

I live in Carmel in the area in question and am opposed to further reductions in pumping from the Carmel River which at worst would put a few fish (not on the endangered species) at risk but would further reduce water availability to an area which has worked to be come the most efficient in the state. There are other solutions and until one has been selected and implemented it is imperative that we pump from the Carmel river even if it is marginally more than we currently pump. This is the logical solution.
