectrophotometer and a Varian Model VGA-76 Hydride Generator were used for techniques employing conventional (flame) atomic absorption spectrophotometry (copper and zinc), hydride generation (arsenic and selenium), and cold vapor technique for mercury (Adrian 1971; Uthe et al. 1974; and Evans et al. 1986). A Perkin-Elmer Model 3030 Zeeman atomic absorption spectrophotometer equipped with a HGA-600 graphite furnace and an AS-60 autosampler was used for techniques requiring a graphite furnace (cadmium, chromium, nickel, lead, and silver). All analytical values were corrected using procedural blanks. Trace element analytical and digestion techniques along with their detection limits are presented in Table S-1. All digestion techniques, except for mercury, are the same as those used since 1988.

Samples were weighed into pre-cleaned 200mm x 25mm glass tubes which had been checked for trace element contamination. Digestion of the sample was accomplished by adding concentrated nitric acid and heating the tube in an aluminum block to reflux the acid. The acid was allowed to reflux until the evolution of NO_x (brown fumes) were no longer apparent (about 2 hours). The block temperature was increased to reduce the volume in the tube by evaporation. When the volume in the tube reached about 0.5 ml the tube was removed and allowed to cool. The digestate was diluted to 40.0 ml with Type II water. The digestate was mixed on a vortex mixer and transferred to a clean polyethylene bottle.

In addition to routine trace element analyses, 10 percent of the samples were analyzed in duplicate to determine precision. The results of duplicate laboratory sample analyses are presented in Table S-2. To protect sample integrity, all materials contacting samples during laboratory operations were analyzed for trace element content. To ensure accuracy, reference materials from the National Institute of Standards and Technology (NIST) and the National Research Council of Canada were analyzed (Table S-3).

Synthetic Organic Compounds Analytical Techniques in Tissues

A 10 gram sample of the flesh-water (1:1) paste was spiked with nonachlorobiphenyl (PCB congener No. 206) and extracted twice with acetonitrile by shaking for two minutes. The sample extracts were combined, filtered, and partitioned with petroleum ether. An aliquot of the petroleum ether extract was eluted through a Florisil^{R} column. The Florisil^{R} columns were eluted with petroleum ether (Fraction 1), six percent ethyl ether (Fraction 2), and 15 percent ethyl ether (Fraction 3). Fractions 2 and 3 were spiked with nonachlorobiphenyl and all of the fractions were concentrated to an appropriate volume in a Zymark^{R} Turbovap concentrator prior to analysis by gas chromatography. The nonachlorobiphenyl was used as an internal standard to determine relative retention times and gas chromatograph operation. A mixture of synthetic standards was eluted through the Florisil^{R} column to determine the recovery and separation characteristics of the column. The distribution of synthetic organic compounds in the three fractions is listed in Table S-4. The detection levels for synthetic organics in flesh are presented in Table S-5.

At stations where the TSMP had previously detected endosulfan, samples were analyzed for endosulfan I, endosulfan II and endosulfan sulfate. This required an additional elution through Florisil^{R} with 50 percent ethyl ether in petroleum ether (Fraction 4, Table S-4). All other stations were initially analyzed for endosulfan I only. This fraction was also spiked with nonachlorobiphenyl prior to the concentration step. Due to the high lipid content of the fraction all of the 50 percent extracts were diluted with iso-octane by a factor of ten prior to analysis by gas chromatography.

As part of quality control, 10 percent of the samples were duplicated in the laboratory (Table S-6). All materials and solutions contacting the sample after initial extraction were analyzed for organic contamination. To preclude errors due to contamination, a vertical solvent blank was passed through each set of glassware and analyzed before introducing a new sample.

Instrument and Analytical Conditions for Chlorinated Hydrocarbons

1991

Chlorinated hydrocarbons were determined with a Varian Model 3500 gas chromatograph equipped with a model 8035 autosampler, temperature programmable on-column injector, and dual Ni^{63} electron capture detectors. A 30 meter J&W DB1 fused silica capillary column is connected to the temperature programmable injector, the column effluent is split using a press-fit "Y" connector to a 30 meter J&W DB5 and a 30 meter J&W DB17 column. The DB5 and DB17 columns are connected to the electron capture detectors. All three columns have a 0.25 mm ID and a 25 um liquid phase thickness. Helium was used as the carrier gas at a linear velocity of 35 cm/sec and nitrogen was used as the detector makeup gas at a flow of 25 ml/min. Chromatographic data was acquired and processed with a Perkin-Elmer Model 7700 professional computer using Chromatographics 3 software.

