Subject: "Comment Letter-Klamath River-TMDLS"

The action plan for the "...Klamath River Total Maximum..." does not state clearly the plans for accepting impaired waters at the California-Oregon border. One only has to read the numerous water quality studies at the Keno area to know that water containing unacceptable levels of nutrients and microcystin impairments are flushed into the California watersheds. Although efforts to address water quality are noteworthy, one can not be more than marginally successful without taking on some of the major sources of pollution coming from Oregon. No additional funding or studying needs to be done: Utilize the multitude of studies already published, some as recent as 2009, governing the water quality of the upper Klamath River. As part of any future measurement plan, an absolute "MUST", must be that water samples will be taken at the California-Oregon border and that the results of these studies be made available to the general public.

Respectfully:
