Subject: Comments on the Draft North Coast Instream Flow Policy

April 24, 2008
Chair & Members Tam Doduc
1001 I Street
Sacramento, CA 95814

Dear Tam Doduc,

Thank you for the opportunity to comment on the draft North Coast Instream Flow Policy. As all Californians know, the state's salmon and steelhead fisheries are in trouble. One of the biggest problems is clear: too many of our rivers and streams simply lack the water to support fish. I urge you to take decisive action with the Instream Flow Policy to conserve stream flows and to help put salmon and steelhead back on the road to recovery.

The final Policy must include a few basic things: scientifically-based criteria to limit diversions when stream flows drop below a certain level, measures to guard against the cumulative effects of multiple diversions, restrictions on new on-stream reservoirs, mandates for universal monitoring and reporting of both water diversions and stream flows, and provisions to periodically review the effectiveness of the Policy.

The Policy should take a broad, watershed-scale approach to the problem. It should provide incentives for landowners to go above and beyond the minimum required by the Policy, including measures to improve stream flows during the critical dry season. The State Water Board also needs to establish strong programs to ensure compliance with the law. Finally, the Board should conduct an honest assessment of the funding and staffing needed to implement the Policy and request adequate resources to get the job done.

With those steps, the Instream Flow Policy can be a crucial step forward for conservation in California. After more than 15 years of hard work by Trout Unlimited and others, it is time to finalize the Policy and get about the business of bringing back the fish.

As someone who owns property in Humboldt County, I have seen how much the rivers have dropped over the years. When I was about four or five, a neighbor caught a salmon as big as I was. We never see fish like that now. Because the lower water levels favor them, trash fish kill salmon fry, which need colder water higher flows would provide. The entire ecosystem depends on the amount of water reaching the rivers. In late summer, swimming becomes impossible and dogs and even people are poisoned by algal blooms which would not exist if the rivers were colder and faster flowing (which means more water in them.)

For all these reasons, I hope you will take the measures described above and ensure adequate flows in Northern California's streams and rivers

Sincerely

Linda Morgan