All samples were analyzed using a single injection for each extract under the following conditions:

Injector temperature program:	
	Initial temperature - 50 °C
	Program rate - 300 °C/min
	Final temperature - 280°C
	Final temperature hold time - 57 min
Column temperature program:	
	Initial temperature - 50°C
	Program rate 1 - 15°C/min to 210°C
	Program rate 2 - 2°C/min to 280°C
	Final temperature hold time - 0 min
Detector temperature:	330°C

Analytical Techniques for Polynuclear Aromatic Hydrocarbon Compounds (PAHs) in Flesh

Sample extraction procedures for PAHs were similar to those used for chlorinated hydrocarbons and are described below. A 10 gram sample of the flesh water (1:1) paste was homogenized with acetonitrile in an all-glass blender with stainless steel blades and filtered.

Sample extracts were analyzed using a Varian Saturn II Ion Trap GC-MS. One microliter of sample extract was injected into a J&W Scientific DB-5, 30 meter x 0.25 mm I.D. fused silica capillary column having a 0.25 um film thickness. The GC oven temperature was initially held at 70°C for two minutes. The temperature ramp was 15°C per minute until the oven reached 150°C. The second temperature ramp was 2°C per minute to a final temperature of 280°C and held for 5 minutes. Initial injector temperature was 70° and was programmed to 280° at 300°/min immediately after injection. The GC carrier gas was helium at a linear velocity of 37 cm/sec. Detection limits of the PAHs are reported in Table S-7.

Procedure for Lipid Determination

As synthetic organic concentrations in organisms may vary with lipid content, it is customary to provide lipid data when reporting tissue concentrations. A thoroughly homogenized sample weighing approximately 5 g (wet weight) is macerated and dried with anhydrous granular Na_2SO_4. The dried sample is transferred to a blender with 150 ml of petroleum ether and blended for two minutes at high speed. The liquid is vacuum-filtered into a 250 ml filter flask through a 10 cm Buchner funnel containing Whatman #1 filter paper. The sample is blended once more with an additional 150 ml of petroleum ether and filtered. The filtrate is concentrated to approximately 25 ml with heat (steam bath) and nitrogen steam. The remaining filtrate is then quantitatively transferred into a 50 ml pre-weighed planchet. The petroleum ether is evaporated, the planchet containing the residue is reweighed, and the percent lipid is calculated.

TABLE S-1

Toxic Substances Monitoring Program

1991 Digestion Techniques and Detection Limits in Fish Tissue

Element	Digestion Techniques	Instrumental Analysis	Detection Limits (ug/g wet weight)
Arsenic	Dry Ash w/$Mg(NO_3)_2 \cdot 6H_2O$	$NaBH_4$ Reduction A.A.	0.05
Mercury	HNO_3 reflux	Cold Vapor A.A.	0.02

APPENDIX T

Median International Standards

Median International Standards

In 1982, the Food and Agricultural Organization (FAO) of the United Nations conducted a survey of standards and legal limits for metals including mercury, pesticides, and other contaminants in fishery products. This was in response to frequent inquiries from institutions and companies active in international commerce that found it difficult finding such information.

The FAO surveyed nations that were members of the FAO as well as those who were not. Most nations cooperated with the survey and, in certain other cases, the standards were drawn from other sources. The FAO took all of the responses and presented them in a report entitled "Compilation of Legal Limits for Hazardous Substances in Fish and Fishery Products" (Nauen 1983). Most of the limits were presented in a standard format and in standard units of fresh or live weight. Exceptions are clearly noted.

Nearly all of the standards for pesticides were from the United States (FDA standards). However, with the exception of mercury, the United States has no standards for trace metals in fishery products. It is this very lack of standards that makes interpretation of some of the TSMP findings difficult.

Table T-1 summarizes the standards and guidelines for metals from the FAO report. The table notes whether the standards are for freshwater fish, marine fish, shellfish, or a combination of these. When more than one standard was listed by the FAO report, those values closest to a standard for "fresh weight, edible portion" were chosen. Exceptions are clearly noted in the table. Standards for each element are arranged in ascending order. The country of origin and the approximate date of adoption are also noted.

As can be seen in Table T-1, some of the standards are not truly for edible portion, fresh weight. For example, some standards refer to canned products or protein. In the case of India, the standards are on a dry weight basis. If the Indian standards were stated in fresh weight terms, they would be approximately one fifth or one sixth of the stated standard.

Table T-1 has many striking features. One feature is that most of the standards are surprisingly similar. Another feature is the large number of countries that have standards for metals. Also, although many of these countries are less developed nations, the standards adopted by these nations do not differ from those of the more developed nations.

The standards were not summarized for mercury because there is a USFDA standard of 1.0 ppm for methyl mercury in the edible portions of fish and shellfish. This was, incidentally, the highest limit set by any nation in the FAO study. The great majority of nations have set a mercury standard of 0.5 ppm.

Median International Standards presented in Table 7 were calculated from the standards listed in Table T-1. The median standard was chosen for use for several reasons. The median is less influenced than the mean by outliers in the data. Also, direct comparisons of standards for fresh versus canned

versus dry can be misleading. By using median standards, these misleading comparisons can be more easily avoided. In most cases, the Median International Standard is actually a standard set by one or more nations rather than an average value not actually set by any country. The median was calculated as follows. All standards or guidelines (with the exception of the Indian standards which are based on dry weight) were considered to be more-or-less equivalent. For the purposes of calculating the median, the Indian standards were divided by five. The median was calculated as the middle value of all of the standards (e.g., the fourth of seven values arranged in ascending order). In a few cases, the number of standards was even. In this event, the two mid-values were averaged (most were not different). None of the adjusted dry-weight standards from India ended up as a median or as part of a mid-value pair.

For obvious reasons, the Median International Standards can only be used to provide a general idea of what other nations have chosen to use as a standard. The range of all values is listed in Table 7 as a reminder of this. However, with the lack of American standards, Median International Standards can provide a guidepost for those responsible for interpreting trace metal findings in fish and shellfish tissue.

APPENDIX U

Elevated Data Levels

Elevated Data Levels (EDL)

An EDL is defined for the purposes of the TSMP as that concentration of a toxic substance in a fish tissue that equals or exceeds a specified percentile (such as 85 percent) of all TSMP measurements of the toxic substance in the same fish and tissue type between 1978 and 1991. EDLs were determined as follows:

(1) All TSMP data from 1978 through 1991 were pooled by fish and tissue type, (2) The concentrations of each toxicant were ranked from highest to lowest concentration down to, and including, instances when a chemical was not detected, (3) The cumulative frequency of occurrence and percentile ranking for all concentrations were calculated, (4) The concentration of the toxic substance representing the 85^{th} percentile was identified and designated the 85 percent EDL or EDL 85, and (5) The concentration of the toxic substance representing the 95^{th} percentile was identified and designated the 95 percent EDL or EDL 95. The EDL 85 is that concentration of a toxic substance that equals or exceeds 85 percent of all TSMP measurements of the toxic substance in the same fish and tissue type between 1978 and 1991. The EDL 95 is that concentration of a toxic substance that equals or exceeds 95 percent of all TSMP measurements of the toxic substance in the same fish and tissue type between 1978 and 1991. EDLs for trace metals are summarized in Tables 8 through 10. EDLs for synthetic organic substances are summarized in Tables 11 through 16.

Because EDLs are based on the relative ranking of each measurement, rather than a percentage of the highest concentration obtained, they are not influenced by unusually high (anomalous) toxicant values. This characteristic of EDLs is especially desirable in the evaluation of synthetic organic toxicants where the highest concentration may be as much as ten times the next highest concentration. EDLs do, however, reflect the biases of the data upon which they have been based. For instance, EDLs for mercury and selenium in California fish show that a large number of samples for each exceed criteria. However, much of the mercury and selenium data collected by TSMP were in locations known to have elevated mercury and selenium levels, and often large numbers of fish were analyzed from those locations to determine the extent of the problem.

Because they are based on TSMP data rather than an absolute number external to the TSMP, EDLs, when exceeded, can provide a sensitive first indication of elevated toxicant levels in California waters. As such, EDLs fulfill the monitoring function of the TSMP effectively. In addition, EDLs may be expressed in wet weight or lipid weight to eliminate data variability due to lipid content and to conform to scientific literature relevant to fish monitoring programs worldwide. However, EDLs do not assess adverse impacts, nor do they necessarily represent concentrations that may be damaging to the fish or to a human consuming the fish. They do not directly relate to Maximum Tissue Residue levels (MTRLs), FDA action levels, NAS guidelines, or Median International Standards (MIS).
